# THE IRON AGE

THURSDAY, MAY 16, 1889

## To Test Boilers for the New Cruiser.

One of Secretary Tracy's first acts on assuming the control of the Navy Department was to revive the Board of Engineers on Experiment at the New York Navy-Yard, which for many years after the close of the Civil War did so much valuable service in ascertaining the practical value of inventions and improvements in steam machinery, boilers and fuses. The new board consists of the ex-chief of the Bureau of Steam Engineering, Charles H. Loring, as president, and Chief Engineer

bility, will be adopted in the coast-defense vessel, provided that the price is satisfactory to the Navy Department. Only such boilers as appear to possess merit will be tested for the purpose. The boilers offered for test must be of the type and approximately of the same size as those required by the plans intended for the vessel, and the manufacturers must prepare them for the test at their iron works or at such place as may be arranged with the Department.

An evaporate test of not less than 24 hours' duration, using clean and fresh

## The Putnam Steam-Engine Valves.

The high-pressure variable cut-off engine made by the Putnam Machine Company, of Fitchburg, Mass., has a wide reputation as being a well-designed and well-built machine. We herewith present several engravings illustrating the valve-gear, the valves being of the double-poppet form. The valves are operated by a side-shaft placed parallel with the axis of the cylinder, and extending beneath the valve-chests and operated by the main shaft through suitable gearings, as shown

Fig. 1.

## THE PUTNAM STEAM-ENGINE VALVES.

Louis J. Allen as executive, and an assistant. As the new coast-defense vessel must be fitted with them, the board is about to begin experiments with and tests of the various tubular, sectional or coil boilers to determine the best type.

They must be designed to furnish continuously, under forced draft, with due economy, at least three-fourths of the steam necessary to work triple-expansion engines of 4800 initial horse-power at 160 pounds gauge pressure. The boiler which appears to the Department, after investigation, to be the best for the purpose, taking into account the evaporative efficiency, the dryness of the steam, the weight of the boiler, the weight of the water contained, the accessibility for repairs, the simplicity and interchangeability of the parts, the space occupied, the ease of firing and of regulating the feed of the water, the suitability for working in battery, the capability of long-continued steaming without cleaning and the dura-

water, will be made at the rate of combustion proposed to be used on the vessel, all feed-water being measured in tanks to be furnished by the manufacturer, the coal weighed and the steam tested for dryness. Boilers which give good results in evaporation will be further tried by being surrounded by walls representing the adjacent bulkheads on board ship, and joints will be made and unmade in this limited room to prove that repairs can be properly made in the space available. The boiler which gives the best results will be again subjected to a test to show whether or not it will work satisfactorily under the everyday conditions existing on board ship. Several designs have been promised to be submitted.

The Anglo-American Electric Light Company, of New York, are offering treasury stock to enable them to enlarge their manufactory of electrical accumulators.

in Fig. 3. The steam-chests are placed one at each end of the cylinder. On this shaft are placed four cams—one for each valve—shaped as shown in Fig. 4. The cams operate, by raising the free ends, cam-levers, which in turn actuate the valves. The two outer or exhaust cam-levers are journaled to arms projecting from the engine bed, so that their free ends have an up-and-down movement, but no horizontal movement toward or from the cam-shaft. The movement of the exhaust-valves, therefore, is never altered.

The outer ends of the levers operating the inlet-valves are pivoted to the upper ends of arms rigidly secured to a shaft placed parallel with and outside of the cam-shaft, and having at its center a third arm, E, Fig. 4, which extends to and unites with the governor-rod. The governor, of the ball type, is driven by bevel gears from the cam-shaft, and its lower end is slotted to inclose the cam-shaft and extend to the arm E. It is evident that

the raising and lowering of the governor-rod will partly turn the shaft carrying the arm and thereby move the cam-levers toward or from the valve-stems in a horizontal direction. The free ends of these levers are shaped as shown in Fig. 4, the under side of the lever being cut away on a curve directly over the cam. When the cam-lever is in the position shown in the left-hand cut of Fig. 4 it will not be lifted by the cam, which revolves in the direction of the hands of a watch. The governor-balls are now at their highest possible point. In the right-hand drawings of the same figure the governor-balls are shown at their lowest position, and the cam will now strike the shoulder of the lever and open the valves the longest possible time. The valves are seated by their own weight and by the action of springs arranged as shown in Fig. 1. All jarring of the valve at seating is prevented by the curved form of the shoulder on the cam-lever, which rides upon the cam and brings the valve gently to its seat.

An idea of the form of the steam-passages may be obtained from Fig. 2, which is a view of one of the steam-chests split vertically through the center of the valves, and the two parts opened as if on a hinge. D D' are the inlet and E E' the exhaust valves. The live-steam

planation are then press-copied, so that the many steps for years past can be ascertained by consulting the copying-books. The drawing then passes to the chief draftsman, who assigns the task of reproducing it to scale to one of his assistants. It is drawn upon white paper and inked in, and all necessary dimensions are marked on it. Although the drawing is made to scale, it is the rule to dimension all those parts the size of which the builder must know, and any information necessary to be given beyond the form and size is written near the drawing. The drawings of the machinery for the Calumet and Hecla Mining Company are so self-explanatory that no specifications accompany them.

The original sketch and the drawing on white paper are then passed to another draftsman, who makes a tracing on cloth of all on the first sheet. During his work he checks both the design and the dimensions, and is considerably more than a mere machine copying lines made by another. He must be able to read the drawing and be capable of detecting any error. The finished drawing before being sent to the shop is examined by the chief draftsman, another employee, so that from the first sketch it had passed through the hands of four men, all of whom understood

### Photographing Projectiles in Flight.

Lieut. Albert Gleaves and Ensign Stokely Morgan have succeeded in photographing a projectile in flight. In Austria last year Professor Anschuetz succeeded in getting a photograph of a rifle bullet, the projectile moving at the rate of 1300 feet a second, and the plate which he used for the purpose being exposed for only .000076 of a second. The two English officers named used a surface Hotchkiss rifle, weight of charge 70 grains, weight of lead bullet 405 grains, with an initial velocity of about 1400 feet a second. Professor Anschuetz, of Lissa, has succeeded in obtaining remarkable and interesting results in photographing the flight of cannon-balls from the moment of their projection to their striking the target or other object aimed at. He demonstrated the perfection of his studies on the trying grounds of the Gruson works, near Buckau. His plates were submitted to the expert, Dr. Koenig, of the Berlin University, who was perfectly able to make therefrom the desired practical calculations. He established the fact that the projectile thus photographed had a velocity of 400 meters a second and that the duration of the light thrown upon the photographic plate did not exceed the 10,000th part of a second.

Fig. 2.—Steam-Passages of Putnam Engine Valves.

enters at C from a passage cored in the side of the cylinder and leading to the supply-pipe, which is placed between the valve-chests. Upon the lifting of the valve D D' the steam enters the cylinder through the port B. The exhaust is made through the port B and opening A when the valve E E' is lifted.

### The Leavitt Drawings.

The drawings made in the office of E. D. Leavitt are almost as well known as the machines they represent, and have earned an enviable reputation not only for the ideas they represent, but also for their accuracy and artistic finish. When it is stated that drawings for the machinery, the execution of which cost over \$4,000,000, were so near absolute perfection that less than \$2500 was paid for the errors in construction, an idea may be formed of the accuracy of the first conception and the faithfulness of the reproduction in metal. When, further than this, we remember that the apparatus made embodied new principles, was of proportions in many cases without precedent, and which made necessary new forms of construction, we respect the knowledge displayed in the first crude sketch and the skill shown in perfecting it.

The system by the aid of which this has been accomplished in the office of E. D. Leavitt is remarkable mainly because of its simplicity—there is nothing cumbersome about it. The several parts of a new machine are sketched by Mr. Leavitt and described. The drawing and its ex-

it and all of whom vouched for its accuracy. Mr. Leavitt never assumes any responsibility concerning the drawings. He gives all the necessary data and then throws the responsibility into the office. Of course he is responsible for the proper working of the machine, but as one has never yet failed to perform what was expected of it, his burden is light.

The first drawing is made on white paper, mounted on linen stretched on a board a little larger than the sheet, which measures 40 x 26 inches. The sheet is not removed from the board until the drawing has been completed, and if from any cause work upon any drawing ceases, it is labeled and placed in the safe. All drawings finished are placed in a fire-proof vault, those relating to the same machine being kept together in a drawer just large enough to easily admit the sheets. All those mounted, upon which work has been for a time abandoned, stand in racks made just large enough to admit them, and in similar racks all the drawings which have been worked upon during the day are placed; at night either the white-paper drawing or the tracing is always kept in the office, and a record is kept showing the disposition of all copies, such as blueprints.

During the building of a machine an inspector, appointed by Mr. Leavitt, is stationed at the works. He sees that the work done conforms to the requirements of the drawings and from time to time reports. In case of dispute between the inspector and builder the case is referred to Mr. Leavitt, who makes a personal examination and decides the case.

The theory of the motion of projectiles is a subject regarding which volumes have been written. An Austrian chemist named Mash has photographed a number of rifle bullets while in motion by means of the electric light, and thus presented some remarkable phenomena. In this operation his plan is to illumine the bullet by letting it break an electric current, but the velocity of the bullet must exceed that of sound in order that the conditions of the air before and behind the projectile can be shown. After various experiments Mash succeeded in his efforts to photograph projectiles fired from Werndl and Guedes rifles having respectively an initial velocity of 438 and 530 meters per second. The photographs obtained in this manner showed an air formation in front of the bullet having the form of an hyperbola, while behind it almost a vacuum was formed in which, when the initial velocity was great, there were some curious spiral motions. From the description given there appeared from these photographs to be a great similarity between the motion of a body through the water and that of a projectile through the air. A use of photography is to make a cannon-ball take a picture of its own wabbings. An arrangement something like a camera is placed in the forward end of a bolt projectile, and when it is fired directly at the sun the light traces lines upon the exposed sensitive plate, from the direction of which experts can afterward tell whether the projectile kept "end on," has "upset," or has kept in one position or wavered to and fro during its flight.

### The Pullman Shops.

The unsatisfactory condition of manufacturing establishments which depend upon railroad patronage is well shown in a recent statement published concerning the Pullman shops at Pullman, near Chicago. This report says that among the cabinet-makers and carvers there are usually from 400 to 500 at work, while now there are not over 200. There are less than 80 in the foundry, while there ought to be 700. No work is being done in the steel mill, and 300 men are idle, but it is expected enough work will be on hand in this department in a few days to last a month. There are 150 men in the iron department, while usually there are 500 or 600 at work. In the freight shops only 40 out of 400 or

concerns as the Pullman company, while some of the merchants and men say things have been getting worse from week to week.

### Drifting Test for Steel Angle-Bars.

A drifting test of the toughness of medium steel for structural purposes, recently devised by Hunt & Clapp, of the Pittsburgh Testing Laboratory, has been found to be one of the most effective of the usual tests for ascertaining the quality of the metal. The angle experimented upon measured  $6 \times 4 \times \frac{1}{4}$  inch and gave the following results when tested in an Olsen machine: The test consisted in punching  $\frac{1}{4}$ -inch holes 2 inches from the edge of the angle and 8 inches between centers, and

dication of how the metal will behave under other than tensile and compressive strains. Rails, for example, are now bought and sold absolutely without an effective test for their real wearing qualities. We have often stated, and now repeat, that the real tests which it is desirable to establish for rails are, first, a wearing test under abrasion; second, a deformation test under impacts of heavy loads at very low velocities; third (and this is the only test for rails now practiced which sheds any real light on their quality), breaking tests under impact. All chemical and mechanical tests other than this merely serve the negative use of excluding exceedingly bad rails. They do not show whether a rail of fairly good metal will wear well or ill in service, but

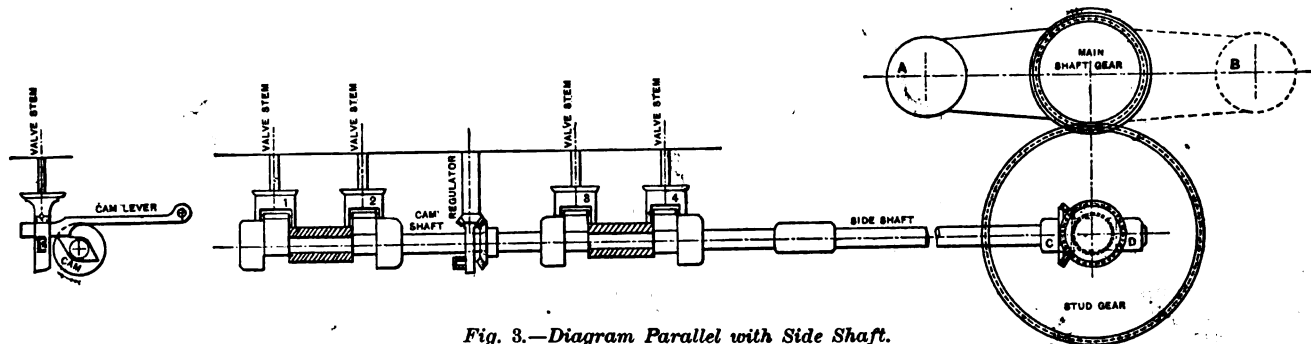

Fig. 3.—Diagram Parallel with Side Shaft.

Fig. 4.—Governor and Cams.

500 are at work, and these are just finishing up a few caboose cars. Work in this department is slack because of a lack of material and because a new Corliss engine is being put in place. In the store-room the force has not been cut down, but the wages have. The men who received \$1.50 per day now get \$1.25, and the chief store-keeper's salary has been cut from \$150 to \$120 per month. Less than 100 men are now working in the lumber-yard, where the regular force is from 240 to 250. The helpers of the steam-fitters have been cut from \$1.50 per day to \$1.25 per day, and over a dozen have left their work. Some 25 men were laid off from repair-work on the 8th inst. The wood machine department was closed down week before last, and unless more work is forthcoming the claim is made that but very few men will be employed in the Pullman shops in a short time. The officials say it is only temporary and nothing unusual with such

then enlarging the holes to an average of  $1\frac{1}{4}$  inches by the blows of a sledge on a drift pin. In good quality of steel the edges of the holes were found to be sound throughout, while the flow of the metal was plainly indicated. The test is an inexpensive one, and, in the opinion of Hunt & Clapp, is a very satisfactory one. They now use it regularly on all steel which is to be riveted up without reaming, and also in other cases where they wish to demonstrate the qualities of individual bars. It is found that metal which is short or burned or which is too hard chemically will fail under this test. In an article upon this test *Engineering News* says: This test is precisely in the line of a too-limited list of others which substitute a test somewhat approximating the actual destructive strains of service for the bare tension and compression tests, which are all right for the members or parts of members exposed to like strains in service, but which give no absolute in-

rather often indicate directly wrong conclusions.

Another test of this practical nature, which we may mention for illustration, is Mr. M. Wilder's bending test for stay-bolt iron. Finding the ordinary tests gave no direct evidence whether stay-bolt iron would prove good or bad, and reasoning that stay-bolt fractures resulted from bending due to expansion and contraction until the bolt was broken off, as one might break a piece of wire in his fingers, it occurred to Mr. Wilder to imitate these strains exactly. A piece to be tested,  $2\frac{1}{4}$  to 3 feet long, was fixed in a vise, and a piece of pipe slipped over it to give a grip, leaving about 6 inches bare next to the vise. Two men then walked around with the end of the pipe until the test piece was bent to a right angle, when they walked back again, and bent it to a right angle the other way. The quality was judged by the number of complete right-angle bends which it was possible to form without fracture, which varied from 4 to 16 in  $\frac{1}{4}$ -inch iron sold as good stay-bolt metal, although the same lot would vary only two or three bends. A stipulation that all metal accepted must stand 12 bends resulted in a very speedy improvement in the quality of the metal, and gave the manufacturers a definite criterion, which greatly aided them also by enabling them to determine just what was necessary to fill the requirements. Until consumers determine such standards as this it is quite idle to expect manufacturers to fulfill their expectations. They do not know how to do so, in the first place; and as the consumer will not give them credit for it, in the second place, for lack of a standard of comparison, but will probably buy some other iron  $\frac{1}{2}$  cent per pound cheaper, why should they take the trouble?

The plant of the Susquehanna Iron Company, at Columbia, Pa., which has been idle for some weeks on account of a strike of the puddlers, partially resumed operations on the morning of the 6th inst. The old employees were offered their positions, but refused to accept them. The company expect to have the mill in full operation in a few days.

### The Boulton Apparatus for Compressing Steel.\*

The Billings process for compressing steel ingots was intended to apply the pressure instantly when the casting was formed, but operated only to lock the gases within the ingot. In experiments tried by William R. Hinsdale, at the Jersey City Steel Works, in the year 1884, it was found that a pressure of 300 pounds per square inch, operating upon a 24-inch piston, and concentrated upon the end of a 3½-inch-square ingot, merely produced an ingot containing innumerable globules of gas. If the pressure was deferred until the ingot slightly hardened a pipe would form in the ingot at the upper end, and would remain permanently, as the hardening would prevent the pressure from operating effectively. The Billings and Hinsdale process provided a reservoir at the top of the mold and a movable plunger within the mold, by which the steel was drawn downward to make an ingot, which would be fed, during the shrinkage period, by the residue remaining in the reservoir. This process is not, therefore, convenient, except for the casting of large ingots. Mr. Hinsdale also experimented at the Jersey City Steel Works with a pressure of 60,000 pounds per square inch upon the metal applied to the end of a 3½-inch-square ingot—nearly double the pressure ever applied by Sir Joseph Whitworth. The result was the shortening of the ingot from 25 to 22 inches in length, and perfect solidity, except that the pipe appeared in the same form, a flaw, as it ordinarily displays itself at the piped end of a forged bar. Mr. Hinsdale thus found that piping or its effects could not be eliminated by pressure, and invented a perforated plug to insert in the mold upon the top of the fluid metal, through the perforation in which the gases might escape while applying the pressure. With this device the top of the ingot became slightly chilled and a crust formed thereon; but after the pressure upon the metal was raised to about 20,000 pounds per square inch the crust of metal exploded with a loud report, and a circular piece like a boiler-punching shot out of the perforation in the plunger, followed by the gas and sufficient metal to fill the cavity and form a stud as long as one's little finger on the top of the ingot.

This process produced ingots absolutely solid and free from defect, which had been proved impossible by the mere use of pressure. The expense of all these methods and the inconvenience of applying them to the open ingot molds universally used for casting steel ingots resulted in the invention, by Mr. J. B. D'A. Boulton, of Jersey City, N. J., of an apparatus in which ingot molds made without bottom, but in other respects like the common ingot molds, are superposed one part upon another and successively filled, the shrinkage in each ingot being fed by the fluid metal in that above it, and the resulting product being a series of absolutely sound ingots connected by cold-shut joints. An ingot made by this process and split open has been shown to be perfectly sound. By interposing an asbestos washer with a small aperture between the successive mold sections the resulting product was necked at intervals, so that the ingot bar could be readily broken at such points.

Boulton's apparatus, now manufactured by the Solid Ingot Company, of Jersey City, N. J., is shown in Figs. 1 to 8, inclusive, Fig. 1 representing the apparatus mounted over a pit, with a hydraulic elevator to raise the ingots to the floor level; Fig. 2, a vertical section through the cyl-

inder D in Fig. 1, and the parts above it; Fig. 3, an elevation of the elevator at right angles to that shown in Fig. 1; Fig. 4, a longitudinal section on the center line of Fig. 3; Fig. 5, a transverse section on line *xx* in Fig. 4; Fig. 6, a plan or end view of the elevator; Fig. 7, a plan of one mold; and Fig. 8, a side view of the same showing notches *k* and *j*, by means of which the mold is propelled through the casting machine and the elevator. The apparatus consists in a spring holder made of two I beams, A A, pressed together by tie-bolts, *m*, provided with springs, B (2). Hydraulic cylinders, I, are provided with piston-rods, *i*, to actuate a cross-head, *h*, which encircles the top of the holder and is provided with pawls, *a*, Fig. 1, adapted to fit the notches *i* in the sides of the

thus forcing the filled mold further down in the holder. When several molds have been filled, the first contained in the pocket *e* is shifted transversely by reciprocating the piston *f f'*; and the pocket being restored to a line with the holder, the subsequent downward movement of the molds within the holder discharges the severed mold and its contained ingot from the machine.

The hydraulic pistons are governed by valves shifted by hand levers not shown in the drawing, and the motions of the several parts are thus effected with great ease and rapidity. In practice a cycle of the required movement can be performed in much less than a minute, while it is found that such an interval is required to fill each mold and cool the ingot the de-

Fig. 1.—Mounted Over Pit with Elevator.

### THE BOULTON APPARATUS FOR COMPRESSING STEEL.

molds. A transverse cylinder (D, Fig. 1; *f f'*, Fig. 2) is applied to the bottom of the holder, and contains a piston, *f f'*, Fig. 2, provided with a pocket, *e*, to receive the molds in succession as they are forced downward in the holder. A spring dog, *e'*, sustains the weight of the mold and its contents in the pocket, while the piston is moved laterally, as shown in Fig. 2, and the ingot, while still red-hot, is thus sheared off at the joint of two molds. A spring tongue, *s'*, is used to set the molds in the holder, and the lifting of the head *h* separates the extremities of the tongs and detaches them from the mold. After the pawls *a* have engaged the notches *k* the head is moved downward and forces the mold within the holder into position for filling, as shown in Fig. 4. The apparatus is used by first inserting in the top of the holder a mold with a bottom (like that at *b* in the pocket *e* in Fig. 2). When filled another mold is superposed in like manner, and the head *h* and pawls, *a*, again reciprocated to draw it downward,

sired degree by the time they reach the sharing pocket *e*.

The molds being formed in longitudinal halves, as shown in Figs. 7 and 8, are readily separated from the castings, which, owing to the perfect feeding of the shrinkage in the progress of the molds through the machine, are absolutely sound and free from piping, and the cast steel is of high density throughout. The gases are also fully discharged from the fluid metal, as their free escape from the top of the metal is always possible. In most instances the machine may be set at such a level as to discharge the ingots at a convenient point for subsequent work; but where it is desirable to raise the ingots to the level of the casting-floor the elevator shown in the figures may be used. The elevator is arranged in an inclined position, with its lower end beneath the casting machine, to receive the molds and their contents and to intermittently raise the same through a guide, E, Fig. 1, to discharge the molds *s'* at the top. This is

\* From a paper entitled "The Piping of Steel Ingots," read by T. S. Crane, of Newark, N. J., at the Erie meeting of the American Society of Mechanical Engineers.

effected by providing a box, G, pivoted at one side and held vertical when empty by a counterbalance weight, *p*, operating in a dash-pot, *o*. The entrance of the mold into the box G tips the box over into the guide E, which is provided with a ladder-like frame, *F*, carrying a series of pawls, *L*.

works of Messrs. Spaulding & Jennings since December, 1887, and one ingot per minute is cast in it regularly when the heat is ready. The ingots cast are nearly 4 inches square and are absolutely sound, but the machine is equally adapted to cast larger ingots by making the holder and

## THE BOULTON APPARATUS FOR COMPRESSING STEEL.

The ladder is reciprocated by the hydraulic cylinder H, and operates to push the molds intermittently upward within the holder. Pawls, *m*, are provided to hold molds, when the ladder *l* is moved downward for the pawls *l* to engage another mold.

Boulton's apparatus has been in commercial operation at the West Bergen steel

the ingot molds of suitable dimensions. One man suffices to operate the levers of the hydraulic apparatus, and the ordinary operators are employed to pour the metal. The whole operation of forming the ingots is so similar to the use of ordinary molds that no training is needed to use the machine, and it may therefore be regarded as practically perfect.

portion of this report relates to the progress of the industrial and art schools connected with the institute. There are three departments to this school, the mechanical department, architectural department and artistic department, the first having 176 members, the second 148 members and the third 183 members. In the mechanical department students are

instructed in studies relating to the work of machinists, metal workers, foundrymen, blacksmiths, pattern-makers, &c. The architectural department is designed especially for carpenters, joiners, builders, masons, bricklayers, &c., while the

Fig. 1.—New Turret Ship.—Design.

artistic department is for instructions in drawing, painting, carving, silver-smithing, ornamental ironworking, decorating, &c. Instruction is given in each department two evenings a week, from 7 until 9 o'clock. We understand the instruction is given free of charge, all the pupil has to provide being the necessary materials and instruments for use in the classes. This school, in connection with the Ohio Mechanics' Institute, is comparatively little known, but from what we have heard it deserves a far wider publicity. The work done in the past has been most excellent, and the school offers many facilities for

Fig. 2.—New Barbette Ship.—Design.

instruction for persons residing in the neighborhood of Cincinnati. For the benefit of those who may care to learn further about this institute we will state that the secretary is William H. Stewart, 305 Plum street, Cincinnati, Ohio.

#### Designs for New English Battle-Ships.

The first paper read at the late meetings of the Institution of Naval Architects of Great Britain was "On the Designs for the New Battle-Ships," by

Fig. 3.—Sultan.

W. H. White, F.R.S., Assistant Controller of the Navy and Director of Naval Construction. The paper, which we condense below, describes the main features of the approved designs for the eight first-class battle-ships which are proposed to be added to the navy, and contrasts their protection, armament, speed and

coal endurance with the corresponding features of other battle-ships designed during the last 20 years. The information presented may be considered accurate and authoritative, as the author obtained permission from the First Lord of the Admiralty to prepare the paper.

Two designs have been prepared and approved by the Board of Admiralty, and in both are embodied identical qualities, so far as relates to the disposition (in plan) of the armament; the number and caliber of the heavy guns; the nature, disposition and protection of the auxiliary armament; the distribution and thickness of the hull armor; the propelling machinery, speed and coal supply; the complement and equipment; magazines and transport of ammunition, and arrangement for hold stowage. In principal dimensions and displacement the two types are identical. The essential differences

A is bulkhead from breastwork to ship's side. B B are bulkheads added during construction. S S is superstructure added during construction.

Fig. 4.—Devastation.

are that while one design is for a turret ship with moderate free-board at the extremities, and with guns about 17 feet above water, the other is for a barbette ship with the guns carried about 6 feet higher, and with high free-board at the bow and stern.

The board took into consideration all the principal dispositions of armament adopted in recent years for battle-ships, as well as several proposals that have been made—some of which have been patented—but not yet carried out in practice. It may be of interest and assistance in the discussion if I briefly summarize and illustrate some of the more important of these arrangements, and for this purpose a series of dia-

Fig. 5.—Fury.

grams—Figs. 3 to 16—have been prepared. On these diagrams the arrangement of the armor is also indicated. Fig. 3 shows the disposition of the armament of the Sultan, designed in 1868. Practically the whole of the armament is contained in a central two-storied battery placed amidships, and associated with a water-line belt of armor. Other illustrations of the "belt and battery system" need not be given, as it is well known. Figs. 4 and 5 show respectively the arrangements carried out in the "breastwork monitors" Devastation and Thunderer, designed in 1869 and proposed for the Fury in 1870. Here a low free-board is adopted for the greater part of the length; and the two turrets, each containing two guns, are placed at the ends of the armored breastwork, which is of less breadth than the ship. This design for the Fury was canceled, and work upon the ship stopped at an early stage. The vessel was entirely re-designed in 1872—

see Mr. Barnaby's paper in *Transactions* for 1873—and became the Dreadnaught, which is illustrated in Fig. 6. In all these designs the disposition of the armament is identical, and in securing the "all-around fire" of the turret guns it was made practically impossible to carry any effective secondary armament. Fig. 7

Fig. 6.—Dreadnaught.

shows the Inflexible, a central citadel ship, with turrets placed *en échelon*. In some of the later ships of this type an endeavor has been made to carry a few 6-inch guns as well as light quick-firers on the super structures; but, as in the previous disposition, the means taken to secure large arcs of command for the heavy guns reduced greatly the efficiency of the secondary armament. Fig. 8 illustrates the arrangements of the Italian citadel-turret ships Duilio and Dandolo, and Fig. 9 those of the German citadel-barbette ships of the Sachsen class. During the period 1869-78 very little was done in the designs of H. M. ships in the direction of providing for a numerous and effective secondary armament, but this was not true in foreign

Fig. 7.—Inflexible.

navies, and particularly in the French Navy. Figs. 10 and 11 show the principal features in the disposition of armament in a large proportion of the French battle-ships. There are four protected stations, each containing a heavy gun with a large arc of training. At a lower level are placed a number of guns of moderate caliber, sheltered to some extent from the fire of the heavy guns. A very similar arrangement to Fig. 11 has been adopted in the Imperieuse and Warspite of the Royal Navy, where considerable experience has been gained of its practical working. Another typical disposition of the armament is illustrated by Fig. 12, which represents broadly the arrangements adopted in the Italian battle-ships Italia and Lepanto. Here

Fig. 8.—Sachsen Class.

the four heavy guns are carried *en barbette*, high above the water, at the ends of a single armored inclosure placed near the middle of the length of the ship; nearly the whole upper deck forming a glacis, over which these guns fire if the, full arcs of training are obtained. The auxiliary ar-

mament is chiefly carried on the main deck, and sheltered by the upper deck from the fire of the heavy guns. It will be remembered that in the design for an American battle-ship, described by Mr. John in a paper read before the institution last year, a somewhat similar disposition of the armored battery or citadel was adopted,

Fig. 9.—Duilio and Dandolo.

but in association with turrets, and with a different arrangement of the auxiliary armament and upper works. Fig. 13 represents the Russian battle ship Catherine II. In this case the battery is of large extent, and at each end of the corners pairs of heavy guns are mounted *en barbette* on the disappearing principle. The upper deck is a glacis for their fire, and the auxiliary armament is placed below this deck. Fig. 14 represents the disposition

Fig. 10.—Admiral Duperre.

of armament in the Admiral class. Here the secondary armament is greatly developed and mainly carried in a central battery between the two protected stations containing the four heavy guns. Fig. 15 illustrates the very similar arrangements—in plan—adopted in the Nile and Trafalgar. It will be seen that in these vessels the central battery is shorter, and the secondary armament less numerous than in the Admirals. Fig. 16 illustrates one

Fig. 11.—Magenta Class.

of the various arrangements proposed by Sir Edward Reed, but not adopted, I believe, in any ship yet built.

After careful consideration of these and other alternative arrangements the board laid down the following principles for the new designs: 1. That there should be four heavy guns placed in two protected stations, situated at a considerable distance

apart, each pair of guns having an arc of training of about  $260^\circ$ , equally divided on each side of the line of keel. All four of these guns to be available on each broadside. 2. That the greater portion of the auxiliary—or secondary—armament should be placed in a long, central battery, situated between the two heavy-gun stations, and so disposed that there should be practically no interference with the fire of any one gun by that of any another. 3. That in view of the development of high explosives, it was desirable to secure the widest possible distribution of the guns in the auxiliary armament, and that it was preferable to mount the auxiliary armament on two decks, one of them being the spar deck, rather than to carry the guns chiefly between decks. It has been decided that each ship shall carry four  $13\frac{1}{2}$ -inch 67-ton guns as the principal armament, with

Fig. 12.—Italia and Lepanto.

hydraulic apparatus for training, elevating and loading the guns. The grounds for this decision are stated as follows: The height of the turret guns above water in the Trafalgar as designed was 15 feet; in the new turret ship it will be 17 feet. With the thick armor used for the protection of turrets and turret bases this apparently small change in the height of the guns above water involves an additional weight exceeding 150 tons. In the barbette ships the heavy guns will be 23 feet above water.

While the heavy-gun armament is practically identical with that of preceding ships, the auxiliary armament is of un-

Fig. 13.—Sinope Class.

precedented weight and power. The new battle-ships are each to carry ten 6-inch 100-pounders, besides a considerable number of smaller quick-firers. The 6-inch quick-firing gun is still in the experimental stage; it will be adopted in these ships if successfully worked out, and weight has been taken for it. So far as weights are concerned, these ten 6-inch guns, with their mountings and ammunition, represent no less than 20 guns of the same caliber with the allowance of ammunition hitherto carried. The total weight of the auxiliary armament in the new ships is about 500 tons, or considerably over three times the weight originally assigned to the corresponding armament in the Trafalgar, and two and two-third times as great as the weight of the auxiliary armament to be actually carried by that ship. The weight of the auxiliary armament in the new battle-ships is practically equal to the total weight of armament proposed for the Fury design in 1870, the latter ship being of nearly 10,500 tons displacement.

The armor protection of the hull proper includes two principal features: 1. A

belt  $8\frac{1}{2}$  feet broad extending over two-thirds the length of the vessel, and having a maximum thickness of 18-inch armor. Transverse armored bulkheads complete the belt; a 3-inch steel deck is fitted above it, and a strong protective under-water deck completes the protection before and abaft the belt. 2. The broadside above

Fig. 14.—Collingwood.

the thick belt is protected to a height of about  $9\frac{1}{2}$  feet above water over a considerable portion of the length by 5-inch armor. Screen bulkheads, similarly armored, inclose the central battery. The protection of the heavy guns consists of 18-inch armor on the turrets, and 17 inches on the redoubts protecting the turret bases, &c. The illustrations in Fig. 1 will make this description clearer. It will be seen that each turret stands in a separate battery or redoubt, which rests upon the protective deck, and is strongly armored for the de-

Fig. 15.—Nile and Trafalgar.

fense of the turret bases and loading apparatus. This system has been previously carried out in the Victoria and Sans Pareil, in each of which there is only one turret. The belt armor rises 3 feet above water and extends  $5\frac{1}{2}$  feet below water. Its longitudinal extent is sufficient to insure that if the spaces before and abaft it and above the under-water protective deck were flooded very small "sinkage" and very moderate "change of trim" would ensue. The maximum thickness of the belt armor is 18 inches, as against a maximum of 20 inches in the Trafalgar; the minimum thickness at the ends of the belt is the same as in the Trafalgar—14 inches. The proportion of the length protected by the belt is

Fig. 16.—Sir E. J. Reed's Design.

the same in both cases. Above this thick armor belt and protective deck the broadside is armored with 5-inch steel for a length of 145 feet, and to the height of the upper deck amidships ( $9\frac{1}{2}$  feet above water). Oblique armored bulkheads or screens extend across the protective deck and meet the redoubt armor, thus com-

pletely inclosing a high armored citadel with its top at the level of the upper deck (9½ feet above water), having the same extreme length as the central battery, viz., 170 feet. Within the 5-inch steel armor on the sides coal bunkers are built, extending from the belt to the upper deck, and having an athwartship thickness of 10½ feet. When filled with coal these bunkers would greatly re-enforce the defense; when empty, the minimum defense is 5 inches of steel, which is proof against all the smaller kinds of quick-firing guns and against many of the most destructive forms of attack from much larger guns. In the Trafalgar the two "turrets stand at the ends of a long armored citadel extending to the full breadth of the ship, with vertical armor on the sides (varying in thickness from 16 inches to 18 inches) rising to a height of about 11 feet above water," according to the original design. In the completed ship this height will be about 10 feet. The upper deck over the citadel is plated with 8-inch steel. The distance between the centers of the two turrets is about 150 feet, and the central battery between the two turrets has an extreme length of less than 110 feet and a length along the broadside of about 65 feet. In the new turret ship it has been necessary to provide a much longer central battery (about 170 feet in extreme length) to accommodate the more numerous and powerful guns in the auxiliary armament; and the turrets are placed about 200 feet apart. Consequently, if the citadel system embodied in the Trafalgar had been repeated the length of the thickly-armored sides would necessarily have been considerably increased; and a great additional weight and cost of armor, &c., would have been incurred if the same thickness had been maintained, or a considerable thinning of the armor, &c., made necessary if the same total weight had been adhered to. No point in the new designs received more careful consideration than this. In order to elucidate the matter, alternative designs were prepared for ships of the same displacement, identical in all respects except as regards the adoption of the "citadel" or the "separated redoubt" systems. With separate redoubts, placed far apart, the two stations are isolated, and there is practically no risk of simultaneous disablement by the explosion of shells or perforation of projectiles from the heaviest guns. Each redoubt offers a small target to the fire of an enemy, and its weakest part—the thick steel protective plating on the top—is of so small extent that the chance of its being struck is extremely remote. Serious damage to the unarmored turret bases, therefore, involves the perforation of the thick vertical armor on the redoubts.

With a single citadel extending the full breadth of a ship the case is widely different. Over a comparatively large area of the protective deck plating in the neighborhood of each turret perforation of the deck or its disruption by shell explosions at any point involves very serious risk of damage to the turret bases and the loading apparatus. In fact, such damage may be effected and the heavy guns put out of action while the thick vertical armor on the citadel is uninjured. Moreover, as the turrets stand at the ends of a single citadel, there is a possibility of their simultaneous disablement by the explosion of heavy shells within the citadel. This last risk may be minimized (as in the Nile and Trafalgar) by constructing armored "traverses" within the citadel, but it cannot be wholly overcome so long as both turrets stand in one armored inclosure. It may be thought that the risk of damage to a 3-inch steel deck situated 11 feet above water is remote; but I think the facts are as stated, when actions at sea are taken into account. For example, if a ship of 70 feet to 75 feet

beam is rolling only to 10° from the vertical, which is by no means a heavy roll, she presents a target having a vertical (projected) height of 13 feet to 14 feet to an enemy's fire, and even if she is a steady, slow-moving ship she will do this four or five times in each minute. Now, at this angle of inclination, assuming the flight of projectiles to be practically horizontal, even the thickest protective steel decks yet fitted in battle-ships are liable to serious damage from the fire of guns of moderate caliber, and this danger is increased by the employment of high explosives. Of course I do not mean to say that this damage is to follow from fire intentionally aimed at the protective deck; but with a great and sustained volume of fire, such as is possible with a powerful auxiliary armament, and especially with quick-firing guns, it is obvious that there is a very real danger of chance shots injuring seriously the wide expanse of the protective deck at the top of a long citadel. Again, it must be noted that the chances of damage to a deck placed 10 feet or 11 feet above water, and with large exposed surfaces in the neighborhood of the turrets when a ship is inclined or rolling, are greater far than those of a deck 7 feet or 8 feet lower, and with 5-inch armor on the sides protecting the deck from the direct impact of shells containing heavy bursters. It is for the naval gunners to estimate these chances of injury; but, unless I am greatly mistaken, their verdict will be that a far greater number of shots are likely to strike at a height of 8 feet to 10 feet above water than at a height of 4 feet to 5 feet.

I will now proceed to summarize the chief points of difference between the designs—see Figs. 1 and 2. In the barbette ships the free-board at the ends is increased to 18 feet, or 6½ feet more than the free-board in the turret ship, and about 7 feet 4 inches more than in the Trafalgar as completed. The heavy guns are carried 28 feet above water, as against 17 feet in the new turret ship, and about 15 feet as designed, or 14 feet as completed, in the Trafalgar. In the Royal Navy a very large proportion of our most recent and powerful ships are of moderate free-board, carrying their guns only 12 to 14 feet above water, whereas in foreign navies, in recent years, the heavy guns are chiefly carried from 22 to 28 feet above water, and the free-board is high. The decision of the admiralty to largely adopt the barbette design is avowedly based on these facts and arrived at with a full knowledge of the relative advantages and disadvantages of the turret and barbette systems, after considering designs for turret ships with guns placed at equal height above water, and with the same free-board as the barbette ship. It will be obvious that the increase in height of free-board and of guns above the water can only be secured by means of additional hull weights and rearrangements of the armor. What has been done is this: The turrets have been abolished, and the weight of armor, &c., is utilized in adding to the height of the redoubts in which the turret bases stand. The barbettes thus formed are strongly armored from the 3-inch protective deck above the belt upward, and are divided into two stories. In the upper story stand the turn-tables carrying the heavy guns; in the lower story will be placed the turning engines and other important portions of the equipment. The hydraulic system of mounting, working and loading the 67-ton barbette guns to be carried out in the new ships will resemble closely that already successfully adopted in the Admiral class. As regards the disposition of the belt armor, protective deck and 5-inch armor, as well as the protection of the auxiliary armaments, the barbette ships are identical with the turret design, already described.

It was originally contemplated to adhere in the new designs to the speed that had been first accepted for the Trafalgar—viz., 15 knots on the measured mile with natural draft and 16½ knots with forced draft. In working out the designs it has been found possible to increase these speeds to about 16 knots natural draft and 17½ knots with forced draft.

It was decided, after full consideration, that the new ships should ordinarily carry 900 tons of coal, as in the Trafalgar, and be capable of covering the same distance—viz., about 5000 knots at 10 knots. Like the Trafalgar, the new ships will have a bunker capacity sufficient to carry a much larger quantity of coal if desired. But whereas any increase above 900 tons in the coal put on board the Trafalgar necessitates an increased draft and some loss of speed, in the new designs provision is made—in the form of the so-called "board margin"—for an unappropriated weight exceeding 500 tons to be carried at the designed load draft and at the full speed. Strictly speaking, therefore, the case stands thus: Trafalgar, coal at load draft, 900 tons; new designs, coal at load draft and unappropriated weight, about 1400 tons. If the unappropriated weight should be assigned to coal it would give the new designs a coal endurance of nearly 8000 knots at 10 knots. Apart from any such increase in coal, however, the 900 tons proposed is a very large supply in relation to expenditure; larger, in fact, than that of nearly all first-class battle-ships. Take, for example, the Thunderer and Devastation as completed. They can cover about 4700 knots at 10 knots. Their full speed for continuous steaming in smooth water is estimated at 12½ knots, and they can cover about 2700 knots. At that speed with 900 tons of coal the new ships could cover about 3500 knots. At the highest speed contemplated for smooth water, continuous steaming—about 16 knots—the new ships could cover about 1900 knots. The forced-draft speed is never intended to be maintained for more than four to five hours continuously, so that an estimate of coal endurance under these conditions is worthless for any practical purpose.

	Length.	Mean draft.	Displacement.	Maximum speed.
	ft. in.	ft. in.	Tons.	Knots per hour
New ships, excluding board margin.	380 0	26 8	13,600	17½
Trafalgar, as designed.	345 0	27 6	12,000	16½
Inflexible.	320 0	25 3	11,880	13.8
Dreadnaught.	320 0	28 9	10,820	14.2
Minotaur.	400 0	28 9	10,600	14.4
Warrior.	380 0	28 9	9,210	14.1
		Extreme draft.		
Italia.	400 6	31 3	13,900	18
Lepanto.	400 6	30 9	13,550	18
Sicilia.	400 0	28 6	13,253	18
Admiral Baudin.	321 6	26 2	11,880	15

Before sitting down I will add two or three statements which appear to be of some importance when dealing with the relatively large size of the new ships. First, they have been shown to be made large by the great loads of armament equipment and board margin they carry on a moderate draft at high speed. Omitting the board margin—or allowance for contingent additions during construction—the ships are of 13,600 tons displacement and about 26 feet 8 inches mean load draft. I am not at liberty to make any statement respecting the admiralty estimate of cost for these ships, for reasons which will be obvious. But this I may say, that while the total weight of protective material in the new ships is greater than the corresponding total in the Trafalgar by something like 150 tons, the adoption of the 5-inch armor in association with redoubts, instead of a

central citadel thickly armored throughout, has the result of largely reducing the cost of the armor. This was not the reason, however, for the adoption of the system, as has already been explained. At the next meeting of the institution this question of cost may be debated on the basis of ascertained figures, and I therefore say no more.

## THE WEEK.

In 1886 there were three cities in Kansas with a population exceeding 15,000 each. At this time there are six cities varying in population from 15,000 to 50,000. In 1886 there were but 55 towns and cities exceeding in population 1000. At this time there are 107 cities and towns with a population of 1000 each.

Relative to steamship traffic between British Columbia and American Pacific ports, Captain Goodall, of San Francisco, agent of the Pacific Coast Steamship Company, states before the United States Senate Committee to Investigate Trade Relations with Canada that of the shipments north from San Francisco about 10 per cent. goes east by the Canadian Pacific, and about the same amount by the Northern Pacific. In his opinion the subsidized steamer lines of the Dominion Government will in time prove fatal to American lines unaided by the Government. British vessels cost fully 25 per cent. less to run than American vessels.

Secretary Tracy awarded to the Richmond Locomotive and Machine Works the contract for supplying the boilers and machinery of the battle-ship Texas, now building at the Norfolk Navy Yard. The price fixed in the contract is \$634,500. The Richmond bidders were in competition with some of the largest and oldest engineering works in New York, Philadelphia and Baltimore, and the contract was awarded to them after a careful inquiry which satisfied the Department of their ability to undertake a work of this magnitude. This action is in accordance with the Department's policy of enlarging the number of private establishments capable of building vessels and machinery, as well as of locating them in different sections of the country.

The introduction of flax culture on lands where wheat has ceased to be profitable is strenuously advocated by the Agricultural Department at Washington.

A new gas company, with a capital of \$800,000 is forming in Pittsburgh to run a pipe line to the Bellevue gas fields, for the supply of Oliver Brothers & Phillips' South Side Mills, the Republic Iron Works and Oliver & Roberts' Wire Mills.

In sinking a well for Spreckels' refinery at Philadelphia a copious flow of gas has been struck which Mr. Spreckels says will be worth \$2000 a day if the supply is sufficient.

An unseemly strife for the possession and occupancy of piers in New York City is renewed from year to year in the absence of specific laws relating thereto. The effort now is on the part of railroad corporations as against ship-owners in the China trade and others who have long occupied piers on the East River, to whom deep water alongside the wharves is indispensable. The shippers claim that enough short piers could be built below Grand street to accommodate the railroad companies, which only use shallow transports, without encroaching on their ancient prerogatives.

The Assembly ceiling scandal is followed by the report of an investigating committee, which states that there was a profit in the work of \$120,000, of which \$39,086.91 still remains in the Treasury. This leaves

\$80,000 in the hands of Snaith and Sullivan, the contractors. Investments aggregating \$26,000 being admitted by Sullivan and \$28,089.28 by Snaith, leaves to be accounted for only \$26,000, which the committee are satisfied was not disbursed on account of legitimate expenditures on the Capitol building.

The transcontinental mails between New York and the Pacific Coast are being transported in about 22 hours faster time than heretofore.

The Turkish Government is asked to consent to the invasion of Palestine by a locomotive railway, from the Mediterranean to Damascus, with the right of navigating Lake Galilee. The whole distance is 105 miles. "Fifteen minutes' stop at Jerusalem for refreshments!"

The Hamburg steamship Rugia, outward bound from this port with a cargo of cotton and lard, narrowly escaped destruction from fire, but was saved by forcing steam into the hold after the use of water seemed to be unavailing.

Throughout Florida the season has been several weeks behind the average, while at the North the spring has come early, and in the grain-growing regions far West the reversal of ordinary conditions is quite as noticeable as anywhere else.

Boston papers pronounce as ridiculous the attempt to boom the rubber market, intimating that it is only a device of speculators to get rid of their holdings, carried at a considerable loss.

The Government of Trinidad offers a subsidy of \$25,000 per annum for the establishment of a semi-monthly line of mail and fruit steamers between New York and Port of Spain.

General Brust, of Colorado, has purchased for a cattle company 140,000 acres from the Cherokee Nation for \$5000.

Minnesota millers say the recent rains in Dakota and Minnesota would have been cheap at \$1,000,000.

The New York Central Railroad Company propose to rebuild their grain elevator recently burned in this city.

In West Virginia, between Fairmont and Clarksburg, there are veins of coking-coal 6 feet thick. A railway connection will be made direct to Pittsburgh.

In consequence of the strike of about 70,000 German coal-miners many iron furnaces have been compelled to extinguish their fires. The Krupp Works have arranged to obtain coal from Upper Silesia and England and will resume the making of rails.

Caleb W. Mitchell has received from the Mexican Government a concession of land in several Northern States, permitting the establishment of several industrial and agricultural colonies, at the same time guaranteeing a bonus of 10 per cent. on the capital invested. The privileges include the erection of factories and workshops.

Surveys are making for a railroad from Pierre, Dak., to Puget Sound under the auspices of the Illinois Central, with the object of controlling the cattle trade. The line will run through the Sioux Reservation and the Yellowstone.

The directors of the Exposition Society of Pittsburgh awarded the contract for the erection of Machinery Hall to the Marshall Foundry and Construction Company for \$130,000, to be completed by September 1. The contractors for the main building are Murphy & Hamilton.

American trade relations with China are briefly touched upon in the annual review issued by the New York Chamber of Commerce. For nearly 100 years New York merchants have had friendly inter-

course with those of China, but there has been a change of late, and a feeling of alienation has gradually arisen. The report says the question of Chinese registration is delicate in many respects, but there is reason to hope that it will be finally solved in accord with the liberal spirit which the American Government has usually manifested in its dealings with foreign nations. If not, we must not be surprised to see this once profitable commerce pass from American and from British hands also into that of the German, with whom there cannot arise any such race conflict as the immigration of the Mongolian race has caused on the Pacific slope of the American continent.

The Illinois State Commissioners appointed to consider the expediency of manufacturing twine in the State prison estimate the consumption of twine in the State annually to exceed 4000 tons, costing about \$150,000 delivered.

Judge Barrett, of the Supreme Court, has decreed the dissolution of the bogus sugar-refining company and the forfeiture of its franchises.

The American Meat Company, of which Warner Miller is president, expect to supply New York and other Eastern markets with beef raised in New Mexico and slaughtered in Kansas City, in competition with beef from Chicago.

Ten beet-sugar factories to be erected in California will be supplied with machinery from workshops in that State, except a few pieces from Germany. The expenses of each factory will amount to at least \$100,000 a month, or a total of \$1,000,000 for the ten factories at the lowest calculations, exclusive of what they will have to pay to farmers for beets. The factories will produce 50,000 tons of sugar annually, which means the production of 500,000 tons of beets in that State.

Five large breweries, of which three are in Newark, one in this city and one in Albany, have been consolidated under a single management, with an aggregate capital of about \$5,000,000, to be represented by an issue of stock.

Charles George Wilson, the newly appointed Commissioner of Public Works, is the subject of much unenviable criticism by the newspaper press.

The residence of the late Joseph Sheffield, of New Haven, is about to pass into the possession of the Sheffield Scientific School.

With reference to numerous expected consular appointments by President Harrison, word comes from Washington that they will not be made hastily. The President, it is stated, is going to make personal investigation into the fitness of applicants for consular offices, in accordance with the policy which he outlined some time ago of reorganizing the service. It will be the policy of the President to put in consular offices men who can be of commercial advantage to their country abroad.

The new recitation hall for Yale College, now approaching completion, is architecturally the pride of New Haven. Fourteen huge Scotch granite columns adorn the entrance. The entire cost will be \$200,000, but who the benefactor is remains a mystery.

Thomas A. Edison brings suit to recover \$250,000, which in some way disappeared in a phonograph transaction, and which he claims to have lost. The defendants are E. T. Gilliland and John C. Tomlinson.

Ex-Consul Smith, of Carthage, says that the Republic of Colombia presents a vast field for American enterprise. Electric

lights, water-works, railways and ice machines are particularly wanted now, and the Government is liberally disposed.

The Brooklyn Bridge trustees voted to expend \$409,000 in extending and otherwise improving the New York terminal. The cost of changing the platform will be \$150,000.

A Rio paper says there is no doubt that the Brazilian Government, as an ally of Paraguay, is preparing to protect her against a threatened invasion by Bolivia, and that the cost may be very high.

It is estimated that 100,000 persons will go abroad this season, and if each individual takes but \$1000 the total will reach \$100,000,000, a sum large enough to have an important effect on our trade balances with foreign countries.

The Supreme Court at Washington, on Monday, affirmed the validity of the law excluding Chinese laborers known as the Scott Exclusion act. The case in which the decision was made is that of Chac Chang Ping, who left this country with a certificate entitling him to return, before the passage of the act. He has since attempted to land at San Francisco, and was refused admittance. The Supreme Court holds that Congress has the power to abrogate a treaty, and in support of that view cites the authorities of the courts on the subject, holding that the propriety of such action is not a matter for judicial cognizance, but that it is a matter for the political department. Congress, it says, has the power to exclude aliens from the country whose presence is deemed inimical to our interests.

Our Consul at Neuvo Laredo, Mexico, reports to the Department of State that the bridge across the Rio Grande, connecting Neuvo Laredo, Mexico, and Laredo, Tex., was completed on the 6th inst. and will greatly facilitate commerce between the United States and Mexico, and result in reduced rates of transportation.

The Spanish Exhibition will open on May 30.

It now appears probable that nearly all the governments invited to participate in the Congress of American Nations at Washington next autumn will be represented. The question of steamship subsidies is likely to be among the leading topics discussed.

It is announced that the Canadian Pacific road across Maine is practically completed, and will be opened late in June ready for business from British Columbia across the continent, and to Europe from Halifax.

Forty-seven hundred tons of sugar, valued at \$470,000, arrived at Boston 12th inst., brought by the steamship Shawmut, with a cargo of 12,700 bags, and the barge Atlas, with 16,000 bags, the latter taken in tow, from Matanzas, Cuba. The voyage was made in 11 days, and the two captains by whom this feat was accomplished claim that long-distance towing is practicable if suitable vessels are used.

New York State is now prepared to kill murderers by the use of machinery, the Superintendent of State Prisons, Austin Lathrop, having bought three dynamos, which will be distributed between Auburn, Sing Sing and Clinton prisons, each capable of making corpses of healthy men in a period of less than seven seconds. They cost the State \$8000.

Cramp & Sons have received a \$350,000 contract for the construction of a steel steamship for the Metropolitan Steamship Company, of New York. The new craft will be 271½ feet long, 43 feet beam and 19½ feet depth of hold, registering 2625 gross tons.

## MANUFACTURING.

### Iron and Steel.

Soho Furnace, of the Moorehead-McCleane Company, produced 5520 gross tons of pig-iron during the month of April.

The two blast furnaces of Schoenberger, Speer & Co., of Pittsburgh, produced 5354 gross tons of Bessemer pig-iron during the month of April last.

The nailers in the employ of Chess, Cook & Co., Jones & Laughlin, Limited, and Schoenberger & Co., nail manufacturers, of Pittsburgh, have received notice that if the scale of wages for cutting nails recently put in operation at the Bellaire Nail Works, of Bellaire, Ohio, is adopted in the Ohio Valley district the Pittsburgh nailers must also accept the reduction or the machines will be stopped entirely. Out of about 200 nail machines in Pittsburgh only about 75 are being operated, and these only about half time. It is believed that the nailers will agree to accept the reduction, with the expectation that by doing so they will have steadier employment. The scale now in force at Bellaire is a reduction of 35 per cent. on 5d nails and sizes below, and 12½ per cent. on all sizes above 5d. It is the heaviest reduction made for nail-cutting since the long strike of 1882.

The charcoal furnace of the South Mountain Mining and Iron Company, at Pine Grove Furnace, Cumberland County, Pa., was blown out on February 23 in order that improvements in the plant might be made. Since that date the stack has been relined from bottom to top, the hot oven has been renewed and general repairs have been made. The furnace was successfully blown in again on April 20 and 21. It has continued running well, and its capacity is found to have been increased 25 per cent. With these advantages and thorough cleaning of the ore the company expect to reduce the cost of making pig-iron. Mr. S. R. Still is now the superintendent of the furnace.

Some extensive improvements have just been completed at the Edgar Thomson Steel Works of Carnegie Brothers & Co., Limited, at Braddock, Pa., by which the capacity of the rail mill has been increased to nine finished rails per minute. The rolls of the blooming mill have been enlarged, and now 1½-ton ingots are made into two blooms, each of which makes three rails. Another saw has been added also, and now three rails can be sawed, instead of two, as before.

The nail factory of the Belmont Nail Company, at Wheeling, W. Va., resumed operations last week, the nailers agreeing to accept the Bellaire scale for cutting.

The blast-furnace of the Bellaire Nail Works, at Bellaire, Ohio, has now been in blast for two years and seven months on its present lining, and during that time has made 123,000 tons of pig-iron, 95 per cent. of which was No. 1 Bessemer. From present appearances the furnace will continue in blast for some months to come.

The 24-inch mill of the National Tube Works Company, at McKeesport, Pa., was put in operation last week to fill a large contract for 8-inch pipe. It has been idle for some time.

The coke blast-furnace of the Paducah Iron Company, at Paducah, Ky., is to be put in blast during the summer. This furnace formerly belonged to the Nova Scotia Iron Company, of St. Louis, and ran on charcoal. It was removed from Salem, Mo., to Paducah in 1888.

On the 7th inst. work was resumed in the pipe mill of the Reading Iron Works at Reading, Pa., to finish 1000 tons of

pipe that had been commenced before the firm suspended. This work will occupy three weeks. The two large blast-furnaces of the works, which have been in operation since the failure, were ordered to go out permanently last week. The assignee will in a few days begin to dispose of the property.

The Bouton Foundry Company, of Chicago, have for some time been engaged in removing their buildings from the old location on Archer avenue to a tract of land which they have secured at Thirty-ninth and Winter streets. In re-erecting the plant a number of improvements have been made, and the owners believe that they will have one of the most conveniently-arranged and perfectly-equipped foundries in the West. They will have an abundance of room for enlarging the plant if that should become necessary. The machine-shop is now partly in operation, and the foundry will probably begin to melt iron this week.

The Pioneer charcoal furnace of the Iron Cliff Company, at Negaunee, Mich., has been doing remarkably good work. The furnace has made thus far on this blast 52,000 tons of pig-iron, and during the last month it averaged over 80 tons daily. The highest product for any one day was 89 tons, which was accomplished on the 30th of April. As the dimensions of this furnace are but 57 feet by 10 feet, it is claimed that this is the best record for a charcoal furnace up to this time. The large output is certainly very creditable to the management, and sustains the reputation which charcoal furnacemen are now making for progressiveness.

The Wellston Furnace Company, of Wellston, Ohio, exhibit in the office of Forsyth, Hyde & Co., at Chicago, a sample of their No. 1 foundry pig-iron cast in the form of a carving knife and ground to quite a sharp edge. The iron is remarkably close grained and shows up well in a test of this character.

The South Halsted Street Iron Works, at Twenty-sixth and Halsted streets, Chicago, are quite busy at present on architectural work. Last week the foundry turned out some of the heaviest columns which have been cast in Chicago. They are 28 inches square, weigh 7½ tons each, and were cast in two lengths, one part weighing 4 tons and the other 3½ tons. These columns are to be used in a very substantial building now being erected for manufacturing purposes in Chicago. The company have contracts for the architectural iron work on quite a number of buildings now in course of erection in Chicago, as well as a large office building and the Masonic Temple in Denver, Col.

Furnace A, of Carnegie Bros. & Co., Limited, at Braddock, Pa., was blown out on the 11th inst., for relining and other repairs. It will be ready for blast again about July 1, next.

A press dispatch from Green Brier, W. Va., under date of the 12th inst., says: "The Glenmore Iron Company, organized with Gen. J. R. Anderson, of the Tredgegar Iron Works, Richmond, as president, will erect a great plant on the Glenmore estate, 3 miles from this place. They have acquired 3000 acres of land, upon which there is a vein of iron ore 40 to 60 feet thick and 6 miles long, which can be mined by open cutting. The Chesapeake and Ohio Railroad will run a branch line to the mines and works."

Wm. B. Scaife & Sons and the Scaife Foundry and Machine Company, Limited, of Pittsburgh, have about completed the greater portion of a new Bessemer plant, with a number of new improvements, for Messrs. Miller, Metcalf & Parkin. The buildings, all of iron frame-work, covered

with corrugated iron, were designed and erected by the first-named firm, and the various styles of cranes, ladles, converters and hydraulic machinery were designed and built by the latter.

#### Machinery.

The Mahoning Boiler Works of W. B. Pollock & Co., at Youngstown, Ohio, are in full operation, with plenty of orders on hand. This is one of the oldest industries in Youngstown, having been established more than 25 years ago.

The Metcalfe Company have recently been organized at Shippensburg, Pa., with a capital stock of \$150,000, for the manufacture and sale of machinery.

J. A. & S. F. Dunkle, of Steelton, Pa., and J. B. Ewing, of Harrisburg, Pa., have recently purchased the entire plant and good-will of the Star Steam Heater Company, of Mount Joy, Pa., including the exclusive control of the patents. Large and commodious shops will at once be built at East End, Harrisburg, according to new plans especially adapted for their business. Three departments—viz., boiler-making, machine shop and foundry—will be fully fitted out with the best machinery. It is expected that the shops will be completed some time during July, when they will immediately be occupied. Meanwhile operations have begun in the old shops in Mount Joy, where work is being pushed to its utmost to supply the demand. The address of the firm is Star Steam Heater Company, Harrisburg, or until after August 1, Mount Joy, Pa. H. H. Lindemuth, the patentee, has connected himself with the new firm and will give the boilers his personal supervision.

The Buffalo (N. Y.) Forge Company have issued a catalogue on heating, drying, ventilating and cooling, which not only shows the fans and blowers made by them, but also shows the machines applied to various uses. The construction and operation of their hot-blast apparatus is also described and illustrated, and its application to the warming of factories of different designs and to lumber dry-kilns is shown. The ventilating arrangements by means of their exhaust disk-wheels are illustrated in the case of school-houses, foundries, machine and blacksmith shops, &c.

A catalogue recently issued by the Buffalo (N. Y.) Steam Pump Company fully illustrates the many and various styles of pumps made by this firm. From the catalogue a clear idea may be formed of the construction and operation of each of the pumps and the work they are designed to perform. The last few pages of the book are devoted to useful information regarding hydraulics, steam-engines, wrought and cast iron pipe, watering-pipes, &c.

The Canton Steam Pump Company, of Canton, Ohio, have recently issued an illustrated catalogue and revised price-list of the Miller duplex steam pump and the Torrent and Unique steam pumps for boiler-feeding, brewing, mining and general purposes. The sectional views accompanying the engravings clearly show the construction and operation of the pumps and their most important features.

#### Hardware.

William Neil & Co., manufacturers of oil tanks for the use of grocers and others, have removed to Nos. 11 and 13 Dearborn street, Chicago, where they will have increased facilities and will be fully prepared to meet promptly the demands of their customers.

Hubbard & Co., of Pittsburgh, have expressed themselves to the effect that they would rebuild their axle factory, destroyed in that city a few weeks ago, in Beaver Falls, Pa., on the same grounds and adjoining their branch works at that

place, provided they could get ground enough. The council has passed a resolution grading a 60-foot street between the branch works and the Western File Works. This will give them ample room, and it is thought will induce them to locate there.

The Youngstown Stamping Company, of Youngstown, Ohio, manufacturers of stamped and japanned ware, report business to be in a very satisfactory condition. One of the articles manufactured by the firm is a glass fruit jar with a patent cover, which is said to be meeting with an excellent sale.

The I. L. Ellwood Mfg. Company, of Dekalb, Ill., have been incorporated with a capital of \$500,000 to manufacture barb wire and other products. The incorporators are Isaac L. Ellwood, Hiram Ellwood and Edward C. Lotta.

The Brainerd Bolt Company, of Chicago, have also been incorporated with a capital of \$500,000. They will manufacture steel and iron bolts. The incorporators are A. M. Brainerd, A. C. Webb, W. R. Jerome and M. J. Enright.

The United States Scale Company, of Terre Haute, Ind., report trade better than usual during the spring months. Despite the natural gas there is great activity in the coal-mining business, and the demand for railroad scales in this line of business is greater than ever before. They report recent shipments of five 50-ton scales to one firm in Ohio; one 50-ton, 54 feet long, to Kanawha and Lake Erie Coal Company, of West Virginia; one of the same kind to the Leavenworth Coal Company, Leavenworth, Kan.; also same to Glendale Coal Company, St. Louis, Mo.; also same to S. W. Little, Evansville, Ind.; and one 40-ton, 36 feet, to Charles Valier, Greenville, Ill.

#### Miscellaneous.

There were shipped from the ports of Marquette, Escabana and Ashland during the week ending May 1 133,763 gross tons of iron ore, of which quantity 16,741 tons went from Marquette, 86,347 tons from Escabana, and 30,955 from Ashland. Shipments have begun from the Vermilion, Minn., mines also, but the report from Two Harbors has not yet reached us. With the Two Harbors shipments added, the shipments for the week would no doubt be 150,000 tons, which is well up to the average weekly shipments of previous years after the season had fairly opened. At this season in 1888 no ore had yet gone forward, so it will be seen that the mines are getting a good start over last season in the matter of getting their product to market.—*Mining Journal*.

The works of the Novelty Steel Wheel Company, recently organized in Pittsburgh, will be located at Bissell, on the Baltimore and Ohio Railroad. The main building will be a two-story iron structure 40 x 208, and the machinery, which will be of a special design, will be made in Philadelphia. The works will be in operation in about three months and will furnish employment to about 75 men at the start.

The Wrought Iron Bridge Company, of Canton, Ohio, have just secured the largest single contract they have ever taken. It is for the structural iron-work of a massive all-steel viaduct for the Denver Cable Railway Company, of Denver, Col., which will require for its building over 1000 tons of steel structural work and over 1,000,000 feet of lumber. To transfer the steel-work it will require 75 cars, and this will be the largest shipment ever sent out of Canton. The price is \$135,000.

The annual meeting of the stockholders of the Philadelphia (Westinghouse) National Gas Company was held in the office of the

company at Pittsburgh last week. George Westinghouse, Jr., president, was in the chair. According to the statement read by Mr. John Caldwell, treasurer, the total assets of the company amount to \$10,805,888, an increase of \$1,100,000 over last year's assets. The gross earnings during the year were \$2,756,217 and the expenses \$1,696,293, leaving net earnings, \$1,059,923. The dividends paid during the year amounted to \$900,000. The company operate 181 producing wells and have 706 miles of pipe laid. From Mr. Paine's report it was learned that the company propose to pay the dividend quarterly instead of monthly, which was accepted. The new steel line which the company are laying from Thirty-third street to Leamington avenue and Tilford station is estimated to cost \$300,000. Seventy-seven miles of new telephone lines have been laid by the company during the year. The company have only sold \$375,000 of \$2,500,000 bonds issued, and it was stated by Mr. Westinghouse that the directors had been hampered in selling any more because the Charters Company were selling theirs cheaper than the Philadelphia Company would let them go. Ninety-four thousand votes were cast on the election of the board of directors, and the old board was re-elected. Their names are: A. M. Byers, A. Groetzing, Robert Pitcairn, Charles Paine, John Caldwell, C. H. Jackson, J. A. Chambers, Calvin Wells and George Westinghouse, Jr. Subsequently the board organized, and the following-named officers were elected: George Westinghouse, Jr., president; Charles Paine, vice-president and general manager; J. R. McGinley, secretary and general agent; John Caldwell, treasurer; T. A. Gillespie, general superintendent.

The Hall Mowing Machine Company have been incorporated at Portland, Me., to manufacture lawn and field mowers under the patents granted George A. Hall. President, Hon. Charles J. Chapman; clerk, Seth L. Larrabee; treasurer, Clinton A. Woodbury; superintendent, George A. Hall. Directors: Hon. Charles J. Chapman, Geo. A. Hall, William H. Stevens, C. A. Woodbury, T. B. Percy.

Among recently authorized corporations in the State of Illinois are the following: The Lewis Metallic Packing Company; capital, \$30,000; for the manufacture of piston-rod packing; incorporators, G. C. Fry, A. D. Lewis and J. E. Babb. The Anti-Railroad-Frog Company; capital, \$8000; for the manufacture of substitutes for railroad frogs and other railroad appliances; incorporators, A. A. Ackerly, L. Bartlett and W. P. Graves. The Chicago Matrix Machine Company; capital, \$1,000,000; for the manufacture of matrix-making machines; incorporators, E. B. Springer, G. M. Brinkerhoff and P. H. Gunkel.

**Rates on Cotton Ties.**—The freight agents of the railroads having connection with Pittsburgh have reduced the rates on cotton ties from that city to East St. Louis to 14½ cents in carload lots and to 18 cents in less than carload lots. The rate to Cairo, Ill., has been reduced to 17 cents in carload lots and 21 cents in less than carload lots. From the Mahoning and Shenango valleys the rate on the same article to East St. Louis has been reduced to 12½ cents in carload lots and to 16 cents in less than carload lots. To Cairo the rate has been reduced to 15 cents in carload lots and 19 cents in less than carload lots. The new rate from Pittsburgh went into effect on the 13th inst., and the new rate from the valleys on the 10th inst.

The Grand Jury at Bridgeton, N. J., has indicted Master Workman Coffey, of the K. of L., for inciting men to strike recently in a factory in that place.

# The Iron Age

New York, Thursday, May 16, 1889.

The Chicago editorial and business offices of *The Iron Age* have been removed from 95 and 97 Washington street to 59 Dearborn street.

## Eastern and Western Pig-Iron Prices.

The Western newspapers have treated the announcement of the Thomas Iron Company's reduction in the price of pig-iron as a sensation worthy of glaring head-lines. To them this change in prices comes like a revelation, and they are bound to make the most of it for the benefit of their readers. The effect of the sensational statement that pig-iron has been reduced \$1.50 per ton by the leading manufacturers of the East has been quite marked in the West. The circumstances under which this reduction of price was made were fully set forth in our last issue, and it was clearly shown that the company had been for some time sustaining the market for native iron considerably above the rates at which other iron could be bought. This does not seem to have been fully understood in the West, but consumers believed that the whole range of Eastern prices had been suddenly dropped \$1.50 per ton. They therefore, in a number of instances, have argued with Western sellers of iron that prices would have to come down in that section to correspond with the new range of values established in the East. If it were true that Western prices had been maintained at about the same rates as the Thomas Iron Company's former figures, the reduction would probably take place in time out of sympathy with the condition of other markets. But this is not the case. The reduction just announced in the East was made long since in the West.

It is a remarkable fact, which Western consumers of pig-iron do not seem to realize, that for some time pig-iron has been quoted at lower rates at Chicago than at any other Northern consuming center of any prominence. Our market reports have shown this from week to week. Cincinnati, Louisville and St. Louis are cheaper pig-iron markets, but as they are just on the border and handle a great preponderance of Southern iron, they are excluded from this comparison. The market reports in our last issue quote No. 1 Northern foundry iron at \$16 at Chicago, against \$17 to \$18.50 at Philadelphia, \$17 to \$17.50 at New York and \$16.25 to \$16.75 at Pittsburgh. Southern foundry iron is available at \$16 at both Chicago and New York. It will be seen that at Chicago either native or Southern iron can be had at the same price, which is not the case in Eastern markets. This puts the Chicago consumer in a much more favored condition than his fellows enjoy in the East. And this advantage he has had for months, as will be seen by reference to our market reports. It would therefore seem to be

wholly unreasonable for a Western consumer to expect that because Eastern prices have been reduced to nearly the Western level a further decline should be made in Western prices.

The change in the Western iron trade which has taken place within the past year or two has been so radical that it is not yet fairly understood and does not receive proper consideration, even among those who should be thoroughly informed. The time has been when Chicago prices were based on rates established at points further East, the difference depending mainly on freight schedules. At such a time the action of an important Eastern furnace company in raising or lowering prices would have had a decided effect on prices at Chicago. But those days have passed, probably forever. The consumption of pig-iron in that section might increase so rapidly that the local furnaces could not supply it, and in that event prices would be somewhat dependent on quotations made by distant makers; but such a contingency is certainly remote. Meanwhile Western prices for pig-iron will be regulated by the natural laws of supply and demand within the territory tributary to the furnaces and without much regard to occurrences in distant markets, until they assume a much more general character than this recent action of the Thomas Iron Company, which has been so widely published. Western prices may recede slightly from their present range, but it is altogether unlikely that they will fall \$1.50 per ton more during this particular period of depression.

## The Competition of Canadian Railroads.

The Interstate Commerce Committee of the United States Senate, during their sessions in this city last week, do not seem to have found much of a case against the Canadian railways. The argument in favor of protection to American railroads, as well as to American manufacturers, is of course sound, but the analogy seems to end with the theory. No testimony has been offered to prove that, as a matter of fact, Canadian roads were offering unjustly low rates. At first the committee seemed to misapprehend the differential rates question, thinking them to be favors to the Grand Trunk, but it was explained that lines like the Chesapeake and Ohio and the Chicago and Atlantic, in our own borders, had them. Albert Fink's testimony that they were fair seemed to dispose of the question. The subsidy granted the Canadian Pacific was given, but no evidence was offered to show that the American lines were injured by it.

The testimony of the merchants before the committee was entirely in favor of allowing the carriage of goods through Canada to continue. It was shown that American interests were deeply involved in the question, and it is probable that a policy of exclusion would cause more loss to our own citizens than to Canadians. Nearly every Eastern railroad except the Pennsylvania and the New York Central would be hurt. The Central Vermont would be greatly injured. The commercial interests dependent upon direct transportation through Canada are very large; sudden stoppage would mean hardship to many of them, and this alone is reason

enough for its continuance. Our down-East friends at Portland, Me., and throughout New England would be deprived of one and in some cases the only outlet to and from the West. Detroit and all of Michigan would be put in a sort of business *cul-de-sac* for their trade Eastward. Chicago has for some time been favorable to the Grand Trunk, the merchants thinking that that company have kept rates down. St. Paul, Minneapolis and the Northwest would lose a valuable route for flour and merchandise. The moment the possible results of a stoppage of the bonding privilege, and consequently of carriage of goods through Canada, are seriously contemplated it becomes apparent that without strong and convincing reasons the business men of the United States will not consent to bear the losses which such a stoppage would necessarily entail upon them.

The discussion of the witnesses took a range wider than the subject in hand, embracing all the results of the Act to Regulate Commerce. There was a surprising unanimity of sentiment in favor of the law. Not one railroad manager or business man advocated the repeal of the act, though amendments were suggested, and even of these many were such as to be now practically in the power of the commission to effect without changing the law itself. Pooling was thought necessary by the railroad managers, but was asked for only under careful restrictions. Merchants thought that business men had not been enough consulted by the classification and rate committees of the railroads, and undoubtedly the complaint was just. The president of the Union Pacific seemed to utter the general opinion when he said that the law ought not yet to be modified, and meanwhile that it should be rigorously enforced. The prevailing sentiment seemed to be that as yet the alarm raised against transportation through Canada had but little foundation.

A brief cable dispatch, remarkable chiefly for the number of errors which the sender managed to crowd into about 80 words, announces that the Iron and Steel Institute of Great Britain will hold a meeting in the fall of 1890 on this side of the Atlantic. We may state that the invitation emanated from the Council of the American Institute of Mining Engineers, who, we understand, have informed the governing bodies of the American Society of Civil Engineers and the American Society of Mechanical Engineers, coupling their preliminary announcement that an invitation had been sent with the suggestion that the societies in question co-operate with the mining engineers. We understand that Andrew Carnegie has been named as the chairman of the American committee, which will embrace the leading manufacturers of iron and steel in the United States, and will include the most prominent engineers. No efforts will be spared to make the visit of the English iron-masters memorable to them professionally and socially, and they will be certainly afforded every opportunity to study our resources and our methods of manufacture. It is probable that a joint meeting of the English and American societies will be held at some central point, possibly Pittsburgh, and it may be arranged that such Continental organizations as the Verein

Deutscher Eisen-Hüttenleute, a worthy rival of the Iron and Steel Institute, will participate.

#### The Trade of Chicago in 1888.

The magnitude of the business interests of Chicago is most comprehensively shown in the report just issued by George F. Stone, secretary of the Board of Trade. He has gathered from all sources facts and figures bearing upon every branch of prominence represented in the trade of Chicago, and has incorporated with them a large accumulation of statistical information relative to national matters of interest to business men. The tables cover population, public debt statements, valuation of property, prices of farm products, exports and imports, crops produced for a series of years, &c. The report has been prepared with great care and forms a valuable addition to our statistical literature.

Referring to the trade of Chicago, the very important fact is pointed out by Mr. Stone that by far the largest class of manufacturing industries, except what is known as meat production, is that relating to iron and steel. The rolling mills in and near Chicago turned out in 1888 a product valued at over \$16,000,000 and employed nearly 700 hands; the foundries, machine shops, boiler works, car-wheel works, stove works, &c., turned out a product valued at \$28,000,000 and employed over 10,000 hands. The quantity of pig-iron handled was necessarily very large, aggregating 850,000 tons, valued at \$17,000,000. The wholesale trade in manufactured iron and hardware, in which some of the largest jobbing houses in the country are interested, amounted to \$11,500,000.

As Chicago is particularly conspicuous for meat production, the statistics of this branch of business are worthy of consideration. Meat production includes hog-packing, beef packing and canning, and the manufacture of refined oil, stearine, butterine and sausage. The total value of this production in 1888 was \$95,000,000, and 20,000 hands were employed. A comparison of these figures with those of the preceding paragraph shows that the iron and steel business of Chicago is fast overtaking the line which has hitherto been most prominent in the trade of the city. Those who are most familiar with the developments of the past few years in the Chicago iron trade will not be surprised if a further rapid advance is made in the near future which will thoroughly establish the ascendancy of iron and steel over all other interests represented in that city.

The statistics of other trade movements at Chicago reach enormous figures. For instance, the receipts of flour and grain in 1888 aggregated 182,588,188 bushels; the number of hogs received was 4,938,413, together with 2,611,543 cattle and 1,515,014 sheep; the lumber received amounted to 2,066,927,000 feet; the tonnage of vessels arrived during the year was 4,898,768 tons; the total number of miles of railway tributary to Chicago is 70,431, of which 41,870 miles lie west of the Missouri River; the total bank clearings for 1888 were \$3,163,774,462; the number of manufacturing factories is now 2400, employing a capital of \$117,000,000, giving work to 132,000

hands, to whom yearly wages of \$74,000,000 are paid, and turning out a product valued at \$402,000,000; the wholesale trade in all lines amounted to \$455,000,000 in 1888, against \$370,000,000 in 1884; the agricultural-implement industry of Chicago, although mainly confined to three large establishments, gives employment to about 4000 men, who turn out about \$12,000,000 worth of goods annually; the receipts of coal in 1888 were 5,517,859 tons.

Although Chicago is an inland city, its trade connections have been well established over the civilized world. The direct importations of all classes of goods in 1888 amounted to \$13,805,354. Among them were 397,641 boxes of tin-plate, 16 cases of needles, 2416 cases of manufactured metals, 1102 tons of pig-iron, 168 packages of hardware, 368 cases of fire-arms, 151 cases of cutlery and 25 cases of bicycles. Large quantities of manufactured goods are exported, as well as grain, flour and provisions, but it is impossible to obtain the statistics of such shipments, as they are credited in the Government reports to the cities where they are transferred on shipboard. The project of a navigable water-way from Lake Michigan to the Mississippi River, which has been constantly growing in favor and seems reasonably certain of being undertaken at an early day, derives much of its support from the desire felt by Chicago business men to secure as many channels of intercourse as possible between their city and remote sections. Such an outlet to the South will be found specially valuable in case the steamship lines now contemplated are established between Gulf ports and cities in Central and South America.

#### The Improvement in Mexican Affairs.

The improvement that has been going on during the past four years in nearly every department of national life in Mexico is very striking, and recent advances were dwelt upon in detail in President Diaz' message to Congress of April 1. Our industrial and commercial interests with Mexico have become so interwoven that the improvement in its finances through good administration of public affairs is a matter of much concern to the American manufacturers, merchants and railroad men. It is a subject for congratulation, too, that President Diaz has entered upon another term of four years, and that all the capable men who assisted him, together with Minister Romero at Washington, remain in office. When on December 1, 1884, President Diaz took the helm of State for the second time Mexican finances were in a terribly confused state, and there was little hope that the subsidies to railroad companies would be paid regularly for a long time to come. The recognized domestic and foreign federal debt of Mexico, after throwing out the Maximilian bonds and others like, for example, the famous Jecker bonds, amounted at the time to \$144,058,785. The foreign debt, then aggregating \$108,812,570, by honest arrangements and payments has since been reduced by no less than \$87,000,000, and a large amount of floating debt been paid off. When President Diaz formed his present Cabinet in 1884 Mexican bonds were far below par in the London market. After a long negotiation

Dr. Dublan, the Minister of Finance, completed an arrangement with Bleichroeder, of Berlin, by which a Mexican loan of £10,500,000 was to be placed upon the foreign market at par, the payment to be in Mexican foreign bonds at 50 per cent. of their face value. This, of course, meant practically to reap the advantage of an understanding previously arrived at with the British bondholders to cancel their 3 per cent. bonds within a given time at 40 per cent. Bleichroeder took £7,600,000 at 84, with the proviso that he could call for the remainder of the bonds if they proved popular, and on May 1 last the Government made the official announcement that the Berlin banker had made a demand for the remainder, for which he held an option. In President Diaz' message we find the following passage: "The interest on the home and foreign debts has been met with strict punctuality on the day of maturity. The bonds of the Berlin loan are now quoted in Europe at 93½; the reserves are increasing, the collections in the first half of the current fiscal year being greater than in the corresponding period of the previous year."

Other portions of the message related to public works. Mexico, according to this document, has at present about 5000 miles of railroad in operation (against 3438 on December 1, 1884), and a number of new lines are now under construction and in part built. Mexico has nearly 14,000 miles of telegraph lines. The culture of the vine and of silk is rapidly increasing; the army has been reduced. He remarks:

The mining industry continues in full development, and the good effects of the law of June 6, 1887, in regard to the concessions of mining zones, are visible in the number of contracts that have been made in accordance with its prescriptions. Their number is 155, of which nine have been declared forfeited, and four zones covered by as many of the forfeited contracts have been newly solicited. The contracts now in force promise an investment in mining enterprises of more than \$40,000,000, and the amount deposited in public-debt securities, bonds of the mortgage bank, and in cash, as a guarantee of the fulfillment of those contracts, is \$280,000. In order to facilitate information in regard to the country, &c., Mexico participates in the Paris Exposition, and pains have been taken to send thither a complete collection of such objects and products as will convey an adequate idea of its resources and industries. The day is not far off when our national establishment of pisciculture will begin to show useful results; a similar establishment in the United States has favored us with important gratuitous assistance. From September up to the present more than 5,000,000 hectares of public land have been surveyed by companies duly authorized, thus adding to the area available for colonization or sale. Indeed, through the land sales in the border States large areas have been opened which were formerly unproductive, enhancing the value of private property and increasing the revenues of the States named. The Vera Cruz harbor improvement works have continued without interruption, 1170 blocks of 14 c. m. having been submerged. These blocks will gradually form the foundation for the great breakwater that is to protect the port on the northwest. The hydraulic works undertaken to protect the bank of the Rio Bravo at Ciudad Juarez (El Paso) are on the eve of completion, seven jetties having been constructed in that locality and three at Matamoras; these, in connection with those existing at the latter point, will protect the city from serious dangers that threaten it. The Department of Public Works and its subordinate offices have prepared a general map of the country, as well as nine special charts of the railways, telegraph lines, geology, mining, &c., and four agronomical charts exhibiting

our chief agricultural products. All of these, together with the topographical charts prepared by the geographical exploring commission, and those prepared in other sections of the Department, with a number of documents of various sources, are to go to the Paris Exposition. The ten mints of Mexico coined in 1888 in the aggregate \$6,276,364 silver. The common school system is meeting with popular favor, and regulations for primary compulsory education will now be completed, while for the training of male teachers a normal school has been established, and the furniture and apparatus for a normal school for female teachers are now being put in place.

This item of education is of all the greater importance in view of the fact that of the 12,000,000 inhabitants only 19 per cent. are whites, 88 per cent. pure Mexicans and 48 per cent. mixed races. The number of wild Indians (chiefly in Yucatan) does not exceed 15,000; the rest are civilized, till the soil and are employed in manufacture, &c., but millions of them still speak the native Mexican tongue. To thoroughly educate these masses is therefore conferring a boon which cannot be estimated too highly. In fact, as our extracts from the message show, there is not a branch that is neglected in the Republic.

#### Cable Yoke Contracts.

The introduction of cable propulsion for street-cars has opened up a new field for foundries, particularly in the West, where the system has met with marked favor. The cast-iron yokes which are used to support the rails and the cable conduit furnish a great deal of work to foundrymen, as but a few miles of cable road will require yokes whose tonnage runs into the thousands. The competition for this class of business has been very animated among the foundrymen of the West, as the corporations building the roads are usually well equipped with funds and are very desirable customers. The work appears to be specially inviting, all the yokes being practically of the same dimensions and weight. This competition has forced prices to an unnaturally low point, and it is not singular that foundrymen are considerably exercised at this condition of affairs. A peculiar feature of these yoke contracts is that those who have had experience in manufacturing them, and therefore should be presumed to know how closely they could safely make their bids, are always beaten by inexperienced firms. A leading construction company who have built quite a number of cable roads in the Northwest state that every time they let a contract for yokes it is to a new foundry, whose estimates of cost undergo a radical reconstruction after the work of manufacturing them has actually been begun. Experienced Chicago foundrymen agree in placing the cost of manufacturing yokes at \$27 per ton with pig-iron at \$14 per ton, and their bids on this class of work range from \$28 to \$30 per ton, according to the profit which each thinks he should have. Yet other foundrymen, who pay the same price for pig-iron and the same wages to their molders, turn in their bids whenever a new contract is to be given out at several dollars a ton below the actual cost stated above, and take the risk of imperfect castings and the large percentage of rejections which is inevitable under the rigid system of inspection adopted by the builders of the roads. It is not surpris-

ing that they lose heavily on these contracts and join the high bidders the next time. But a new candidate for the honor of making yokes at a low price then steps in, and with a serene confidence in his ability to keep down costs takes the work. It had been supposed that several occurrences of this kind would impart a general knowledge on the art of making yokes profitably to the foundry trade, but this does not seem to be the case, and a branch of business which should be of great importance to foundrymen bids fair to continue profitless until many more manufacturers have acquired experience.

#### The Charcoal Furnaces on May 1.

There has been a slight increase in the capacity of the charcoal plants operating throughout the country, due chiefly to the blowing in of a few of the larger plants.

In Pennsylvania Mont Alto suffered from a disastrous fire and Eagle went out for repairs in April. Pine Grove, remodeled, started successfully on the 22d under the superintendence of S. R. Still. The furnace has been relined, its height, diameter of bosh, crucible, the height of its cinder-notch and of its tuyeres was changed, and practically a new hot-blast oven was built. In Maryland both the Stickney furnaces are at work, No. 1 Maryland was started in April, and Muirkirk is to blow in this month. In Kentucky Hunnewell is again running. In Ohio Mount Vernon blew in during April. In Michigan the total product of the furnaces, all of them reporting, was 15,644 tons. Gaylord blew out for the purpose of making general repairs, which will probably consume three months. Pine Lake blew in late in April. The Pioneer has made an exceptionally good run during April, the average daily product for the whole month being 77 6 tons. In Wisconsin Hinkle was stopped nine days and did not therefore make its usual heavy monthly product. In Missouri Sligo blew out on April 14, but is expected to resume at an early date. La Grange, in Tennessee, started in April, and the old Standard, now controlled by the Warners, has probably been making iron for some days. In Alabama No. 1 Shelby has gone out, to be rebuilt entirely.

Secretary Tracy has extended for four months and four days the time allowed the Union Iron Works, of San Francisco, in

which to complete cruiser No. 5 (the San Francisco). This is one of the large 4000-ton cruisers which was contracted for October 27, 1887, at a cost of \$1,428,000.

## CORRESPONDENCE.

#### No Case of Yellow Fever at Sanford.

To the Editor: I notice in your current issue a statement that Sanford has a case of yellow fever, resulting in death, &c. Will you allow me to say that, despite the State Board of Health, we have not had a case of yellow fever in this city either this or last year? The diagnosis of the reputed case was made by an alarmist who is desirous of making for himself a reputation as a fever expert, even if he has to make such reputation at the expense of his friends and fellow-citizens. There is not to-day, nor has there been since the death of Mrs. Demont, a sick person, male or female, in the city or suburbs. The suspect camp, originated by these expert (?) doctors, has been broken up and all restrictions to travel, &c., removed. As soon as Dr. J. Y. Porter, the State health officer and an experienced yellow fever expert, came on the ground and investigated the foolish, senseless scare and quarantine caused thereby he immediately modified it and removed a great many restrictions.

It is our misfortune that we are harassed and afflicted with an army of self-constituted crank doctors, from whom as yet there is no immunity, but we would be a grateful people if the press of the country would take no heed, and thus protect us in this way. Kindly give a part of this letter the same prominence as you did the notice of the "Case of Fever at Sanford," and oblige, yours truly,

WILLIAM T. COTTER.

Sanford, Fla., May 7.

The gun-boat Petrel, built by the Columbia Iron Works, Baltimore, was given a trial trip to test her engines. While she did not come up to the requirements of the Government as to horse-power, she showed herself fully capable of doing it when the machinery was in perfect working order. Between Seven-Foot Knoll and North Point she averaged nearly 15 knots with her engines working 110 revolutions a minute, and on the last quarter nearly 17 knots. It took 1½ minutes to stop her when going at full speed and 28 seconds from full speed to reverse her. The best test was made when she ran 17 knots with 115 revolutions. William H. Varney, superintendent of hulls for the Government, said that he was very much pleased with the trip and was sure the new boat could make an average run of 15 knots with the 1850 horse-power required by the Government. The Government trial trip, which must be taken before the Petrel is turned over to take her place in the reconstructed navy, will be made in about three weeks.

An unofficial trip of the uncompleted cruiser Charleston was made between San Francisco and Santa Barbara with satisfactory results. A maximum speed of a little more than 14 knots an hour was made, and a steady speed of 11 knots was maintained in a rough sea.

A convention of the American Society of Civil Engineers will be held at the Octagon House, Seabright, N. J., on June 26. About 250 delegates and visitors will be present, and the convention will be in session for one week.

The Royal Society, at Ottawa, have appointed a committee to welcome the American Institute of Mining Engineers on their visit to Canada next fall.

## THE MECHANICAL ENGINEERS.

### The Erie Meeting of the American Society of Mechanical Engineers.

The nineteenth meeting of the American Society of Mechanical Engineers is now in session. Among the members in attendance or expected are the following: Horace See, H. R. Towne, F. H. Ball, F. F. Hemenway, John W. Weston, J. L. Horn- ing, A. L. Ide, W. M. Welken, C. H. Parker, C. H. Manning, F. R. Low, C. W. Bray, William Roberts, F. M. Hartreck, W. S. Doran, E. H. Parks, C. D. McDuffie, G. H. Smith, R. J. Gilmore, Prof. F. R. Hutton, S. A. Smith, A. L. Burns, W. W. Sprague, F. A. Shaffer, E. W. M. Hughes, J. S. Miller, H. R. Barnhurst, J. A. Gil- kerson, W. C. Jones, L. C. Skinner, J. H. Raymond, J. K. Hallock, E. Fawcett, W. H. Wiley, D. Ashworth, W. A. Ball, E. F. Davies, C. M. S. Smith, J. H. Cooper, H. H. Supplee, W. J. Creelman, Prof. De Volson Wood, J. W. Cloud, C. W. Nason, Alfred Betts, C. M. Morse, H. W. Spangler, W. L. Clark, Prof. J. E. Den- ton, Prof. J. D. Webb, T. J. Ridgway, George W. Passel, E. L. Moore, William Hardwick, R. W. Ryan, William Ruth, J. G. Sowter, S. Higgins, S. J. McFarren, Harris Tabor, Geo. Higgins, W. F. Mattes, Charles Bauer, F. G. Coggin, E. J. Fickengier, J. H. Springer, Henry Buckley, E. A. Mehling, Lycurgus B. Moore, A. F. Nagle, H. I. Snell, L. S. Randolph, J. J. Illingworth, James B. Ladd, Francis C. Blake, W. W. Drum- mond, A. P. Trautwein, John Skenson, J. C. Debes, A. C. Christensen, Peter Kirkerag, R. H. Soule, R. W. Bailey, Thomas D. West, J. A. Roche, Charles J. Hillard, F. W. Taylor, A. E. Manchester, Edwin Reynolds, F. D. Potter, W. G. Stewart, L. G. Laureau, Alfred R. Wolff, F. H. Pend, John Dick, R. C. Carpenter, John Walker, William Forsythe, Geo. A. Porter, James N. Warrington, C. J. Woodbury, D. W. Payne, A. M. Goodale, Prof. R. H. Thurston, John L. Gill, J. L. Bancroft, Coleman Sellers, Jr., B. H. Warren, August Sinclair, Samuel Hig- gins.

On Tuesday afternoon the members vis- ited the water-works on the shore of Lake Erie, and examined the 5,000,000-gallon Gaskill compound duplex pumping engine, and also the pair of old Cornish pumps of same capacity. The two engines fur- nished an interesting study of the past and present methods of raising water. From the top of stand-pipe, which is 250 feet high and the third highest in the world, a very few of the visitors obtained a grand view of city and lake. At

#### The Evening Session

Mayor Clarke heartily welcomed the engineers, and hoped that their visit to the city, whose prosperity was largely due to the efforts of resident members of the society, would be remembered with pleasure. President Towne thanked the Mayor for his kind words of greeting. After the address a most tempting repast was served.

The address of ex-President Horace See, which should have been delivered at the meeting in last October, but was postponed because of his severe illness at that time, might have been termed "Practical Edu- cation." As the supply of skilled work- men is insufficient to meet the demand which the marvelous growth and diversif- ied character of our manufacturing inter- ests has created, numerous schemes have been advanced for the education of the young to fill any position, from the work- man to the manager. It has been suggested that the mechanic arts high school be brought into our existing system of public education, the course of study to be three

or four years, two-fifths of the time daily being given to selected or graded shop- work, one-fifth to drawing and two-fifths to appropriate book-work. This plan is not favored, as the boy, after having ob- tained his load of science, technology, in- dustrial art and commercial activity, can- not be brought to work at the trade, as he aspires at once to something higher. One of the most prominent schemes, on account of the large endowment of the institution, and one which shows how far from nat- ural methods the teaching of the young to become skilled workmen is drifting, is that of a free school to be located in an agricultural country at a distance from manufacturing establishments. It is im- portant that the machinist acquire his skill by contact with the best mechanics, by practice in and by familiarity with the customs, usages, character and variety of work of the workshop.

"It would be a great advantage to our youths if the common school education were modified so as to call on all of the faculties of the mind, and not to rely so much on cramming the memory. The eye should be taught early to perceive, and the hand to delineate, the objects around. The knowledge acquired in this way would be real, and of more value to the possessor than all that is abstract in most of the pur- suits of life. Let us bend our efforts and lend our assistance to hasten the time 'when,' says Sweet, 'more of the mechan- ical branches of our educational institutes shall find their true position, and where the students shall be instructed by example of noble work, rather than by the toy models abounding in confusing compli- cation which they cannot understand, and which are constructed regardless of pro- portion and meaningless in design, and are pernicious in every sense of the term. Let us hope, if the tide of human progress is sweeping on toward a more useful edu- cation, that the day may not be far away when he who knows what to do and how to do it will be regarded as the equal of him who only knows what has been done and who did it.'"

#### Wednesday Morning.

On Wednesday morning the report of the council showed a total membership of 986.

The following deaths were reported: Daniel N. Jones, C. H. Delamater, John Ericsson, H. F. Gaskill. The council prepared a minute stating that in the death of Captain Ericsson the profession of me- chanical engineering had lost one of its most illustrious representatives, whose life spanned the entire epoch of the locomot- ive. The resolutions briefly cited the great works done by the immortal Swede, and closed with the following:

That a committee of the American Society of Mechanical Engineers be appointed by this council to memorialize the Government of the United States to commemorate in some suitable manner the prominent services ren- dered to this country at a time of great na- tional crisis by the engineering genius and skill of our late member, Capt. John Ericsson.

The first paper presented at the Wednes- day morning session was by Thomas S. Crane, on "The Piping of Steel Ingots." This we publish in full elsewhere in this issue. There was no discussion.

The next paper was by Henry R. Towne, on "Gain-Sharing," a term coined to dis- tinguish the system proposed from "profit- sharing." The factor affecting the profit fund of a manufacturer who buys raw material, makes it up and sells the prod- ucts, may be divided as follows:

1. Those contributed by the owner, such as capital, buildings, plant.
2. Those influenced by the mercantile staff—the buyer and selling agent.
3. Those determined by causes beyond the control of the principal and his agents, such as fluctuations in cost of raw material

or in the market value of the finished product, losses by bad debts, &c.

4. Those influenced by the workmen, such as care of property, economy in the use of material and supplies, and, chiefly, efficiency in the use of machinery and em- ployment of labor.

"Now, it is obvious that while the opera- tives may influence the items in the fourth or last group to an extent which may be large, or even controlling, in determining the question of profit or loss, they have little control—and in most cases none whatever—over the items specified in the other three groups; and that to admit them to participation in the net results of the whole business, while commendable as an act of generosity, is not defensible either on an equitable adjustment of the complex and often conflicting interests involved, nor as a theoretically correct solution of an economic problem. The right solution of this problem will mani- festly consist in allotting to each member of the organization an interest in that portion of the profit fund which is or may be affected by his individual efforts or skill, and in protecting this interest against diminution resulting from the errors of others, or from extraneous causes not under his control. Such a solution, while not simple, is attainable under many circumstances, and attainable by methods which experience has shown to be both practical and successful." Having ascertained the cost of the product in labor, supplies, &c., the principal offers the employee one-half of any gain or reduction of cost which he may effect, the wages to be those gener- ally paid for similar services. If the total gain was \$800 and the aggregate wages paid during the year \$10,000, then one- half of the gain, or \$400, would be paid to the operatives, each of whom would be entitled to a dividend of 4 per cent. on his earnings during the year. This is the "gain-sharing" system. As the foreman has more power and control than any sub- ordinate, it is proper that his interest should be larger, and the author of the paper prefers to allot him a definite part of the profit fund—from 10 to 15 per cent. Mr. Towne also considers this method as applied to the contract system of work. It has been found very beneficial to have posted in each department where the gain- sharing system is in force a suitable blank on which can be entered each month the net results of the working for the preced- ing month, and including a statement of the rate of dividend earned since the be- ginning of the contract year. The stimu- lus thus given to the interest of the em- ployees is very marked. Another impor- tant point is the question of the length of time during which a contract for gain- sharing shall continue without modifica- tion. When the cost of the product is accurately known a contract may be safely made for a long time, from three to five years, but when the cost is not well known it is better to fix the terms for a shorter period.

"In the case of a foundry, the gain- sharing system can be easily and advan- tageously applied. Here economy of material as well as efficiency of labor is largely under control of the operatives, and should be made a factor in the account. This can be accomplished by basing the 'cost of product' upon the ascertained results of a previous period, labor and miscellaneous items of small supplies being charged up at actual cost, and fuel and metal being charged accord- ing to an arbitrary scale of fixed prices, which may conveniently be determined by adopting the average market rate during the previous year or at its close. The arbitrary values for material which are thus adopted are then incorporated in the gain-sharing contract, and remain un- changed during its period. The 'contract

prices' for finished product are deduced from the actual results of the preliminary period, the cost of material being calculated by extending the actual quantities at the arbitrary prices per pound or other unit which may have been adopted for the proposed contract, the employer using his discretion as to how close the contract prices should be to previous actual costs. Where the foundry product is of varied character, a separate price is fixed for each class of castings, and a record kept of the output of each."

Appended to the paper were the results obtained in a number of cases to which the gain-sharing system had been applied by the Yale & Towne Mfg. Company, of Stamford, Conn., and also the rules governing the system as applied to the foundry. The dividends ranged from 0.03 per cent., the smallest, to 0.123 per cent., the highest.

Professor Denton stated that gain-sharing would tend to make that workman more contented who has a direct interest in the business. The system is tried on a small scale at the Stevens Institute, where the testing work coming in is distributed among the instructing mechanics, who are given an interest in the profits. As a result they always cheerfully perform any extra duty.

Mr. Towne stated in answer to a question by Professor Wood that he had made 21 contracts, and from his experience the system could be extended to embrace almost any line of manufacturing company. Professor Webb asked whether the system would not have a tendency to make each workman watch his neighbor and note the skill and energy he displayed in his work, and if decidedly incompetent to demand his discharge. Mr. Towne said although this had not occurred at his works, it had been found that the operatives exercised increased economy and care and that the general morale of the force was greatly improved.

The "Comparative Cost of Steam and Water Power" was considered in a paper by Charles H. Manning, the data being drawn from the towns of Lawrence, Lowell and Manchester, on the Merrimac River, which were created by their water-powers. The Lawrence water-power is owned by the Essex Company, who have sold 130 mill-powers. The unit of water-power varies slightly in the different places, that in Lawrence being 80 cubic feet of water per second on a fall of 25 feet, while at Manchester it is 38 cubic feet per second on a fall of 20 feet; the first being equivalent to 85.23 horse-power gross and the latter to 86.36 horse-power gross. Cost per horse-power per annum at Lawrence:

Under original leases.....	\$10.55
Surplus water up to 20 per cent.....	14.51
Surplus water from 20 per cent. to 50 per cent.....	29.02
Under recent leases.....	14.08

At Lowell the cost is:

Under original leases.....	\$10.55
Surplus water up to 40 per cent.....	18.14
Surplus water from 40 per cent. to 50 per cent.....	36.28
Surplus water from 50 per cent. to 60 per cent.....	72.56

At Manchester the cost is:

Under original leases.....	\$10.42
Surplus water.....	7.15

In computing water-powers it is usual to subtract 1 foot from the head as measured from still water. The efficiency of the turbine being taken at 85 per cent. of the net fall, about 75 per cent. of the gross power paid for will be delivered to the shaft. Under the original leases the net horse-power costs \$14. The total cost per net horse-power per annum under the original grants is:

Cost of water.....	\$14.00
Sinking fund, &c.....	7.90
Attendance and supplies.....	.72

Total..... \$22.63

We now come to the steam side of the question. The cost per net horse-power per annum of a compound engine of 1000 horse-power is \$21.16, and the cost per horse-power for a single-cylinder engine, the exhaust steam from which is used at a pressure of about 10 pounds above the atmosphere for other than power purposes, is \$14.58.

D. W. Robb described "The Old Locomotive 'Sampson'" in an illustrated article which we shall publish in an early issue. The discussion of these two papers did not bring out any facts of general interest.

## THE LEAD HEARING

(From Our Washington Correspondent.)

(By telegraph to The Iron Age.)

At 10 o'clock this morning about 50 gentlemen, representing the different interests involved in the importation, mining, smelting and handling of lead ores, gathered in the office of the Assistant-Secretary of the Treasury to present their conflicting views. Secretary Windom occupied a seat by Assistant-Secretary Tichenor, who had charge of the hearing. Among those present were ex-Secretary of War George W. McCrary, representing the Board of Trade of Kansas City; Delegate Thos. H. Carter, of Montana; Senator Wolcott and ex-Gov. J. B. Grant, of Colorado, representing the Omaha and Grant Smelting and Refining Company; George H. Loker, Jr., of the St. Louis Smelting and Refining Company; D. Sheedy, of the Globe Smelting and Refining Company; R. Myer, Kansas City Smelting and Refining Company; Mayor Van B. DeLashmuth; Mr. Shepherd, of New York City, and Joseph McCammon, of Washington, D. C.; ex-Governor Hauser and Russell Harrison, of Montana; C. W. Bennett, of Utah; ex-Minister Foster, of Mexico; ex-Senator Conger, Messrs. Caswell and W. G. Vanhorn, of New York.

Delegate Carter, of Montana, opened the subject by going into a technical dissertation upon the relations of lead to silver in ores, and drawing a deduction that, while silver found in ores was not in sufficient quantities to justify mining and smelting, it afforded a small margin of profit to help out on the general results. He read certain official decisions of the Treasury, claiming that classification should be in accordance with the preponderance of metal in the ore, and not the component metal of chief value. He did not believe in putting lead ore on the free list because it contained other more valuable minerals which were free. The lead ores of Mexico are admitted free as silver ores because analysis shows silver in excess of value. This, he claimed, was unjust to home interests. He cited a decision in 1888, which ruled that when silver was the ore of predominating value it was subject to free entry as silver ore, and when lead was the chief value should pay a duty of 1½ cents a pound. He objected to this. He also dwelt upon the report of the United States Senate Committee on the Judiciary, which was to the same effect, and which he thought did not treat the question in its proper light. He said: "The matter at issue is the free importation of Mexican lead ores. Under a ruling of the Treasury in 1884 all ores in which the value of the precious metals exceeds the value of the base metal are allowed free entry as precious ores. Lead and lead dross are dutiable at 1½ cents per pound. But by this ruling lead ores are practically duty free. The Treasury returns show that the importation of dutiable lead ores from Mexico has almost ceased. Yet it is coming in by the train-load, with a sprinkling of high-

grade silver on top, to give it an appearance of legality. Silver is found in carbonates and with galena, from which lead is obtained. The Treasury is not only being robbed outright and American mines seriously injured by this free importation, but the methods adopted in making the tests are wrong. Instead of pulverizing the ore in a body and getting an even sample to test the comparative value, lumps are taken at random and tested. Ore from the same vein runs unevenly, so a sample may be taken which will show 500 ounces of silver to the ton, yet by the other test the silver would average less in value than the lead. But we are anxious that all lead should pay the duty. Mexican mines are run with low-priced labor, against which our highly-paid mines cannot compete." Mr. Carter stated that but 1263 pounds of lead ores paid duty in one year, while 1,443,000 pounds were imported, defrauding the Government of duty to the extent of 1½ cents a pound.

Senator Walcott said the question was not one of interpretation of law, but, first, what is lead ore. All ores carrying over 5 per cent. of lead are lead ores. Outside of the ores of Iowa, Illinois and Missouri there are no ores in the world which do not carry silver. The Senator asked four hours to present their case and testimony, the same to be given the other side.

Judge McCrary for the opposition to the producers took the floor. He said that they were not here to legislate nor to usurp the powers of Congress, but simply to ascertain the intentions of Congress. The question, he said, has been so often decided by secretaries and the Judiciary Committee of the Senate that there should be no doubt on the subject. Secretary Sherman decided in 1880, before the act of 1883 was passed, that the value of silver in the ore should determine the classification, and if silver predominated in value the ore was subject to free entry. This, he said, is an old rule. Assistant-Secretary Fairchild decided it in 1886. The Director of the Mint passed on it in 1888, and others the same. The parties then went to Congress to ask a resolution of the Senate, and in 1888 the same ruling was sustained by a unanimous report from the Senate Committee on the Judiciary. Judge McCrary said that there was no instance where the Secretary of the Treasury has reversed a decision so strongly intrenched, and further that money was invested on the faith of those decisions. He then showed that the statutes provide in one paragraph for duty on three kinds of ore—lead ore, at 1½ cents per pound; nickel in ore, 15 cents on nickel contained therein, and copper in the form of ore 2½ cents on each pound of fine copper therein. He said the framers of the law knew what they were about, and if they intended to draw the line between lead and silver in the same ore they would have done so. The ex-Secretary's argument was brief, but laid down the principles which should govern the Department in dealing with the questions in very clear terms. Secretary Windom paid close attention. Delegate Carter's presentation of the case from the miners, and Judge McCrary for the importers and consumers of Mexican ores, represent the case as it will be discussed. Mr. Caswell and Mr. W. G. Van Horn, of New York, followed in favor of the home producers.

The hearing then closed until to-morrow.

The new steel ferry-boat Pierrepont, for the Union Ferry Company, of Brooklyn, launched from the ship-yard of Thomas S. Marvel & Co., at Newburg, on Saturday, is 209 feet long, 37 feet beam and 16 feet depth of hold. If the new vessel works satisfactorily the company will build two more of steel.

## Bessemer Steel.

### Its Composition for a Variety of Uses.

Robert W. Hunt, of Chicago, some time since delivered an address on the manufacture of Bessemer steel before the Franklin Institute at Philadelphia. It has just been printed in the *Journal* of that society, and contains the following results of a particularly valuable series of investigations:

I believe now, as I have always, that the more nearly you can have metal composed of only iron and carbon the closer you will be to the ideal. Unfortunately, in this, as in many other human matters, we cannot attain that sublime altitude, and so must be content to do the best we can with that which is vouchsafed us. If we can make one impurity offset the bad effects of another, we will accomplish the results which will be more orthodox in the metallurgical than the religious world. As we are forced to put up with the presence of silicon, sulphur, phosphorus and manganese, we must endeavor to compel as many of them as possible to be our allies. Leaving phosphorus out of consideration, we will first consider the effects of silicon. This element is recognized as valuable in rendering steel castings sound or free from "blow-holes," but has been generally regarded with disfavor by other steel makers. I do not fully agree with them in this condemnation when other than the very soft or high phosphorus metals are considered. Some years ago I made quite a full investigation of the composition of various steels of approved brands, and which had given satisfaction to many users for various purposes. I was particularly interested in my silicon results, and I herewith present some of them.

[We have tabulated the analyses given by Mr. Hunt as follows:

Steel for	Carbon	Silicon	Phosphorus	Manganese
1. Planters' hoes.....	0.76	0.136	0.069	0.441
2. Scarf steel.....	0.52	0.150	0.068	0.406
3. Circles and plungers for rifles.....	0.66	0.171	0.067	0.416
4. Machine screws.....	0.46	0.223	0.066	0.376
5. Hoes.....	0.61	0.158	0.086	0.445
6. Pitchforks and large forks.....	0.63	0.241	0.073	0.610
7. Planters' hoes.....	0.52	0.150	0.043	0.376
8. Gooseneck hoes.....	0.53	0.249	0.040	0.413
9. Spring steel, Jenks' English.....	0.64	0.145	0.088	.....
10. Spring steel, Jenks' English.....	0.52	0.150	0.060	0.06
11. Spring steel, Graves' Swedish.....	0.53	0.110	0.030	.....
12. Spring steel, Graves' Swedish.....	0.76	0.84	0.018	0.065
13. Spring steel.....	0.65	0.185	0.102	.....
14. Hatchets.....	0.70	0.270	0.041	0.195
15. Swords.....	0.64	0.268	0.017	0.453
16. Scythes (German steel).....	0.63	0.127	0.056	0.212
17. Cutlery, knife.....	0.51	0.180	0.029	0.265
18. Fork.....	0.49	0.365	0.030	0.444
19. Cutlery.....	0.61	0.310	0.045	0.402
20. Tool.....	0.66	0.220	0.023	0.140
21. Tool.....	0.65	0.204	0.022	trace.
22. Tool.....	0.65	0.190	0.022	0.174
23. Tool.....	0.66	0.216	0.030	0.091

No. 1 and 2, Lane, Gale & Co.; 3, Providence Tool Company; 4, Hartford Machine Company; 5 and 6, Huntly & Babcock, Utica, N. Y.; 7 and 8, Remington; 13, Naylor's, Bridgeport, Conn.; 14, Johnsville Axle Works; 15, Ames & Co.; 16, stock used by A. S. Millard; 17 and 18, Landers, Frary & Clark, New Britain, Conn.; 19, 20, 21 and 23 made by Park Brothers; 22, Frith's English.]

I have before related that while I was making these investigations, and at the same time endeavoring to produce in the Bessemer converter steels to take the place of those, or as it was apt to be commercially put, "fill the bill at a less cost," I made a visit to the works of a firm, the members of which were and are highly esteemed by me, and whose products of the higher grades of steel have the very highest reputation. These gentlemen have always been

progressive, and therefore their utterances are not likely to be controlled by prejudice; hence carry with them great weight. On the occasion of my visit I was full of what I was accomplishing in my converter. They treated me kindly, but said I must not expect too much. That in making the harder steels I would find silicon my constant enemy. As they happened, while we were talking, to be testing a piece of their own steel which was yielding splendid results, one of them said to me: "My dear fellow, when you can make such steel as that in your Bessemer converter we will begin to believe in it." I was thrown into a depressing state of humility and could with difficulty muster courage to beg a piece for analysis. It was most cheerfully given. The result was:

Carbon.....	0.86
Silicon.....	0.306
Phosphorus.....	0.016
Manganese.....	0.196

About this time several American makers of rifles and pistols were filling European contracts for both the Russian and Turkish governments. Most of them were using foreign iron and steel, the iron being of special brand known as Marshall. Supplying the requirements of these firms presented a tempting field, and we devoted ourselves to it. It did not prove such an easy matter as we fondly hoped, and it was only after numerous trials and some failures that we attained success. But we soon learned that to give a satisfactory gun-barrel steel the manganese must be kept somewhat low. Increasing it might make the steel sound and roll well, but it also caused it to throw a long chip before the drilling tool. This was very objectionable, as such chips would throw the necessarily long and slender drills out of line, and thus cause them to run to one side of the rifle-barrel. A very satisfactory metal had the following composition:

Carbon.....	0.29
Silicon.....	0.212
Phosphorus.....	0.048
Sulphur.....	0.065
Manganese.....	0.370

It is well known that manganese has a strong influence on the tempering characteristics of steel. Therefore it must not be in excess in any metal which will be tempered. It causes water-cracks and other undesirable qualities.

### Lower Eastern Freight Rates.

The Philadelphia *Press* reports that the railroad companies have taken action on the complaints made by the pig-iron manufacturers that the freight on raw material was too high, and at a meeting held recently in New York it was decided to decrease the price for hauling Lake Superior ore or iron ore from Buffalo from \$1.75 to 1.55 per ton—a reduction of 20 cents per ton—for every ton shipped. It is only within a few days that the freight agents of the various railroad companies would listen to talk of a reduction in the tolls, but when the Thomas Iron Company made its cut last week, giving as the reason that the Southern furnaces were treated better by the railroads than the furnaces North, and that at the present prices it was impossible to compete with them, they realized something must be done. The day following the Thomas Company's announcement the Pennsylvania Railroad sent out agents to several of the leading pig-iron and steel manufacturers to get information as to the advisability of making a reduction. The agents were all met with the same answer: "The freight on raw material is too high," said the iron men, "and we cannot make money at the present prices charged." The agents reported and a meeting of the general freight agents was called in New York, with the result stated.

The meeting was not altogether harmonious in more ways than one. Several

of the roads were opposed to the reduction, but one of the agents said: "We intend to reduce the price on iron ore whether you do or not." This made a sensation, and after various plans were submitted the reduction was agreed to. The Reading Company were the first to enforce the new rate, for no sooner had it been made than they issued orders that it would go into immediate effect. They formerly charged \$1.75 per ton for ore shipped from Buffalo to the furnaces on their line, but now the rate is \$1.55. The ore is first taken at Buffalo by the Erie road, then to the Lehigh Valley road, which carries it to Bethlehem, where the Reading takes it to destination. The reduction applies to ore shipped to all furnaces along the line of the Reading. The Pennsylvania Company, it is understood, sent notice to all agents that the reduction would go into force at once. Several other roads have not yet made the reduction, but it is expected they will do so this week.

### PERSONAL.

A. F. Raveret, formerly assistant superintendent of the M. C. Bullock Mfg. Company's works, at Chicago, has accepted the position of assistant superintendent of the Union Foundry and Machine Company, at Los Angeles, Cal. On the 11th inst. the officers and employees of the former company presented Mr. Raveret with a gold watch and chain, the presentation speech being made by F. H. Brown, foreman of the erecting floor.

Andrew Carnegie, the well-known iron and steel manufacturer, was in Pittsburgh for several days last week for the purpose of inspecting the various iron and steel plants in that city in which he is interested. Mr. Carnegie sailed for Paris yesterday to attend the exposition and to secure statistics concerning trade and commerce in the South American States. He thinks that in Paris he can easily procure all the information necessary to prepare him for his work as a member of the South American Commission.

Ladenburg, Thalmann & Co., bankers, of 46 Wall street, announce that Richard Limburger has become a partner of the firm, which now consists of Adolf Ladenburg, Ernst Thalmann, Richard Limburger, the estate of A. Limburger as general partners, and Gerson von Bleichroeder, of Berlin, as special partner, who has contributed \$400,000 in cash. Karl Thalmann and Paul Lichtenstein sign by procuration.

G. W. Maynard, of New York; W. D. Cogswell, of Syracuse, and A. M. Shook were members of a party who have left for a brief trip to the New River District, Va.

Among the passengers departing by the City of Paris are Robert T. Lincoln, United States Minister to England; Allen Thorndike Rice, Minister to Russia, and Captain Zalinski, U. S. A., who will be military attaché to the United States legation in St. Petersburg.

Ex-Mayor Hewitt says he is in England to look into matters connected with the manufacture of steel, more particularly the basic process of making open-hearth steel.

Thomas F. Gilroy, Mayor Grant's appointee for the office of Commissioner of Public Works, took possession regardless of objections, under a decision of the Supreme Court.

Owners of junks on the upper Yangtse fiercely oppose the introduction of steam navigation, blockading the stream against any advance.

# TRADE REPORT.

## Chicago.

Office of *The Iron Age*, 59 Dearborn street, CHICAGO, May 18, 1889.

**Pig-Iron.**—Furnace agents report a slight increase in business in some quarters, with negotiations in progress for considerable quantities of both Coke and Charcoal Iron. Buyers are endeavoring to use the late reduction made by the Thomas Iron Company in the East as a club to knock prices lower here, ignoring the fact that Pig-Iron has for some time been sold lower in this market than the new rates made by that company. Prices were depressed more rapidly in the West than in the East, making Chicago for the past few months the cheapest of the strictly Northern Iron markets. It would be unreasonable to expect a further decline to correspond with the \$1.50 cut made by the Thomas Iron Company. Quotations are practically unchanged, ruling about as follows for cash, f.o.b. Chicago: Local Coke Iron, No. 1, \$16; No. 2, \$15; No. 3, \$14; Chicago and Bay View Scotch, \$16.50; Lake Superior Charcoal, \$19; American Scotch (Blackband), No. 1, \$18 @ \$18.50; Southern Coke, No. 1 Foundry, \$16; No. 2 Foundry and No. 1 Soft, \$15.25; No. 3 Foundry, \$14.75; Gray Forge and No. 2 Soft, \$14.25; Tennessee Charcoal, No. 1, \$19; No. 2, \$18; ditto, lower grade, No. 1, \$17; No. 2, \$16; Alabama Car-Wheel, \$25.25.

**Bar-Iron.**—The situation is about the same as it has been, both mill agents and jobbers reporting a very light demand. Carload lots of Common Iron are quoted at 1.60¢ @ 1.65¢, half extras, f.o.b. Chicago, while small lots from store sell at 1.75¢ @ 2¢, according to quantity and quality. The mills are trying to get an advance of 1¢ over present prices for deliveries between the 1st of July and the 1st of October.

**Structural Iron.**—Very few large contracts have lately been on the market, but small orders have been so numerous that the mills are making heavy shipments this way, particularly of Beams. Carload lots from mill are quoted as follows, f.o.b. Chicago: Universal Plates, 2.15¢ @ 2.20¢; Angles, 2.10¢ @ 2.15¢; Tees, 2.50¢ @ 2.55¢; Beams and Channels, 2.90¢. Angles from store are held at 2.25¢ @ 2.30¢; Tees, 2.65¢ @ 2.70¢; Beams, 3.4¢.

**Plates, Tubes, &c.**—The boiler-makers are beginning to pick up orders, and have considerable business in sight, so that a better feeling prevails in this line. The Plate mills are stiffening on Iron, but are not quite so firm on Steel. The Wrought-Iron Pipe trade is quite active, and prices were advanced on Thursday. Store prices are as follows: Nos. 10 to 14 Iron Sheets, 2.50¢ @ 2.60¢; Nos. 10 to 14 Steel Sheets, 2.75¢ @ 3¢; Tank Iron, 2.40¢ @ 2.50¢; Tank Steel, 2.50¢ @ 2.60¢; Shell Iron or Steel, 3¢; Flange Iron, 4¢; Flange Steel, 3.50¢; Fire-Box Steel, 4.75¢ @ 5.50¢; Ulster Iron, 3.75¢; Boiler Rivets, 3.75¢ @ 4.25¢; Boiler Tubes, 57½ ¢ off for 1½-inch and less and 62½ ¢ off for 2-inch and larger.

**Sheet Iron.**—The impression is growing that the supply of Black Sheets will hardly be equal to the demand, so many mills having already sold all they can make for the balance of the year, while inquiries continue to pour in. Common, No. 27, is quoted at 2.85¢ @ 2.90¢ at mill; guaranteed to corrugate, 15¢ per 100 lb advance. Store lots of Common, No. 27, sell at 3.10¢ @ 3.30¢, according to quality.

**Galvanized Iron.**—Manufacturers' agents have had a lively trade in small

lots, but prices are as low as ever. Small quantities are quoted at 65 ¢ off for Juniata and 65 ¢ and 5 ¢ off for Charcoal.

**Merchant Steel.**—The trade of the past week was very fair, including some good-sized orders for Tool Steel. No heavy contracts have come forward as yet, but the market is well sustained by the flow of small orders, and prices are about the same as they have been, viz.: Soft Steel Bars, 2.20¢ rates; Tool Steel, 7.75¢ @ 8¢; Specials, 12¢ @ 25¢; Crucible Spring, 3.75¢; Open-Hearth Spring, 2.50¢; Open-Hearth Machinery, 2.40¢; Sheet Steel, 7¢, 8¢ and 10¢; Tire Steel, 2.20¢ @ 2.25¢.

**Steel Rails.**—A very satisfactory movement is reported in small lots, ranging from 250 to 1000 tons, and originating principally in the Far West and Northwest. The demand for Light Rails has been a noticeable feature of the trade. They are wanted for mine use, for lumber roads and for the construction of feeders to main lines in sparsely settled districts. A couple of large orders are the subject of negotiation at present, and a very hopeful feeling is expressed that by June a much more active market will be experienced. An encouraging indication for the future is the successful sale of bonds by a new railroad company, who will require from 20,000 to 25,000 tons of Rails. Although this particular project lies outside of the territory reached by the Chicago mills, it is accepted as evidence that other new railroad schemes can be financed which will draw their Rail supplies from this quarter. Prices have been irregular for some time, depending upon the extent of competition from other mills, the adjustment of freight rates, &c., but a stiffer feeling now obtains among sellers, and they are endeavoring to work prices upward. The regular quotations for Standard Rails for strictly Chicago delivery are still \$29.50 @ \$30.

**Track Supplies.**—A better demand for Spikes is noted, but generally speaking the market is very quiet. Small lots are quoted as follows: Steel Fish-Plates, 1.90¢; Iron Fish-Plates, 1.75¢; Bolts with Square Nuts, 2.55¢; Bolts with Hexagon Nuts, 2.65¢; Spikes, 1.95¢ @ 2¢.

**Old Rails and Wheels.**—Sales of moderate quantities of Old Iron Rails at interior points are reported at \$20. Holders ask the same price here, but the best bids brokers have been able to get from consumers would only equal \$18.50 at Chicago. Old Car-Wheels are quiet. Quotations are nominal at \$16 @ \$17.

**Scrap.**—Small quantities of Old Material have been sold to consumers, but the bulk of the transactions now in progress consists of purchases by dealers. A little better demand for Steel Scrap than Iron is noted. Dealers quote to consumers as follows: 1 ton of 2000 lb: No. 1 Wrought, \$17 @ \$18; Track, \$17 @ \$18; Axles, \$22; Horseshoes, \$17; No. 1 Mill, \$18.50; Cast Machinery, \$12 @ \$12.50; Stove Plates, \$9; Cast Borings, \$8; Wrought Turnings, \$11.50; Axle Turnings, \$12.75; Mixed Steel, \$10.50 @ \$11; Coil Steel, \$13.50; Leaf Steel, \$15.

**General Hardware.**—It is commonly remarked that the course of the Hardware trade this spring has been very peculiar, fluctuating widely from week to week and often from day to day. The demand has been of a spasmodic character, making business very active for a time, to be followed by decided quietness. Just now there is a little spurt of activity. Taking the entire spring, however, the volume of business is reported by the leading houses to have been about equal to that of other years. Apprehensions of drought were beginning to be felt throughout a large part of the West, but they were dispelled last week by refreshing rains, and traveling salesmen now send in most encouraging reports of trade prospects.

**Nails.**—Manufacturers' agents have had a fair run of inquiries for Steel Nails, and have made moderate sales, with prices ruling a fraction better for the mills than during previous weeks. Wire Nails are firmer, jobbers reporting an advance in the cost to them of at least 5¢ per keg on recent purchases, and they are now instructing their salesmen to endeavor to secure better prices also. Small lots of Steel Nails are still quoted at \$1.95 @ \$2 and Wire Nails at \$2.35 @ \$2.40, with 5¢ off for mixed carloads.

**Barb Wire.**—Jobbers are pushing the manufacturers for more prompt deliveries on their contracts, not being able to fill orders fast enough, yet prices are as low as before, namely, \$2.75 @ \$2.80 for small lots of Painted and \$3.35 @ \$3.40 for Galvanized.

**Pig-Lead.**—Relative to the course of the market at the several Lead centers during the past week, Everett & Post say: "At the opening higher prices were quickly established and each day witnessed a still further stiffening of values until the middle of the week, when, for the moment, the upward movement seems to have ceased. A noticeable feature is that most of the buying has been done for speculative interests, while consumers generally are holding aloof. It is hard to give the exact cause of the recent 'boom,' but probably the chief reason is to be attributed to the Secretary of the Treasury, who has appointed the 15th inst. for the hearing of pros and cons on the Mexican Silver-Lead Ore question. Should it then be decided not to change the present ruling the metal would undoubtedly react to a much lower basis; while if, on the other hand, the Treasury Department should decide to no longer admit these Ores free of duty, then a considerably higher range of values might soon be expected. The recent upward movement has been helped along by a considerable short interest in New York and elsewhere, and also a large demand for Spot Lead; at the same time, most of the refiners are well sold up for May and June delivery and are unable to take advantage of the present advanced rates. The Chicago market, opening at 3.60¢, has kept in line with New York, and though no large sales were made values have been firm. At the close we call the market 3.75¢, with sales of some 200 tons at that."

## Philadelphia.

Office of *The Iron Age*, 220 South Fourth St., PHILADELPHIA, Pa., May 14, 1889.

**Pig-Iron.**—Now that things have settled down a little after the break made by the Thomas Iron Company, it is possible to take a reasonably correct view of the position. In doing so it is found that one or two brands that were selling at \$17.50 for No. 1 are now available to good buyers at \$17, but the majority have made no changes whatever. Those who were getting \$18 are still holding for \$18; those who were down to \$17 before the Thomas reduction still remain at that figure and say they see no reason why they should change. A reduction in the cost of Ores, however, may induce some of these parties to shade a little on Pig-Iron, but they are not doing it at present, as there is no accumulation of good Iron, and their action will depend more on what the demand may be in the near future than on any arbitrary figure which may be named by those controlling other makes of Iron. As to the probabilities, it is pretty hard to say what may be done. Owing to the reduction in cost, as we have said, prices could be shaded without placing sellers in any worse position than they were in before, but when things are in the miserable condition that they have been in during the past six months it is improve-

ment they want, and not to be satisfied because they are no worse off. Still, there is some comfort in that, considering all the terribly bad things which have been predicted during the past few days. Apart from outside influences, it is almost certain that this market would easily develop into higher prices, but it depends on the amount of overflow from the South and West. Advices from these points are not encouraging, and it is understood that Western buyers are not willing to continue at the prices ruling during last month. It is just possible that they may have been unduly frightened at the "dollar-and-a-half drop," but whatever may be the cause, it is stated on good authority that buyers at the points named are standing out for concessions, and that business in large lots cannot be closed to-day unless at more or less of a reduction in price. This, if persisted in, leaves the Eastern market open to a further attack from the South, although at the moment there is nothing offering below last week's prices. But the law of supply and demand will assert itself, and this is what the trade are waiting for. If consumers must have Iron, prices will be sustained; if their requirements are such that they can curtail purchases, prices must decline in spite of all theories to the contrary. It is a waiting market, and at the moment it is impossible to say what the next turn may be, although much confidence is felt in better prices after midsummer. The range of prices for Philadelphia deliveries may be given as follows: Good to choice No. 1 Foundry, \$17 @ \$18; No. 2 do., \$16 @ \$16.50, and Gray Forge, \$14.75 @ \$15.50. Southern Irons and brands new to the market may sell at 25¢ @ 50¢ below the inside rates above named, but it depends on quantity, quality, point for delivery, terms of payment, &c. The Philadelphia Iron trade regards as the worst result of the action of the Thomas Company the establishing of a most pernicious precedent in regard to the binding character of a contract. If a contract is not binding on both sides it is no contract at all, but simply an option. A six or eight months' option on Iron is a very different thing from a contract binding on both sides, and cannot by any means be regarded as a *bona fide* sale until the price is mutually agreed upon. The hardship in this case is not on the customers of the Thomas Company, but on those who made sales in good faith at prices lower than the Thomas, and who are now frequently called upon by their customers for a similar reduction to the Thomas, which is manifestly unjust and totally at variance with correct business principles.

**Blooms.**—Market dull and irregular, but sales are mainly within the following range of quotations: \$28 @ \$28.50, at mill, for Nail Slabs; \$30 @ \$31 for Tank Slabs; \$32.50 @ \$33.50 for Shell Slabs; \$35 @ \$36 for Flange, and \$37 @ \$39 for Fire-Box; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite, \$41 @ \$42.50; Scrap Blooms, \$32 @ \$33 per "Bloom" ton of 2464 lb.

**Muck-Bars.**—Business has not been very active, but with something of a scarcity of good Bars prices are well sustained at \$27 delivered, or \$26 @ \$26.50 at mill, for good-quality Bars. One or two sales of good-sized lots have been reported at \$26.75 delivered.

**Bar-Iron.**—No improvement can be noted in this department, and prices are as low and as unsatisfactory as ever. There is a little more demand probably, but competition is as close as ever; hence the continued demoralization in prices. The approach of hot weather, &c., will doubtless do much to curtail the output, and while there may not be much improvement in the immediate future, there

is little doubt that to-day's prices are about as low as will be seen during the year 1889. Prices are nominally from 1.70¢ to 1.80¢ for Best Refined Bars, but cutting in extras is so general that base prices give very little idea of actual prices.

**Plate and Tank Material.**—The demand is quite active, and mills are running pretty nearly to their full capacity. The volume of new business is quite on a par with the output, but it seems impossible to establish any advance in prices, although they are firmly held at the limits prevailing for some weeks past. The character of the demand is such, however, that manufacturers believe that the time is at hand when an upward movement may be started, as the demand promises to be large during the next three months, while the output cannot be increased very much, although it may be considerably decreased. Prices, therefore, are steady at about the following figures asked: 1.85¢ @ 1.95¢ for Ordinary Plates and Tank Plates; 2.1¢ @ 2.2¢ for Universal Plates; Shell, 2.4¢ @ 2.5¢; Flange, 3.3¢ @ 3.4¢; Fire-Box, 3.5¢ @ 3.7¢; Steel Plates, Tank and Ship Plate, 2.1¢ @ 2.25¢; Shell, 2.7¢; Flange, 3¢ @ 3½¢; Fire-Box, 3½¢ @ 3¾¢.

**Structural Material.**—There is no special movement in this department, and in most respects the market is just about as it was a week ago. Mills are fairly busy on Shapes, &c., with indications of a considerably better demand in course of a few weeks. Prices about as follows: Bridge Plate, 1.95¢ @ 2.05¢; Angles, 1.95¢ @ 2¢; Tees, 2.4¢ @ 2.6¢; Beams and Channels, 2.8¢ for Iron or Steel.

**Sheet-Iron.**—The demand is very satisfactory, the current product of the mills being taken almost as fast as it is turned out. Inquiries are coming in from all sources, with every indication that the demand will be large all through the season. Prices remain about as follows:

Best Refined, Nos. 14 to 20.....	3¢
Best Refined, Nos. 21 to 24.....	3.20¢
Best Refined, Nos. 25 to 26.....	3.40¢
Best Refined, No. 27.....	3.50¢
Best Refined No. 28.....	3.60¢
Common, ¼¢ less than the above.	
Best Soft Steel, Nos. 14 to 20.....	3¼¢
Best Soft Steel, Nos. 21 to 24.....	3½¢
Best Soft Steel, Nos. 25 to 26.....	3¾¢
Best Soft Steel, No. 27.....	4¢
Best Bloom Sheets, ¼¢ extra over the above prices.	
Best Bloom, Galvanized, discount.....	.65 %
Common, discount.....	.67½ %

**Steel Rails.**—The market is quiet, although the feeling is somewhat firmer. The unsettled condition of affairs in Pittsburgh is a standing menace to the market, and doubtless will be a barrier to any special movement for the present. Eastern mills quote \$27.50 @ \$28, although it is reported that a sale of 12,000 tons has been made at \$27 by one of the Western mills.

**Old Rails.**—Absolutely no business in this market. There are buyers at \$22 for T's, but holders quote \$22.50 and upward, some as high as \$24.

**Scrap-Iron.**—There is very little change in Scrap, although consumers contend for lower prices, but the supply being small prices are fairly maintained at about the following quotations: \$20 @ \$21 for cargo lots; \$21 @ \$21.50 for carload lots, delivered, or for choice, \$22; No. 2 do., \$14 @ \$15; Turnings, \$14 @ \$15; Old Steel Rails, \$18 @ \$19; Cast Scrap, \$15 @ \$16; do. Borings, \$9 @ \$10; Old Fish-Plates, \$23 @ \$24; Old Car-Wheels, nominal, \$17 @ \$18, Philadelphia.

**Wrought-Iron Pipe.**—There is an increasing demand, and prices are firmer, as shown by the following discounts: Butt-Welded Black, 52½ %; Lap-Welded Black, 65 %; Butt-Welded Galvanized, 45 %; Lap-Welded Galvanized, 52½ %; Boiler Tubes, 60 %.

**Nails.**—The demand has fallen off somewhat, although the movement is still considerable. Prices are nominally unchanged, but extremely low figures are mentioned in the case of sales to realize cash. Standard brands command about \$1.80 @ \$1.85 in carload lots, and \$1.90 @ \$2 from store.

Jas. G. Lindsay & Co., Bullitt Building, Philadelphia, are now the representatives of the Duquesne Forge Company (formerly Miller Forge), Pittsburgh, Pa.; also the general agents for the Garry Iron Roofing Company, of Cleveland, Ohio.

## Cleveland.

CLEVELAND, May 13, 1889.

**Iron Ore.**—The best authorities agree that the total sales of Lake Superior Ore to date amount to not less than 3,250,000 tons, almost a million tons of Ore having been sold during the past week. Included in the heavy orders placed during the past six days were several round lots of No. 1 Specular and Magnetic Ore, non-Bessemer quality, at \$4.75 @ \$5. Cleveland delivery; a substantial amount of Gogebic Bessemer Ore at \$5; considerable Bessemer Ore from the Menominee Range at \$4.90 @ \$5.10 and a large number of orders for Non-Bessemer Hematites at about \$3.75, f.o.b. vessels, Cleveland, Ashtabula and Buffalo. The market is certainly active and the amount of Ore sold during the week just closed closely approximates a million tons. Every mining company represented in this city reports heavy orders at about the same quotations furnished *The Iron Age* last week. Ore is being pushed down from Ashland, Two Harbors, Marquette and Escanaba at a tremendous rate, 22 vessel-loads arriving yesterday and the total receipts of the past seven days aggregating not less than 60,000 tons. The mine owners are experiencing no trouble in engaging plenty of tonnage at 90¢ from Escanaba, \$1.10 from Marquette and \$1.25 from Ashland and Two Harbors. The heavy buyers at Pittsburgh have thus far made only scattering purchases, but the Ore men profess to be indifferent to this situation, claiming that they are having all the orders their clerks can place on the books, and that the present prices for Ore will unquestionably be the season's quotations. This claim may be subject to doubt from the fact that in July and August of 1888 the market declined from 25¢ to 40¢ per ton upon all grades of Ore, and something equally favorable to the purchasers may occur this year. Furnacemen argue that this is likely to come about, because of the comatose condition of the Pig-Iron market, and because, too, lake freights are much more favorable to shippers than was the case last year. Representatives of the very highest grades of Bessemer Ores claim additional sales amounting to 12,000 or 15,000 tons at \$6.25, Cleveland delivery, and of Minnesota Bessemer at \$5.75. The following are the quotations, f.o.b. vessels, Lake Erie ports:

Specular and Magnetic Bessemer Ores.....	\$5.75 @ \$6.25
Specular and Magnetic Non-Bessemer Ores.....	4.50 @ 5.00
Red Hematite Bessemer Ores.....	4.50 @ 5.00
Red Hematite Non-Bessemer Ores.....	3.50 @ 4.00
Menominee Range Bessemer Ores.....	4.90 @ 5.10
Menominee Range Non-Bessemer Ores.....	3.50 @ 4.00
Gogebic Range Bessemer Ores.....	4.90 @ 5.25

**Pig-Iron.**—Dealers are encouraged by the increased demand for Wire-Rods, necessitating, of course, an improvement in the inquiry for Blooms and Billets. The market certainly retains the hopeful features of last week, a result due in some degree to the existing demand for Bessemer Iron, at which an offer of \$16 for 10,000 tons at the furnace was refused during the week just closed. Prices for Iron are rigorously

guarded, but that a considerable quantity is being sold is evident from the reports of the amount of Iron going into consumption, and also to the fact that there is little or no accumulation of stocks at the yards. The following are the quotations:

Nos. 1 to 6 Lake Superior Charcoal.....	\$20.00 @ \$21.00
No. 1 Strong Foundry, Bessemer quality, $\frac{1}{2}$ ton.....	16.50 @ 17.00
No. 1 Strong Foundry, $\frac{1}{2}$ ton.....	16.00 @ 17.00
No. 2 Strong Foundry, $\frac{1}{2}$ ton.....	15.00 @ 16.00
No. 1 American Scotch, $\frac{1}{2}$ ton.....	16.50 @ 17.00
No. 2 American Scotch, $\frac{1}{2}$ ton.....	15.50 @ 16.50
No. 1 Soft Silvery, $\frac{1}{2}$ ton.....	17.00 @ 18.00
Mahoning and Shenango Valley Neutral Mill Irons, $\frac{1}{2}$ ton.....	14.00 @ 15.00
Mahoning and Shenango Valley Red Short Mills, $\frac{1}{2}$ ton.....	14.50 @ 15.50

**Old Rails.**—Old Americans are still weak at about \$20.50 @ \$21, and with only a few scattering sales reported. Old Wheels are to be had in plenty almost at buyers' prices.

## St. Louis.

Office of *The Iron Age*, 212 N. Sixth st.,  
St. Louis, May 13, 1889.

**Pig-Iron.**—For some reason business holds off. Orders are scarce and when placed are generally for small lots. This city is amply supplied with Pig-Iron agents and the competition to secure what little business there is is consequently very active, and naturally prices are shaded to secure trade, and agents appear willing to concede part of their commission to secure some business for the furnaces they represent. This is a feature that just at the present time is particularly objectionable. If the agents would be satisfied to name a fair price and abide by it, taking their regular commission, it would be far more advisable than following the course they are at present pursuing, especially so just at this time, as the market is certainly in a very depressed condition, although there appears to be considerable confidence as to the future; in fact, more than the actual condition of things seems to warrant. During the week some few sales were entered, in 200 and 300 ton lots, made up of different grades. Under the circumstances prices are holding very well, and notwithstanding the dullness prices seem to be held with some degree of strength. We quote as follows for cash, f.o.b. St. Louis:

Southern Coke, No. 1 Foundry, \$15.50 @ \$16.00	
Southern Coke, No. 2 Foundry, 15.00 @ 15.25	
Southern Coke, No. 3 Foundry, 14.50 @ 14.75	
Gray Forge.....	13.50 @ 14.00
Ohio Softeners.....	17.00 @ 19.00
Lake Superior Charcoal.....	20.50 @ 21.50

### Missouri.

Charcoal Foundry, No. 1.....	16.00 @ 16.50
Charcoal Foundry, No. 2.....	15.00 @ 15.50

### Tennessee.

Charcoal Foundry, No. 1.....	17.00 @ 18.00
Charcoal Foundry, No. 2.....	16.50 @ 17.00

Connellsville Coke, f.o.b. East St. Louis, \$4.55; St. Louis, \$4.70.

**Bar-Iron.**—The improvement noted last week continues, and it now looks as if some advance in prices will be made shortly, as it is reported that the mills which were known to be cutting prices are about filled up with orders, and the stronger concerns who held off and only took what business as was actually necessary are in the market to sell, but not at the extreme quotations that prevailed during the first three months of the year. Small lots from store are quoted at \$1.80, and carload lots from \$1.60 to \$1.70, according to circumstances.

**Barb Wire.**—There is an active demand for Wire, and prices show more strength. The prospect of any combination among the manufacturers seems to be as distant as ever, as it is understood that there are two or more concerns that will not enter the combination under any circumstances. But aside from the combination there seems to be some prospect of

improvement in prices, but how soon it is difficult to tell. There is a growing disposition among manufacturers to discontinue taking orders to be delivered, and if possible sell all goods f.o.b. St. Louis. If this could be accomplished it would prove quite a saving to the manufacturers, as they are compelled to pay freight on the wooden spools, which is a complete loss to them. One manufacturer during the past week refused a carload order on account of this feature. Whether the other manufacturers will take the same stand remains to be seen. Mills quote from \$2.80 to \$2.85 for Painted and from \$3.40 to \$3.45 for Galvanized. Carload lots are quoted at from \$2.70 to \$2.75 for Painted and \$3.80 to \$3.35 for Galvanized, f.o.b. St. Louis.

Continental Wire Company have removed their office from 409 North Third street to Laclede Building.

Wolfe & Good, manufacturers' agents, have removed their office from 411 North Third street to Laclede Building.

## Cincinnati.

Office of *The Iron Age*, Fourth and Main Sts.,  
CINCINNATI, May 13, 1889.

A tour among the local Iron agents and factors was but lightly rewarded to-day, the general report for the week being small sales and unsatisfactory prices. Traveling men from the South bring more discouraging facts than reassuring news, from Alabama at least. The foundries in that section are selling at ruinously low prices; others are looking for more favorable localities. In the North, parties who have made large contracts in some instances are asking a postponement of deliveries, reflecting a falling off or a cancellation of orders. Rolling-mills are especially dull. On the other hand, Pipe-works continue to melt heavily, and some Car-works in the West have been fortunate in securing larger contracts, on the strength of which Cincinnati has been enabled to sell 800 tons Lake Superior Car-Wheel Iron on a basis of \$20.25, cash, here, but this is the only sale of moment recorded. At the moment bids are in for 1500 to 2000 tons No. 8 Foundry and Gray Forge, and the award will probably be made to-day or to-morrow. The open prices quoted for Gray Forge and No. 3 Foundry are \$13 and \$13.25 respectively, and the inference is that these prices can be shaded 25¢ on such a market. Even the run of small orders is becoming lighter.

**Manufactured Iron.**—The rainfall during the past few days has much improved the agricultural outlook in this section, but more moisture is necessary to restore the crops to a normal condition. In the North and West rain has been ample. It is only in the Central West that there has been much apprehension. General business has not yet received the stimulus anticipated, and orders for Manufactured Iron reflect dullness more than any other condition, and an easy tone prevails. The following are the approximate prices current here at the close, for cash, f.o.b.:

### Foundry.

Southern Coke, No. 1 (new classification).....	\$14.75 @ \$15.25
Southern Coke, No. 2 (new classification).....	14.00 @ 14.50
Southern Coke, No. 3 (new classification).....	13.25 @ 13.75
Ohio Soft Stone Coal, No. 1.....	15.50 @ 16.00
Ohio Soft Stone Coal, No. 2.....	14.50 @ 15.25
Mahoning and Shenango Valley Hanging Rock Charcoal, No. 1.....	16.00 @ 16.50
Hanging Rock Charcoal, No. 2.....	20.00 @ 22.00
Tennessee and Alabama Charcoal, No. 1.....	19.00 @ 21.00
Tennessee and Alabama Charcoal, No. 2.....	17.50 @ 18.00
Tennessee and Alabama Charcoal, No. 2.....	16.50 @ 17.00

### Forge.

Strong Neutral Coke.....	12.75 @ 13.00
Mottled Neutral Coke.....	11.75 @ 12.00
Gray Forge.....	12.75 @ 13.00

### Car-Wheel and Malleable Irons.

Southern Car-Wheel.....	20.00 @ 24.00
Hanging Rock, Cold Blast.....	22.00 @ 25.00
Lake Superior Car-Wheel and Malleable.....	20.00 @ 21.00

**Nails.**—There has been a fair order trade and a steady market for all kinds; 12d @ 40d sell at \$1.90 @ \$1.95  $\frac{1}{2}$  keg, with 10¢ rebate in carload lots at the mills. Steel Nails sell at \$1.90 @ \$1.95, and Steel Wire Nails at \$2.45 @ \$2.50  $\frac{1}{2}$  keg.

**Old Material.**—There has been an improved demand for Old Rails at \$20 cash, but holders have refused to sell under \$21. Old Wheels have been neglected and prices have remained nominal at \$18, spot cash, here.

W. H. D. Totten, Jr., the Western representative of Messrs. Carnegie, Phipps & Co., of Pittsburgh, Pa., has secured quarters in the Michell Building, adjoining the new Chamber of Commerce. Mr. Totten, although representing the firm mentioned but a few months in Cincinnati, has succeeded in building up a very satisfactory trade for the productions of the company.

## Chattanooga.

Office of *The Iron Age*, Carter and 9th Sts.,  
CHATTANOOGA, May 13, 1889.

**Pig-Iron.**—The market continues in about the same quiet condition that has prevailed for the past two or three months. The cut of the Thomas Iron Company, so far as can be ascertained, has not created even a ripple in prices. It certainly has not affected prices, as small round lots are now being sold to go to the Eastern markets at about the same prices that prevailed before the announcement. Taking the whole condition of the market into consideration, prices have receded but very little during the last month. Good grades of favorite and well-known brands are as closely sold up as the furnaces care to go, and the constant demand and inquiries go to show that these special Irons will continue to find a market. Grades that are a little off, or not as well known, are of course being sold at conceded prices. Iron producers are now taking no other position than that the market is down as low as it will get any time in the future, and are simply holding on for something to "turn up," or some other turn. Some say that they are making some money, which is probably so; others say they are losing nothing, which may also be true, and under this condition of things all will keep running on. Under a freight rate of \$3.75 from this, as well as the Birmingham district, they still claim the New York and Philadelphia markets. At the same time, the enormous retail trade, as it were, from every consuming point in the United States keeps the prices that they are getting for their output up to something more than what their Eastern markets net them. Large quantities of Nos. 3 and 4, mixed with a little No. 1, are now being used by some of the largest consumers, so that the yards are now well cleared up in those qualities, which leaves the bulk of the Nos. 1 and 2 for the open markets East and to special customers. So far as can be ascertained, none of the furnaces are suffering for orders, and there are a great many offers a little under that are declined.

## Louisville.

LOUISVILLE, KY., May 13, 1889.

**Pig-Iron.**—The market has been very quiet during the past week, purchasers buying in small lots and to meet their immediate necessities rather than for future delivery. A disposition is being shown among a few to buy for deliveries extending throughout the year. Consumers are

recognizing that the price of Iron is extremely low, but are not willing to contract for large amounts until they see the effect of the drop in prices in the Eastern market. It is not felt, however, that there will be any special change in prices among Southern furnaces in this section owing to the action of the Thomas Iron Company, as the drop has been discounted for some time. We quote as follows:

Southern Coke, No. 1 Foundry, new classification.....	\$14.75 @ \$15.25
Southern Coke, No. 2 Foundry, new classification.....	14.25 @ 14.75
Southern Coke, No. 3 Foundry, new classification.....	13.75 @ 14.25
Gray Forge.....	13.25 @ 13.75
White and Mottled, different grades.....	12.75 @ 13.25
Silver Gray, different grades.....	13.00 @ 13.50
Southern Charcoal, No. 1 Foundry.....	16.25 @ 16.75
No. 1 Mill.....	14.75 @ 15.25
Southern Car-Wheel, standard brands.....	21.75 @ 22.75
Southern Car-Wheel, other brands.....	18.00 @ 19.50
Hanging Rock Coke, No. 1 Foundry.....	15.50 @ 16.00
Hanging Rock Charcoal, No. 1 Foundry.....	19.50 @ 21.00
Hanging Rock, Cold Blast.....	20.75 @ 22.75

## Pittsburgh.

Office of *The Iron Age*, 77 Fourth Ave.,  
Pittsburgh, May 14, 1889.

The general Iron situation remains in much the same condition noted a week ago; in some respects the outlook is favorable, while in others it is not. There is a large volume of business, but prices continue unsettled and unremunerative. Nearly all our mills and furnaces are in operation, but there is very little money in the business at the present time. While consumption is increasing, production continues in the lead.

The strike at the Rail mill of the Allegheny Bessemer Company, at Duquesne, continues, although it is claimed that it is about over, the mills in operation being operated by non-union men, but, the strikers say, with very poor results. However, as stated in this column a few weeks ago, it is the evident intention of the company to make it a non-union mill; and it looks now as if they would be successful. Some of the strikers, it is said, have left the place, which may, if true, be taken as an indication that the back of the strike is about broken.

Mr. Andrew Carnegie, who was here a few days, was interviewed again in regard to his status toward the Pennsylvania Railroad and its discriminations against Pittsburgh. Among other things, Mr. Carnegie said: "I make this prediction, that what we have asked will be granted soon; some of it very soon. First, Ores will be carried from the lakes to Pittsburgh as cheaply as from the lakes to the Ohio furnaces, the distance to the latter being greater than the former. This is the most vital change of all. Second, Coke will be supplied to the furnaces in the Pittsburgh district at the same rates as the Pennsylvania Company receive upon Coke carried to Pittsburgh destined for Chicago furnaces. Third, rates upon all classes of freights, east and west, say to Baltimore, Philadelphia, New York and Eastern cities, and to Chicago and Western cities, will be just one-half of the through rate between Eastern and Western cities. With these fair requests granted I think that every manufacturer in Pittsburgh will change position in regard to the railroads. They will recognize them as their allies and friends and be only too glad to co-operate with them. There may be other equally wrong discriminations in other branches of business of which I have no knowledge."

Word comes from Washington that John Jarrett, a former president of the Amalgamated Association, and Wm. Martin, at present secretary of the same, are to receive consular appointments. The appointments if made will be a source of great satisfaction here to people generally,

but to members of the Amalgamated Association in particular. Both men stand high in this community.

**Pig-Iron.**—There has been an increased volume of business the past week, and just as soon as consumers can satisfy themselves that hard-pan has been touched the demand will be largely increased and the result a stronger market. Consumers generally are low in stock, as they have been buying from hand-to-mouth for some time past, and as soon as the feeling begins to obtain that the lowest notch has been touched all will want to buy, which will be immediately followed by sellers refusing to sell, and up will go prices. Pig-Iron, it is said, with but a single exception, never sold lower than it is at present, and the situation warrants the prediction that there will be an increased demand and a reduced production within the next few weeks. There is no margin for profit at present prices, while the cost of production has been reduced to the lowest possible limit, and a number of furnaces will go out as soon as they get through with existing contracts. We quote prices as follows:

Gray Forge Neutral.....	18.75 @ \$14.00, cash
White and Mottled.....	18.00 @ 18.50, "
All-Ore Mill.....	14.75 @ 15.25, "
No. 1 Foundry.....	16.00 @ 16.50, "
No. 2 Foundry.....	15.00 @ 15.50, "
No. 3 Foundry.....	14.50 @ 14.75, "
No. 2 Charcoal Foundry.....	21.50 @ 22.00, 4 mon.
Cold Blast Charcoal.....	24.00 @ 27.00, cash
Bessemer Iron.....	16.00 @ 16.25, "

Sales of several thousand tons Neutral Gray Forge reported at \$18.95 @ \$14, cash, and \$14.25, four months; 2200 tons Bessemer at \$16, cash, which is now the ruling price.

**Muck Bar.**—So far as we can learn there have been no sales below \$26, cash, at which it is offered pretty freely. Offers were made last week to buy at \$25.50 @ \$25.75, cash, but no sellers could be found.

**Spiegel.**—Is still quoted at \$30 @ \$30.50, cash, for 20%. Sale, 300 tons Ferromanganese, 80%, at \$58, cash, and a smaller lot, 77½%, at \$57.50, cash.

**Manufactured Iron.**—The Merchant-Iron trade is more active, but prices continue unsettled and unsatisfactory. We continue to quote upon a basis of 1.60¢ @ 1.70¢ for Bars for first-quality Iron, 60 days, 2% off for cash. Old-Rail Iron is being offered by mills in Mahoning and Shenango valleys at 1.40¢ @ 1.50¢ rates. There is an increasing demand for Skelp-Iron, and some of the mills not only have all they can do for the present, but are sold up until July. No change in prices—Grooved, 1.62½¢ @ 1.65¢; Sheared, 1.90¢ @ 1.95¢.

**Nails.**—There is no change in the position of the market here; trade continues very dull, with but little prospect, apparently, of any immediate movement. We continue to quote Cut Nails at \$1.85 @ \$1.90, 60 days, 2% off for cash, and Wire Nails at \$2.15 @ \$2.20, same terms.

**Wrought-Iron Pipe.**—An important meeting of the Wrought-Iron Pipe Association took place in New York on Thursday last. The attendance was large, proceedings harmonious, and all the mills in the country are now members of the association. It was ascertained that all the mills are busy, some of them contracted for several months ahead, and the indications point to an active trade until the advent of the winter season. Prices were advanced, or, what amounts to the same, discounts were reduced. The new discounts are as follows: On Black Butt-Welded Pipe, 52½¢; on Galvanized do., 45¢; on Black Lap-Welded, 65¢; on Galvanized do., 52½¢; Boiler Tubes, 1½ inches and smaller, 57½¢; 2 inches and larger, 62½¢; 5½ inch casing, 62½¢; other sizes, 60¢; 2-inch Tubing,

13¢ per foot net; 8-inch Line Pipe, 20¢ per foot net; 6-inch do, 56¢; 8-inch do 90¢.

**Old Rails.**—Old Iron Rails continue dull, and prices are weak and drooping; offerings at \$22 with no demand. We are advised of a sale of 1000 tons for delivery at Youngstown at \$21.50. Old Steel Rails continue in demand with but few offering; short lengths are quoted at \$17 @ \$17.25, and long lengths at \$19 @ \$19.50. It is not long since Old Steel Rails were almost unsaleable, while Old Iron Rails were wanted on all sides; now it is the other way.

**Steel Rails.**—Manufacturers still quote heavy sections at \$26 @ \$27, cash, at mill, but it is rumored that orders have been booked below the lowest price quoted. The strike at the mill of the Allegheny Bessemer Company is still in progress, but the company now entertain but little doubt of ultimate success—that is, of making it a non-union mill, which is the main point in the contest.

**Railway Track Supplies.**—There is no change in prices. Spikes, 2¢, 30 days, Splice Bars, 1.60¢ @ 1.70¢; Track Bolts, 2.75¢ with Square and 2.85¢ with Hexagon Nuts.

**Blooms, Billets, &c.**—Bessemer Steel Billets and Blooms are quoted at \$27 @ \$27.25, cash; do. Nail Slabs \$28.50. Sale of 1000 tons Rail Crops at \$17.25, cash.

**Old Material.**—Continues very dull, and there is so little doing that it is difficult to quote reliable quotations. We hear of sales of No. 1 Wrought Scrap at \$18 @ \$18.50, net ton; Wrought Turnings, \$12.50 @ \$13; Old Car Axles, \$24 @ \$25; Cast Scrap, \$14 @ \$15.50, gross; Old Car-Wheels, \$18 @ \$18.50.

## New York.

Office of *The Iron Age*, 66 and 68 Duane street,  
New York, May 15, 1889.

**American Pig.**—The Thomas Iron Company report that, as the result of their recent circular, their customers are taking Iron more freely, so that their accumulated sold stock, larger than it was ever before, is likely to be rapidly reduced, especially since additional sales have been made to customers, and some Iron is being sold to outsiders at \$17 for No. 1 and \$16 for No. 2, respectively. There has been some readjustment in contracts made by other sellers. It is well known, too, that some business was closed earlier in the year on the basis of "\$1 below Thomas," which is now less favorable to the furnaces who entered into it. Some of the other Lehigh furnaces have issued circulars quoting \$17 for No. 1 and \$16 for No. 2, while Southern Iron continues to sell at \$16 @ \$16.25 for No. 1 and \$15 @ \$15.25 for No. 1, with rumors of a slight shading of the lower figures, which cannot, however, be traced to any authentic source and should be received with caution. Some of the leading Southern makers who are longer identified with the business are inclined to regard the step of Thomas Iron Company with favor, stating that their worst competitors are not the Northern furnaces, but the new plants in some sections of the South. The most interesting question which has arisen is the effect of the lower prices for Lehigh Irons in New England. Taking Boston for instance, it costs Lehigh and Schuylkill furnaces about \$1.25 to go from New York to Boston. Southern furnaces can get into that port for about 25¢ more than they go for into New York. But as soon as the Iron goes inland they must pay in addition 35¢ for the haul on the belt-line to the cars. The further inland they must go the easier it is for the Northern furnaces to meet them,

especially if, as is probable, the railroads take off the recent addition to freights. Some New England harbors for instance, Portland and Bangor, Me., can be reached by Northern furnaces for \$1.35 over tidewater prices. To Southern furnaces it costs about \$1.50 more. During the past week a lowering of Ore and Coke freights to Eastern Pennsylvania furnaces has been granted, and Anthracite Coal is also to be reduced. We may note the fact that off-grades of Northern Irons are being crowded on the market lately and that prices are lower. We hear of business at \$14.50 on Forge at tide and \$15 on Plain No. 2, with a report of \$13.50 on a small lot of off-grade Forge.

**Scotch Iron.**—The market is very dull, with Coltness nominally \$21.50 @ \$21.75; Summerlee, \$21.25 @ \$21.50, and Dalmington, \$20.25 @ \$20.50. American Scotch is selling at \$19, and is gaining in favor.

**Structural Iron and Steel.**—The contracts for the Ironwork for two office buildings on Wall street were placed during the week, the aggregate quantity of Beams being about 800 tons. We continue to quote Sheared Plates, 1.9¢ @ 2¢; Universal Mill Plates, 2¢ @ 2.1¢; Angles, 1.9¢ @ 2.1¢; Tees, 2.35¢ @ 2.5¢, and Channels and Beams, 2.8¢, on dock.

**Plates.**—We quote Iron Tank, 1.9¢ @ 2.2¢; Shell, 2.25¢ @ 2.4¢; Steel Tank, 2.15¢ @ 2.25¢; Shell, 2.35¢ @ 2.4¢; Flange, 2.55¢ @ 2.75¢, and Fire-box, 3¢ @ 4¢.

**Steel Rails.**—The conference of Rail-makers did not result in anything that is tangible. As one leading manufacturer put it, "they walked up the hill and walked down again." It was understood that a number of the Eastern mills were in favor of the adoption of some method to fix a price more remunerative than that ruling at present. So far as we are informed, however, no definite arrangement ever came up for discussion. It is stated that the representative of the Pittsburgh mill held that with an active competitor, not one of the association, in his own territory anything which approached an agreement to fix a price is altogether out of the question. The first signs appeared this week of the usual newspaper bear campaign which annually precedes the entrance into the market of a leading railroad interest in the Southwest. Until the great magnate alluded to has purchased all sorts of rumors of low prices are likely to be kept afloat with much ingenuity, but they are not likely to have much effect. We class among them the story which cropped up in Philadelphia that Rails had been sold at \$24.75. So far as we have been able to learn \$26 has been shaded only once by any mill East or West during the past two months, all the talk by outsiders and rival Rail-makers to the contrary notwithstanding. Eastern mills report business, scattered from Maine to the Gulf, of an aggregate of 13,000 tons at \$26.50 @ \$27. In the West only one small transaction, an addition to a larger order placed with a Pittsburgh mill lately, is reported. Prices there are still \$26. Dividing the mills in the association into three groups, the Eastern with the Troy, Scranton, Lackawanna, Pennsylvania and Bethlehem; the Central with Edgar Thomson, Cambria and Cleveland, and the Western with North Chicago, Juliet, Union and Springfield, the report of the Board of Control shows the following for the first four months:

Group.	Sales.	Allotment.
Eastern.....	300,995	583,537
Central.....	222,548	281,280
Western.....	226,521	288,306
Total.....	750,064	.....

The total allotment, which includes one mill not enumerated in the above, is 990,-

850. It should be noticed, however, that the total sales reported, 750,064, do not, of course, include the Allegheny Bessemer Company, whose sales aggregate at least 50,000 tons. Nor does it, of course, include the sales made since May 1. It is estimated by good authority that this will swell the total to 850,000 tons, at least. On May 1, 1888, the sales had been about 721,000, while at the same date in 1887 they aggregated 1,598,048 tons. The shipments from the mills up to May 1 were 343,044 tons in 1889, against 299,556 tons in 1888, and 564,403 tons in 1887. It may be of interest to add that there is an inquiry in the market for 40,000 tons of Rails for an extension into Oklahoma of the Chicago, Kansas and Nebraska Railroad.

**Bar-Iron.**—The market remains dull. We quote: Carload lots on dock, Common, 1.6¢ @ 1.65¢; Medium, 1.65¢ @ 1.7¢, and Refined, 1.7¢ @ 2¢.

**Scrap-Iron.**—Business appears to be at a stand-still, except in very small lots, sellers showing a disposition to stack material rather than sell at the prices offered. We quote: No. 1 Scrap, \$20 @ \$20.50 for cargo lots, and \$20.50' @ \$21 for carload lots, delivered; Turnings, \$13.50 @ \$14; Cast Scrap, \$15 @ \$16; Borings, \$9.50 @ \$10.

**Old Rails.**—These are dull and nominal at \$22 @ \$22.50. No business of any consequence is reported.

**Fastenings.**—Spikes in large lines may be quoted \$1.90 @ \$2 and Angles \$1.70 @ \$1.80, Iron or Steel, delivered.

Naylor & Co., of 99 John street, New York, the Bullitt Building, Philadelphia, and Lewis Block, Pittsburgh, announce that they have made arrangements to supply with Ore Isaac McHose & Sons, of Norristown, Pa., and to take the sale of the special low phosphorus Pig-Iron known as Acme, which is guaranteed phosphorus not to exceed 0.03, sulphur not exceeding 0.03, and silicon 1 to 2 per cent. Isaac McHose & Co. publish daily determinations of phosphorus of the Acme for April, which shows a maximum on only two days of 0.028 phosphorus, the lowest being 0.022. They expect to make a limited quantity which they can guarantee 0.02 and under in phosphorus, which they call Special Acme.

Wetherell Bros., Steel merchants, agents of the La Belle Works, of Pittsburgh, and the Carlisle Works, of Sheffield, England, have moved their New York office to 93 Liberty street.

## Financial.

The course of events affecting trade, taken as a whole, is pronounced favorable, the drawbacks being only occasional. Confidence in the future seems to be well grounded. The fact is construed favorably that despite considerable exports of gold in face of a low bank reserve no uneasiness was occasioned. A depletion of money might be reasonably welcomed, rather than an accumulation that stimulates reckless speculation. Favorable conditions are reported from various sections of the country, particularly as to crop prospects. According to the Bureau reports the condition of wheat presents not merely the best May average for seven years, but surpasses the May condition in 1884, when the yield was the largest ever reported. For Dakota and Minnesota alone, we are told, the recent rains would be "cheap at \$1,000,000." The season in Texas is said to be at least one month in advance of previous years, and the outlook for crops was never more promising. It is also stated that the assurance of more stability in railroad tariffs, resulting from

the salutary operation of the Interstate Commerce law, is heightened in effect by better railroad earnings. Among other influences are the decrease in iron production, a reduction of 10 cents in tolls on bituminous coal and 20 cents on iron ore from Lake ports and the opening of a new line from New York to Chicago. Corn is more active. Wheat is firmly held, spot cotton is steady, provisions are dull and weak under large receipts. Prices of staple dry goods rule firm all around, and in the case of print cloths are raised 1.16¢.

On the Stock Exchange the volume of business is small, and there is little activity beyond a few leading specialties. Atchison, St. Paul and Oregon Transcontinental have been most conspicuous. The contest for the control of Oregon excited much interest. Richmond Terminal was strong in face of the proposed issue of stock. On Tuesday the tendency of prices seemed to be downward. Atchison continued to reflect a growing confidence. appointment of a receiver for the St. Louis, Arkansas and Texas had little effect. The undertone was strong until the final dealings, when the whole list fell off and the market was heavy.

United States bonds were quoted as follows:

U. S. 4½, 1891, registered.....	106½
U. S. 4½, 1891, coupon.....	107½
U. S. 4, 1897, registered.....	124½
U. S. 4, 1897, coupon.....	125½
U. S. currency 6s.....	121½

The total bond purchases from August 8, 1887, to date have been \$167,459,900, of which \$61,587,250 were 4 per cents and \$103,862,650 were 4½ per cents. Their cost was \$193,574,784, of which \$78,925,014 was paid for the 4 per cents and \$114,649,770 was paid for the 4½ per cents. They would have cost at maturity \$229,124,951.

The total bank clearances last week in 40 cities show an increase of 13.3% over the corresponding period last year. Outside of New York the clearances are increased 11.6%.

The weekly statement of the associated banks shows a loss of \$672,000 in surplus reserve, which was unexpectedly favorable, considering the recent heavy specie shipments. The surplus reserve now held amounts to \$8,821,135. Against a loss of \$3,204,900 in specie there was a gain of \$2,675,100 in legal tenders, resulting from the influx of currency from the interior. In loans there was a contraction of \$905,500. The money market has ruled fairly easy during the week, but for time loans there was a firmer feeling, and there was little disposition on the part of lenders to make engagements maturing after September except at an advance. The demand for commercial paper is urgent in the absence of opportunities for profitable investment. Quotations for indorsed bills are 3½% @ 4% 60 @ 90 days, and first-class commission-house names are 4% @ 4½% four months. The counting of \$178,394,763.45 in cash in the vaults of the Sub-Treasury was completed and the amount found to be correct. H. B. Collins & Co., the bankers, of this city, control the entire capital stock of the two gas companies doing business in St. Louis. It is said that the purchase amounted to \$8,500,000. The Spanish-American Commercial Union have leased permanent quarters in the Manhattan Bank Building, in Wall street. Exports of specie for the week were \$808,000 and of merchandise \$6,919,000, the latter including 230,500 bushels of wheat, 545,000 bushels of corn and 28,427 bales of cotton. Importations amounted to \$10,207,000.

The market for sterling was steady, with no features of interest. Bankers were divided in opinion as to whether any important shipments of gold to Europe are likely to be made this week. Posted rates

closed at 4.88 for 60 days and 4.89½ for demand. On the Paris Bourse last week Credit Foncier shares fell 10 francs; Rio Tintos declined 11 francs; Comptoir d'Escompte shares lost 12 francs. The Rothschilds arranged for a Russian conversion loan for \$240,000,000.

The imports at New York during April amounted to \$40,599,237, a gain of \$1,200,000 on the corresponding month last year, but the demand for foreign products was not sufficient to impart much animation to the market. In a survey of the previous 18 years it appears that there were five corresponding months when the receipts of foreign merchandise were larger. For four months the imports make a total of \$168,550,700, as compared with \$161,805,700 in the same time last year, and for ten months the total, including specie, is \$387,589,000, against \$385,066,000 for ten months ending April 30, 1888. The total exports for ten months of the fiscal year are \$318,045,000, an increase of about \$31,000,000 compared with the previous year, figures which are encouraging but look meager compared with 1881, when shipments of produce and merchandise alone were \$75,000,000 in excess of the current year.

The Bureau of Statistics reports total exports of breadstuffs during April to have been \$9,537,376, an increase of about \$1,500,000 over those for April, 1888. Of these the exports of corn were \$3,750,291, an increase of nearly \$3,000,000; of wheat \$2,534,032, a decrease of about \$100,000, and of wheat flour \$3,135,547, a decrease of \$1,300,000. For the ten months of the fiscal year the exports of breadstuffs were \$101,282,823, as compared with \$110,028,536 for the corresponding ten months of 1888. The exports of cotton for April were \$15,880,910, about \$2,500,000 more than for April, 1888. The exports of mineral oils were \$3,641,490, about \$400,000 more than April, 1888. The total exports of beef and hog products for April amounted in value to \$8,388,602—an increase of about \$1,500,000 over April, 1888. The total exports of dairy products were valued at \$420,021—an increase of about \$100,000.

## Coal Market.

The outlook for Anthracite Coal is not as cheering as the trade might desire, on account of the plethora of stock as compared with demands, and this despite the persistent efforts to keep production within the prescribed limits. Still, there is claimed to be some improvement. Intimations are thrown out that at the next meeting of sales agents in this city, 22d inst., "an advance" in tidewater prices will be announced, but it is elsewhere assumed that this does not necessarily follow; that really the design is simply to stiffen the schedule. The Eastern demand is satisfactory, while in the Western trade stagnation is the feature.

The Pig-Iron manufacturers have addressed a letter to the most prominent furnacemen to secure a reduction of the freight rate on Coke. The Philadelphia Press of Wednesday says: "The price of Coke is now \$1 ½ ton, while the freight to the Eastern furnaces is about \$2.25 ½ ton. The price of Anthracite Coal is just double the price of freight. This the furnacemen say is not just and that a considerable reduction should be made in the freight on Coke. It was reported that the Southern furnaces could manufacture Iron for \$10.50 per ton, and paying full freight they could ship it North and sell it for \$14.50, thus making from \$1 to \$1.50 on every ton. To compete with them something must be done and done quickly, and the first thing is the reduction in Coke. At the Reading's office it was said that a number of furnacemen had been to see them, and they had

proffered them their support. If the other companies would act they would willingly make a concession." The Philadelphia Ledger says: "Several of the larger mining and carrying corporations, as well as a number of individual operators, are reported to have sold their output of Coal for the entire month of May at about the actual selling quotations which were ruling in the later part of April, and consequently they are now asking higher prices." The scarcity of vessels and consequent advanced rates of freight operate to retard shipments. The output of Coal reported for the week ending May 11 is 584,427 tons, an increase of about 96,000 tons compared with the previous week. Since January 1, the total is 10,062,000 tons, a decrease of about 1,602,000 tons compared with the same time in 1888.

The following from a Philadelphia paper excited much comment in the trade: "The Reading Railroad Company have their surveyors out locating a line from Loftus to run into the heart of the Lehigh Valley Coal region. Ever since the Lehigh Valley Railroad Company built an extension to Pottsville the Reading Company have been trying to get even with them, and by building this new road they expect to get control of a great deal of their rival's Coal tonnage. A large number of the Coal mines in the Lehigh Valley are owned by the Lehigh Valley Railroad Company and operated by them. They also have leased out a number of mines to individual operators, but with the promise that they ship all the Coal mined over the Lehigh Valley Railroad. Besides these mines owned and controlled by the Lehigh Valley there are a number of operators who can ship their Coal as they please, and it is said that these operators have been soliciting the Reading people to make the extension. Among the principal operators who want to ship their Coal over the new road are: Coxo Bros. & Co., the Pardees, J. S. Wentz & Co., W. T. Carter & Co., the Silver Brook Coal Company, Linderman, Sker & Co., and M. M. S. Kemmerer."

A. Pardee & Co.'s breaker at Hazleton was destroyed by fire 9th inst. The fire originated in the boiler-room. Loss, \$50,000. Rebuilding will commence at once.

Bituminous Coal is plenty and inferior grades are cheap. The output of Cumberland for the week was 57,071 tons; Clearfield, 67,560 tons; Beech Creek and Pocahontas each nearly 38,000 tons.

The Philadelphia and Reading and the Pennsylvania railroads have reduced the rates on Bituminous Coal from the Beech Creek and Clearfield regions to \$1.70 for tidewater shipment. The Baltimore and Ohio reduced their rate on Cumberland Coal to \$2 per ton.

## Metal Market.

**Copper.**—Conferences among the representatives of the Copper mining companies were held in this city during the past few days, with the object of arriving at some arrangement. On the 16th the two months expire during which deliveries to the syndicate were to be stopped, the agreement in question ostensibly making it impossible to fix a price. It is generally understood, however, that the mines have been supplying customers, with the understanding that a rebate would be given to them equal to the difference between 16½¢ and the price ultimately to be fixed on all Copper delivered during the interval. It is probable that the mining companies will make an effort to place the price as high as they dare go, even at some risk, in order to make the rebates on former business as small as possible. They argue that after all the manufacturer has little cause for growling, since it is altogether unlikely that he has given his customers the ben-

efit of it or will do so now. The meeting on Tuesday appears to have been devoted exclusively to the discussion of the European situation. All the representatives are pledged to secrecy, but it is understood that the proposition before the meeting was the following: The bankers holding syndicate Copper in this country are to transfer the whole of the stock to the other side and agree to maintain the market at £45, G. M. B., distributing the disposal of their holdings over five years. In consideration thereof the American miners agree not to export as much Copper by 20 % as they did in 1888, when the shipments aggregated about 75,000,000 lb. In other words, a policy of mutual non-interference is to be adopted. It should be stated, however, that thus far this plan has not been adopted so far as known, nor do the utterances of Mr. Haggin on his arrival give much hope of it. To-day the American companies held a second meeting, at which the home situation was discussed. Obviously any success in maintaining a fixed price must be contingent upon an arrangement with foreign holders. It has been urged that 18¢ be made the price, but the general opinion seems to be that 12¢ will be the figure. In fact, Lake for June delivery has been offered to manufacturers at 12 cents. It is possible that some compromise measure, paying a rebate of 3½ cents for the copper delivered during the last two months, will be arranged. The manufacturers will certainly be slow to contract for any length of time for any quantities at any price fixed upon by agreement. They have not got any faith in the whole undertaking and will act accordingly. For May and possibly June they must and will buy literally, but they will let other people carry stock and will keep the quantity of metal in their mills down to the lowest notch. As a speculation 12¢ copper is certainly not a tempting commodity. Casting brands have meanwhile been sold at 11½¢ @ to 11¼¢. London gave way from £39.15/ to £39 yesterday since our last report, with but little doing.

**Tin.**—London has been quite active and a little higher; opening at £91, spot, a week ago, it closed yesterday at £91. 2/6, while futures improved from £91.15/ to £92; sales 1000 tons, all told. In this market 10 tons May were at first placed at 20.60¢, subsequently 80 tons at 20¢ @ 20.25¢, and 80 at 20.70¢ @ 20.75¢; 40 June at 20.40¢ @ 20.60¢, and 25 tons August at 20.65¢, in accordance with the momentary London fluctuations, which somewhat unsettled the market. Messrs. Gilfillan, Wood & Co., Singapore, in their report of April 9, remark: "The supply during the next six weeks will be on a reduced scale, and it is estimated that the year's production will not be over the average." The closing quotation for Tin on the spot is 20½¢ @ 21¢. **Tin-Plates.**—Have been quiet and unaltered, both here and in Liverpool. During the first quarter the total shipments from England were 110,017 tons, against 87,591 in 1888 and 77,559 in 1887; the export this way was respectively 87,286, against 68,347 and 58,058. We quote, large lines, ordinary brands, ½ box: Siemens-Martin Steel, Charcoal finish, \$4.80 @ \$5.50; Coke finish, \$4.60 @ \$4.70; Terns, \$4.12 @ \$4.30; Coke Tins, \$4.25 @ \$4.35, and Wasters \$4.12½ @ \$4.15.

**Lead.**—While the Treasury has the Mexican Ore question under consideration, no further sales of Common Domestic to consumers have transpired in this market to speak of, the quotation at the close being 3.80¢ @ 3.90¢, nominally.

**Spelter.**—A much better feeling and more doing locally can be reported, hence

we have now to quote Common Domestic 4.80¢ @ 4.85¢, below which figure nothing can be had, while with the rise in Europe Silesian cannot be sold for less than 5½¢.

**Antimony.**—While the demand has remained moderate, prices have gone on stiffening in response to the higher London ruling, so that we can now quote Hallett's 12½¢ @ 12½¢, and Cookson's 13½¢ @ 13½¢.

The annual report of the Rio Tinto Mining Company has just reached us. The company have a share capital of £3,250,000, £2,182,140 first mortgage 5% bonds and £1,127,180 second mortgage 5% bonds. The gross earnings, including balance of £27,269, were £1,142,778. The net earnings were £754,706. An interim dividend of £325,000 was paid during the year, and a further dividend of £227,500 is recommended, making £552,500, or 17% on the par value of the stock, carrying to revenue account a balance of £202,206. The total quantity of Ore mined was 1,403,638 tons, against 1,182,438 tons in 1887, the average Copper contents being respectively 3.049% and 2.949%. The product at the mines was 18,522 tons of 21 cwt. in 1888, against 17,813 tons in 1887. The quantity brought to market was 17,945 tons, in addition to 7830 tons contained in the Pyrites delivered, making a total of 25,325 tons. The report adds: "The Copper stocks, chiefly in Matte and Precipitate, at Huelva and Cwm Avon carried over at cost price amount to 4600 tons." These figures are interesting, in view of the statement made that the Rio Tinto had delivered more than they were entitled to and had pushed production to the utmost by smelting a good deal of Ore in Spain in blast-furnaces.

#### New York Metal Exchange.

The following sales are reported:

THURSDAY, May 9.	
10 tons Tin, May.....	20.25¢
16 tons Lead, June.....	3.92½¢
100 tons Lead, June.....	3.90¢
10 tons Tin, June.....	20.40¢
20 tons Tin, June.....	20.50¢
10 tons Tin, June.....	20.60¢
FRIDAY, May 10.	
20 tons Tin, May.....	20.70¢
10 tons Tin, May.....	20.75¢
16 tons Lead, September.....	3.95¢
25 tons Tin, August.....	20.65¢
TUESDAY, May 14.	
10 tons Tin, May.....	20.60¢
28,000 lb G. M. Copper, May.....	11.05¢
28,000 lb G. M. Copper, May.....	11.00¢
WEDNESDAY, May 15.	
10 tons Tin, spot.....	20.70¢

### British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]

LONDON, WEDNESDAY, May 15, 1889.

Prices for Chili Bars and Good Merchant Copper advanced on the strength of demand to cover "short" warrants, and reacted on subsequent free selling by agents of the leading mines. Sellers still ask comparatively high prices, which are paid, for special sorts. The Anaconda company has sold 1500 tons Matte at 8/. It is understood that a promise has been obtained from some of the mining companies to reduce their output and allow warrant-holders to share in supplying the trade demand. There is no truth, however, in the statement that holders and producers have entered into an agreement to regulate prices. Negotiations to that end have been dropped since the American delegates sailed.

In a report by the president of the French bank the statement was made that the institution had advanced at the rate of £48 per ton on 1225 tons of Copper. The Mason & Barry Company announce a dividend of 9/ per share, and the report of the company shows that £42,000, the amount owing by the Société des Métaux on two shipments, has been carried forward. The Rio Tinto Company announces a dividend of 14/.

The Block-Tin market has been supported the last few days by purchases for America, and it is stated that there are still a number of orders here unexecuted. Otherwise speculation has been slow, but more purchasing has stiffened prices to £92. 15/ for prompts.

Buyers of Tin-Plate are still waiting for easier prices. The market is overloaded with ordinary grade Coke, but Bessemer and Siemens Cokes are active at an average of 13/9, and, being well booked ahead, makers are very firm. There are now over 375,000 boxes of Plates, all kinds, at shipping ports, or 135,000 boxes more than was on hand at the corresponding period last year.

The strikes in Germany have had some influence upon the Pig-Iron market, it being thought that, should the troubles continue, stock will be taken from Connal's stores to meet the shortage of supplies. This has led to more speculative buying and higher prices for warrants. Very little change has taken place in prices for makers' brands of Scotch, in Hematites or in Cleveland Pig.

In nearly all branches of the Manufactured Iron and Steel trades business continues brisk and prices are strong. Staffordshire Steel-makers have thus far advanced their prices 12/6, bringing the figures for heavy sections up to within 5/ of the price proposed to be fixed by the promoters of the syndicate.

**Scotch Pig.**—There has been a very fair business with but little change in prices:

No. 1 Coltness, f.o.b. Glasgow.....	55/6
No. 1 Summerlee, " ".....	54/3
No. 1 Gartsherrie, " ".....	52/6
No. 1 Langloan, " ".....	54/
No. 1 Carnbroe, " ".....	47/3
No. 1 Shotts, " at Leith.....	58/8
No. 1 Glengarnock, " Ardrossan.....	51/6
No. 1 Dalmellington, " ".....	48/
No. 1 Eglinton, " ".....	44/

Steamer freights, Glasgow to New York, 2/6; Liverpool to New York, 10/.

**Cleveland Pig.**—The market without important change; business fair. No. 3 Middlesborough, G.M.B., quoted 39/ prompt.

**Bessemer Pig.**—A quite active business doing and the market strong. West Coast brands, mixed numbers, 49/ @ 49/6, f.o.b. shipping point.

**Spiegeleisen.**—There continues to be a brisk demand and prices are strong. English 20% quoted 82/6, f.o.b. at N. W. England shipping point.

**Steel Rails.**—The decline of last week has been recovered and demand is brisk. Heavy sections quoted at £4. 12/6, and light sections £4. 17/6 @ £5, f.o.b. at N. W. England shipping point.

**Steel Blooms.**—A good demand for these, and prices firm. We quote £4. 2/6 for 7 x 7, f.o.b. at N. W. England shipping point.

**Steel Billets.**—There is still a good trade at firm prices. Bessemer, 2½ x 2½ inch, £4. 10/, f.o.b. at N. W. England shipping point.

**Steel Slabs.**—Transactions moderate, but prices held firmly. Bessemer, £4. 2/6, f.o.b. at N. W. England shipping point.

**Old Rails.**—But little doing in these and former prices asked. Tees quoted at £3. 5/ @ £3. 7/6, and Double Heads, £3. 12/6, c.i.f., New York.

**Scrap-Iron.**—A moderate business at about former prices. Heavy Wrought-quoted at £2. 2/6 @ £2. 5/, f.o.b.

**Crop Ends.**—The demand moderate and prices unchanged. Bessemer quoted £2. 10/ @ £2. 12/6, f.o.b.

**Tin-Plate.**—Trade rather slow and prices barely steady. We quote, f.o.b. Liverpool:

IC Charcoal, Allaway grade.....	15/3 @ 15/6
IC Bessemer Steel, Coke finish.....	13/8 @ 13/9
IC Siemens.....	14/ @ 14/3
IC Coke, B. V. grade.....	13/ @ 13/3
Charcoal Terne, Dean grade.....	12/ @ 12/6

**Manufactured Iron.**—The market less active than last week, but still a good business doing at steady prices. We quote, f.o.b. Liverpool:

	£	s.	d.	£	s.	d.
Staff. Marked Bars.....	8	5	0			
Common.....	6	0	0			
Staff. Bk Sheet, singles.....	7	15	0			
Welsh Bars (f.o.b. Wales).....	5	5	0	5	7	8

**Copper.**—A fairly active movement. Prices somewhat irregular. To-day's prices for Bars were £38. 15/ @ £39, spot; £38. 15/ @ £38. 17/6, three months' futures. Best selected, £44.

**Tin.**—Business quite brisk and the market firm. Straits quoted at £92. 12/6 @ £92. 17/6, spot, and £93. 5/ @ £93. 10/ for three months' futures.

**Lead.**—Trading smaller, but prices very steady. Quoted £12. 12/6 for Soft Spanish.

**Spelter.**—Dealings continue lively and prices are stronger. Quoted at £17. 15/ @ £17. 17/6 for ordinary Silesian.

### Foreign Markets.

#### EAST INDIES.

PENANG, April 2, 1889. — **Tin.**—Receipts sum up 7400 piculs for the fortnight. Europeans bought 5000 piculs and Chinese 5600. The market gave way from \$35.80 per picul to \$35.65, but winds up at \$36.41, \$36.75 having been paid by Chinamen yesterday.—Schmidt, Kustermann & Co.

#### SPAIN.

BILBAO, April 27, 1889. — **Iron Ore.**—Sales for the week have been restricted to a few cargoes Rubio at 7/ @ 7/2. Campanil, always in short supply, may be quoted nominally 8/4 @ 8/8. There being plenty of steamers, shipments have been quite lively. Since January 1 they amounted to 1,310,958 tons, against 1,260,645 in 1888. **Pig-Iron** has been in active request for domestic use, 1146 tons being shipped coastwise and nothing abroad. Spain's metal exportation during the first two months has been as follows:

	1887.	1888.	1889.
Tons.	Tons.	Tons.	Tons.
Calamine.....	3,160	2,576	2,313
Pyrites.....	128,200	113,569	180,156
Iron Ore.....	845,009	802,869	816,528
Pig-Iron.....	19,606	5,128	10,433
Precipitate.....	4,914	3,344	3,811
Quicksilver.....	228	115	750
Pig-Lead.....	24,368	23,261	22,648

Totals.....1,025,385 950,663 1,086,648  
The increase in Quicksilver exportation will be noticed.—*Bilbao Marítimo y Comercial.*

#### BELGIUM.

BRUSSELS, May 4, 1889. — **Iron.**—The Belgian Iron market remains firm. The demand for Beams has fallen off, but this is hardly perceptible, makers being busy on old orders; ere these are about delivered a revival is likely. **Pig-Iron** remains stiff; Luxembourg No. 5 Foundry sells with ease at 5.10 @ 5.20 francs per 100 kg., Charleroi at 6.50, and Steel Rails may be quoted at 6.75. The stock of **Pig-Iron** is on the increase; the export demand is slack. Sheets and Plates are scarce, and orders are declined by makers. The structural iron works are very busy.—*Moniteur des Intérêts Matériels.*

## Hardware.

Business in several lines shows an increased activity, and on the whole the volume is fair. While there is more or less complaint in regard to the season's trade, it appears that the amount of goods sold compares well with that of the corresponding time last year; but the profits for manufacturers are less, and jobbers in many cases complain of narrow margins on account of the vigor of existing competition. Prices are without important change, but are not characterized by much strength. Collections are rather slow.

### Wire Nails.

The market is without important change, the leading mills being pretty well occupied with orders. Prices are low, and to some extent irregular. A moderate business is doing from store on the basis of \$2.55 to \$2.65.

### Barb Wire.

The market is in a good condition, and while prices remain without change, they are characterized by a good tone. An excellent business is being done by the Eastern manufacturers, who find some difficulty in obtaining Wire as promptly as needed for their orders. Quotations are on the basis of 3.5 cents for carload lots, 3.6 for 3-ton lots and 3.8 cents for small lots, with the usual deliveries.

The Kelly Barb Wire Company and the Western Fence Company have removed their offices to their works at Deering, in the suburbs of Chicago.

### Cut Nails.

The volume of business done in the New York Nail market continues quite satisfactory, but prices are still low, our quotations remaining \$1.80 @ \$1.85 for carload lots on dock.

It is quite generally conceded that the much discussed pool of Eastern manufacturers over which so much time and labor have been spent is dead. It is stated that the refusal of three of the Upper Susquehanna mills to sign killed it.

The regular monthly meeting of the Western Cut Nail Association was held at Wheeling, W. Va., on Wednesday, the 8th inst. The following firms were represented:

LA BELLE IRON WORKS, Wheeling, W. Va.  
RIVERSIDE IRON WORKS, Wheeling, W. Va.  
JUNCTION IRON COMPANY, Mingo Junction, Ohio.  
WHEELING IRON AND NAIL COMPANY, Wheeling, W. Va.  
LAUGHLIN NAIL COMPANY, Wheeling, W. Va.  
BENWOOD IRON WORKS, Wheeling, W. Va.  
BELMONT NAIL COMPANY, Wheeling, W. Va.  
SPAULDING IRON COMPANY, Brilliant, Ohio.  
JEFFERSON IRON WORKS, Steubenville, Ohio.  
BELLAIRE NAIL WORKS, Bellaire, Ohio.  
KING, GILBERT & WARNER, Columbus, Ohio.

Nothing but routine business was transacted. Reports from the members showed that there has been no improvement either in the demand or prices for Cut Nails, and future prospects are not encouraging. It was thought that the recent cut made in nailers' wages by the Bellaire Nail Works would be brought up for discussion, but it was not. No date was set for the next meeting.

### Miscellaneous Prices.

In the paragraph in our last issue relating to the prices of Thomas Laughlin & Son, Portland, Me., a misleading error occurred by which, through the substitution of *and* for *for*, Tackle Blocks, as well as Iron Sheaves, were quoted at discount 70 per cent. The correct statement would have

been that Iron Sheaves *for* Tackle Blocks are quoted from the manufacturers' standard list at the discounts named—that is, Common at 70 per cent., and Patent at 60 per cent. The trade will please note the correction, as Tackle Blocks are not selling at any such price, and in fact are quite firm and in good shape.

The American Brass Kettle Manufacturers, for whom O. W. Graves is agent, 21 Cliff street, New York, are putting on the market this season a line of Brass Kettles *tinned inside*. This is done to meet the demand for such goods, in the use of which there will be no danger of the food being contaminated by its contact with the brass, thus adapting them to more general use and commending them in an especial degree. The Brass Kettles thus tinned inside are made in sizes from 8 to 17 inches, and are sold at an advance of 2½ cents per pound over the regular goods, the prices for the season being 24 cents for the regular goods and 26½ cents for the inside tinned. It is expected that there will be a large demand for these new goods.

The prices of Picks, Mattocks, &c., under the recent arrangement made between the manufacturers are steady and firm, and a satisfactory trade is being done.

There is more or less complaint of irregularity in the prices of Carriage Bolts, and there is some evidence that in one way or another the combination terms are departed from, but in general the arrangement is working pretty satisfactorily, and it is hoped that these irregularities will be corrected.

The Chain market is without material alteration, but it is noticeable that there is a slight tendency toward lower prices. More or less irregularity exists in the prices named by different manufacturers, and some of the leading makers have recently made offers at concessions from prices heretofore prevailing. Existing quotations are recognized as low and some of the manufacturers who are not as completely equipped as the others have some difficulty in meeting the market.

A good business has been done the past spring in Wire Mats, but there are indications that this line of manufacture is becoming somewhat overdone, owing to the number of manufacturers who have entered the field and the extent of their facilities.

In sympathy with the Copper market lower prices are named on Copper Rivets and Burrs, and it is expected that other goods into which Copper enters as an important material will be to a greater or less extent affected by the decline in Copper. Several lines, however, did not follow Copper in its advance and will probably not be materially changed by the reduction in its price.

Some manufacturers are offering Files at lower prices than prevailed a month ago, and this line of goods as a whole is not characterized by much strength. The manufacturers who occupy the first place in regard to quality are able to obtain considerably better prices than others the reputation of whose goods is not so assured.

The Echo Pistol, made by the Hamblin & Russell Mfg. Company, Worcester, Mass., and illustrated on page 757, is put up one dozen in a box, three gross in a case, and is sold to the trade generally at \$10.50 per gross.

### Trade.

From a special correspondent we have the following advices in regard to the condition of business in Northern Illinois:

Trade through Northern Illinois is good for those who do the most business, while the smaller dealers are complaining of things being

dull. The extremely dry weather has caused a feeling of fear that the crops would seriously suffer, and parties interested in grain and cereals have watched the weather reports from day to day with as much interest as if they were infallible. While rain and local showers have been predicted, dryness has been the result. It is surprising, however, how much dry weather crops will stand when properly put in. During the past day or so, however, some slight showers have relieved the anxiety, and we trust a continuance of these will improve every one's temper. The retail trade is very busy, selling and delivering Gasoline Stoves and Refrigerators, which the extremely warm weather of the past two weeks has created a demand for. In fact, some of the merchants are complaining of overwork in this direction. Modern civilization has created a demand for this class of goods of which our relatives of 50 years ago had no conception. We wonder how, without Screen Doors and Windows, Gasoline or Oil Stoves, Refrigerators or ice, with 10 or 15 children, the grand old hard-working housewife got along at all.

From Salt Lake City, Utah, we have the following advices, which give information in regard to the condition of things in that city and Territory:

The condition of business in general is fairly good. Have recently had fine rains, which have materially improved the growing crops, and the condition of business has correspondingly bettered. Hardware is in good demand. Stocks are full and quite complete and as large as usual. Prices generally are good. The prospects for trade during the next few months are good. Considerable immigration is coming to the Territory from Eastern States. Our best mining camps are producing largely, and some new mines recently opened are turning out well. Prospects for building in this city and principal towns in the Territory are very good, and there will be more building than usual. We have a large amount of good farming lands in this Territory and good crops materially improve general business. The outlook now is rather favorable for moderately good crops. Collections are rather slow in most localities, but as the wool crop will soon be marketed they will doubtless much improve within a few weeks.

From a wholesale Hardware house in Georgia we have the following review of the business during the past 12 months:

Our year's business (1888-89) is fast nearing its close. It will find us highly satisfied with its results, and we are of the opinion that the Hardware trade throughout the State has been very satisfactory. While prices have been quite low on the majority of lines of goods, still the volume of business is very much larger and the prospects are very flattering for a continuance of fair trade even until fall business opens, which is early in July. With us, like many other sections of the South, the building season promises to be one of great activity. There is not an idle mechanic in the city, and not a house under contract but what an occupant only awaits its completion. To be sure, the prosperity of an agricultural country depends on the success of the farmers. Blessed with fairly good crops last year and already under the most favorable circumstances for planting, they have launched out again in good spirits, hoping for another good yield. Under the circumstances we had good collections.

### Hardware in Texas.

From the voluminous reports received from our subscribers in all parts of Texas we are enabled to give a general view of the condition of the Hardware business in that State, with a special reference to its course since the first of the year, and the opinion of merchants in regard to the outlook for future business. It is to be noted with gratification that the tenor of the reports received both from the large and small trade is almost uniformly cheerful, the business for the past four months having been in nearly all sections good, and in many cases exceeding in volume that of last year, and in several instances being better than any recent year. At the present time trade is, as usual at this season, comparatively quiet, business holding off until the crops are harvested. The prospects for the crops are uniformly referred to as good at the time of writing, the indications pointing to large harvests, though of course at this time it is impossible to predict with confidence in regard to the outcome. At the present time there is some complaint in regard to collections,

but they have been fairly good during the past season, and are referred to by several of our correspondents as having been exceptionally satisfactory. On the whole the prospects for trade throughout the State are excellent, and the year promises to be, as it has begun, eminently satisfactory. In regard to the central portion of the State we have from one of our correspondents the following advice, which agree with others which we have received:

During the past winter Central Texas (the black, waxy land section) had long-continued rains which thoroughly saturated the earth, started all the springs and filled all the streams, and these rains we count as the foundation for a good crop in every line the coming season, as good full crops can now be made with comparatively light rains during the summer. The acreage in oats and wheat is fully up to the average. The grain now looks well and is beginning to stalk. The corn is all up with a good stand in most localities and full acreage. The cotton acreage will be increased 5 to 10 per cent. Much of the seed is already planted and the ground is in good condition to receive the balance. All considered, our prospects are first-class.

Throughout the State there is good activity in building, and railroad construction in some sections is stimulating business, but in order to give our readers more detailed information of the condition of things in the different parts of the State we make the following abstracts from reports received from some of the principal points:

**AUSTIN.**—Business is considered fair in general, and about 20 per cent. better than during first four months of last year. The condition of Hardware is somewhat better than other branches of mercantile business. Stocks of Hardware are about as usual. Prices are generally lower than heretofore, which, however, is not attributable to any local causes, our rate of profit being pretty near the same as usual. Prospects for trade during the next few months are better than they have been for several years at same period. There will be nothing beyond the usual amount of improvements. The agricultural condition is good and promising, which inspires confidence and stimulates trade. Collections are better than for several years at this time of the year. Impressions received from traveling salesmen as to business are very good, promising a good trade for next fall contingent upon realization of present agricultural prospects. Reflex of Oklahoma excitement, harbor improvements at mouth of Brazos, development of iron industries in East Texas, &c., will probably cause more rapid development and improvement in our State.

**DALLAS.**—Trade for the next few months will be light in the interior, but stocks of Hardware are not too large for the requirements of the trade. During the season business has been good, but is now quiet. In this city there will be a good deal of building. The agricultural conditions are promising, but trade will be light until the fall, when if crops are satisfactory an excellent business will be done. An increase in immigration is noted, promising well for future business.

**HOUSTON.**—The outlook was never better at this time of the year in our section of the country. We believe that our Hardware merchants are doing a very fair business and are in a thrifty condition. Our merchants are well stocked, as largely as at any time for this season of the year. Prices are well maintained in all lines. We have prospects of a splendid business year. Prospects for building are good. Agricultural conditions are very promising in all sections of our State. Collections are good for this time of year. Traveling salesmen report good business. The prospects are good, and we feel confident of splendid developments in the Southwest.

**SAN ANTONIO.**—General business is very good, as is also Hardware, but it is expected that there will be an improvement in May. Stocks are large in this city and prices have a downward tendency. The prospects for building are excellent, about 80 buildings being in construction, and it is expected that others will be started soon. The prospect for crops is good, and altogether the outlook for business is promising.

**WACO.**—Hardware is more overdone than other lines and the conditions may be regarded as less favorable in Hardware than in general business. I am under the opinion, which is based on my own observation and the testimony of intelligent traveling men, that Waco has better stocks of Hardware than any other city in the United States not more populous and that has no more territory tributary to it. The

general tone of the market is still weak, suffering from congestion caused by chronic overproduction. I look for a turn of the tide before the year is out. The well-known dull period usual at this time of the year in most cotton-growing countries is very apt to be with us at least until August, and longer if the crop prospects should be unfavorable then. The prospects for building are not good, as we have more storehouses now than are likely to be needed in two years, and plenty of dwelling-houses for present wants, and farmers are mostly financially unable to attempt any improvement this summer. Prospects for a good crop were never better at this time of the year than they are now, but a prudent buyer never buys on crop prospects in Texas, for "there is many a slip 'twixt the cup and the lip." Considering past crop failures collections are reasonably good at present. A dull trade is expected until the crops are assured and a brisk trade afterward. The railroads are discriminating strongly in favor of the water points and against the interior cities. If this discrimination is continued for five years almost the entire jobbing business will be driven away from the interior of Texas to the shores of the Gulf and the banks of the Mississippi River.

**WEATHERSFORD.**—Business is brisk in farming implements, but Builders' Hardware rather quiet. Building is fair, more or less going on all the while. The agricultural conditions very encouraging and wheat and oats look well, with a fair acreage. Large crops of cotton and corn planted. Stock interest is rather flat. A fair prospect for trade.

#### Items.

We have received from the Gilbert & Bennett Mfg. Company, 148 Lake street, Chicago, a copy of their catalogue No. 110, which has just been issued. It consists of 80 pages of illustrations and descriptive matter, covering an immense variety of Wire Goods, Wire-work, Wire Cloth, Netting, Fencing, &c. The goods shown embrace Tools, Domestic Implements, Ornamental Wire-work, and all kinds of ingenious devices into which Wire is capable of being formed. It is only by glancing through such a catalogue as this that a true conception is obtained of the important part now occupied in the industrial world by Wire. Full price-lists are printed in connection with the several articles. A complete alphabetical index is an important and very useful feature of the catalogue.

**E. Bement & Sons, Lansing, Mich.,** issue a circular relating to patents on Harrows controlled by them, and refer to J. M. Childs & Co., Utica, and A. W. Stevens & Son, Auburn, N. Y., as the only concerns authorized to manufacture under their patents.

A recent issue of *Health* has an article entitled "A Good Filter," in which a description is given of the Filter manufactured by the Gate City Stone Filter Company, 46 Murray street, New York. It also emphasizes the importance of filtering water in order to remove impurities.

**W. R. Baker Mfg. Company, Watertown, N. Y.,** have issued a neat catalogue of nearly 100 pages, showing the line of Hardware specialties which they manufacture, together with a general line of Trimmings and Hardware for canoes, pleasure boats and yachts, inside and outside Brass Fixtures for banks, offices and residences. It will be remembered that this company succeed W. R. Baker & Son, and in the circular to the trade it is stated that the change gives them considerable additional capital, and enables them to enlarge their plant and increase their manufacturing facilities. Additions to their present three-story building are in course of construction. It is intimated that in addition to their regular line of Boating Hardware, their factory will be equipped for the manufacture of Hardware specialties of every description, and that they will add various other goods.

**Brewer Bros., Philadelphia, Pa.,** have issued a new catalogue which is exceptionally complete in its representation of Wrought Goods, of which a large variety

is shown with illustrations and list prices. In addition to the more common line of Hooks, Staples, Meat, Awning and other Hooks, a variety of Mirror Hooks, Stay Nails, Hitching Hooks and Rings, to drive, screw or lead in, Sign Hooks, Nail Drags, Corner Braces, Mending Plates, and many other goods are shown. The catalogue is neatly printed, and will be found very convenient.

The motion made recently in the United States Circuit Court in behalf of the Enterprise Mfg. Company for a preliminary injunction to restrain Peter Deissler from manufacturing and John Wanamaker from selling a meat-cutting machine, alleged to be an infringement of the plaintiff's rights under a patent, was disposed of by Judge Butler, May 10. The writ was refused for the present, the court giving the defendants the option to either enter security and render an accounting of profits from the present time until the matter came to final hearing or have the preliminary injunction granted. An order was directed to be entered in accordance with this decision.

**Sidney Shepard & Co., Buffalo, N. Y.,** have issued a new catalogue of nearly 200 pages, which represents the line of goods manufactured and for sale by them. A full-page illustration is given of their handsome store and views also of their works. The extent and variety of the manufactures of the house is indicated in the fact that 183 pages are devoted to their representation, including a large assortment of Tin-Ware with many interesting specialties, and such other goods as Dripping and Fry Pans, Bath-Tubs, Kettle Spouts, Handles, Ears, &c., Dampers, Damper-Clips, Stove-Boards, Japanned Ware, Mincing-Knives, &c. An interesting variety of house-furnishing goods, including Refrigerators, Bird-Cages, Wringers, Stove-Polish, &c., are shown, and a line of Tinmen's Tools and Machines. The extent of their line of Tinner's Supplies is to be especially noted. Many of the specialties shown in this catalogue are also widely known, and among them may be mentioned Bread-Raising Pans, Gem or Muffin Pans, Buffalo Drinking-Cups, Oblong Dinner-Pails, Buffalo Family Oil-Cans, Sieves, Egg-Beaters, Milk-Cans and Fixtures, the Shaker Flour-Sifters, and Grocers', Druggists' and Spice Dealers' Tin-Ware. Owing to the weight of the catalogues they will not be sent by mail, but it is stated that they will take pleasure in packing a copy of the same with the first order received from their customers. The list is accompanied by a revised list of prices of Pieced Tin-Ware, in which a general reduction is noted.

Announcement is made by **Aquila Rich, 84 William street, New York,** that having withdrawn from the firm of C. T. Reynolds & Co., with whom he has been identified for the past 30 years, he has formed the Aquila Rich Paint and Color Company for the purpose of continuing the manufacture, importation and sale of Dry Colors, Paints in Oil and Japan, Varnishes and Artists' Materials.

The **Chapman Mfg. Company, Meriden, Conn.,** in addition to their old lines, Saddlery Hardware and Sleigh Bells, have recently begun the manufacture of Dog-Collars, of which they have a number of new styles. They state that in connection with the other branches of their business they are enabled to produce Dog-Collars at exceptionally low cost. An addition to their factory is in process of erection, designed especially to accommodate the Dog-Collar department.

**Albert Geiger, 6 Oliver street, Boston, Mass.,** calls attention to a valuable business property in his advertisement on page 49. It includes the machinery and tools, with buildings, lands and leasehold, formerly

occupied by Welch & Griffith. The property is situated on Grove street, in Arlington, Mass., and is referred to as well adapted for manufacturing purposes, having both steam and water power.

The Canton Saw Company, Canton, Ohio, issue neat colored lithographs calling attention to Class' See-Saw and Merry-Go-Round, which they are manufacturing. It is made in two sizes, one intended for the lawn and the other for the parlor or nursery.

A recent number of the *Evening News*, Detroit, Mich., contains a portrait of L. W. Sprague, senior member of the firm of Sprague Bros., well-known Hardware merchants, Greenville, Mich., and gives a sketch of his life, with reference to some of the qualities which have given him the prominent position he occupies.

Farwell, Ozmun, Kirk & Co., St. Paul, Minn., have issued a Hardware catalogue which will rank with the largest and most complete. It consists of 1120 large pages, which are well occupied in the display of a very extensive line of Hardware and related goods. The extent of the assortment is indicated by the fact that the first department of the catalogue is devoted to Mechanics', Lumbering and Tanners' Tools, in the display of which 280 pages are occupied. Builders' Hardware follows, covering Locks, Padlocks, Butts, Hinges, Bolts, Door-Bells, &c., Drawer-Pulls, Coat and Hat Hooks, Screws, Wire Nails, &c., in the display of which 342 pages are employed. The next section covers Miscellaneous Hardware, including such goods as Bolts, Rivets, Tacks, Horse Nails, Saddlery and Wagon Hardware, Whips, Chains, Brushes, Shovels, Steel Goods, Lawn Mowers, Scales, Bells and many others, this section ending with page 758. The remainder of the catalogue is devoted to the following departments: Sporting Goods, Fishing Tackle, Pocket and Table Cutlery, Carvers, Plated-Ware, &c., Granite Iron-Ware, Tin-Ware and House-Furnishing Goods, Indurated Fiber-Ware, Wooden-Ware, &c., Tanners' Trimmings. It will thus be seen that the arrangement is systematic and convenient. The index is also exceptionally complete, every compound word being indexed by both letters, making it easy to find an article under either heading. The manner in which the different goods are arranged with a view to economy of space, effectiveness of display and convenience of reference, as well as the arrangement of the catalogue as a whole, reflects credit on A. E. Allen, by whom the volume has been compiled, while the extent of the book and the large and varied line represented in it indicate the enterprise of the company and the important position occupied by them in the trade. The printing, electrotyping and binding, all of which are very satisfactory, were done by the Pioneer Press Company, of St. Paul, and a large part of the wood engraving by the Art Engraving Company, of that city.

The Allendale Lock Company, Lancaster, Pa., have issued an illustrated and descriptive catalogue, showing their recent improvements in Scandinavian Padlocks, and giving a full description of their new Padlock with patent tumbler, of which we recently gave a description. A line of Malleable-Iron Padlocks is also shown. The company have discontinued the manufacture of the old-style Red Lock, and state that they will hereafter manufacture only goods of the first quality.

D. G. Gautier & Co. are occupying 114 John street, New York, as a Steel warehouse and carrying a full line of Merchant Steel. They call attention especially to their individual brand of High-Grade Tool Steel, which is controlled solely by them, and allude to their extra and special grades

as equal to any English brand of Tool Steel made. They will also carry in stock the regular sizes of Machinery Steel, Spring Steel, Toe-Calk Steel, Tire Steel and Cold-Rolled Shafting manufactured by the Gautier Steel Department of Cambria Iron Company. They also allude to their arrangements for furnishing Die-Blocks, Steel Forgings and other shapes and grades of Steel not usually carried in stock.

The suit brought by the Chas. F. Henis Company, Philadelphia, against Paine, Diehl & Co., of that city, for infringement of patents on the Henis Press and Vegetable Strainer has been decided in favor of the plaintiffs and an injunction granted.

### Merchandise Brokers in Southern California.

Southern California, with its development and its increased importance as a mercantile field, is showing a disposition to assert itself, and claims more consideration in trade matters than it has heretofore received. One grievance of which they complain is the establishment of agencies for the Pacific Coast with headquarters at San Francisco, making the point that Southern California, having so important a trade center as Los Angeles, should receive more consideration and have agencies established there. On this point a recent issue of the *Commercial Bulletin* of Los Angeles says:

It is high time that the merchandise brokers of Los Angeles arose and made vigorous protest against the establishment and maintenance of Pacific Coast agencies with headquarters in San Francisco. Before going further we wish it understood that the following remarks are intended to apply only to parties doing a brokerage business, and are not intended for wholesale grocers or jobbers, who, although "agents" for large manufacturing firms, purchase their goods. We consider that these parties are not included in the category. If Eastern manufacturers and importers could be induced to realize the fact that the Pacific Coast embraces a stretch of country equal in extent to the area from Pensacola to Maine and from New York to Chicago, and that California, Arizona, Nevada, Montana, Oregon and Washington Territory cannot be compressed into the space occupied by the New England States, they would or should at once come to the conclusion that one general agent for this enormous empire is altogether insufficient to cover the field as it should be. Before Southern California attained the prominence and population it now possesses a Pacific Coast agent in San Francisco (500 miles away) was sufficient, but now it is an altogether different proposition.

Many of these Pacific Coast agencies were abolished when investigation revealed that Southern California has become a populous, busy section, and that Arizona was developing a market for Southern California's products. Investigation also brought to light the fact that Los Angeles was a teeming distributive point of nearly 100,000 inhabitants, and that the "Pacific Coast agents" in San Francisco depended on sub-agents in Los Angeles for the sale of their goods. Having to divide their commissions with the San Francisco men, a feeling of discontent very naturally arises among local brokers, and the attention which is necessary to insure success is lacking. If Eastern parties manufacturing, wholesaling or jobbing special lines of goods wish to obtain a market in Southern California and Arizona they must establish agencies in Los Angeles, covering that field, and not depend on the half-hearted half-paid work which is being performed under existing circumstances.

### Binder Twine.

The feasibility of manufacturing Binder Twine in the prisons of Illinois has been receiving consideration, and we give below an extract from the report of the Com-

missioners of the Southern Illinois Penitentiary, which was recently submitted to the Legislature. After referring to the factories in that State and the manner in which their information was obtained, the commissioners say:

We find that the present market price of Sisal Grass is about 11 cents; Manilla, from 13 to 14 cents per pound. These are combined in about equal parts in the manufacture of Binding Twine, making the cost of the raw material for this class of Twine about 12½ cents per pound. Hemp is somewhat cheaper. Whether this price is produced by the Twine Trust or by the increased demand, or both, we are unable to ascertain. The machinery for manufacturing the Twine is complicated and expensive, being covered by patents and manufactured by but one or two firms in the United States. In fact, the factory at Champaign is now putting in some improved machinery manufactured in Europe. Manufacturers offered to furnish us machinery on the cars in New York for about \$7000 for each ton of producing capacity per day. That is to say, the machinery for a factory that would turn out 10 tons of Twine per day, or 3000 tons per annum, and to give employment to 50 prisoners, would cost, delivered in Illinois, \$70,000, plus the freight. It is estimated that there was used in Illinois more than twice this amount of Twine last year. From the above it would seem that a factory containing machinery costing \$150,000, and employing 125 convicts, ought to very nearly, or quite, supply the demand for Binding Twine for Illinois. As to the feasibility of starting such a factory in one of the prisons of this State, we do not doubt it can be done. But nothing can be accomplished in time for the present season. Machinery must be manufactured to order. It is not kept in stock. Factory buildings must be erected, steam-power must be supplied, raw material must be purchased, skilled mechanics must be found and employed, convicts must be taught the use of the complicated and delicate machinery. All this takes time and money, as any other manufacturing industry does. If the prisons of our State can, consistently with our amended Constitution, be employed at any remunerative labor we do not see why this is not a valuable field toward which to direct that labor. It is true it can only give employment to a few of the many that will soon be out of employment, but, so far as it goes, it will probably conflict less with the skilled mechanics of the State than any other manufacturing industry that can be carried on by the convicts, and if it will so employ them and at the same time grant any relief to our heavily-burdened agricultural interests it is certainly worthy of a trial.

### Exports.

BY BARK SVANEN, APRIL 22, 1889, FOR PORT NATAL, SOUTH AFRICA.

By Arkell & Douglas.—3 dozen Meat Cutters, 2200 pounds Fence Wire, 6600 pounds Fence Wire, 6600 pounds Fence Wire, ¼ dozen Churns, 3 dozen Axes, 2 cases Hardware, 2 dozen Scythes, 15 crates Washers, 8 dozen Axes, 9 cases Agricultural Implements, 102 cases Agricultural Implements, 75 reels Barb Wire, 30 cases Agricultural Implements, 26 dozen Handles, 1 case Lampware, 1 dozen Scales, 24 dozen Brooms, 1 case Hardware, ¼ dozen Saws, ¼ dozen Carriages, 4 cases Meat Cutters, 2 cases Axes, 12 dozen Washboards, 1 dozen Rolling-Pins, 10 boxes Clothes-Pins, 1 case Broom Handles, 12 dozen Pails.

FOR DELAGO BAY.

By Arkell & Douglas.—500 pounds Barb Wire, 200 pounds Staples, 120 dozen Axes, 5 kegs Nails, 230 dozen Handles, 9 cases Agricultural Implements, 1 bundle Sash Cord, 2200 pounds Sash Weights, 100 dozen Picks.

PER BARK ANNA, APRIL 22, 1889, FOR PORT NATAL, SOUTH AFRICA.

By R. W. Forbes & Son.—30 cases Scales, 4 barrels Hardware, 6 cases Perambulators, 10 boxes Clocks, 16 boxes Axes, 410 dozen Axes, 4 dozen Brushes, 1 case Toys.

By Marcial & Co.—2 dozen Steel Rakes, 14 packages Washing and Wringing Machinery.

By Corner Bros. & Co.—53 cases Tools, 19 packages Hardware, 133 cases Agricultural Implements.

BY BRIG PEERLESS, APRIL 25, 1889, FOR EAST LONDON.

By Arkell & Douglas.—75 cases Agricultural Implements, 15 cases Edge Tools, 3 crates Ranges, 3 boxes Tin-Ware, 20 cases Agricultural Implements, 3 cases Fruit Jars, 4 cases Hardware, 1 case Saws, 1 case Nails, 25 cases Agricultural Implements, 5 cases Agricultural Implements, 10 cases Axes, 2 cases Handles, 6 cases Axes, 80 cases Agricultural Implements, 9 cases Scales, 1000 Handles, 25 dozen Brooms, 4 cases Drills, 2 cases Handles, 10 cases Axes, 9 cases Hardware, 8 crates Churns, 1 case Saws, 1 case Drawing-Knives, 22 kegs Nails, 1 box Nails, 81 cases Agricultural Implements, 208 Agricultural Implements, 6000 pounds Sash Weights, 14 crates Ranges.

PER BARK HAWTHORN, APRIL 26, 1889, FOR PORT NATAL, SOUTH AFRICA.

By Woodhouse & Stortz.—5 cases Hardware, 40 dozen Edge Tools, 8 cases Scales.

By Coombs, Crosby & Eddy.—60 dozen Brooms, 2000 pounds Nails, 47,097 pounds Wire, 12 gross Shoe Blacking, 504 Plows, 6 Corn Shellers, 1 Plow, 12 dozen Picks, 20 dozen Axes, 156 dozen Handles, 69 dozen Axes, 46 dozen Axes, 66 dozen Hardware, 5 dozen Tools, 1 set Axes, 20 Pumps, 9 Scales, 4 dozen Hardware, 4 dozen Tools, 24 Washing Machines, 25 dozen Axes, 100 pairs Plow Handles, 130 dozen Tool Handles, 4 dozen Axes, 39 Plows and Parts, 12 Children's Carriages, 28 dozen Edge Tools, 2 Scales, 6 Scales, 30 dozen Brooms, 5600 pounds Wire, 30 dozen Brooms, 9 Churns, 2 dozen Well-Wheels, 30 dozen Hammers, 6 Corn Shellers, 40 Scales, 96 Plows, 950 Plow Parts, 1 Plow, 6 Wringers, 12 Ladders, 30 dozen Axes, 36 Children's Carriages, 6 Meat Saws, 6 Children's Carriages, 50 dozen Hatchets, 8 dozen Picks, 33 dozen Brooms, 2 cases Sash Weights.

PER BARK ANTWERP, APRIL 27, 1889, FOR CAPE TOWN, SOUTH AFRICA.

By Coombs, Crosby & Eddy.—1 Carriage, 14 cases Carriage-Ware, 8 Freezers, 4½ dozen Carpenters' Tools, ½ dozen Stuffers, 6 Churns, 500 Handles, 3 dozen Falls, 2 Tubs, 7 dozen Hardware, 3 dozen Hammers, 9 Carpenters' Tools, 2 Scroll Saws and Lathes, 30 Bird Cages, 3 dozen Traps.

By W. H. Crossman & Brother.—8 packages Hardware, 19 bundles Carriage-Ware, 18 Sewing-Machines, 21 dozen Axes, 1 case Handles, 12½ gross Axle Grease, 5 cases Carriage-Ware, 90 bundles Carriage-Ware, 20 dozen Hatchets, 3 Carriages.

By R. W. Forbes & Son.—1 case Store Trucks, 2 Refrigerators, 1 package Kitchen-Ware, 3 packages Hay-Cutters, 6 dozen Fly-Traps, 3 dozen Grain-Cradles, 5 gross Axle Grease, 4 packages Hardware.

By New Home Sewing-Machine Company.—100 Sewing-Machines.

By Coombs, Crosby & Eddy.—7½ gross Axle Grease.

By H. W. Peabody & Co.—1 case Hardware, 1035 pounds Blacking, 330 packages Harvesting Machinery.

By Arkell & Douglas.—15 cases Fruit Jars, 2 gross Blacking, 3½ gross Axle Grease, 1 gross Traps, 500 Broom Handles, 1 gross Glue.

By Strong & Trowbridge.—6 crates Blacking, 21 cases Axes, 24 cases Axle Grease, 4 cases Brooms, 2 cases Carriages, 1 case Broom Handles, 12 bundles Wash-Boards.

By Leaycraft & Co.—1150 pounds Axle Grease.

By W. B. Fox & Bro.—1660 pounds Brooms, 270 pounds Shoe Blacking, 46 pounds Hardware, 780 pounds Wood Handles.

PER BRIG CURLEW, MAY 7, 1889, FOR PORT NATAL, SOUTH AFRICA.

By W. H. Crossman & Bro.—10,500 pounds Barb Wire, 1 gross Shade Rollers, 9 Meat Choppers, 2 dozen Wood Falls, 6 Scales, 7 packages Lawn Mowers, 500 Handles, 25 dozen Falls, 3 Mangles, 50 cases Clothes-Pins, 45 Pumps, 6 dozen Hammers, 4 boxes Wringers, 15 crates Washers, 32 dozen Tools, 3 dozen Hammers, 1 Scale, 3 dozen Apple Parers, 3 Hay-Cutters, 9 dozen Clocks, 2 2 cases Scales, 50,000 Slate-Pencils, 800 coils Barb Wire, 4 dozen Braces, 2 gross Can-Openers, 3 kegs Nails, 125 cases Plow Parts, 3550 pounds Sash Weights, 75 pounds Cordage, 1 case Hardware.

By H. W. Peabody & Co.—2 gross Blacking, 165 packages Agricultural Implements, 5½ dozen Wringers, 233 packages Hardware, 53 packages Carriage-Ware, 18 cases Clocks, 7 packages Lawn Mowers, 1 case Stamped-Ware, 318 dozen Handles, 1 barrel Blocks, 1 case Step-Ladders, 1 case Bolts, 1000 pounds Nails, 3 crates Fiber-Ware, 8 dozen Stamped-Ware, 4 cases Hardware, 36 cases Agricultural Implements, 33 cases Axes.

## Dressing Show-Windows.

At the present day there is probably no one feature of the retail store which commands more attention than the show-window, for upon its attractiveness depends in a large measure the success of the dealer. In these times every man is making a hard fight for supremacy, and whatever will conduce to this end is eagerly sought by the wide-awake and progressive business man. He realizes that he cannot afford to sleep while his competitor works, and he is therefore constantly on the alert as to what is taking place about him and takes advantage of all information pertaining to his particular line of trade of which he may become possessed. The literature of the subject is not voluminous, but additions are rapidly being made and much that is interesting and valuable is coming out. The following letter from a correspondent of the *American Storekeeper* contains suggestions which are applicable to more than one line of business, and we republish it for the interest it has for retail stove and hardware dealers:

In all well established and regulated retail stores, with pretensions to carrying any classified line of merchandise, a certain degree of attention is, or should be, paid to the art and underlying principles of window dressing, or, in other words, the more stirring class of merchants who pay prompt attention to advertising and to contriving all possible methods of reaching the attention of customers claim show-windows to be one of the great methods.

I think I am correct in saying that the original design of displaying a line of goods by means of large show-windows is often lost and replaced by a less interesting practice of displaying for display alone. That is, showing the complementary colors and not the class of goods that that immediate locality would be at once interested in. It is very nice for one to be sufficiently talented in the art of window dressing to know just how a general assortment of any particular line of goods should be arranged so that they will strike the public eye in one continuous blend of complementary colors and tasteful arrangement, but at the same time the original and underlying idea should not be lost and overlooked, that of showing such goods in your stock as will strike the feminine eye as being the latest styles, or the masculine eye as rare bargains. By thus arranging the taste to suit the design the window becomes a large and varied column of advertisements.

Thus it is that very often the most artistically arranged windows fail to secure the result intended. Now, do not infer from my last statement that I am opposed to fancy window dressing, for I am not. In my conception of a model store there is nothing that adds more to the beauty and symbolic get-up-and-stir of a retail establishment than that of window dressing, or that has more outward appearance of neatness and system. In this connection it may be said (to my regret) that many windows are often packed full of the finest and most elegant styles and novelties, and yet without the least trace or show of an underlying idea of system. In conversation with an experienced window dresser the subject of window trimming was broached, and in the course of his (now to me invaluable) remarks he made the statement that one might study the designs and systems of the arrangements of the most tastefully arranged city show-windows, and then make an attempt at reproducing the subject in all its taste, without the pattern right before the eye, and it would be a signal failure nine times in every ten. From this I draw the conclusion that, instead of the pattern, or idea, being before the eye, the eye must be before the pattern, or, in short, the artistic pattern is in the very brain, and can only be carried to perfection by actual ex-

perience. Right here I may say that many a time has the window dresser been constrained to tear down his pattern only because it did not suit his inward idea.

In preparing the window for public attention the dresser must be governed in his taste and arrangement by the class of goods consumed by that particular locality, and not display such goods as belong to the trade of the city merchants. The careful buyer will never have such goods in stock. For illustration, I may say that in the retail dry goods store the display should be made up of goods in which the people are interested and would stop and look at; and when the public eye is forced to pay homage to the window dresser, the original design of window trimming is accomplished—it is then a great advertising medium. In this way, by a careful and not too hasty study, a knowledge of what the trade is most interested in may be acquired; and thus an advertising medium established of as much or sometimes even more value than the long column in the daily or weekly papers. By this expression I do not wish to deny the value of the press as an advertiser, for it is of indispensable value.

The beautiful effect of window shows is sometimes spoiled by a continued sameness. Just as the gossip runs that a new preacher is to preside at the village church next Sunday assures an increased audience to hear something new, so is the effect of a weekly, or, if possible, a semi-weekly, change in the dress of the show-window. The change will always greatly increase the attention of and the interest in that which it contains, so that by so doing people will soon pass your window just to see what you offer new, distinct and apart from the week previous. One would hardly believe such to be the fact unless he actually made the trial. Something I had almost overlooked I must say regarding the consequences of placing too much confidence in certain colors while on display in the window. I can proudly say I have the "consequence" stored permanently in my first experience. Beware of pink and the lighter shades of blue.

They look nice enough in windows, but how disgusting on the job counters. This is why I make this remark, so that an idea may be formed from my own knowledge of perishable colors. Now, I may safely say that in fancy goods stores the window trimming should be always in harmony with the season. There is nothing that looks more ridiculous to the trained eye than to see the winter window arrayed in summer goods and *vice versa*. The changes from month to month and from season to season should be as harmonious and blending as the growth and change of the flowers of the summer months. What I mean in this connection I may illustrate by saying that it would be quite out of good taste to display to any great degree laces and embroideries in the winter months, when the store is full of goods suiting the season and highly necessary to be shown; or to display any heavy woolen goods in summer, when you have new patterns and fancy styles in dress goods, or other novelties suiting the occasion. A careful attention to this will add greatly to the public interest taken in your windows. I have confined my remarks to dry goods from the fact that they are my "building blocks." I do not pretend to be an expert in window dressing at all, but have been simply giving my idea of showing goods and its general advertising connection with any store. And before I conclude my attempt I must pay a necessary honor to all window dressers. They are one of the invaluable methods of advertising. A well-dressed window is one of the greatest outward expressions that can be given by a progressive store—an ever-telling indication of the live and energetic persons within.

### Cook's Spirit Level.

C. E. Jennings & Co., of 97 Chambers street, New York, are introducing to the trade a spirit level known as Cook's patent. Since 1887 some important improvements have been made in the construction of the level, a general view of some of which is presented by means of the accompanying illustration. The engraving represents a section of the level, showing one of the tubes carrying the bubble. This, it will be observed, is set in a frame faced with glass on either side and placed in the body of the stock. Instead of looking at the top and down into a narrow groove as is usually demanded, the construction of the level is such that the eye is directed to

Sectional View of Cook's Patent Level.

the side and notes at a glance the position of the level. There are two of these tubes used in the level, one being designed for testing vertical lines and the other for leveling. The parts holding the tubes are arranged with screws, as will be readily seen from an inspection of the cut. The screw reaches to the plate on the upper edge of the stock, making the level adjustable and possible to correct for any inaccuracy which may exist. The manufacturers direct special attention to these features of the level, and to the fact that

Combined Sheeting and Lath, Manufactured by T. F. Timby, New York.

it can be used in many positions which is not possible with the ordinary device. It is a carefully made instrument, being highly finished, and in its improved form is expected to prove more popular with the trade than ever.

### The Perfect Filing Machine.

The saw-filing machine of which we here-with present an engraving is made by the Ambler Saw Mfg. Company, of Natick, Mass. The saw is held in a vise, as shown, and is raised and lowered by means of a back gauge placed inside the vise and controlled by a thumb-screw from the bottom. The file mechanism consists of two arms, one with a long straight cam-slot and the other with a curved one, both being in connection with a cam-roll on the face-plate.

Each rotation of the face-plate, therefore, gives the file-carriers a reciprocating motion, and, by means of the curved cam-slot, the file is raised at the end of its stroke to free it from the tooth and resumes its position at the proper time to move forward on its cutting stroke. The saw is fed by a pawl cam-follower, all in one piece. The cam-follower being in contact

The Perfect Saw-Filing Machine.

with the cam on the back of the face-plate, as shown in the engraving, each rotation gives it a movement which may be graduated for different lengths of teeth by means of thumb-screws, as shown. The adjustments are quickly made, the time necessary being no more than is always required to put a saw upon ordinary filing-wheels, after which the work is entirely automatic and much more perfect than that done by hand.

### Combined Sheeting and Lath.

We here present a view of a section of Timby's combined sheeting and lathing, which is being placed upon the market by T. F. Timby, of 32 Warren street, New York City. This lathing is made in 6-inch strips, and so constructed that each section may swell or shrink without affecting those on either side of it. This is accomplished by making in the back deep kerfs which pass the bottom of the face grooves,

spacing of joist or studding is necessary, neither are furring strips required, while the peculiar shape of the grooves is such as to firmly hold the mortar in place. It has the further advantage of using less mortar than the common plan. The lathing is made with both edges finished alike, as shown in the illustration presented herewith, and is supplied six pieces in a

### The Torpedo Ventilator.

From one of our English exchanges we reproduce the engraving of a new form of ventilator. The following description, furnished by our contemporary, is not so full as it might be, but the cut shows the principal features of the device: The accompanying illustration shows a new form of ventilator which has been introduced by the Patent Grate Company, Sheffield, as a thoroughly efficient means of preventing down draft and securing an exhaust action under all atmospheric conditions. It differs essentially from all other forms, either of cowls or ventilators, and no matter in what direction the wind may blow, or what eddies may be formed by the wind rebounding from adjacent roofs, the Torpedo acts just as well as under the

The Torpedo Ventilator.

most favorable conditions. As it is a "fixed" ventilator, and is, therefore, free from all complicated working parts, such as diaphragms or vanes, it is not likely to get out of order, and requires no attention to keep it in a state of efficiency. The London agent is Mr. G. Knowless, Cross street, Finsbury, E. C.

### New Sheet-Metal Elbow.

The National Sheet Metal Roofing Company, of No. 510 East Twentieth street, New York City, are introducing to the trade a sheet-metal elbow for which they make strong claims. The various pieces of which the elbow is composed are formed

New Sheet-Metal Elbow.—Fig. 1.—Sections of Elbow as they come from the Press.

in dies, and when "struck up" present the appearance shown in Fig. 1 of the accompanying illustrations. From an inspection of the pieces in the lower part of the cut it will be seen that the edges are countersunk, allowing the various sections when put together in an elbow to be

Fig. 2.—Group of Finished Elbows.

flush on the outside. The holes shown in the ends of each piece are for rivets to fasten the ends together. One section of elbow is joined to another by placing the lap over a point upon a mandrel and then using a small rivet set, the result being to give to the elbow the appearance of having been riveted. When the parts are fastened in place the whole elbow is gal-

vanized, giving a very neat and smooth finish. In Fig. 2 of the cuts are shown several finished elbows of the kind above described and also an adjustable elbow which may be used in connection with the fixed one, cases often arising where such a com-

bination could be used to advantage. The makers direct special attention to the facility with which these elbows can be put together and the economy in shipping them "knocked down," the construction being so simple that any sheet-metal worker can readily put the pieces together. In case it is desired to secure a supply of these elbows, a portion of which shall be finished and the remainder in sections as shown in Fig. 1, the latter can be packed within the former, thus greatly reducing the space occupied in transportation. The company at present are offering the trade

two sizes of elbows, but expect soon to have a full line ready.

This will be a bonanza year for fruit and grain growers in California. The value of the California fruit crop this year is estimated at \$24,000,000. The wheat crop is estimated at 70,000,000 bushels, worth \$52,000,000.

### Combination Hay Carrier.

F. E. Myers & Bro., Ashland, Ohio, are manufacturing and putting on the market the hay carrier illustrated herewith. This carrier is referred to as composed of new

Combination Hay Carrier.

patterns, and adapted to run on the Myers' patent T-rail steel track. It is so constructed that it can be used as a straight reversible carrier. The rope can be drawn through the carrier so that it can be operated either way from the stop. The two pulleys over which the rope is drawn are hung on a turn-table or swivel, thus permitting its use as a swivel hay carrier when desired. It is described as made of the best quality of annealed malleable iron, and is equipped with the double lock trips and stop, which is a prominent feature of their well-known Myers' double-lock reversible carrier. The manufacturers refer to the neat and symmetrical appearance of the apparatus and its substantial construction, as well as its reliability.

**Square Driving Ropes.**—According to *Industry*, some experiments recently made in India with leather ropes of a square section are deserving of attention. Square leather ropes have for some time been used in England, and with success. They are especially suited for what are called "quarter twist" belts, not being affected by the diagonal strain as a flat leather band is. The sections are square, equilateral, and the grooves in which they run are made to an angle of 45°, so there is a perfect fit of one-half the surface of the rope, and more than is possible with a flat band of equal weight; not only this, the traction is more because of the angles. The square leather ropes employed for main-driving are about 1½ inches square, made up of layers of leather cemented so the whole is uniform and continuous. A rope of this size weighs 1 pound for each foot of length and will sustain a pull of 600 pounds. A single rope of this size will, at a speed of 2500 feet a minute, transmit 25 horse-power. They are, however, driven at much higher speed than this, in some cases to 6000 feet per minute; a safe or suitable speed is from 4000 to 5000 feet a minute.

Valuable iron ore mines which were recently discovered on the banks of the Orinoco River are being worked and the product is ready to be shipped to Philadelphia. The English steamship *Cypress* will leave with the first cargo of 1800 tons in May, and will receive 15/ per ton freight.

**New Galvanized Sprinkling-Pots.**

Sidney Shepard & Co., Buffalo, N. Y., are manufacturing the new line of sprinkling-pots which is shown in the accompanying illustration. These pots are fitted, it will be observed, with a new style spout, which is double seamed in and has a delivery orifice extra large. The form of

*New Galvanized Sprinkling-Pot.*

the sprinkler heads is also alluded to. These goods are galvanized after being put together, a process which is referred to as soldering all the seams and coating the entire surface. The goods thus made are claimed to be stronger and more durable than tin and of attractive appearance, while cheaper and more substantial than copper. The reasonable price at which they are sold is especially alluded to.

**The Ideal Refrigerator.**

A refrigerator of new and handsome design is offered to the trade by Hibbard, Spencer, Bartlett & Co., of Chicago, who

*The Ideal Refrigerator.*

are the sole agents for the manufacturers, the American Fiberware Company, of the same city. An illustration of the refrigerator is shown herewith. It is cylindrical in form, 36 inches high, 22 inches in diameter, and weighs but 40 pounds, being made of compressed wood pulp. The ice is put in at the top, and rests on a corrugated galvanized-iron rack or shelf. The food or provisions are inserted in a door on the side, which opens the full height of the provision-chamber and flush with the bottom, to render cleaning simple and easy. A full circulation of air is secured

by apertures in the ice-chamber which have been arranged for this purpose. The wood pulp being a non-conductor, double walls are not needed, and there is no grain as in wood to shrink or swell, while the inside space is unusually large for its external dimensions as compared with other kinds of refrigerators. It is intended for the use of small families and for dwellers

ing the parts to be taken off for cleaning. The following are the directions for the operation of this machine:

To operate, cut the lemon in halves, placing one piece in the holder and press it in level (allowing it to rest on the pan, which centers it) against the fluted head, at the same time revolve it with the crank a few times, which will flatten out the pulp and extract all the juice, when the peel can be dropped out and the op-

*A New Toy Pistol.***Walker's Improved Lemon Squeezer.**

This article, which is a departure from the usual form of lemon squeezers, is represented in the illustration herewith given, and is manufactured by the Erie Specialty Mfg. Company, Erie, Pa. This machine is designed to be clamped to a shelf or table, and is made high enough to allow a glass to be placed under the catch-pan to receive the juice, which is strained as it passes through the slits in it, the seeds and the pulp being thus kept out of the juice, and the point is made that by this operation all the juice is removed from the lemon without crushing the seeds or peel, thus avoiding the extraction of the bitter oil which is detrimental to the juice. It is also claimed that much more juice is in this way secured than with the ordinary squeezer. The standard of the machine and the clamp are made of iron,

eration repeated. As the oils are all left in the peel, they can be used at a profit for extracts, &c.

**A New Toy Pistol.**

The accompanying illustration represents the Echo pistol, which is made by the Hamblin & Russell Mfg. Company, Worcester, Mass., the cut showing it full size. Its construction is exceedingly simple, the handle being made of iron and the barrel of wood handsomely japanned. In operating the pistol a sharp report is produced without the use of powder or caps, but simply by the mechan-

*Walker's Improved Lemon Squeezer.*

nickel-plated, while the parts coming in contact with the lemon are enameled to prevent corrosion, there being thus no danger of the deleterious effects which are liable to result from the use of galvanized squeezers. The fluted head and pan are held in place by a split spring-pin, allow-

ical operation of the toy. The hammer, shown in the cut, is connected with a piece of steel, the lower part of which is the trigger, and this piece of steel is expanded in the center and given a bound rim, in such a way that it makes a report as it is bent either backward or forward,

and the construction of the large part of the barrel is such as to cause a reverberation, materially increasing the noise. With this construction it will be seen that the report is made in cocking, as well as in firing, the pistol. It can also be made to do service in firing peas or beans. The fact that it is harmless and apparently indestructible are points in its favor. The regular style of the pistol has a bronzed handle, but it is also made nickel-plated. It is intended to retail at 10 cents, and the manufacturers intimate their willingness to send a sample of the pistol by mail at this price.

## Legal Decisions.

### PARTNERSHIP.

M. received in payment of a debt due him by P. the firm check of P. & Co., and got the money for it. After the dissolution of the firm, W., one of the members, went to M. and demanded from him the amount of the check, on the ground that the money belonged to the firm and had been misappropriated. M. refused to refund and W. brought suit. In the action plaintiff sued for the money or moneys of the firm, and the defendant alleged that no recovery could be had on such a statement of facts, and the court sustained him. The case—*Warren vs. Martin*—was then carried to the Supreme Court of Nebraska, where the judgment was affirmed. Judge Cobb, in the opinion, said: "In an action by co-partners against a vendor for the proceeds of a bank-check made by one partner on the firm's bank deposit for goods sold to one member of the firm for his own use, it must be presumed, unless it is alleged to the contrary, that the check was given on account of the partner's interest in the profits of the firm. The rule is when a partner gives the firm check for his own debt it must be presumed that the transaction was fair, and that the debt was paid out of the private funds of the partner indebted. Every check is presumed to be given for value received; it is payable without grace and is an absolute appropriation of so much money in the bank to the holder. To hold the payee to the duty to return the money so received from one partner in payment of his debt it must be made to appear, by allegation and proof, that he knew that the partner was misappropriating the funds of the firm. When there is so much improper appropriation no recovery can be had."

### COMMISSION MERCHANTS—FAILURE TO SELL GOODS WHEN ORDERED—FIRE.

P. had on store with L. & Co., who were commission merchants and warehousemen, a number of bales of cotton, which had been delivered to L. & Co. by her tenants, and she instructed them to sell the cotton at a price which could be obtained. She held the warehouse receipts, but they did not demand them when they got the order to sell. The sale was not made, and after a few days the cotton was destroyed by fire. L. went to P. & Co. and demanded from them the value of those bales, on the ground that as they had not obeyed her instructions she could hold them as though they appropriated the cotton to their own use. They refused to pay her, and she sued for the value of the property and received a judgment, from which the defendants carried the case—*Lehman vs. Pritchett*—to the Supreme Court of Alabama, where the judgment was reversed. Judge Clifton, in the opinion, said: "Commission merchants in their business, duties and liability are substantially the same as factors. The relation in both cases is created only when the property is consigned or received, or is placed at the disposal or under the control of the commission merchant to be sold."

Whenever he receives the property without special instructions as to the time, mode or price, the duty is devolved to use due diligence to sell in a reasonable time; but the duty is not devolved until he receives such possession and power of disposal and control as will enable him to make an effectual sale—to deliver possession and to pass title. Though L. & Co. were conducting business also as warehousemen, under the title of 'the Alabama Warehouse Company,' they were not bound to carry out Mrs. P.'s orders to sell before she dealt with them as commission merchants, by placing the cotton in their hands for sale, and to this end she should, at the least, have delivered to them her warehouse receipts. We have come to the conclusion that, as to her, L. & Co. were not acting as commission merchants. But conceding that they were acting in this relation to her, still, in our opinion, they are not liable to her for the value of the cotton. The fire here is admitted to have been accidental, and the burning of those bales was an accidental and collateral injury to this property, not usually following as the result of any delay by L. & Co., as commission merchants, in making sale of the cotton. If the defendants were bound to sell in a reasonable time and failed to do so, they would be liable only for any injury naturally resulting from the delay, not from an injury suffered from an extraordinary or fortuitous cause, having no relation to the delay, except that it was contemporaneous. In this case the burning of the cotton was the result of an accidental or collateral injury, between which and the delay in selling there was no necessary or rational connection. The fire must be regarded as the proximate and the delay as the remote cause of the loss of the cotton. The damages against the defendants, which the jury were instructed to give, were too remote, and we must reverse the judgment."

### SALE—MONEY PAID TO BE RETURNED IF DISSATISFIED.

P. & Co. made for the T. Mfg. Company a lot of belting, and they gave the purchasers a note for about one-tenth of the price, as a compensation to them should the belting after three years' use show any cause to dissatisfy G., the agent of the T. Mfg. Company, the said note to be paid "promptly on demand of G. or his successor—he was the treasurer of the company—without the intervention of third parties, the matter to rest solely on the decision of G. or his successor." G. declared himself not to be satisfied with the quality and workmanship of the belting after the time limited, and presented the note for payment, but payment was refused on the ground that the belting showed no inferiority after its three years' use, and therefore G. had no reasonable ground whereon to decide that the amount of the note should be paid. Suit was then brought to recover upon the note and the agreement, and P. & Co. set up as a defense the above-stated ground. The company contended that the defense set out was not sufficient in law to prevent judgment being entered for it, and in the case—*Terrapee Mfg. Company vs. Page*—the Supreme Court of Rhode Island gave judgment for the company on the ground that the defense was not sufficient, as stated. The Chief Justice, Durfee, in the opinion, said: "We think the agreement to abide by the decision of G. after a three-years' use of the belting was the very substance of the compromise, and that in the absence of fraud his decision is conclusive. No fraud is alleged in the defense set up; it alleges that the belting answered the requirements of the company, and that G. had no reasonable ground for his decision. But this may be true and yet G.'s decision be honest. The defense must be overruled; the matter of

the decision by the terms of the agreement rested solely on G.'s decision. The stipulation was in effect a submission of the matter, after the three-years' use of the belting, to the unconditional arbitration of G., and it is settled that under such a submission the judgment of the arbitrator, fairly formed, is conclusive."

James P. Witherow, the well-known engineer and contractor, of Pittsburgh, and Hon. William L. Scott, of Erie, Pa., with some capitalists of New York City, have recently secured the franchise of a German syndicate in the Sonora Valley, Mexico, and are now hastening the completion of preparations to develop the great anthracite coal deposit there. The vein is 8 feet thick and is 600 square miles in area. It is situated on the International Railway, about 80 miles from the Gulf of Lower California. They will project a railroad to the gulf and will create facilities for supplying coal for the entire Pacific Coast, from Behring Sea to Patagonia, and for the supply of all the Pacific coaling stations. They will ultimately have a number of collieries and will transport their product, as the Philadelphia and Reading Coal Company now do, in their vessels.

# CURRENT HARDWARE PRICES.

MAY 15, 1889.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers' prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers.

# THE IRON AGE

THURSDAY, MAY 23, 1889

## New Wheel Lathe.

This machine is built from new and improved designs, embodying the most modern ideas for convenience in operating, and is made very strong and stiff to meet the demands for locomotive work of the heaviest class. This lathe will swing wheels 74 inches diameter over tread. The adjustable head is moved along the bed by an improved method that permits of its being located at the exact desired point in a much shorter time than by the ordinary method. The bed consists of three inverted U-sections, the two front ones of which are carried up much higher than is usual, and all are thoroughly united by cross-pieces of same section. This form of bed permits of the use of a very short

90 revolutions per minute. Single and double quartering attachment can be furnished, and when this is done a positive device for locking the face-plate while boring is provided. This machine is built by the Pond Machine Tool Company, the agents in New York being Manning, Maxwell & Moore, of 111 Liberty street.

## The Cruiser Charleston.

Although the Charleston is the third of the war vessels recently constructed, yet for several reasons her trial trip possesses a special interest and importance. Of her two predecessors one was classed only as a heavy gun-boat and the other as a pneumatic torpedo vessel for harbor defense. The Yorktown is of only about 1700 tons

engines came from the Pacific Rolling Mills, of San Francisco. These include such castings as a stern-post weighing 11,180 pounds, a stem weighing 13,430 and a rudder frame weighing 9420. While the Charleston is the pioneer in ship-building for the Government on the Pacific Coast, the still larger cruiser San Francisco is now under construction by the same firm, the Union Iron Works, and lately the contract for the coast-defense monitor has also been given to them.

The great advance in construction indicated by this vessel is shown by the fact that whereas in the Atlanta the contractor only guaranteed, with 664 tons of machinery, to produce 3500 horse-power, in the Charleston the guarantee is with 710 tons of machinery to produce 7000 horse-power.

SEVENTY-NINE-INCH WHEEL LATHE, BUILT BY THE POND MACHINE TOOL COMPANY.

tool-post, thus materially lessening the strain which is common by reason of the leverage arising from the greater length of the long tool-post ordinarily used. This bed is of sufficient length to admit wheels on the axle fitted with the longest crank-pins without the adjustable head overhanging the end. The tool-posts are furnished with compound slide-rests, and the feeds for the same are positive and universal. The driving-cone has five steps for a 6-inch belt. Each face-plate has ten speeds, and they can be driven together or separately and at the same or different speeds. All gearing is cut from the solid. The face-plate pinions and pinion-shaft are of forged steel, the shaft being of extra large diameter. The slotted hand-wheel on the end of the internal spindle screw, from which the feeds are operated, is so locked to the main spindle that it is impossible for the internal spindle to back out and allow the axle to become loose on the centers. The countershaft is furnished with pulleys for two speeds, and is driven by a belt 6 inches wide. The 42-inch pulley should make 55 revolutions per minute, and the 30-inch pulley should make

displacement, and the Vesuvius of about half as much, while the Charleston is of 3730 tons. The Yorktown's engines develop about 3650 horse-power, while those of the Charleston are guaranteed to produce 7000 horse-power under forced draft, and have been confidently expected to reach double the Yorktown's power. The armament of the Charleston will exceed that of the Yorktown by two 8-inch guns, the highest caliber as yet actually introduced into our war vessels. Thus a great interest is lent to the trials of the Charleston, it being evident that if she should come up to her contract speed there need be no anxiety as to the remaining cruisers of the new fleet now under construction.

A second source of interest in the Charleston is that she is the first war vessel ever built on the Pacific Coast. With the exception of the crank and two shafts made by Krupp, at Essen, all the steel used in her is of domestic manufacture. The beams, outside plating for the hull and the plates for the protective deck were made at Pittsburgh, but the pistons and other forgings for the engines, the frames and all the steel castings for the hull and

In other words, the guarantee in the former case was to produce a little over 5 horse-power per ton of machinery, while in the latter it is to produce nearly 10 horse-power per ton of machinery. Originally the Charleston was meant to carry in her main battery two 10-inch guns and six 6-inch, which would have been an equivalent of the battery of the British-built Japanese vessel of which she is a copy. But finally 8-inch guns were substituted for the 10-inch, so that she is now to carry only the same battery as that of the Boston and the Atlanta, which are of about 700 tons less displacement. The Chicago carries a still heavier battery, consisting of four 8-inch and six 6-inch guns. But, all things considered, the battery of the Charleston is no doubt as heavy as she needs, some of the new English vessels finding that they have gone too far in this respect. At all events, in the Charleston the new navy has a vessel of the highest engine-power yet reached by it, the Chicago only developing a little over 5000 horse-power, and she is surpassed only by the Chicago in offensive strength. With the Dolphin, the Atlanta, the Boston, the

Chicago, the Yorktown, the Charleston and the Petrel, soon to be joined by the Baltimore, our fleet of steel cruisers is rapidly taking on numbers and efficiency.

#### Pig-Iron for Car-Wheels.

A. W. Whitney, chemist of the Whitney Car Wheel Works, of Philadelphia, has furnished to the *Journal of the United States Association of Charcoal Iron-Workers* the following reply to the question, "What are the requirements as to physical characteristics and chemical composition of pig-iron for the manufacture of chilled-iron car-wheels?" :

It is, of course, impossible to lay down any strict rule in regard to the above requirements, as the practice of wheel-makers varies much, some finding a few irons to give good results, while others use many and various irons. In either case an iron may at one time with one mixture work well, and at another time with another mixture be worthless. It cannot be said of such an iron that it is not a good ingredient of car-wheel mixtures, but merely that it will not work well with the particular mixture with which it failed. It is largely the object of the chemist to ascertain with what irons it can be used.

In general, in regard to the physical character of car-wheel pig-iron, the great requirement is uniformity. The character being once ascertained should not vary in different shipments. The chill test on the side of pig is useful; but would it not be well if furnacemen could go further and apply Keep's tests, or an equivalent, to their product? Small sample pigs might be run off from the larger pigs; 50 pounds or less melted in a covered crucible would probably give chill tests and other test pieces which would be useful as an indication of the quality of remelt of the larger pigs. Would not iron graded in this way give more uniform results? This would be an interesting question for practical investigation.

In regard to chemical composition the same may be said. If uniform as received at different times, the wheel-maker will know from his experience, or perhaps in the future from his chemist, in what cases any particular iron may be used. As a rule, I should say that good chilling irons, exclusive of white or mottled, contain between 0.56 and 0.95 per cent. of silicon, though there are some good ones with silicon above and below these limits. White irons often contain less than 0.15 per cent. of silicon. Manganese may be between 0.08 and 0.90 per cent.; phosphorus, 0.05 to 0.75 per cent.; sulphur, 0.0 to 0.15 per cent., and total carbon always as high as the above-mentioned ingredients will allow.

There are, therefore, probably several proper compositions for wheel mixture, each of which depends for its physical success upon the manner of working the iron as to fuel, blast, temperature, &c., and on the relative proportion of one element to another, as well as on the actual amount of each present. Thus some makers may allow as much as 0.95 per cent. silicon in a car-wheel by properly balancing it with other elements, or by special methods. Others using different irons will keep the silicon even below 0.6 per cent. As yet this is generally done empirically, not by deduction from chemical analysis, which, however, within certain limits, as already intimated, can probably predict the results for any given method of working. I am of the opinion that, other things being equal, a small change in chemical composition affects the result; and that a different mode of working affects the result not only directly, but indirectly, by influencing the chemical composition. The following is an analysis of a re-

markably strong wheel with good chill, 33-inch double-plate wheel, weight 569 pounds, cracked slightly at twentieth blow of a Pennsylvania railroad test drop, not broken at 425th blow of same drop. It then broke at the third blow of a 600-pound drop falling 12 feet. The chill of

#### Petroleum-Burning Boiler.

The boiler of which we herewith present an engraving is designed to carry 150 pounds of steam and is rated at 4 horsepower. It measures 20 x 30 inches. Each head is formed of two steel plates placed

The *Street Railway Gazette* reports that the wire rope made by the Broderick & Bascom Rope Company, of St. Louis, for the Olive street road is running on its thirteenth month of continuous service and has never stranded or had a break. This road runs trains of two coaches and a grip night and morning, and the cars are nearly always crowded. Some time ago a very interesting competitive test of cable ropes took place on the line of the Cincinnati Street Railway Company. Twenty-seven thousand feet of rope were spliced together and put in service, half of which, or 13,500 feet, came from the Broderick & Bascom factory and the other half from that of another works. The other rope wore out and had to be renewed three months before the St. Louis rope showed the least break. On the Grand avenue line in Kansas City one of the Broderick & Bascom ropes is now in service that has outlasted by one-third in time the average term of five previous ropes.

2 inches apart and riveted to a separating channel-bar, as shown. The copper tubes have a shoulder formed on them, against which the inner steel sheets of the heads abut. The burner is intended for the use of petroleum, and is formed of a wrought-iron pipe, coiled as shown, having its upper end capped and bent so as to cross the center line of the coil. The under side of

Fig. 2.—The Petroleum Burner.

the cross-bar is provided with a small hole. The two burners are fed with oil from a tank preferably placed near the bow of the boat, and furnished with a small hand air-pump, by means of which an air pressure of a few pounds can be formed in the tank to force the oil through the burner at starting. After the engine has been

started it is intended that the small auxiliary pump shall supply this pressure. The coil of the burner becomes heated in the downwardly-spreading flame, and the petroleum forced through it is converted into a gas, in which state it is burned as it issues from the vent. It is claimed that this arrangement of the burner, while being exceedingly simple, will generate all the heat required for quick steaming, and is in no danger whatever of clogging. The boiler is provided with the usual glass gauge and water-cocks. The sole agent handling this boiler is J. J. Brockee, of 47 Dey street, New York.

#### Deep-Well Drilling Machine.

In the construction of this drilling machine the aim of the Wells Machine Works, of Fostoria, Ohio, has been to build a practical deep-well machine that would operate any tools which drill by

pendent by a nut journaled in the cross-head, a latch hinged in the the nut locks the nut to the crosshead, and permits the screw to feed out the rope or locks the nut to the screw, leaving the nut and screw free to turn either way. This, it is claimed, is the simplest device possible, and possesses all the advantages of the walking-beam, while doing away with its unwieldy proportions. When the tools are to be withdrawn the temper-screw and all that projects in front of the pitman are hung on one side on a balanced hook. By means of a lever attached to the eccentric through which the shaft of the belt-wheel passes the pinion of the shaft is disengaged from the spur-wheel of the rope-spool shaft. The front flange of the rope-spool is also a worm-wheel, into which the worm is thrown to lock the wheel to suspend the tools. By turning the worm, slack or tension is given to the rope, as may be required. To operate the sand-pump

DEEP-WELL DRILLING MACHINE.

dropping of their own weight, and that would possess all the essential qualities of a drilling machine. The engraving we present shows the machine in position for work after the tool has been sunk beneath the surface. When starting the well the temper-screw is removed, the rope that suspends the drill passes over the sheave in the derrick and down through the rope grip attached to the crosshead of the machine, so that at each downward movement of the crosshead the tools are lifted, and *vice versa*. The rope is readily fed out through the rope grip while in motion. This simple means of spuding, which, in the oil well vocabulary, means the starting of the tool at the surface, is valuable where heavy beds of sand or gravel have to be passed through, as self-pumping tools with drive-weight can be used and the casing kept in advance of the tools. To change from spuding to direct drilling with the temper-screw requires but a little time. The drill rope is held by clamps hinged to the lower end of the temper-screw and is inclosed within the U-shaped recess of the screw, so that it practically forms the center of the screw. The screw is sus-

spool, the pinion on the belt-wheel is placed midway between the spur-wheels. When in this position the friction-wheel of the sand-pump spool is brought in contact with the raised part of the belt-wheel. A powerful foot-brake is brought to bear upon the raised part of the belt-wheel when letting the tools down. With this brake the machine can be stopped almost instantly. The machines are built upon an iron frame, resting upon a solid timber bed thoroughly bolted. The iron frame and the feet of the supports of the machine are planed, so as to make a perfect fit of all the parts of the machine. The shafts are steel, and are strong enough to stop the machine instantly without damage in case the tools catch. The length of the stroke can be readily adjusted to suit the work. The derrick is made in halves for convenience, is hoisted in position by the machine driven by its own power, and where there is proper room one man can readily erect it. It is stated that these machines have been thoroughly tested in deep work with the heaviest tools used in the oil and gas region, and that they have proved superior to any other in their line.

#### The Coke Trade.

Advices from the Connellsville coke region are to the effect that the demand continues fairly active, but present prices are far from satisfactory. The owners of a number of small plants in the region have decided that they cannot produce coke and sell it for \$1 per ton, and as a consequence have closed down their ovens until an improvement takes place. This action has allowed the works which are still in operation to make better time than they otherwise would have done. The H. C. Frick Coke Company and the McClure Coko Company, two of the largest firms in the region, have been operating their works full time for some weeks past. A general cut in wages has been made by the small operators, which has been accepted by the workmen. As yet this example has not been followed by the large operators, but unless there is a decided improvement in the trade at an early date it is more than probable that a general reduction in wages in the entire region will be made. For the week ending on the 11th inst. out of 13,266 completed ovens in the region there were 10,585 in operation and 2681 idle. The record for the previous week showed 10,695 in blast and 2571 idle. The active ovens averaged nearly 5½ days, against 5½ days during the previous week and but 5 days for some weeks prior to that. The estimated production was 99,621 tons, as against 97,151 tons for the previous week. Shipments were as follows: To Pittsburgh and rivers, 1376 cars; to points west of Pittsburgh, 3453; to points east of Connellsville, 1327; total, 6156 cars. The figures for the previous week were: To Pittsburgh, 1215; West, 3348; East, 1215; total, 5778. The shipments, it will be noted, have increased 378 cars. The increase is not confined to any one locality, but is pretty evenly distributed, indicating a faint, but general, revival in demand. Prices are now as low as they have been for years, and the prospect for an improvement is not encouraging. The following are the prices now ruling, f.o.b. cars at point of shipment: Furnace coke, \$1; to dealers, \$1.10; foundry coke, \$1.25; crushed coke, \$1.50, per ton of 2000 pounds. Freight rates from ovens to Pittsburgh, 70 cents per ton; to Shenango Valley, \$1.35; Cleveland, \$2.80; Chicago, \$2.75; East St. Louis, \$3.50; Philadelphia, \$2.89. Foundry prices at Western points are quoted as follows: Chicago, \$4.15; St. Louis, \$4.40; Louisville, \$4.50; Kansas City, \$6.75; Toledo, \$3.85; Detroit, \$3.95; Milwaukee, \$4.20; Buffalo, \$4. In the latter place Reynoldsville coke is quoted at \$3.25 and at Chicago at \$4.25. Walston coke is quoted at \$4.15 in Chicago, and New River coke brings \$4.25 at Louisville.

Inquiry was recently made at the Treasury Department as to whether railway iron can be imported from England for remanufacture into frogs and switches and re-exported to Mexico for use by the Mexican Central Railway without payment of duty. Assistant Secretary Tichenor has informed the inquirer that if the frogs and switches referred to shall be manufactured exclusively of imported material a drawback can be allowed on the exportation of the manufactured articles equal to the amount of duty paid on the imported material used in their manufacture less the legal retention of 10 per cent., but that if any domestic materials whatever are used in the manufacture of said articles no drawback can be obtained thereon. He said also that there is no provision of law under which the imported rails can be manufactured in bond into other articles and exported without payment of duty.

### Cruisers and Battle-Ships.

Lord Armstrong contributes to the *Nineteenth Century* an article on the admiralty's ship-building programme which contains many useful hints to Americans interested in the development of their naval resources. There is no greater authority in England on all practical questions relating to modern war-ships, and the importance which he attaches to fast cruisers for defensive and offensive operations is a powerful argument in favor of increased appropriations by Congress for this class of vessels. He considers that the function of armored battle-ships, two of which are now building in American navy yards, is to fight similar vessels. For ordinary purposes of blockade cruisers would be much more effective than the big armored vessels, and they would also be superior for coast defense when transports conveying a foreign army were approaching a menaced port. Lord Armstrong also lays stress upon the fact that while a battle-ship would be useless in hunting down cruisers, the converse is not equally true. Five cruisers, carrying collectively a most formidable armament and having superior advantages for outmaneuvering a battle-ship, could close in upon her with ram and torpedo and compass her destruction. In the judgment of this expert the presence of a considerable force

for a \$45,000 cotton press, but, owing to the uncertainty as to when the works would resume, he was obliged to take it elsewhere. Large orders for sugar-making machinery have also gone elsewhere.

### Water Cylinder of the Buffalo Steam Pump.

Unless otherwise ordered, all of the pumps of the Buffalo (N. Y.) Steam Pump Company are provided with the new water cylinder, of which we present a vertical longitudinal section. The improvement consists of an auxiliary sleeve which supports and holds the removable water barrel or sleeve. It is bolted against

toward sending American workingmen to the Paris Exposition with a view to examining the advance of mechanical arts, this newspaper syndicate stepped into the breach and has undertaken the work which Congress overlooked. They propose to spend anywhere up to \$25,000 in paying all the expenses of 50 American workingmen chosen from St. Louis, Cincinnati, New York, Boston, Detroit, Cleveland, Chicago and other manufacturing points. The details of choosing the men who are to accompany the expedition are now being arranged, and it is not unlikely that representatives from this city may be among those who accompany it. All trades will be represented, including iron-workers, car-workers, ship-builders, car-

NEW WATER CYLINDER OF THE BUFFALO STEAM PUMP.

of unarmored cruisers would compel a hostile fleet of armored battle-ships to herd together for mutual support. It has been the habit of naval engineers and constructors in the United States to refer to the fast cruisers now under contract as possible commerce-destroyers, but not in any sense as fighting ships. Lord Armstrong does not share this view. He believes that they can successfully attack, when in sufficient number, the most powerful battle-ships, whether of the turret or of the barbette system.

### Assets of the Reading Iron Works.

—The appraisers of the property of the Reading Iron Works are about completing their work. It is found that the assets of stock on hand will foot up more than was supposed. Among the items are some 9000 tons of pig-iron, worth about \$125,000. By reason of the stoppage of the works many valuable orders are being lost. A gentleman from New Orleans was here this week who would have placed an order

for the head of the water cylinder and is bored to receive the end of the water barrel. Lugs cast on the inside of the sleeve are tapped for set screws, which are set up against the water barrel, holding it firmly against the partition in the water cylinder, which is bored and faced to receive it. It will be seen from this that the water barrel has two points of bearing, thus giving rigidity to the barrel and holding it in line. It is well-known that all working barrels wear on the lower side first; in this case the barrel can be easily turned so that the wear will be alike on all sides. They are made of iron for ordinary purposes and of composition when used for pumping acid. The pistons, working barrels and auxiliary sleeves can be removed without disconnecting the piping.

One of the most extensive newspaper expeditions ever projected in this country is that which the Scripps League of Western newspapers will send out during the coming July. As Congress took no steps

penters, molders, printers, &c. All workingmen's organizations are invited to correspond with the Manager Paris Expedition Scripps League, Detroit, Mich., concerning the selection of men.

The Aurora Nail Works, one of the largest manufacturing in the State of Indiana, has contracted to move to Merion to secure free gas. The factory expects to employ 500 men.

Beginning June 1 the Canadian Pacific will put on a line of steamers from Chicago to Sault Ste. Marie and form a new sea-board line. The whole line will be out of the jurisdiction of the Interstate act and compete directly with the Grand Trunk. The latter line has a slight advantage, as its lake lines to Sarnia, Midland, &c., are longer. Chicago east-bound lines will get no export business while navigation is open. This looks like war between the Canadian Pacific and the Grand Trunk, as there is nothing to hinder cut rates.

**Automatic Trimming Machine.**

The accompanying engraving represents a new machine for trimming lamp collars and other brass shells, pill and ointment

immediate vicinity. Charges of bad faith have been made against certain members, and these have been followed by the resignation of several firms, which has weakened the organization. It is claimed that

dition of affairs has, no doubt, considerable to do with the present condition of the Western Cut-Nail Association.

**The Lehigh Valley Iron District.**

A press dispatch from Allentown, Pa., quotes William H. Ainey, president of the Lehigh Iron Company, of Allentown, and a prominent banker, on the probable effect of the reduction upon the smaller furnaces in the Lehigh Valley as follows:

The effect upon the smaller furnaces may be somewhat more hurtful than to the Thomas Company, but it is probable that all will be affected alike or substantially so. The reduction had been largely anticipated, and many of the smaller furnaces for several weeks past had been freely selling at about the figures now named by the Thomas Company, simply because it was necessary because of Southern competition to sell at this price or not at all. It is not now thought that the reduction will result in any furnaces going out that are now in. It seems to be the general feeling of the furnacemen here that they must hold their markets and meet Southern competition now or abandon the fight for good. In the hope and expectation that the railroads will ultimately realize that it is in a large measure their fight as well as the furnaces', the battle is likely to go on, and any further reduction by the Southern furnaces will be met by a similar reduction here.

The Lehigh Valley lost its prestige as the largest iron-producing center because of excessive freight charges and fuel cost. When the late David Thomas, of Catsauqua, first succeeded in using anthracite coal for smelting iron ores away back in the forties, hematite ore could be mined and delivered at the furnaces here at \$1.25 a ton, and other materials correspondingly low. The books of some of the furnaces in this region show that anthracite coal cost them before the war only \$1.75 to \$2 a ton delivered at their works, but coal combinations and the excessive and inordinate greed of the railroads changed all this. These hematite ores now cost from

AUTOMATIC TRIMMER.

boxes, covers for baking-powder and other round cans. The operation of the machine is entirely automatic, the shells, as they come from the die being placed in a chute over the feeding-disk, from which they are taken one at a time, carried into position in front of the trimming cutters, securely clamped, trimmed, and thrown out at the rate of 25,000 or more per day. The makers claim that because of the perfection and rapidity of its work this machine is invaluable to manufacturers who produce large numbers of the articles above mentioned, and by reason of its rapidity reduces the cost of trimming to a minimum.

**TRIMMING AND BEADING MACHINE.**

Among the latest machines put on the market for use in the manufacture of sheet-metal goods is the trimming and beading machine herewith illustrated. It can be arranged to run by either hand or steam power, and is used for trimming and beading sheet-metal boxes, covers, collars, &c., 1 inch in diameter and larger. Round, oval, oblong, square or irregular shaped work may be done on this machine provided the corners are round. With suitable rolls and gearing it may be adapted for crimping, swedging and mousing, as well as trimming and beading. The machine is very strongly built, has steel shafts, cut gears, and means of adjustment are provided to keep the cutters in proper position. Both of these machines are built by the E. W. Bliss Company, of Brooklyn, N. Y.

It is stated on very good authority that there are some differences in the ranks of the Western Cut-Nail Association, which is composed almost exclusively of nail manufacturers of Wheeling, W. Va. and

the influence of the association on the nail market has been limited, and that the members of the association are commencing

ing to realize it. There is not a nail factory in the Ohio Valley being operated to its full capacity, and some of them have not made any nails for weeks. This con-

TRIMMING AND BEADING MACHINE.

\$2.50 to \$3 a ton at the works. It is the superior quality of these ores which has given to the Lehigh irons their high reputation for excellence as foundry iron. But

the fierce competition which has prevailed in the market has made it necessary to use less and less of these local ores. During the past year large quantities of Lake Superior hematites have been brought here.

## WRECK OF THE COMPTOIR.

### Its Relations with the Societe des Metaux.

The report read at the meeting of shareholders of the Comptoir d'Escompte is a curious and instructive document. Being drawn up by judicial officers, it possesses a sincerity that would have been wanting in a report by the old directors, who would have been disposed to extenuate their acts; in fact, with the exception of the names of the parties who were behind the Société des Métaux on the formation of the ring, nothing of interest has been concealed or disguised. The report is of great length, occupying over 13 closely-printed newspaper columns. The London *Economist* gives a brief outline of the history of the relations between the Comptoir and the Société des Métaux. These commenced in October, 1887, with an operation in tin, the success of which induced the latter company to undertake a similar speculation in copper on a much larger scale. To obtain the control of the market the stocks were first bought up, and it was then necessary to secure the production of the mines; but the funds of the company consisted of only £120,000 out of the capital of £1,000,000, the rest being represented by the plant, buildings and good-will of the firms purchased on the formation of the Société des Métaux and £800,000 raised by debentures. M. Denfert Rochereau, who was a member of the board, was also manager of the Comptoir d'Escompte, and it was to that establishment that M. Secrétan, director of the Société des Métaux, applied when the mines demanded a guarantee for the engagements entered into by him. The first signature given by the Comptoir d'Escompte was in December, 1887, to the Anaconda mines. This was followed by others on January 4 and March 13, but no mention of these operations was made in the minutes of the board meetings of the Comptoir.

The next step taken by M. Secrétan was to form a syndicate of capitalists, at first 16 in number, who undertook to advance a sum of £2,800,000 for a period of one to three years. The Comptoir d'Escompte was to act as banker and call for the funds as required, receiving the warrants from the mines, and holding them on behalf of the syndicate. Three members of the group, however, withdrew before February 1, 1888, when the arrangements were completed, but the place of one was taken by a new adherent. The capital of the syndicate was, however, reduced to £2,210,000, and of that sum the Société des Métaux entered for £600,000 and M. Secrétan personally for £480,000. Neither that company nor M. Secrétan furnished their share of the capital when a first call of 20 per cent. was made on the syndicate, and the £216,000 they had underwritten was provided by the Comptoir d'Escompte, and without any margin to protect the Comptoir in the event of a depreciation in the value of the copper. In March five foreign firms joined the syndicate, and the total of the advances to be made by the group was raised to £2,505,000. The Société des Métaux then increased its capital by the issue of 50,000 new shares of £20 at £30; but in the meantime the Comptoir had made a further call of 20 per cent. on the syndicate. The minutes of the board meeting of the Comptoir

d'Escompte, held on March 13, entered for the first time into details of the operations that had been apparently until then conducted exclusively by M. Secrétan and M. Denfert Rochereau. The director of the Comptoir then obtained authorization to guarantee two new contracts with mines in America, on his representations that it was a mere formality, as the Société des Métaux, with its new capital, possessed resources of its own amounting to 4,000,000 of francs. The risk, he said, would not exceed £80,000, and would be spread over a period of three years. This operation the judicial administrators refer to especially as being a violation of the Comptoir's statutes, which interdicted the management from entering into engagements for more than 90 days.

A fortnight later the Société des Métaux asked the Comptoir to guarantee contracts with the Cape Copper, Mason & Barry, Rio Tinto, Tharsis and other mines. The copper was to be delivered to the agency of the Comptoir in London, and M. Denfert Rochereau pointed out to the board that the Comptoir would be secured against loss by the engagements of the Société des Métaux and by the possession of the metal itself. The embarrassments were already commencing, for besides the copper purchases, the speculation in tin had never been liquidated, and the Comptoir was exposed to a loss of £880,000 under that head. A further call of 20 per cent. of the advances from the syndicate was made by the Comptoir, but at the same time a further fresh sum of £3,120,000 was guaranteed under a contract with the Rio Tinto Company. At the end of May the effective advances by the Comptoir amounted to £5,554,000, of which £1,124,000 were unsecured. At the end of June the Comptoir was in such straits that it had to obtain from the syndicate permission to pledge warrants it held for them, and which represented the value received for the advances made by the syndicate. Those warrants were employed to obtain advances from the Bank of France and other establishments. The syndicate which had engaged to advance the £2,480,000 to the Société des Métaux then demanded that the affairs in tin should be disjoined from those in copper, in consequence of which M. Secrétan engaged to transfer land of a value of £120,000, and the Société des Métaux acknowledged its liability for a sum of £628,000. The Comptoir agreed reluctantly to guarantee new contracts presented by the Société des Métaux, while M. Secrétan endeavored to maintain the confidence of his associates by assurances that the English founders had used up all the old copper and would be forced to submit to the conditions of the company.

At the end of July the unsecured advances of the Comptoir amounted to £2,320,000; at the end of October to £2,780,000. In December the negotiations with the object of forming an English company to take over the stock of copper had fallen through, and the Comptoir threatened in vain to refuse to make any further payments on behalf of the Société des Métaux. M. Secrétan replied that such a step would bring about an immediate collapse. At the end of December the advances amounted to £6,880,000, of which £3,480,000 were unsecured. In January the Comptoir was compelled to borrow £840,000 to continue the business of the Société des Métaux. The next sacrifice it was called on to make was to part with warrants representing a security of £1,520,000 to permit the Société des Métaux to raise a loan of £1,000,000. This was on February 5 last. In return for that concession, M. Secrétan engaged to sell from March 1 12,000 tons of copper monthly by public sales, if unable to find purchasers privately; but that arrangement was superseded by the formation of the Société Auxiliare des Métaux, which

was to take over 75,000 tons of copper at the price of £70 per ton, and pay over the value to the Comptoir d'Escompte. That contract was, however, only partially carried out, and as the Comptoir had subscribed a part of the capital of the new company, the effective reduction in the advances to the Société des Métaux was of insignificant amount.

The events that followed are well known: A sudden drop in shares of the Comptoir d'Escompte led to withdrawals of deposits, the embarrassments of the Comptoir having become a matter of public rumor; next came the suicide of M. Denfert Rochereau and the run on the bank. At the end of March the total sum advanced by the Comptoir to the Société des Métaux was £5,860,000, against which there remained 67,827 tons of copper. If this were realized at £40 per ton the loss would amount to £2,713,000. If the price realized were lower the loss would be greater. Some minor endorsements of warrants would increase the loss to above £3,200,000; consequently the entire capital of the Comptoir, which is £3,200,000, has been swallowed up. The Comptoir had further guaranteed the payment of future deliveries of 320,000 tons. The judicial administrators believe that those engagements may be canceled. The mine owners have no interest in insisting on the execution of the contracts of sale. As the report of the judicial administrators remarks, they are placed in the alternative of delivering the copper and being paid a dividend on the amount of their claims, or abandoning the contracts, in which case the guarantee of the Comptoir would become void *ipso facto*.

The Supreme Court of Florida has rendered a decision of vital importance to the public and to railroad corporations. The Board of Railroad Commissioners in 1887 fixed the rates for the Pensacola and Atlantic Railroad Company, which the company asserted were too low to enable them to earn enough revenue to pay their operating expenses, and they refused to adopt the rates fixed by the commission. The State of Florida, at the instance of the commission, brought suit against the railroad to recover the penalties provided by statute, and obtained judgments in the lower court for several thousand dollars. The railroad company appealed, and the Supreme Court now reverses the judgment of the lower court, holding that a reduction by the Legislature or commission of the rates of a railroad to a point too low to permit them to earn operating expenses is a deprivation of property without due process of law and without just compensation, and is confiscation and in conflict with the State and Federal Constitutions. This is the first decision of the kind by a court of last resort.

Forest fires of unusual magnitude for the spring months have recently swept over various sections of the country. They have been particularly destructive of property in Michigan, Wisconsin and Minnesota during the past week. Quite a number of iron-mining companies have been sufferers through the burning of timber which had been cut for use in the mines, the losses of single companies amounting in several cases to many thousands of dollars, which will seriously impair their chances for profits on the season's operations. It is not known how far the stock of cord-wood has been damaged which had been secured by the charcoal furnaces, but it has not escaped. The fall of rain has been much below the average for the season, making the forests very dry, so that it is very difficult to check fires when once started.

The Fassett prison-labor bill has gone to Governor Hill for his signature.

## THE WEEK.

The complaint of hard times in California, heard for a few weeks past, is attributed to low prices of produce and holding for an advance. Of the fruit crop, which is a feature in California agriculture, 300,000 cases are waiting shipment in consequence of high rates of freight. Viticulturists are discouraged by low prices for wine. On the other hand, the promise of extraordinary crops is very cheering. Even with lower prices for wheat and barley it is figured out that the returns will equal \$67,000,000, nearly doubling the receipts of 1888.

Chief Engineer R. L. Harris, U. S. N., one of the officers designated to test the new cruiser *Charleston*, died at San Francisco the 16th inst. of pneumonia.

The locomotive which the Pennsylvania Railroad Company imported from the shops at Crewe, England, and have been testing for the last two or three weeks, has not given satisfaction. It is in charge of an English engineer and a machinist from the shops at Crewe, and can make excellent speed with a light train, but with an average train, like the New York and Chicago limited, it is out-distanced by the Pennsylvania locomotive. When a stop is made too much time is lost in getting the English locomotive under way again. Almost its only point of superiority is the contrivance for saving fuel.

Princeton College has initiated a new course on electrical engineering.

The President's new appointments include Solomon Hirsch, of Oregon, to succeed Minister Straus at Constantinople, and John Jarrett goes as consul to Birmingham. Mr. Jarrett has been long known from his connection with the iron and steel industries. Thomas H. Sherman, Secretary Blaine's private secretary, takes the consulship at Liverpool.

In Amsterdam, the world's diamond market, the proprietors of the largest lapidaries report that America leads in buying the choicest gems.

The ubiquitous "English syndicate" that is always buying up cattle ranches, mining lands, breweries, &c., has purchased 400,000 acres of timber land, mills and other property in Florida, paying upward of \$1,500,000.

The opinion is expressed that beyond a protest from the new Chinese Minister, who will arrive in Washington about September 1, that Government will acquiesce in the practical application of the Scott Exclusion act passed by Congress.

More than 100 persons in New Haven were dangerously poisoned by eating cream from freezers which had been in disuse since last summer and were much corroded.

The scarcity of ships and continued high sales of freight operate to encourage ship-building in the Eastern States, which is receiving a new impetus.

The hardships experienced by importers of merchandise and manufacturers in the ordeal of the Custom House is the theme of a New York commercial editor, who charges that the holder of a foreign invoice is often treated as one having no rights. "Great as may be the frauds on the revenue at the hands of dishonest importers," he says, "we believe the total amount that is illegally exacted by over-estimates of value and unwarranted applications of high rates exceeds the sum that is lost through the knavery of the dealer. The public hear most exaggerated stories of the one side, but the others are compelled to a great extent to suffer in silence.

Their story is not heard, and they have no way by which their wrongs can be redressed." In all the processes of warehousing, appraising, &c., there is a strong temptation to practices that savor of extortion.

In consequence of the invention of improved machinery for the manufacture of linen thread, a company has been formed in New York which expects to compete successfully with foreign mills and to be at work in September next. The new process is known as the Boyce process, and is very simple.

The Spanish-American Commercial Union, lately organized, and which last week established headquarters in Wall street, expects to be recognized as a sort of Spanish-American Chamber of Commerce. It is the intention to establish frequent and speedy communication with South American ports and direct banking facilities between North and South America. The trade of the Spanish-American countries reaches the grand total of \$450,000,000 per annum, and of this, at present, the United States has only about 11 per cent., England and Germany dividing the remainder. The members of the union will make an effort to bring this immense foreign business to the port of New York.

New Orleans is encouraged by the recent growth of her foreign import trade, which in April was larger than for any corresponding month since the war. The returns from the West Indies and Latin America are particularly satisfactory, the imports from these countries being \$1,911,512, against \$6,072,400 for the entire year of 1887. The exports are as large as ever and the coastwise trade as good.

The site of Albany was originally called Oranje, not Aurania, as commonly believed. An investigation of the subject shows that the blunder grew out of a similarity of sound, the name given by the Dutch having been in honor of the Prince of Orange. As it sounded when pronounced by a Dutch tongue like Aurania, many inferred that this was the orthography.

The proceedings of the Samoan Conference in Berlin give promise of an amicable settlement of all differences between the three nations there represented.

The new Post-office and United States Court-house Building which has been erected in Baltimore at a cost of about \$2,000,000, will be ready for occupancy next September.

The superb new steamer, *Connecticut*, for the Providence line, will be completed at Cramp's this week, at a cost of \$625,000.

There are 6,000,000 acres in the Cherokee lands which the Government is negotiating to buy. At \$1.25 an acre this will bring the tribe \$7,500,000. The Cherokees are not rich in invested funds, though notably thrifty in their tribal and individual dealings. All the funds invested for their benefit and held for them in the Treasury—national, school and educational—amount to about \$2,500,000. The sale of the Cherokee outlet will at once increase their national wealth to \$10,000,000 and make them the wealthiest tribe in the United States.

The Canadian Pacific's new line across the State of Maine is now virtually completed, thus securing for that corporation a line extending from the Pacific to the Atlantic. The route is from Megantic, Canada, southeasterly across the State, around the foot of Moosehead Lake to a point on the Maine Central known as Mattawamkeag, about 60 miles from the New Brunswick line. From this point running rights were obtained over the Maine Central, with connections to the

Maritime Provinces. Next winter this new line will be utilized for winter business, but during this summer only a fast mail service will be established, and an effort made to open up the coal mines of Nova Scotia. New iron bridges will be built, one by the Philadelphia and Reading Railroad on the Richmond branch, and another by the Lehigh Valley near San Ringgold.

With well-directed efforts the island of Malta, according to a consular report, might become a profitable market for American-made articles, such as very light plows, hardware, including mechanical tools, especially those used in carriage-making, cheap platform scales, clocks, sewing-machines and oil stoves.

Speaking in reference to a statement which appeared in a San Francisco paper to the effect that Esquimault, British Columbia, was being made into a second Gibraltar, a Cabinet minister at Ottawa stated that such a statement was untrue. "What sensational nonsense," said the minister, laughing. "If the United States have any objection to Esquimault being fortified they can retaliate by building a fort directly opposite." The principal work in progress at Esquimault, he explained, is a gearing dock for the repair of British men-of-war.

G. E. Ruther, of Bridgeport, Conn., claims to have discovered a new system whereby a material reduction of labor in the Fire Department may be brought about. It is called the electric fire-engine, and consists of a motor, to take the place of the present steam-engine. The motors would receive their power from the dynamos of the electric lighting companies. Mr. Ruther's idea is to lay down wires from the nearest dynamos to boxes placed in close proximity to every hydrant. The instant an alarm of fire is sounded an automatic arrangement would start, the dynamos supplying the power. On the arrival of the engine at the scene of the fire a connection of the wires would be made and the pumps set to work immediately. Chief Bonner says that of the many electric substitutes for steam-power presented to him none of them, thus far, have been found both practical and trustworthy.

The Berlin Bridge Company contracted to build a bridge over the river at Sheldon, and they in turn contracted with the Vermont Construction Company to build the abutments and piers. Subsequently the bridge was carried away by high water and ice, and the Berlin Company brought suit to recover from the Vermont Construction Company, alleging defective workmanship by the latter in connection with the bridge masonry. The jury, at St. Albans, brought in a verdict on the 15th inst. for the plaintiffs in the sum of \$5875. Numerous exceptions were taken and the case will doubtless go to the Supreme Court.

In the import trade of Paraguay the United States have no share beyond contributing a few agricultural implements and a little lumber. The American consul, Mr. Hill, says respecting prospects for trade: "There is at present, as is well known, no direct line of steamers from any American port to the River Plate. All goods of American manufacture destined for Paraguay must needs be twice transshipped, once at Rio de Janeiro and again at the mouth of the Plate. Again, here, as elsewhere in South America, business is done on long credits, six months and in some cases still longer time being granted. The English and Germans are anxious to do business on these terms. My correspondence with American firms would seem to indicate that our people are not." Mr. Hill says that trade amounting to about \$4,000,000 annually is worth

the attention of Americans; that the era of progress and prosperity in that country is just dawning, and that the Government would cordially support endeavors to establish trade relations.

A syndicate of Philadelphia capitalists, headed by Mr. Thomas Cochran, is reported to have purchased the graphophone rights for the world outside of the United States and Canada. The price paid was \$500,000.

Six new street railroad lines for the city of Philadelphia have filed their articles of incorporation. A bill authorizing elevated railroads in Boston was killed in the Massachusetts Legislature.

A new railroad line into New York is contemplated by a combination of the Housatonic and New England routes. The plan comprises a water route for steamers of 36 miles from this city to Wilson's Point, near Norfolk, Conn., where they will connect with the Housatonic Railroad.

The fine steel steamer *Alaskan*, built by John Roach for the Oregon Railway and Navigation Company, foundered in a gale on the Oregon coast and many of her crew were lost. She cost \$350,000, and was one of the swiftest boats on the coast. A dispatch says her upper deck suddenly lifted and she broke in two.

Governor Ames, of Massachusetts, having recommended the removal of the old machinery in the prison of that State, a legislative committee are visiting various States in search of information which may aid in pursuing the wisest course.

The new consul to Honolulu, Henry W. Severance, was consul at San Francisco for the Hawaiian Government and is well informed respecting the affairs of the Sandwich Islands.

In the new addition to the American Museum of Natural History there will be the largest box or riveted girders ever used in the construction of a building. These girders were designed by J. Cleveland Cady, the architect, to support the floors and partitions, the object being to give unobstructed floor space. There are 28 of these girders, measuring about 62 feet in length, and weighing 40,000 pounds each. They were landed on the North River front of the city, in the neighborhood of Fiftieth street. Ordinary trucks having been taxed in vain to transport them to their destination, the contractors found it necessary to construct a tramway across the square from Ninth avenue to the building.

Mr. Wannamaker, the Postmaster-General, pays tax upon an annual business of more than \$10,000,000 and heads the list of tax-payers in Philadelphia. There are two others in that city who do a business exceeding \$5,000,000 annually.

The latest fad in boat-building is to "strike" a boat from a die, virtually in one piece of mild steel, with no rivets except where fittings have to be attached at bow and stern. The whole thing, it is said, depends upon the mildness of the steel to be employed, for in the construction there is no mechanical difficulty if only the plates will stand the bending and the force employed.

A crew of 75 men are now at work in the Hudson River tunnel, reinforced with English capital, and the excavation will soon go on from the New York extremity in the north and south tunnels alike.

A cargo of 640 tons of steel rails manufactured by the Edgar Thomson Works for the Missouri Pacific Railroad was sunk in deep water in the Mississippi River near Grand Tower two months ago. Divers in submarine armor recovered all but 90 tons.

## MANUFACTURING

### Iron and Steel.

On the 16th inst. there were shipped from the Homestead Steel Works of Carnegie, Phipps & Co., Limited, at Homestead, Pa., two large steel plates for Government ships. They were 8 inches thick, 9 inches wide and 206 inches long. Each plate weighed 13,000 pounds. The plates were bent in a semicircle, and are to be used round the pilot-houses of large gunboats. The work of bending them was done while the plates were cold—the first attempt ever made at such work in the United States. It was so successfully accomplished that the firm are getting ready to fill six more orders of a similar nature. On Saturday, the 18th inst., there were turned out at this plant two plates 96 inches wide, 180 inches long and 3 inches thick. Each plate weighed 9000 pounds. The plates were heated to a cherry-red and bent on rolls in the shape of a semicircle. They were tested to 60,000 pounds tensile strength and to an elongation of 20 per cent. in 8 inches.

The Henderson Steel and Mfg. Company, of Birmingham, Ala., have decided at a recent special meeting to increase the capital and build a 12-ton basic open-hearth furnace.

The labor disturbance at the works of the Syracuse Tube Company, Syracuse, N. Y., has been adjusted. They are now running all their mills full time in all departments.

No. 2 Furnace, of the Port Henry Furnace Company, Port Henry, N. Y., has again passed her best previous record, having made last week 498 tons of iron. This is nearly double the best average output of any previous blast, and is believed to be by far the best record of any furnace of its size in the Champlain or Hudson River Valley not using coke exclusively. Considering the fact that the ores used were all Champlain magnetites, which while rich in iron are difficult of reduction, and the fuel principally Delaware and Hudson anthracite coal, the record will perhaps compare not unfavorably with other notable furnace outputs.

Andrews Brothers & Co., of Haseton, Ohio, are adding a new and improved hot-blast stove to their furnace, which will cost about \$50,000.

There is a company in embryo to buy or lease the "old mill" and devote it to the manufacture of wire nails and sheet-iron; but nothing more substantial than talk has been done to date.—*Ironton (Ohio) Register*.

The rolling mill and nail factory of the Oxford Iron and Nail Company, at Oxford, N. J., has shut down for temporary repairs.

The American Tube and Iron Company, of Middletown, Pa., have closed a contract with the Pittsburgh Plate Glass Company, to supply immediately all the pipe necessary for their 8-inch gas line from the Ruff Run field to their Ford City Works, a distance of 12 miles. The pipe trade is in the best of conditions.

The Monongahela Furnace Company were permanently organized at McKeesport, Pa., last week. The details of the preliminary organization of the company were set forth in our issue of the 26th inst. The corporation is composed of the stockholders of the National Tube Works Company, and propose to erect two of the latest improved furnaces, each with a capacity of 250 tons daily, on the site of the White homestead at McKeesport, Pa. The pig-iron produced will be used by the National Tube Works Company and the

Republic Iron Works, Limited. Committees will be appointed at once to secure bids for the building of the new plant, which the company hope to have completed by February 1, 1890. The officers elected are: President, E. C. Converse; treasurer, W. F. Eaton, of Boston; assistant treasurer, Horace Crosby, of Pittsburgh; vice-president, D. W. Hitchcock, of Boston. Directors: E. C. Converse, J. H. Flagler, C. I. O'Connor, Horace Crosby, H. J. Eaton and D. W. Hitchcock.

The appraisement of all the real estate of the Reading Iron Works amounts to \$780,000. The estimated appraisement at the time of the failure was about \$1,000,000 more than the above amount. The appraisement of the personal property amounts to \$450,000, including some 11,000 tons of pig-iron. Deducting the mortgage and all expenses necessary for the adjustment of the affairs of the company, the sale of the iron, collecting of rent, &c., it is estimated that the balance left will be enough to pay about 38 per cent. of the claims of the creditors, which does not include the stock lien, and which may be wiped out entirely. Their figures show that the present value of the plant is considerably less than its cost and what it was estimated to be worth at the time of the assignment.

The furnace of the Bellefonte Furnace Company, at Bellefonte, Pa., has been blown out after a very successful run of 17 months. The stack will be relined, and therefore work will not be resumed for two months.

The Glendon Company, at Easton, Pa., are pushing forward repairs on stack No. 3. Their No. 2 stack, which has been in blast some time, is now out of service. This leaves but one furnace in blast.

The charcoal furnace at Joanna, Pa., has started up after an idleness of a year. The furnace has undergone extensive repairs, enlarging its capacity, and new engines and boilers have been put in.

### Machinery.

At a meeting of the directors of the Westinghouse Electric Company, held in the office of the company, at Pittsburgh, on the 16th inst., the regular quarterly dividend of 1½ per cent. was declared.

The Southwark Foundry and Machine Company, of Philadelphia, are turning out this year some very heavy work. They recently finished four immense duplex blowing engines for the new works of the Pennsylvania Steel Company, near Baltimore. Each engine weighs 755,000 pounds, and under each are two bed-plates weighing 63,000 pounds apiece. These were cast in one piece. The fly-wheel, weighing 100,000 pounds, was also cast whole and split afterward. It is believed that these are the largest blowing engines in the country.

### Hardware.

Waltham Emery Wheel Company, Waltham, Mass., report that they are running their factory night and day to fill orders. An enlargement of this plant is contemplated.

The mills of the Harrison Wire Company, at St. Louis, which have been idle for some years, were completely destroyed by fire recently, causing a loss of about \$40,000, with no insurance.

Hubbard & Co., axe and shovel manufacturers, of Pittsburgh, whose works in that city were destroyed by fire some weeks ago, have decided not to rebuild in that city, but will build new works at Beaver Falls, Pa. They already have a plant there, and will simply extend it. The firm have recently been reorganized, David M. Long, W. N. Frew and Martha E. Frew having sold their interests to the

remaining partners. The firm will continue to be known as Hubbard & Co., and is now composed of the following-named persons: Charles W. and Sherman D. Hubbard, Charles Lockhart and Samuel A. Rankin.

The Rockford Bit Company who removed from Rockford, Ill., to Kokomo, Ind., last July, advise us that the growth of their business has been remarkable in a little over a year, gaining in output from about 40,000 dozen to over 75,000 dozen annually. In order to meet the increasing demand they will make large additions to their factory, so as largely to increase their capacity, and it is expected that when finished their factory will be one of the most complete in the country. Besides the common auger bits they will make a specialty of their Perfection brand auger bits (Jennings' pattern). They allude also to the advantages possessed by them in their present location.

#### Miscellaneous.

Among the large leather belts recently manufactured by the Charles Munson Belting Company, of Pittsburgh, was one 120 feet long and 40 inches wide. It was made for the Oliver & Roberts Wire Company, Limited, of that city.

The Norton Fluid Metal Rolling Company, of Chicago, received a license to incorporate under the laws of Illinois on the 11th inst. They will have a capital of \$1,000,000, and will manufacture metal sheets, plates, tubes, &c., directly from fluid metal. The incorporators are Edwin Norton, Oliver W. Norton and C. C. Warren.

The committee appointed to examine the condition of the Malleable Iron Company, at Meriden, Conn., recommended that the creditors accept 30 cents on the dollar.

#### Labor Troubles at Pittsburgh.

During last week the workmen in the employ of the National Tube Works Company, at McKeesport, Pa., to the number of 1500, and a majority of the workmen at the Solar Iron Works of William Clark's Son & Co., at Pittsburgh, went out on a strike. In the first case mentioned the strike lasted but one day, as the firm agreed to give the men the advance in wages which they requested. It will be remembered that about one year ago the company made a reduction in wages of from 5 to 10 per cent., with the understanding that when an improvement in trade took place the reduction would be restored. It is claimed by the men that before the strike took place they made efforts through a committee to have the reduction restored and failed. The company claim that the men failed to give notice that they would strike. The latter say the demand of the committee was in itself a notice that they would come out if it was not complied with. The following statement was prepared by the general manager and handed to the committee appointed by the employees to wait on the firm:

That the management having considered your application for the restoration of the wages existing before the last 1888 reduction, now give notice that all departments will be so restored, to take effect on and after Monday, May 20.

While the business of the general pipe trade does not warrant an advance at the moment, yet we feel that if trade prices improve we have now anticipated what we expected doing at a later date.

The threading and shipping departments will resume operations to-night, Friday, May 17. The furnace and other departments will resume Monday morning, May 20, usual time.

NATIONAL TUBE WORKS COMPANY.  
J. H. FLAGLER, General Manager.

The advance in wages granted will average about 7½ per cent. All departments of the plant are now in full operation.

At the Solar Iron Works all the workmen, with the exception of the puddlers, went out on a strike on the morning of the 16th inst., and at this writing have not returned to work. As is probably well known, this is a non-union mill, and has been operated as such since December, 1887. At that time there was an extensive strike at the mill on account of the refusal of the firm to discharge a man who held two positions, which is against the rules of the Amalgamated Association. It is known as the "two-job" system. A long strike took place, which resulted in the defeat of the Amalgamated Association. For some time past the men have been dissatisfied, as they claimed they were receiving considerably less wages than are paid in mills controlled by the Amalgamated Association. On Wednesday evening, the 15th inst., the men held a meeting, at which President Weihe, of the Amalgamated Association, was present, and decided to again join the Amalgamated Association. A copy of the Amalgamated scale was prepared and presented to Mr. Clark, of the firm, who refused to sign it, the men stopping work at once. The only part of the mill in operation is the puddling department, which is operated wholly by colored men, to the number of 89. It is stated that these men would have also gone out but for the fact that the rules of the Amalgamated Association prohibit a colored man from joining it. It is stated that the firm have sent to the South for colored workmen, and will endeavor to operate the mill with new men. From present indications the fight will be a prolonged one.

The strike at the works of the Allegheny Bessemer Steel Company, at Duquesne, Pa., mention of which has been made in these columns before, is almost at an end, the workmen being defeated. While the entire plant is not in operation as yet, new men are being received every day, and it is a question of only a short time until enough men will be at work to operate the works to their full capacity.

The Lake Superior iron mines are busy. A dispatch from Ishpeming, 19th inst., says: "Over 750,000 tons of ore have already been sent from the five shipping ports of the Lake Superior iron district. At the corresponding date last year scarcely 100,000 tons of the ore had been sent forward. Marquette promises to regain the standing it once had as a shipping port for ore this season. The Cleveland Iron Mining Company, who grew tired of the extortionate charges of the vesselmen for transporting ore to Cleveland, have built vessels which will carry the entire ore output of the company this season. The vessels are of the largest size that will pass through the locks of the Sault Ship Canal, and will carry from 2500 to 3000 tons of ore. The prediction made several weeks ago that fully 6,000,000 tons of ore would be shipped by the mines of the district this year will be verified, unless appearances are deceptive. All of the large mines are preparing for heavy shipments, and the ore is going forward more rapidly than ever before. A number of the mines that ranked among the small producers last year will this season come to the front as heavy shippers. The Gogebic range will not materially add to its output of last year, but the mines of the Vermilion, Menominee, and Marquette ranges will produce more ore than ever before."

The New York Legislature, now adjourned, made appropriations amounting to about \$12,560,000, against \$9,089,000 last year, an increase of more than one-third. The rate of taxation for State purposes is raised from 2.62 to 3.52 mills on the dollar. Mayor Grant's Rapid Transit bill was killed; also the bill to reduce telephone charges. The Fasset Prison

bill was passed. Judge Greene's bill for bridging the North River was killed. The most important bill passed as concerning New York City was the \$4,000,000 Municipal Building bill.

#### Another Atlantic Racer.

The new Hamburg liner, Augusta-Victoria, the first of the twin-screw steamers built in England for the Hamburg-American Packet Company, arrived at this port on Saturday evening, completing the best first trip ever made by an ocean steamer. The exact time taken in going from Southampton to Sandy Hook was 7 days 2 hours and 30 minutes, equal to 6 days 8 hours and 30 minutes from Fastnet. She has a length of 460 feet, a width of 56 feet and a depth of 38 feet. Her engines develop the force of 12,500 horse-power, and her displacement is 10,000 tons. She carries three masts, and has a sharp straight stem and well-rounded stern. The new vessel has its whole working machinery duplicated. There are two distinct sets of boilers, two engines, two shafts and two screws, both sets working independent of each other, and separated by one solid longitudinal bulkhead running through the whole length of the ship from stem to stern, from the keel to the upper deck, and dividing the vessel into two non-communicating halves, of which each is fully equipped to propel the ship. It is claimed that in case of accident to one side of the vessel the other portion could in no wise be affected, as the machinery of the opposite half would continue to work and propel the ship with perfect ease. Numerous water-tight compartments subdivide each side of the ship and do not communicate with each other. These dividing bulkheads are solid fixtures without any openings whatever, and are thus capable of confining to one compartment any accident that might happen, for in case of a leak the compartment might be filled with water without affecting the buoyancy of the ship, and in case of fire such compartment could be quickly flooded with the steam pumps. The steamer has two keels, one on each side, which have not only the effect of lessening the draft but also prevent to a great extent the rolling motion, thus tending to keep the screws always under water and increasing the speed.

The collapse of the Panama Canal scheme is complete, the last contractor having ceased on the 7th inst. The most impressive spectacle in surveying the grounds is the immense quantity of abandoned machinery in various stages of corrosion. Merchants are vacating their warehouses.

The City of Paris, of the Inman Line, arrived at Queenstown on Tuesday night, having made the fastest eastward passage on record. The journey lasted 5 days, 22 hours and 10 minutes. By this feat the Inman liner has outdone her own westward achievement. The last trip of the City of Paris from Queenstown to New York was made in 5 days, 23 hours and 8 minutes.

Berlin dispatches indicate that Germany has agreed to restore King Malietoa to the Samoan throne, but demands an indemnity for what are termed native aggressions against the Germans.

It is reported that a company with a capital stock of \$3,000,000, made up of English capitalists and northern iron-masters, will build four blast furnaces at Cumberland Gap, Tenn., near the Virginia line.

# The Iron Age

New York, Thursday, May 23, 1889.

## Profits of Iron and Steel Manufacturers.

Under existing circumstances it is very natural for business men to draw comparisons between their own unsatisfactory condition and that of those with whom they have trade relations. Although everybody concerned may be suffering from unremunerative prices for their products, as well as a restricted demand, the other man is always the one who is specially favored. Manufacturing consumers of iron and steel seem to be particularly inclined to entertain this view with regard to those from whom they draw their supplies of what to them is raw material. No matter how low prices of such iron and steel may be the consumers insist on having them reduced still lower, in the belief, which is more or less popular, that somehow or other the iron and steel manufacturer will be able to retain for himself a comfortable margin of profit. The competition for business between the manufacturers is by no means relied upon to depress prices to consumers, but the latter resort to all kinds of practices and devices to get their iron and steel cheaper. They ignore statements which may be made of the impossibility of further reducing prices so long as good raw materials and wages continue on the present basis, and take the chances of receiving a product cheapened by the use of inferior materials or poor workmanship, the necessity of which is thus imposed on the manufacturers. Yet the iron and steel business is regarded as such a desirable and lucrative occupation that outsiders are continually seeking to enter it.

Those who have had a long experience in the manufacture of iron and steel, and who should be able to express a correct opinion of its advantages and disadvantages, invariably assert that consumers have in the majority of cases acquired wealth more rapidly than themselves. The years in which a fair margin of profit is secured by a manufacturer are very few in comparison with the years in which prices are low and margins are narrow or else wiped out altogether. There are conspicuous instances of large fortunes made in this branch of trade, but they are the more conspicuous by reason of the numerous instances to be found in every iron-making section of works which have only earned their owners a fair competence, or have barely given them a living or have proved absolute failures, and ruined all connected with them. There is not an iron-making section of the country in which disastrous failures, often occurring despite the most careful management, have not served as reminders of epochs of low prices and unremunerative business. They should have served a useful purpose also as monitors to those who affect to believe that iron

and steel prices can be indefinitely reduced without disaster to the producers.

A manufacturer of not less than 25 years' experience, who has been reasonably frugal and who has acquired but a modest competence to represent that long term of hard work and risk of capital, recently sought to make a sale of iron to a consumer who in less than half that time had swollen his capital of \$25,000 to over \$2,000,000. He was not told that his prices were higher than those made by competitors, but that all prices of iron were still too high and would have to be reduced; iron manufacturers in this country were making entirely too much money and must cut down their profits. If they refused to do so willingly they would be obliged to do so against their wills. The immense fortune which had been accumulated by the consumer in question was evidence in itself that so far as the price of his own products was concerned he had taken good care to see that it was high enough. The view of the iron trade taken by this man is not exceptional, or it would not be worth stating. On the contrary, there are many consumers who express themselves in the same way, and, further than that, they endeavor to depress prices by various means, in order to force values down to the level which they insist should obtain.

It would be invidious to point out the memorable failures in the iron and steel trades which have occurred to add emphasis to this presentation of the manufacturers' side. Examples will occur to the least informed. Those who have made large fortunes out of the iron and steel business in itself are comparatively few in number, taking into consideration the vast extent of the business and the large number of persons interested in it. Side issues, such as land speculations, coal mining, oil speculations, and above all ore mining, have caused accretions of wealth which have often been wrongly attributed to the large profit on the manufacture of iron and steel because the party involved was known to the world generally as an iron and steel manufacturer. We have in mind as an instance of this a good friend who frankly confesses that until he became actively interested in ore mines he was able to accumulate very little money, although he had previously for years conducted what outsiders presumed was a very lucrative iron and steel business. His customers were more benefited than he was, and this, we believe, would be the testimony of most manufacturers.

## Arbitration at the Conference of American Nations.

With few exceptions, all the Governments of nations to the south of us have now officially accepted the invitation of our Government to attend the congress of all American nations to be held at Washington in October next. Among the items in Section II of the programme there are two likely to lead to practical results of far-reaching influence. They are:

1. Measures that shall tend to preserve the peace and promote the prosperity of the several American States.

7. An agreement upon and recommendation for adoption to their respective Governments of a definite plan of arbitration of all questions, disputes and differences that may now or here-

after exist between them, to the end that all difficulties and disputes between such nations may be peacefully settled and wars prevented.

Several wars in Central and South America that occurred during the present generation could easily have been avoided if arbitration had been resorted to. We may instance the war on the Pacific, which ruined Peru almost hopelessly and debarred Bolivia from access to the Pacific, and the war in Central America that followed the invasion of Salvador by General Barrios, then President of Guatemala. War seemed inevitable (at the time of the strife on the Pacific) between the Argentine Republic and Chili on account of the Patagonia frontier. President Hayes' arbitration prevented it, and only last year President Cleveland arbitrated between Nicaragua and Costa Rica in connection with the projected canal. In a few instances European monarchs have lately been arbiters, Spain in particular, the last decision of the latter settling the difficulty between Colombia and Italy. Most of the disputes in Spanish America being border troubles, and Spain possessing in her archives the old documents relating to frontier surveys between the former viceroyalties, she is the less objectionable among the European States, but still if European arbitration can be avoided and the nations of this hemisphere settle the differences quietly among themselves on the basis of a mutually accepted principle, it will be by far better. The sooner a standing committee of an international character can be appointed the better it will be for the settlement of pending disputes threatening war. The most urgent case for settlement seems to be the dispute between Paraguay and Bolivia. We extract from an editorial, which in April last appeared in the leading Rio daily paper, the *Jornal do Comercio*, the following passage: "It is asserted that the Brazilian Government can do nothing to prevent a conflict between Bolivia and Paragua, since our Government has suffered a check from the first nation which will seize the territory in dispute. It is also evident that a treaty of alliance exists between Brazil and Paragua, which, while strengthening the Republic, guarantees the interests of Brazil. There is no doubt that we are preparing for war, since everything indicates that it is imminent. Under the pretext of preventing an invasion of our territory, we send to our frontiers an army five times larger than is necessary."

In answer to insinuations of the kind, the Government of Dom Pedro kept silent. Early in March news was still peaceful; it was then asserted that this question of the Puerto Pacheco district on the upper Paraguay was receiving an amicable settlement. Paraguay was to reserve her sovereignty, while conceding to Bolivians the usufruct of the district. A hitch seems to have occurred since, and Brazil prepares for active military intervention, which may suit its home politics all the better, since the republican agitation would then find a diversion and be suffocated by the martial ardor.

The trouble between England and Venezuela about the British Guiana frontier was alluded to by President Pablo Rojas Paul in his message to the National Congress, assembled at Caracas, in March last, with the following words: "The English have from all appearances definitely

taken possession of the vast territory which stretches from the Essequibo to the Pomaron on the southern bank of the Orinoco, building fortifications, erecting buildings for offices, and organizing colonial administration, the inference being that they regard as their property that portion of the neighbor's house." Prior to the more important gold discoveries in the district the ownership of Venezuela was recognized and permission was asked to build light-houses at the mouth of the river for the benefit of the seafaring nations; it was stated that the garrisoning of Point Barima, situate in a region explored by the English traveler, Schomburgk, did by no means imply that England laid claim to it. The importance of the gold mines, which appears to be permanent, has changed all this.

The partisan strife in Hayti since the exile and death of ex-President Salomon, last summer, does not appear to draw to a close. One month Légitime is the victor, and the next Hyppolite. It is asserted by foreigners arriving thence that both intentionally prolong the strife so as to be able to drain the country of what money there is left till both have enough. Under Salomon Hayti flourished, coffee (about the only product besides logwood) brought good prices latterly, so that it may take some time before the cash that can be extorted is exhausted. As we are the only nation which has not recognized Légitime, nor his blockade, we are doing a thriving trade down there. But the warfare is described as being most barbarous, and it is about time that some pressure be exercised to put a stop to the atrocities mutually perpetrated. The rest of America is in a normal condition, there being no revolution present or in sight. But the three cases we have alluded to amply prove how necessary it has become for the interests of all to firmly establish arbitration. As late as December 4 last Don Matias Romero, Minister of Mexico at Washington, in a letter to the Philadelphia Peace League, dwelt at some length on the good prospects which arbitration evidently has in America, showing how useful it has been between his country and the United States. This seems indeed to be the general sentiment.

#### The Copper Situation.

The American mines fixed the price of copper last week at 12 cents for Lake, which represents the price on the basis of which they are willing to pay rebates of  $4\frac{1}{2}$  cents on copper delivered during the past two months. It represents the price, too, which they hope to maintain, providing the negotiations with the bankers who hold the stock of syndicate copper are carried to a successful issue. It is reported that new propositions have been again submitted. It is certain that the foreign holders will be very eager to participate in the highest market of the world. It may be questioned whether they can realize say £47 for Lake in Europe, which would be equal to about  $10\frac{1}{2}$  cents here. On the other hand, the American mines cannot hope to hold the price at 12 cents if the stock of the foreign bankers cannot be tied up in some way, or entirely taken out of the country, as has been proposed. If the negotiations fail the foreign

bankers will certainly be eager to sell here so long as they can get any more in the American market than they can hope to secure abroad. Only artificial means can hold the market at 12 cents or anywhere near it, and whatever agreement is reached must include the holders of the stock held here on foreign account. It is not surprising that under these circumstances manufacturers and the trade will operate very carefully, and even if finally the completion of the pending negotiations should be announced, there are too many possibilities of leaks and evasions to inspire very much confidence.

The leading considerations which command caution have been repeatedly alluded to. In the first place, our mines are able to supply the market fully, at a small profit, at 10 cents a pound, and then must find an outlet for a surplus abroad. The price at which the latter can be placed must ultimately determine approximately the figure at which the domestic consumers are supplied. The surplus is too great, it comes from too many sources, too readily antagonistic, to allow of the old methods of marketing at a sacrifice for the sake of holding up this market artificially. The price in the United States cannot long be 25 per cent. higher than that for the same grades of metal in Europe. But even if producers all over the world can get together to agree upon a reduction of output, the bankers must be dealt with. It has certainly not proved an easy matter thus far, after months of negotiations in the face of serious dangers.

A good many persons in the copper trade seem inclined to the opinion that its best interests require the maintenance of a price like that just made. But the evil is done. The penalties of the unnatural condition of affairs last year must be borne. It may well be questioned whether all interests are not best served by a complete break with the past, allowing consumption to develop as it should under the stimulus of prices which have become natural.

**Reduced Rates on Iron.**—The Pittsburgh and Lake Erie, Pennsylvania, and Pittsburgh Western railroads have reduced the freight rates on pig-iron, blooms, scrap, muck-bar, &c., to and from the Mahoning and Shenango Valley blast furnaces 15 cents per ton. The former rate was 80 cents. It is now 65 cents. This reduction is in effect between Cleveland and the valleys as well as between Pittsburgh and those points. The depressed condition of the iron trade caused the railroad companies to make the reduction. The rates on the Baltimore and Ohio and Pittsburgh, McKeesport and Youghiogheny between the Connellsville district blast-furnaces and Pittsburgh have been correspondingly reduced. A similar cut has been made on the first-named road between Pittsburgh and Cleveland.

The Treasury Department has designated Barren Island, in the New York collection district, as a place where vessels laden with coal, salt, railroad iron, or other like articles in bulk, may after entry at the Custom-House discharge their cargoes under the superintendence of customs officers at the expense of the persons interested.

The Madrid Government is at work on the Cuban tariff, and it is promised that some of the enormous duties will be moderated.

#### PERSONAL.

George H. Hull, president of the American Pig Iron Storage Warrant Company, is in the South.

Abram S. Hewitt, of Cooper, Hewitt & Co., New York and Trenton, spoke at the meeting of the Iron and Steel Institute to re-enforce the invitation of the American Institute of Mining Engineers and other American societies to hold a meeting in the United States in the fall of 1889.

John Jarrett, the well-known labor leader, for some years president of the Amalgamated Association, has been appointed consul to Birmingham, England. The position is an important one, and one to which it is believed Mr. Jarrett is well fitted from his intimate knowledge of the iron and steel business, which will be of considerable advantage to him in fixing valuations and superintending invoices, part of the duties of the consul. At present Mr. Jarrett is secretary of the American Tinned Plate Association, with headquarters in the Lewis Block, at Pittsburgh. Upon his departure for England his duties will be assumed by James M. Swank, the well-known general manager of the American Iron and Steel Association, of Philadelphia.

E. H. Utley, for a number of years general freight agent of the Allegheny Valley Railroad, at Pittsburgh, has resigned to enter the employ of Carnegie, Phipps & Co., Limited, of that city. He will take charge of the freight business of that firm, and also of Carnegie Bros. & Co., Limited.

F. E. Bachman has resigned his position as manager of the Tennessee Coal, Iron and Railroad Company's furnaces at Ensley, Ala., on account of his health. His address is now Strasburg, Lancaster County, Pa.

M. D. Flynn, a prominent iron-worker of Youngstown, Ohio, is mentioned as the probable successor of William Martin, the present secretary of the Amalgamated Association, at Pittsburgh, who will shortly resign his position to accept an appointment under the Government.

John Birkinbine, of Philadelphia, has gone to Duluth, Minn., where he is superintending the construction of a new furnace. He will be absent for about two weeks.

Adolf Sutro, of tunnel fame, proposes to erect a large library building in San Francisco.

Henry A. Bentley, of Newport, a civil engineer of note, went on board a boat of the Fall River Line and his body was picked up in the Sound five days later.

W. E. Dodge, of New York, has sailed for Europe.

Among those who passed over the Central New England and Western Railroad, a connection of the Poughkeepsie Bridge, were the following, who are well known as being identified with large iron interests in Eastern Pennsylvania: Arthur Brock, John W. Brock, Henry McCormick and Charlemagne Tower, Jr., of Philadelphia.

The American Institute of Electrical Engineers have just elected the following officers: President, Prof. Elihu Thompson; vice-presidents, Francis R. Upton, T. Commerford Martin, Edward Weston, Prof. Edward L. Nichols, Dr. Louis Duncan; secretary, Ralph W. Pope; treasurer, George M. Phelps; managers, Dr. Schuyler S. Wheeler, George B. Prescott, Jr., Joseph Wetzler, Thomas D. Lockwood, Francis B. Crocker, William Mayer, Jr., John W. Howell, Charles Cuttriss, Dr. F. Benedict Herzog, Henry Van Hoevenbergh, H. C. Townsend, Prof. W. E. Geger.

## THE MECHANICAL ENGINEERS.

### THE ERIE MEETING.—II.

On Wednesday afternoon a visit was made to the Erie City Iron Works, manufacturers of steam-engines, boilers and circular saw-mills. The works, which already cover a large area, are being considerably extended. The visitors were much interested in a new form of engine which is to be placed on the market. In plan it is T-shape, the cross-bar representing the cylinder and the stem the shaft. The shaft is placed at right angles to the cylinder, from the center of one side of which it projects, that side of the cylinder next to the shaft being cut away sufficiently to permit the revolution of the crank. Projecting at right angles from the center of the piston, to which it is rigidly attached, is an arm engaging by universal joint with the crank on the end of the shaft. The piston acts as a valve, opening and closing the inlet and exhaust ports, which are placed near the center of the cylinder, core passages leading to each end. As the cylinder moves forward from one end to the other it travels on a spiral, the latter half of which is, of course, the reverse of the first half. The engine shown ran at high speed, and was free from all undue jar. We hope shortly to present engravings showing in detail the construction and operation of this new form of engine.

After passing through the machine-shop, foundry and boiler works, the members were led to the establishment of the Stearns Mfg. Company, a large and well-appointed collection of buildings devoted to the manufacture of engines, boilers, edgers and sawmill machinery. The main machine-shop is 300 feet in length by 80 feet in width, being two stories at the sides, the center portion being occupied by a traveling crane moving the whole length of the shop. Here was shown a partly-assembled Wilkin's gang saw, in which the heavy reciprocating parts were so nicely balanced as to do away with the hurtful pound so common and destructive in these machines at each change of stroke. After making a tour of the works the members were led to the drafting-room, where they were shown the beauties of red fluid adapted for printing in blue, after which they were photographed in a group.

From the Stearns works the visitors passed to the Jarecki Mfg. Company, makers of gas, steam and water fittings of all kinds. Here a most interesting collection of automatic machinery designed especially for the work to be done was found. One machine was found tapping T's up to 10 inches, the six threads of two T's being tapped at the same time. The wheel carrying the T's is hexagonal in section, the T's being held in chucks, one to each face. Two sets of taps of three each were so arranged as to feed toward the T's, tapping the ends of the arms and the stems at the same time. After the thread had been cut the machine reversed and withdrew the taps at a quicker speed than they were at first fed. After tapping the two T's, the wheel was revolved one-third of a revolution to bring two other chucks in position before the taps. A small pump forced oil on the taps as they were fed forward. Machines constructed on the same principle are also adapted for threading angles and straight connections, either right or left. In the cock-boring machine 12 cocks are bored simultaneously. The cocks are held in 12 chucks, arranged on a circular center mounted rigidly on a shaft extending through the center of the machine. These chucks are carried by short revolving shafts placed at such an angle with respect to the axis of the machine that the tools will cut the required taper. The inner end of each chuck-shaft is provided

with a pinion engaging with a stationary gear, the arrangement being similar to an epicycloidal wheel. It is apparent that as the shaft revolves it carries with it the 12 chucks and the cocks held by them, this revolution, by means of the pinions and gear, revolving the chucks. The cutting tools are carried upon a second wheel, splined to the shaft, and so fixed that each tool comes opposite the cock it is intended to bore. The tool-carrying wheel is fed forward by suitable arrangements in the rear of the machine. There was also shown a small and very accurate machine for turning the balls for valves. In the machine-shop near one of the lathes reserved for heavy work was a pneumatic hoist, consisting of an air cylinder and a piston, to the piston-rod of which the hook was attached. This traveled on a track leading from the door over the lathe. The work to be done in the lathe was lifted by means of compressed air admitted under the piston. The device was found to work most admirably.

"Standards" was the title of a paper presented by James W. See, which was held over for the evening session. The following is an abstract of it: "The watch-maker of old was really a watch-maker because he made a watch. He made the works and every part of the works. He made the case and every part of the case. He made the watch as a thing by itself, without regard to any other watch which he might have made in the past, or might be making at present, or might make in the future, and above all, without regard to any watch which any one else might make. His work was well done, or at least we of to-day must say so. . . . When the old watch-maker made his next watch, it also stood upon its own bottom. It was as good as the first one and probably a trifle better, or perhaps worse. It was bound to be different, for the simple reason that in those times no thought had been given to processes for duplicating good things." To-day, looking at the old watch-maker, we would criticize his screws because they would not interchange with each other, and this difficulty would be met by the fact that each screw was marked to correspond with its hole. In those days the screws and other important details of the watch were designed especially to differ from each other, the idea being that repair to be done should be done by the maker. This business theory has long since been exploded, and the watch-maker of to-day understands that if his watch can be readily repaired he will have an advantage in sales. He will not use a screw which cannot be readily produced by another watch-maker called on to repair his watch. It follows that many watch manufacturers will be making the same kind of screws, and then a screw manufacturer appears who can make all the screws cheaper than either can make the part he needs. "The effect of the modern system of product details has been to demand that there should be a uniformity of details—that is, an interchangeability among the individuals of the same class. To secure a reliable uniformity of excellence in the general character of the purchased details of mechanical structures constitutes one of the continued strains upon the manufacturer, and it may be said as a general fact that standards of uniformity have been most thoroughly established in those branches of trades in which the fewest numbers of parties are interested."

The writer then pointed out a few examples in which the desirability of establishing standards is apparent. We give the list in part, without the comments: Steam and gas pipe; cast-iron water and gas pipe; brass tubing; boiler tubes; lead pipes; hose and hose couplings; circular saws and their arbors; bolt threads; machine screws; bolt heads and nuts; gauge

of railroads (there is no standard of record; although the necessities of transportation have brought about an accepted standard expressed as 4 feet 8½ inches, there is no record of it); street-car gauge; gauge of common vehicles; shanks of oil cups, cocks, &c.; nails, braces and bits; drill shanks; tool sockets, tool eyes and their handles generally; machine-tool posts; bolting-slots for machine tools; noses of lathe spindles; sections of rolled iron; hinges; locks; oil-well tools; stove-pipe; pinion wire; washers; brick; tin-plate; wire cloth; rivets; rope and wire rope; files; wire; brass; babbitt metal; pig-iron, steel and the metals generally; steam-engines; tests of machinery.

In the proposed method for the record of standards there shall be a governmental bureau of standards, in which any respectable representation of a trade or craft, after adopting a standard, may file the same. The use of such standards is not to be made compulsory. It is proposed that after a standard has been established a description of it can be procured on payment of reasonable fees. A governmental publication of an established standard is proposed. The bureau of standards could be satisfied by a single additional division and examiner in the Patent Office. An enactment would be required creating the bureau, providing for the filing of a standard after its adoption by a business, trade, representative body, &c., the numbering of the standard and the use of a symbol indicating that the article conforms to the United States standard No. —. The paper closed with suggestions regarding the best method of promoting the proposed system of standards.

The discussion on this paper brought up the fact that the list presented by Mr. See failed in many respects to cover the ground as regards manufactured articles for which there are now no standard sizes recognized by manufacturers in general. This includes taps, reamers, bolts, nuts, set-screws, washers, cut gearing, dowel pins, wing nuts, &c. Oberlin Smith, in a written communication, advised that no society or body should be allowed to file standards indiscriminately. He advocated the appointment of a United States commission of representative men to examine and report upon the adaptability of any proposed standard. He advised the doing away with all present gauges, and the adopting of a new one with numbers in parts of a thousand. A committee, consisting of J. W. See, Coleman Sellers and Oberlin Smith, was appointed to obtain further information.

In the paper by Professor Webb on "An Error in the Encyclopædia Britannica," it was shown that, in the article on hydro-mechanics, the horizontal force or reaction, acting on the side of the vessel opposite the orifice through which the water flowed, was constant and independent of any movement of the vessel. This deduction is contrary to that presented in the article, which gives two formulae for the reaction—one when the vessel is at rest and the other when it is moving in a direction opposite to that of the jet. The paper brought a written reply from Professor Unwin, the writer of the article, in which the inaccuracy is practically acknowledged. From "Note on the Steam Turbine," by Professor Webb, we take the following: "When steam flows out from under a considerable pressure it attains a very high velocity. In the production of this velocity the steam expands from the high to the low pressure, and the mechanical energy thus produced, and existing in the form of kinetic energy in the moving steam, would seem to be obtained with a high degree of economy. The problem, therefore, is to some extent the same as in a water turbine, having given a stream of fluid at a certain velocity, to abstract as much as possible of the energy from it by allowing

it to react upon a moving wheel. Now, the primary condition of economy is that the fluid shall leave the wheel with only enough velocity left in it to get it out of the way; and in the case of the steam turbine this requires an almost, if not quite, impracticable velocity for anything like a great difference of pressure." Professor Webb described a unique form of steam motor which was really composed of a large number of turbine-wheels, which increased in size from the live-steam entrance to the exhaust. The wheels were mounted on a common shaft and were separated from each other by spaces about the thickness of the wheels. The steam as it passes from one space to another impinges on the blades of the wheels, which are driven with great velocity. This steam turbine is used on the steamship City of Berlin to drive a dynamo, its shaft being united to the armature shaft. As the steam at its entrance into the turbine has a pressure of 150 pounds and at the exhaust a pressure of only 15 pounds, the efficiency and economy of the wheel are made evident.

Mr. Swasey stated that he had examined and in fact made the driving-gear for a similar steam turbine which used steam expansively, and which, by actual count, had attained a speed of 25,000 revolutions a minute.

"Notes on the Comparative Loss by Friction in a Transmitting Dynamometer Under Different Loads and Speeds," by Samuel Webber, showed that the friction remained constant under a very considerable increase of load and varied slightly with the velocity. The table accompanying the paper shows not only the constancy of the friction in the dynamometer, but also the consequent decrease of the coefficient of friction.

The paper by Profs. J. E. Denton and D. S. Jacobus on "Steam Consumption of Engines at Various Feeds" was the record of experiments made with a 17 x 30 steam engine driving one of the air compressors used in the construction of the new Croton aqueduct. It was found that there was a distinct gain in economy of steam as the speed increased for one-half, one-eighth, and one-fourth cut-off at 90 pounds pressure; that the loss in economy for about one-fourth cut-off was at the rate of  $\frac{1}{2}$  pound of water per horse-power for each decrease of revolution per minute from 86 to 26 revolutions, and at the rate of  $\frac{1}{4}$  pound of water below 26 revolutions. Also at all speeds the one-fourth cut-off is more economical than either the one-half or one-eighth cut-off. One-half cut-off should be less economical than one-fourth cut-off for 90 pounds boiler pressure, without any consideration of cylinder condensation. One-eighth cut-off, however, should, by the theory of expansion, be more economical than one-fourth cut-off, so that the fact that such is not the case is ascribable only to cylinder condensation. A boiler pressure of 90 pounds was shown to be superior in economy to 60 and 80 pounds at ordinary speeds and cut-offs, the superior economy of the higher pressures not being due to differences of cylinder condensation. The actual minimum water consumption of the engine was found to be at one-fourth cut-off. For 90 pounds boiler pressure the consumption was 27.5 pounds at 60 revolutions and 26.5 at 90 revolutions. "Evidently steam throttled from 90 pounds to an extent which would afford 23.45 pounds mean effective pressure would give somewhere about 5 per cent. as the steam unaccounted for or condensed by cylinder condensation, and the difference between this value and 15 per cent. for Test 45 is fairly attributable to the superheating due to the throttling, and there is a consequent saving in steam consumption per horse-power between the average for 34 and 35 and for 45, equal to

56.87 - 47.8 = 9 pounds, or about 16 per cent. This represents the advantage of obtaining a given horse-power at a fixed cut-off by carrying a high boiler pressure and throttling to a low initial pressure, rather than using a boiler pressure very little above the desired initial cylinder pressure. But if we seek the water consumption for a case where practically the same mean effective pressure is obtained with ordinary ranges of expansion, we find that any such saving due to superheating by throttling as is indicated above is quite incapable of competing with the saving involved in the use of the principle of expansion. Thus we have in Test 38 for 60 pounds boiler pressure and about three-tenths cut-off a mean effective pressure of 27.4 pounds and a water consumption of only 31.6 pounds, or a saving of one-third of the throttling consumption just quoted. Again, in Test 30 for 90 pounds boiler pressure and about one-eighth cut-off we have 22.7 pounds mean effective pressure, and a water consumption of 29.5 pounds per horse-power, or nearly a saving of 40 per cent. of the throttling consumption." Regarding cylinder condensation the writers stated that it was impossible to analyze, in time for the present meeting, the data regarding liquefaction of steam by cylinder condensation, with a view to determine any even approximate law underlying the quantities of steam liquefied under the various conditions covered in the investigation.

In the discussion of this paper Professor Wood stated that in an engine in which the steam was throttled from 90 to 45 or 50 pounds pressure there was a great saving when the boiler pressure was reduced to 50 pounds, and the engine was run with the throttle wide open.

The paper by Professor Denton on the "Performance of a 35-ton Refrigerating Machine of the Ammonia Absorption Type" was founded on tests made of a machine in operation at an establishment where it is used to maintain about 400,000 cubic feet of space at an average temperature of 34° F. It was found "that the total refrigerating effect of the machine during 24 hours was equivalent to the cooling of the circulating brine an amount equal to the heat which would melt 40.67 tons of ice to water at 32° F., or freeze 40.67 tons of water at 32° F. into ice. This work is what is to be understood as '40.67 tons of ice-melting capacity,' and also 'that if each pound of fuel consumed at the boilers evaporated 10 pounds of water into steam at 45 pounds pressure above the atmosphere, then each pound of fuel consumed in operating the refrigerating machine produced an amount of refrigerating effect equivalent to the heat which would melt 17.1 pounds of ice to water at 32° F., or freeze 17.1 pounds of water at 32° F. into ice.'" The paper fully describes and illustrates the machine, and shows how the test was conducted.

Thursday morning Prof. De Volson Wood presented four papers, headed "The Expansion of Timber Due to Absorption of Water," "Some Properties of Ammonia," "Formulas for Saturated and Superheated Vapors," and "Some Properties of Vapor and Vapor Engines." He found by experiments that the elongation in the direction of the grain and the lateral expansion were as follows:

	Pine.	Oak.	Chest-nut.
Elongation, per cent. ....	0.065	0.085	0.165
Lateral expansion, per cent. ...	2.6	3.5	3.65

The tests were made with specimens 36 inches long,  $\frac{1}{4}$  inch thick, and 5 inches wide. The specimens were thoroughly dried and then soaked in water, the two measurements taken giving the elongation and expansion. The paper on ammonia contained important data concerning its properties, and is of value now, as ammonia is used so extensively, especially for refriger-

ating purposes. The paper was prepared as a preliminary step to further investigation. The other two papers gave valuable formulas on saturated and superheated steam. In the discussion Professor Denton presented a table in which the efficiency of the vapors steam, ammonia, ether, sulphide of carbon and air, expanded from 100 pounds to 14.7 pounds, was shown.

We will in an early issue present an illustrated abstract of the paper by A. F. Nagle on the "Cornish or Double-Beat Pump-Valves," and also of the one by A. W. Jacobi, on "Improved Motion Device for Engine Indicators."

A paper on the "Distribution of Steam in the Strong Locomotive," read by F. W. Dean, was supplementary to one read a year ago. The average consumption of steam was shown by diagrams to be as follows:

	Pounds.
Engine No. 383.....	22.34
Engine No. 444.....	25.67
Engine No. 357.....	26.73

After cast-iron valves had been substituted for the steel valves, which were wearing badly and leaking, the average result was for engine 444, 21.95 pounds. The initial pressure in the cylinder of the Strong engine is only some 3 pounds below the boiler pressure.

In the discussion that followed, W. W. Sprague, general foreman of the C. R. I. and P. Railway shops, stated that those engineers who ran with the throttle wide open and regulated with the lever used less coal than those who throttled the steam. In answer to a question if this was not hard on the valve and gear, Mr. Sprague said that the valves were of the balanced type and no undue wear was found to take place.

J. M. Whitham read a paper on "Cylinder Ratios of Triple-Expansion Engines," in which he presented a method of finding these ratios, giving the necessary formula and diagrams, and in which he presented a most valuable table giving the cylinder dimensions and ratios, piston stroke, the boiler-pressure and the piston speed, and the indicator horse-power of many of the best-known triple-expansion engines which have been built during recent years.

Thursday afternoon the members visited the Ball Engine Company's Works, and examined the machinery and methods there in vogue. All the engines made by this company are, before being sent out, tested under steam, and indicator diagrams taken. We expect soon to publish engravings showing the construction of the Ball compound engine, which has only recently been placed on the market. The party were then initiated into the mysteries of paper-making at the extensive Watson mills, after which they inspected the steam-engine and boiler works of T. M. Nagle and Cleveland & Hardwicke.

Thursday evening the members attended a reception at the Reed House, "tendered by the resident members and their friends to the visiting members and their ladies."

At the final session of Friday morning, Scott A. Smith considered the question of "Belt Traction on Pulley Faces." The most intimate contact of a belt with a pulley comes, first, in the smoothness of the pulley face; second, in the smoothness of the belt; third, in having the crown of the driving and receiving pulley exactly alike; fourth, in having the crown of pulleys not over  $\frac{1}{4}$  inch for a 24-inch face; fifth, in having the crown two planes meeting at the center, and finally to so cut the meeting ends of a belt as to bring a nearly uniform stress on the lacing. The closing paragraph is as follows: "As friction is due, largely, to the unevenness of two surfaces in contact under motion, and as the best tractive quality of belts comes from the evenness and smoothness of the two surfaces of belt and pulley face, it easily follows, from what I have said, that the

value of the tractive force of a belt on a pulley face is due, first, to atmospheric pressure; second, to the tractive adhesion of the leather fibers and the oxidized oil of the currying process."

The statement regarding the important part played by the atmosphere brought out a warm discussion. J. H. Cooper said it was necessary to distinguish between friction and adhesion, one being independent of surface and the other dependent largely upon surface. In general, pulleys should be of larger diameter, there should be less width of belt, and the leather should be more pliable to insure better contact. Perforated pulleys in which the entrained air can escape give better results than those with plain surface. Atmospheric pressure has nothing to do with the grip of the belt on the pulley. F. H. Ball said that if the holes in a pulley face performed any function it would be better to perforate the belt, as the centrifugal force would create a current aiding the displacement. The discussion showed that the air theory had two parties of exactly contrary opinions, and, further, that very little concerning the true relation between the belt and the pulley was known.

The paper by J. H. Cooper—"On the Longitudinal Riveted Joints of Steam-Boiler Shells"—gave several new and valuable formulæ for the guidance of boiler-makers in proportioning the longitudinal joints.

In the discussion that ensued C. H. Parker said that the quality of boiler-plates had not yet become so uniform that a test section could be regarded as indicating the strength of the entire sheet. Sheets produced by the same maker also vary in strength. In hot fire seams are raised in temperature, and the tensile strength thereby reduced. Scale deposits add to this. Rivets are more reliable than the plates, as is shown by the rupture of the latter. Cold tests of boilers are not reliable, as the conditions are not those of practice. F. A. Scheffler said that manufacturers could not tell how a boiler would be handled after it left the shop, and that their only resource was to be on the safe side. He had found that the longitudinal seams were three-fourths as strong as the plate, and that the actual strength of the plate exceeded that stamped on it by the maker. If stamped 60,000, it would run from 60,000 to 68,000. Professor Hutton stated that the method of testing affected the results obtained, and he gave as an illustration a case he had had in which copper having a tensile strength of 38,000 pounds was specified. With the slow screw machine it was impossible to obtain this result, but when a hydraulic machine was substituted the desired tensile strength was reached, although the elongation was reduced. President Towne remarked that a standard form of riveted joint was needed, and also a standard method of making tests, and that the elastic limit, rather than the breaking strength, should be adopted as the only factor indicating the exact quality of the metal. E. F. C. Davis said: "We have full-sized testing machines in every boiler that explodes, and the proper study of them would throw much light on the subject."

"Bits of Engine-Room Experience," by L. F. Lyne, showed the harm done a cylinder in which shoulders had been formed at each end by the wear of the piston. The paper illustrated the uneven wear of valve stems, and closed with a description of how a bed of sulphur was removed from under an engine, and a bed of expansion metal (9 lead, 2 antimony and 1 bismuth) was substituted.

Oberlin Smith, in a written discussion of this paper, said that too much attention could not be paid to the reciprocating parts of a machine, and whenever possible the moving part should wipe over the ends

in order to prevent the formation of end-shoulders by the wear taking place in the center.

The paper of Mr. Lyne on the "Use of Crude Petroleum in Steam Boilers" was supplementary to the one read at the Philadelphia meeting in 1887. It compared crude petroleum with kerosene oil when used for the prevention of scale in steam boilers. In one of the two new boilers, which had the same amount of work to do and which worked under the same conditions, 1 gallon of kerosene oil was used each week, while a like quantity of crude petroleum was used in the other. At the end of a month No. 1 boiler had no dirt or scale in it, while in No. 2, using crude petroleum, there was considerable loose scale. Four months afterward about 1 bushel of hard, broken scales was removed from the back headers and tubes of No. 2. The other boiler was still clean, and only required to be rinsed with water. No. 2 boiler was then thoroughly cleaned, after which each boiler was given 1 gallon of kerosene oil a day, and at the end of six months both were found to be perfectly clean. The paper also gives important directions governing the use of oil.

One of the most interesting features of the meetings of this society is the so-called "Topical Discussions." These are questions upon live topics, in which the mechanical engineer is vitally interested, and they are so selected as to be taken as a whole—of importance to each member. The discussions are valuable, since the remarks are almost always based upon practical experience. One question was:

"Does it prevent nuts from working loose or prevent breakage of bolts to reduce their cross-section between the head and the nut?" Professor Sweet said, in a written communication, that a bolt would wear longer and would not work loose if the diameter of the plain part were reduced to the diameter of the bottom of the thread. The same thing could be accomplished by boring a hole down through the head to the thread. A bolt treated in this way had practically no weakest part, and was therefore better adapted to withstand strain, which was distributed over its entire length and not concentrated at one point. Professor Wood instanced the case of a steam-hammer head in which the tapered end of the piston-rod was driven in a tapered hole in the head. The rod frequently broke, and as it always broke a little below the upper surface of the head, the removal of the end from the hole was a difficult task. Mainly to obviate this trouble a groove was turned in the rod a short distance above the head, thereby reducing the section at that point, so that when it broke, as it was expected to, it would be an easy matter to remove the end. But this attempt to produce a convenient weak point for the rod to break at resulted in greatly increasing its life. G. E. Whitehead produced the same result in a milling machine arbor by reducing the shank by grooving to the diameter of the arbor.

"Have you tried the plan of applying electro-motors to mechanical operations requiring not more than 10 horsepower? Can you compare their convenience and economy with those of small engines, or the usual transmissions by belting and shafting?"

James Christie described a traveling gang-drill used at the Pencoyd Iron Works. This drill is located in the bridge shops, across which it travels. Owing to the overhead system of tracks it was impossible to use any method of transmitting power except by means of copper strips, forming an electric circuit. At the tracks the strips are broken and bridged. The current is taken off by brushes. The drill consists of eight independent radial drills, mounted four on each side of the crosshead. The whole

machine is moved forward and back along its track, the crosshead is raised and lowered, and the drills are all operated by a Thomson-Houston electric motor placed on top of the frame. All the movements are controlled by levers, placed within easy reach of the operator. The motor has never caused any trouble. C. J. H. Woodbury, described a method of hanging an electric motor to the shaft to be driven by means of a yoke-pinion and a gear on the shaft. As the load is applied the motor rises, the yoke and the motor at its lower or free end standing at an angle governed by the power required. When transmitting no power the yoke is in a vertical position; when transmitting the maximum amount of power the yoke approaches most nearly a horizontal position. President Towne stated that he had investigated the case of a crane in which the three motors needed would have cost, in the aggregate, more than the crane, making their use prohibitory.

During the afternoon the members enjoyed a sail on the beautiful bay upon which the city of Erie is located, and those who could remain witnessed a drill at the life-saving station.

The success of the Erie meeting was due largely to the well-directed efforts and the unusual harmony which characterized the work of the local committee, Messrs. Ball, Barnhurst, Hallock, Hardwicke, Miller, Selden, Scheffler, Skinner, Watson and Wilkin. A less conspicuous, though more important, part was played by the ladies of Erie, who succeeded most admirably in their endeavors to entertain both the Upper and Lower Houses composing the convention.

#### Reduction of Wages at Homestead.

About one year ago Carnegie Brothers & Company, Limited, of Pittsburgh, put in operation at the Edgar Thomson Steel Works, at Braddock, Pa., a sliding scale of wages, based on the selling price of steel rails, the principal product of the mill. When rails are selling at \$27 per ton the men are paid on that basis as long as that price is in force, while, if an advance or a decline takes place, wages are affected accordingly. It will be remembered that this sliding scale was not put in operation until after a long and bitter strike had taken place, during which the firm were compelled to secure Pinkerton detectives to guard their property. When the scale was first presented to the workmen they opposed it, claiming that it meant a large reduction in their wages. However, the scale has now been in force for about a year and is working to the entire satisfaction of both firm and workmen.

As soon as it was seen that this plant could be successfully operated in this way, Carnegie, Phipps & Co., Limited, made preparations to introduce a scale similar in its workings at the Homestead Steel Works. The firm have been engaged for months in perfecting the details, in order that it would be fair to both employers and employees. This has been accomplished, and on Saturday, the 18th inst., the following notice was posted in various places at the Homestead Steel Works:

Notwithstanding our leading competitors have reduced wages, which were already much below those paid here, we are met with numerous demands for advances, ranging in some instances from 25 per cent. to 68 per cent. Prices never were so low for our product. Nothing in the condition of business justifies a demand for advances in wages. We have, therefore, no choice but to meet the issue thus unfairly forced upon us, and once for all place the relations of capital and labor at these works upon a basis which may enable us to compete with others, and give steady employment to our men.

On and after July 1 next, the labor in these works will be thus paid. Steel blooms have been selected as the fairest obtainable basis

for the scale. Current quotations, as published in the Pittsburgh papers, will be taken as the standard.

The schedules of wages, which can be examined at the office, are based on present price of steel blooms, billets and slabs of sectional area, not less than 16 square inches, of \$27.50 a gross ton, on board cars Pittsburgh. Wages will be advanced or reduced as the average monthly selling price changes, but \$25 per ton will be considered the minimum, below which wages will not fall.

In establishing these wages it has been the aim to make the earnings of our men at least equal to those in the works of our principal competitors in Pittsburgh and elsewhere. In many instances they are higher than paid by others.

The superintendent will receive applications for employment from men at present in our service, and will select from among those whom he thinks best qualified in the order of their application.

Should any positions remain unfilled after June 1 next the superintendent will appoint other men to these vacancies. No man will be employed who cannot bring satisfactory certificates as to his skill, sobriety and general good character.

The firm desire no man to remain in their service who does not feel that he is obtaining as much or more for his labor than he could get elsewhere, and who does not prize steady employment free from strikes and labor quarrels.

In the interest of many well-disposed, fair men who may avoid future loss and disappointment by being told now that whatever may occur from the action into which labor at competing mills and the unwise demands for advances here have reluctantly forced us, the final result is sure. These works cannot run and pay higher prices than their competitors pay, nor will the firm any longer attempt to do so.

Men desirous of obtaining employment will be required to sign an agreement to work under this scale, which will stand until January 1, 1892, either party having the right to withdraw from it at that date, or at the end of any succeeding year, by giving notice of their desire to do so, not later than July 1 of any year after next year has expired.

By order of the Board of Managers,  
CARNEGIE, PHIPPS & CO., Limited.  
WM. L. ABBOTT, Chairman.

The workmen held a meeting on Sunday, the 19th inst. The sentiment of those in attendance seemed to be that the reduction was uncalled for, and would be rejected, even if it became necessary to stop work. After being in session for about three hours, during which a number of speeches were made, the following resolutions were presented and unanimously adopted:

*Resolved*, That the workmen of the Homestead Steel Works recognize that the adoption of the sliding scale, as proposed by Carnegie, Phipps & Co., will be giving up everything that is dear to the heart of every true workman; further be it

*Resolved*, That such a proposition, as presented by the company, is absolutely absurd, there being no foundation in fact for said notice.

*Resolved*, That the firm of Carnegie, Phipps & Co. have misrepresented the facts in said notices, and given broadcast to the public the statement that they had to pay more at their works in Homestead than their competitors have done for their work elsewhere, when the reverse is the case. One hundred tons of steel cost them no more than at any other union mill.

*Resolved*, That the firm of Carnegie, Phipps & Co. be condemned for their intention of declaring the various positions of the employees vacant one month previous to the expiration of the present agreement.

*Resolved*, That the whole matter be referred to the proper officials for adjustment.

From present indications a strike is inevitable unless the workmen agree to accept the scale, as it is the intention of the firm to insist upon its adoption, come what may.

**The Monitor Puritan.**—The double-turreted monitor Puritan, the largest of her class in the United States Navy, which was lately removed from League Island to Norfolk to receive additional machinery, will be completed at the Brooklyn Navy Yard, where the facilities at command will obviate any further delay. The vessel is built of iron throughout, armored with a steel-armor belt extending the entire length of the vessel, and carries four 10-

inch breech-loading rifles. She has a powerful ram, very strongly secured, and is fitted with a steam steering gear and steam windlass. On top of the armor belt is worked an armor deck 2 inches in thickness. The principal dimensions are as follows: Length between the perpendiculars, 280 feet; length on load line, 291 feet; length over all, 295 feet 8½ inches; breadth extreme, 60 feet 1½ inches; depth from fore line to top of main deck beams at middle line, 20 feet 9 inches; draft, 18 feet 2½ inches; area of greatest immersed transverse section, 1037 feet; displacement to load water line, 6000 tons; indicated horsepower, 3000; metacentric height, 10.2 feet; maximum speed, 13 knots; armor on sides, 12 inches; armor on turrets, 11½ inches.

## Washington News.

(From Our Regular Correspondent.)

WASHINGTON, D. C., May 21, 1889.

The lead-ore hearing which ran through two days last week before the Secretary of the Treasury will from appearances be a somewhat prolonged question of consideration. The Secretary has given both sides the privilege of putting in testimony, and has extended the time to 15 days.

It is expected that it will require at least two weeks more to get the testimony into shape and another two weeks before a decision can be reached. Although it is a little early in the contest to talk about the probable decision, from the present indications, based upon general comments in the authoritative quarters, it is more than probable that the result of the hearing will be in favor of a radical change in the present mode of levying duty on lead ores.

In a very significant comment upon the hearing it was stated that the admission of such large quantities of lead ore free of duty was a violation of the spirit and intention, if not the letter, of the tariff statutes.

The present tariff act places a duty of 1½ cents a pound on lead ore and admits silver ores free. It was hinted that if some fixed rule were not adopted to define what is lead ore and what is silver ore it would be possible to admit all the lead ores into the United States free, as very few such ores are without silver; therefore it would be an easy matter by mixing to raise the component metal of chief value to a higher standard than lead ore.

It is probable that the Department will fix some standard of classification by designating all ores containing more than 5 per cent. or some fixed quantity of lead as lead ores.

The Secretary of the Treasury appreciates the great importance of the decision, and will give it a very careful consideration before venturing upon a decision.

The hypothetical case before Secretary Windom recommending increased duties upon worsted cloths by classifying them with woolen cloths, which the Secretary of the Treasury has been considering, has assumed tangible form in an appeal from a decision by the Collector of Customs at New York. In that case the collector levied upon an invoice of worsted cloths the woolen cloth rate, to which the importers had taken exception, and the case now comes before the Secretary of the Treasury. This will result in a decision in a very few days.

The Secretary of the Treasury has promulgated the following decisions relating to customs duties upon metallurgical products:

### POTASSIUM A METAL UNWROUGHT.

In an appeal from a duty of 20 per cent. on certain potassium the appellants claim that the merchandise in question should be exempted from duty by assimilation to

sodium named in the free list. The appraiser, reporting on this appeal, states "that the merchandise was found upon examination to be the elementary substance known as potassium, the metallic base of potash;" that potassium is similar in many respects to sodium, but that the scope of the section of the Revised Statutes "being limited to articles bearing a similitude to articles chargeable with duty does not appear to prevail in this case." He further states that, inasmuch as said potassium is an unwrought metal, and not specially provided for, it was returned for duty. While the appraiser seems to misunderstand the scope of the similitude clause, since its last proviso clearly applies to unenumerated articles similar in material, quality and texture and the use to which they may be applied to articles specified in the free list, his conclusion that the potassium in question is not entitled to exemption from duty by assimilation to sodium appears to be correct, inasmuch as potassium is similar to sodium in some respects only, and as it was otherwise provided for as a "metal unwrought," as aforesaid. The claim of the appellants has been rejected.

### RAZOR-BLADES DUTIABLE AS RAZORS.

An appeal having been made on a 50 per cent. ad valorem assessment of duty on certain razor-blades for 85 per cent. as cutlery, or 45 per cent. as manufactures of steel, the Department, affirming the collector's decision, says: "It appears that the merchandise in question consists of razor-blades which, although without handles, possess all the essential properties of razors and are in a condition ready for use when supplied with handles. Under these circumstances it would seem that the articles are in fact razors, and that the want of handles, which are merely appendages of the blades, does not affect their classification as such under the special provision for razors."

### Southern Freights on Pig-Iron.

The Southern Railway and Steamship Association have issued a circular on pig-iron rates, to take effect on June 1. To the principal points the figures are as follows:

To	From Birmingham, Ala.	From Chattanooga, Tenn.	From Sheffield, and Florence, Ala.
Akron, Ohio	\$4.00	\$3.50	\$3.75
Allegheny, Pa.	4.85	4.15	4.04
Atchison, Kan.	5.49	5.49	5.40
Bellaire, Ohio	4.85	4.15	4.40
Bellefonte, Ill.	3.25	3.00	2.80
Bridgeport, Ohio	4.85	4.15	4.40
Cairo, Ill.	2.75	2.50	2.50
Chicago, Ill.	4.00	3.75	3.75
Cincinnati, Ohio	2.75	2.25	2.50
Cleveland, Ohio	4.00	3.50	3.75
Columbus, Ohio	3.50	3.00	3.25
Dayton, Ohio	3.50	3.00	3.25
Detroit, Mich.	4.00	3.75	3.75
East Saginaw, Mich.	4.50	4.25	4.25
East St. Louis, Ill.	3.25	3.00	2.80
Evansville, Ind.	2.75	2.50	2.50
Fort Wayne, Ind.	3.75	3.50	3.50
Greencastle, Ind.	3.75	3.50	3.50
Indianapolis, Ind.	3.25	3.00	3.00
Kansas City, Mo.	5.49	5.49	5.04
Lafayette, Ind.	3.75	3.50	3.50
Leavenworth, Kan.	5.49	5.49	5.04
Lima, Ohio	3.75	3.25	3.50
Louisville, Ky.	2.50	2.25	2.25
Mansfield, Ohio	4.00	3.50	3.75
Memphis, Tenn.	2.00	2.00	1.55
New Albany, Ind.	2.75	2.50	2.50
Newark, Ohio	3.90	3.40	3.65
Peoria, Ill.	4.00	3.75	3.75
Pittsburgh, Pa.	4.85	4.15	4.40
Pullman, Ill.	4.00	3.75	3.75
Sandusky, Ohio	4.20	3.70	3.95
South Bend, Ind.	4.00	3.75	3.75
Springfield, Ohio	3.50	3.00	3.25
Steubenville, Ohio	4.85	4.15	4.40
St. Joseph, Mo.	5.49	5.49	5.04
St. Louis, Mo.	3.25	3.00	2.80
Terre Haute, Ind.	3.25	3.00	3.00
Toledo, Ohio	4.00	3.50	3.75
Wheeling, W. Va.	4.85	4.15	4.40
Zanesville, Ohio	4.00	3.50	3.75

A circular has also been issued relating to rates of freight on manufactured iron from Birmingham and Chattanooga. It does not differ from the rates published in *The Iron Age* of April 4, page 517.

# TRADE REPORT.

## Chicago.

Office of *The Iron Age*, 59 Dearborn street,  
CHICAGO, May 20, 1899.

A better feeling is perceptible in various branches of the iron trade, caused by increasing inquiry and a somewhat larger volume of business. A widespread belief has existed for some time that the tide would certainly turn by midsummer, but predictions are now being made that June will see decided indications of an improvement, which may not at first be accompanied by higher prices, but will in time have that effect. The attitude of heavy consumers indicates that they are ready to place large orders for future delivery in lines now neglected as soon as they have convincing evidence that bottom has been touched.

**Pig-Iron.**—The course of business during the past week would seem to presage a much more active business very soon. Some good orders have been placed for local Coke Iron, Southern Coke Iron and Lake Superior and Southern Charcoal. These sales were largely for early delivery, the Agricultural Implement manufacturers not being in the market yet with their season contracts. As far as can be ascertained, no orders have been taken up to this time for deliveries running into next year, but consumers are seeking to cover at least part of their monthly requirements until the summer of 1899, if they can do so at present prices. The Southern Iron most in demand of late has been Soft Iron, but some sales have been made, and in quite heavy quantities, of ordinary Foundry grades. Quotations continue about as they have been, with more or less shading to suit circumstances, governed by the extent of competition and the size of the order. We quote as follows for cash, f.o.b. Chicago: Local Coke Iron, No. 1, \$16; No. 2, \$15; No. 3, \$14; Chicago and Bay View Scotch, \$16.50; Lake Superior Charcoal, \$19; American Scotch (Blackband), No. 1, \$18 @ \$18.50; Southern Coke, No. 1 Foundry, \$16; No. 2 Foundry and No. 1 Soft, \$15.25; No. 3 Foundry, \$14.75; No. 2 Soft, \$14.25; Gray Forge, \$13.75 @ \$14; Tennessee Charcoal, No. 1, \$19; No. 2, \$18; ditto, lower grade, No. 1, \$17; No. 2, \$16; Alabama Car-Wheel, \$25.25.

**Bar-Iron.**—Orders are running all the way from carload lots to 50 tons, with quite a steady trade in this small way. Heavy buyers are holding aloof for the present, having their immediate wants well covered, and are indisposed to contract ahead at the higher rates which manufacturers are asking for that privilege. Prices are based largely on the rate asked by the Valley mills, which is 1.45¢ at mill, half extras, for Common Iron, not guaranteed. Single Refined Iron, of guaranteed tensile strength, is quoted at 1.70¢, half extras, at mill. Small lots from store are selling at 1.75¢ @ 2¢, according to quantity and quality.

**Structural Iron.**—The volume of business is fairly satisfactory in this line, but of course it runs mainly to Beams. Prices are firmly maintained, the mills making this kind of work being in receipt of large orders from other sections. Mill lots are quoted as follows, f.o.b. Chicago: Angles, 2.12¢ @ 2.15¢; Universal Plates, 2.15¢ @ 2.20¢; Sheared Plates, 2.20¢; Tees, 2.55¢, Beams and Channels, 2.90¢. Small lots from store are sold at 2.25¢ @ 2.30¢ for Angles, 2.65¢ @ 2.70¢ for Tees, and 3.4¢ for Beams.

**Plates, Tubes, &c.**—Dealers report that manufacturers of Plates are less disposed to accept orders at low prices and that some mills are unable to fill orders

promptly. The advanced price on Wrought-Iron Pipe is said to be well sustained. Should trade continue to improve another advance may soon follow. Quotations from store are as follows: Nos. 10 to 14 Iron Sheets, 2.50¢ @ 2.60¢; Nos. 10 to 14 Steel Sheets, 2.75¢ @ 3¢; Tank Iron, 2.40¢ @ 2.50¢; Tank Steel, 2.50¢ @ 2.60¢; Shell Iron or Steel, 3¢; Flange Iron, 4¢; Flange Steel, 3.50¢; Fire-Box Steel, 4.75¢ @ 5.50¢; Ulster Iron, 3.75¢; Boiler Rivets, 3.75¢ @ 4.25¢; Boiler Tubes, 57½ ¢ off for 1½-inch and less and 62½ ¢ off for 2-inch and larger.

**Sheet-Iron.**—The number of mills sold up and withdrawn from the market received further additions last week, and still orders for Black Sheets appear to be quite numerous. Prices are moving upward, and it would be difficult to find a place to put an order in at below 2.85¢ @ 2.90¢, at mill, for No. 27; Corrugating Sheets are 15¢ @ 20¢ @ 100 lb dearer. Store lots of Common No. 27 are quoted at 3.10¢ @ 3.30¢, according to quality.

**Galvanized Iron.**—The demand seems to be gradually improving. City cornice-makers and country merchants are increasing their orders, which come in more frequently. Makers of the best brands are refusing to meet the extreme low prices, because they find that they can now get orders enough to keep their mills full at better figures. From store Juniata is quoted at 65 ¢ off and Charcoal at 65 ¢ and 5 ¢ off.

**Merchant Steel.**—There are no orders of importance in sight that will be placed for early delivery. There is a class of consumers who are watching the market very closely, and occasionally ask quotations on 500-ton lots for the purpose of feeling the tendency of prices. In such cases deliveries are not stated, but in placing the order they would likely extend over all of this year. Small orders for low-grade Steels are fairly plentiful, and prices remain steady at about the following quotations: Soft Steel Bars, 2.20¢ rates; Tool Steel, 7.75¢ @ 8¢; Specials, 12¢ @ 25¢; Crucible Spring, 3.75¢; Open-Hearth Spring, 2.50¢; Open-Hearth Machinery, 2.40¢; Sheet Steel, 7¢, 8¢ and 10¢; Tire Steel, 2.20¢ @ 2.25¢.

**Steel Rails.**—A light business is reported for the past week, but plenty of inquiries continue to be received. New railroad projects, which seemed to be hopelessly stranded but a few months since, are being resuscitated, and are securing funds to purchase track material, so that the future for the Rail trade is growing brighter. It would not be surprising if there was a pressure for short deliveries in the summer months which would appreciate prices, which are now quite firm, with \$29.50 @ \$30 quoted for strictly Chicago business.

**Track Supplies.**—The Rail trade having been quiet, but little business transpired in Fish-Plates last week. Other Track Material was also in limited demand. Small lots are quoted as follows: Steel Fish-Plates, 1.90¢; Iron Fish-Plates, 1.70¢ @ 1.75¢; Bolts with Square Nuts, 2.55¢; Bolts with Hexagon Nuts, 2.65¢; Spikes, 1.95¢ @ 2¢.

**Old Rails and Wheels.**—Old Iron Rails have been moderately active at about \$20. This price appears very high in comparison with other kinds of material, but the supply is quite contracted. In Old Steel Rails there is nothing doing. Old Car-Wheels are nominally quoted at \$16 @ \$17 in the absence of large transactions.

**Scrap.**—Dealers universally report complete stagnation. They continue to lay in stock when it is to be had at tempting figures, but very little goes out. Low-grade material holds its own better than high-priced stock, quotations being about as follows by dealers to consumers @ ton

of 2000 lb: No. 1 Wrought, \$17; Fish-plates, \$18; Axles, \$22; Horseshoes, \$17; No. 1 Mill, \$13; Cast Machinery, \$11; Stove Plates, \$9; Cast Borings, \$8; Wrought Turnings, \$10.50; Axle Turnings, \$12; Mixed Steel, \$10.50 @ \$11; Coil Steel, \$13.50; Leaf Steel, \$15.

**General Hardware.**—The active condition of trade continues in Shelf Hardware which was noted last week, the leading jobbers being particularly busy. While the business of either April or May has not been equal to that of March, it has been more profitable, as the orders ran more into Hardware and less into staple goods. The large sizes of Tin Roofing Plates have been advanced 50¢ @ 75¢ @ box. Prices range from \$9.50 to \$10.50 on standard grades. The Heavy Hardware jobbers are complaining somewhat of dullness. Collections are fair.

**Nails.**—Jobbers report a pretty fair demand for Steel Nails, and quote \$1.90 @ \$1.95 in carload lots, and \$2 from store in small lots. A rumor that the Western Nail Association is broken is being circulated in a quiet way. One of the mills has given notice of withdrawal, and this will be sufficient excuse for abandoning an agreement that has been of very little benefit for some time past. Wire Nails are quoted at \$2.35 for small lots from store, and carloads at \$2.80.

**Barb Wire.**—There is no change in the condition of the market. The demand continues good and prices low, notwithstanding the fact that makers cannot keep up with their orders. Painted Wire is quoted at 2.75¢ in small lots from stock and Galvanized at 3.35¢. These prices are demanded for carload orders.

**Pig-Lead.**—There is no change to report. Values have remained fairly steady at 3.75¢, though a weaker feeling prevailed toward the close of the week. Sales of 300 tons are noted at the above figures, and 3.70¢ bid for near deliveries.

## Philadelphia.

Office of *The Iron Age*, 220 South Fourth St.,  
PHILADELPHIA, Pa., May 21, 1899.

**Pig-Iron.**—The market has developed no new features since date of our last report, although its course seems to indicate that the declining tendency has been arrested. The higher qualities of Foundry grades are taken in liberal quantities at \$18 for No. 1, while nothing below \$16.50 has been mentioned in the other direction, with medium quotations for the general average of the offerings. Mill Irons show a similar steadiness, \$14.50 @ \$15 being realized for Good Neutral Irons, without any special evidence of disproportion between supply and demand at these figures. Southern No. 3 has been offered rather freely, a sale of 6000 tons in one lot having been made by Justice Cox, Jr., & Co., at a trifle over \$14, delivered ex-ship Delaware River. The figures above named are believed to squarely represent the present condition of the Philadelphia market, and while the demand is not as active as could be desired, neither can prices be called weak. Holders are perfectly indifferent as regards business at less than the prices named, and further concessions appear to be quite improbable, unless sales are forced under special circumstances, such as a doubtful quality or to clean up odds and ends. In some directions there are prospects of a better demand although at this season it may not be safe to offer any very decided opinions on that point. Much will depend upon the turn of events further West. Any increase in the demand there would not only quicken the demand here, but would probably divert some brands from this into other markets. In other words, the position is extremely sensitive, and could be easily influenced

by developments favorable or the reverse, with the chances slightly inclining toward the former alternative. For the present, therefore, we have to report a waiting market, the outcome of the past week having been comparative steadiness, without much activity, closing with more inquiry and an apparent desire to pick up good Irons in liberal quantity, providing that prices are cut down to the lowest figures talked about 10 or 15 days ago.

**Foreign Iron.**—There is some inquiry for Bessemer, with buyers at about \$18 for average qualities, \$19 for special brands and \$27.50 for 20 % Spiegel, c.i.f., duty paid. Sellers ask \$19 @ \$20 for Bessemer and \$28 for 20 % Spiegel.

**Blooms.**—There is a good demand for Blooms and Billets, but prices are not as firm as could be desired, although in a general way the market is fairly represented by quotations as follows: \$28 @ \$28.50, at mill, for Nail Slabs; \$30 @ \$31 for Tank Slabs; \$32.50 @ \$33.50 for Shell Slabs; \$36 @ \$37 for Flange, and \$38 @ \$40 for Fire-Box; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite, \$41 @ \$42.50; Scrap Blooms, \$32 @ \$33 1/2 "Bloom" ton of 2464 lb.

**Muck-Bars.**—The market has been rather tame of late, buyers holding off and sellers not willing to reduce their quotations. Sales are reported at \$26.75, delivered, with \$27 asked, for good qualities, and \$26.50 bid.

**Bar-Iron.**—There is a better general demand, and although large orders are still scarce, mills appear to have secured a fair amount of business one way or another. Prices are said to be a trifle firmer, and the disposition is to get more money, as the output is somewhat affected by the hot weather. There is nothing yet that can be fairly called an advancing tendency, although manufacturers are not inclined to enter much business at current rates, believing that the chances are all in favor of a better market later on. Meanwhile, 1.72 1/2¢ @ 1.80¢ is asked for Best Refined qualities, but, as usual, there is a good deal of irregularity, according to what the order may be. Skelp Iron is beginning to move a little, with sales at 2¢ for Sheared, and 1.75¢ asked for Grooved.

**Plate and Tank Material.**—There has been a considerable demand for Plates, and mills are nearly all full of orders for May and June delivery. Some business has been offered for July and August delivery at current rates, but the manufacturers have not felt at liberty to accept it, believing that better prices will be in force by that time. There is a great deal of work going on, and the demand for Plates is expected to be usually heavy during the fall months. Prices are still pretty well down to the lowest of the year, but, as already stated, manufacturers think they have got all the orders they ought to have at prices which barely return first cost, although no one seems inclined to be the first to stand out for an advance. Nominal prices about as follows: 1.85¢ @ 1.95¢ for Ordinary Plates and Tank Plates; 2¢ @ 2.1¢ for Universal Plates; Shell, 2.3¢ @ 2.4¢; Fire-Box, 3.5¢ @ 3.7¢; Steel Plates, Tank and Ship Plate, 2.2¢ @ 2.25¢; Shell, 2.5¢; Flange, 2 1/2¢ @ 3¢; Fire-Box, 3 1/2¢ @ 4¢.

**Structural Material.**—A fairly active demand is reported in this line, new business being somewhat in excess of the week's deliveries. Manufacturers are very much encouraged by the outlook, and while prices are still on a low plane, it is believed that the increasing demand will soon bring about a corresponding improvement in values. Meanwhile quotations are about as before, viz.: Bridge Plate, 1.95¢ @ 2.05¢; Angles, 1.95¢ @ 2¢; Tees, 2.4¢ @ 2.6¢; Beams and Channels, 2.8¢ for Iron or Steel.

**Sheet-Iron.**—There is no special change to note in this department, the demand is well maintained, and prices are steady for all descriptions. Mills are running full without accumulating stock. Prices remain as before, viz.:

Best Refined, Nos. 14 to 20. .... 3¢  
Best Refined, Nos. 21 to 24. .... 3.20¢  
Best Refined, Nos. 25 to 26. .... 3.40¢  
Best Refined, No. 27. .... 3.50¢  
Best Refined, No. 28. .... 3.60¢  
Common, 1/4¢ less than the above.  
Best Soft Steel, Nos. 14 to 20. .... 3 1/4¢  
Best Soft Steel, Nos. 21 to 24. .... 3 1/2¢  
Best Soft Steel, Nos. 25 to 26. .... 3 3/4¢  
Best Soft Steel, No. 27. .... 4¢  
Best Bloom Sheets, 1/4¢ extra over the above prices.

Best Bloom, Galvanized, discount. .... .65 %  
Common, discount. .... .67 1/2 %

**Steel Rails.**—Business is still dull and inactive, although there are inquiries on the market which seem to promise a good deal of activity before the season is over.

**Old Rails.**—No sales have been reported in this market for some time past, so that prices are merely nominal at from \$22 to \$22.50, as covering both extremes of the market.

**Scrap-Iron.**—There is a demand for good lots at quoted rates, but other descriptions are dull and irregular. Prices about as follows: \$20 @ \$21 for cargo lots; \$21 @ \$21.50 for carload lots, delivered, or for choice, \$22; No. 2 do., \$14 @ \$15; Turnings, \$14 @ \$15; Old Steel Rails, \$18 @ \$19; Cast Scrap, \$15 @ \$16; do. Borings, \$9 @ \$10; Old Fish-Plates, \$23 @ \$24; Old Car-Wheels, nominal, \$17 @ \$18, Philadelphia.

**Wrought-Iron Pipe.**—There is a good business doing, and at the advance recently quoted, prices are firm. Prospects are considered to be unusually promising as regards the volume of business, while prices show a hardening tendency. Discounts as follows: Butt-Welded Black, 52 1/2 %; Lap-Welded Black, 65 %; Butt-Welded Galvanized, 45 %; Lap-Welded Galvanized, 52 1/2 %; Boiler Tubes, 60 %.

**Nails.**—There is a good demand for Steel Nails, but Iron are very quiet, and, unless for Standard makes, prices are irregular. Carload lots about \$1.80; lots from store, \$1.90 @ \$2.

## Pittsburgh.

Office of The Iron Age, 77 Fourth Ave. {  
PITTSBURGH, May 21, 1889. }

The general situation here is improving in some respects, while in others it is not. There is an increasing demand, but labor complications are growing more numerous. Mill owners say that it is impossible for them to pay the present wage-scale and compete successfully with other points where the cost of labor is much less.

The trouble at the Rail mill of the Allegheny Bessemer Company, at Duquesne, is regarded as being about over, as the mill is being operated by non-union men and may be placed in the list of non-union mills. At the Solar Iron Works (Wm. Clark & Sons), a non-union mill, there was a strike a few days since, owing, as alleged by the men, to the firm acting in bad faith, which is denied by the latter. The works have been started up again, and it is the intention of the firm to keep it a non-union mill.

It is expected that a considerable reduction will be demanded by mills operated by Amalgamated Association men when the wage-scale comes up for consideration next month, and unless it is conceded there will probably be a pretty general suspension for a time at least. The feeling continues to obtain that it would be much better to have this wage-scale settled for three years instead of one; that it would be more satisfactory for both interests, and that other lines of trade in this district dependent upon the Iron interest would be benefited thereby.

The river Coal interest is very dull at present. Many of the mines in the Monongahela and Youghiogheny valleys have shut down for the present, and until stocks in the down-river markets have been considerably reduced they are not likely to be started up again. It is claimed that present prices for Pittsburgh Coal in New Orleans scarcely cover lay-down cost. It is claimed that nearly all the furnacemen in this district have been buying considerable Lake Ore recently, with the assurance on the part of the Ore companies that if the market should take a turn backward, which is not expected, they (the furnacemen) who have bought will be taken care of. In consequence, it is probable that some large Ore contracts have been made in this district.

**Pig-Iron.**—There is nothing particularly important to note, with the exception that the feeling appears to be gaining ground that the market has about touched hard pan, although here and there an operator is found who predicts still lower prices. So far as we can learn, none of the furnaces in this district are willing to sell Neutral Gray Forge below \$14, cash, and some of them are indifferent in regard to contracting for future delivery even at that price; they are selling along for present or near-by delivery, but do not care to sell ahead. While some consumers are still holding off, there are others who would not object to contracting for future delivery at ruling prices; hence, while the market has been comparatively quiet the past week the general feeling, if anything, is firmer, and furnacemen generally are as indifferent about selling as consumers are in regard to buying, if not more so. The market is in that position that it would not require very much to stiffen it up, and there is a possibility if not a probability that those consumers who are holding back with the intention of filling up as soon as hard pan has been reached will wake up some of these days and realize that they have made a mistake. We quote prices as follows:

Neutral Gray Forge. ....	\$13.75 @ \$14.00, cash
White and Mottled. ....	13.00 @ 13.50, "
All-Ore Mill. ....	14.50 @ 15.00, "
No. 1 Foundry. ....	16.00 @ 16.25, "
No. 2 Foundry. ....	15.00 @ 15.25, "
No. 3 Foundry. ....	14.50 @ 14.75, "
No. 2 Charcoal Foundry. ....	21.00 @ 21.50, "
Cold Blast Charcoal. ....	24.00 @ 27.00, "
Bessemer Iron. ....	16.00 @ "

No sales of Bessemer Iron reported. So far as we can learn there have been no sales below \$16, cash, and it is doubtful whether it can be bought below that figure.

**Muck-Bar.**—Good strong neutral Muck may be quoted steady at \$26, cash; it can be had at that figure, but nothing less. Some mills refuse to sell at that price. It has been discovered that there is a difference between that made for sale and for use by the maker; that the latter as a rule is much better than the former.

**Spiegel.**—Small sales of 20 % at \$30 @ \$30.50, cash, and of Ferromanganese, 80 %, at \$58, cash.

**Manufactured Iron.**—The general Merchant-Iron trade continues slow for the season, but the demand is improving and some of the mills are moderately well employed; prices—that is, for first quality Iron—are still quoted upon a basis of 1.60¢ @ 1.70¢, 60 days, 2 % off for cash. There is a continued good demand for Skelp Iron, and all the mills making a specialty of it have about all they can do. Prices are firmer but unchanged; 1.62 1/2¢ @ 1.65¢ for Grooved, and 1.90¢ @ 1.95¢ for Sheared.

**Nails.**—There is no improvement to report in the demand for Cut Nails, and prices continue irregular, quoted all the way from \$1.75 to \$1.85 for 12d @ 40d, 60 days, 2 % off for cash. Wire Nails are quoted at \$2.15 @ \$2.20, 60 days, 2 % off for cash, for large lots, and \$2.25 @ \$2.35

in a jobbing way. Carnegie, Phipps & Co. deny having made any sales as low as \$2.15, but we are informed that some large orders were taken by some firm recently at the price quoted. It is claimed that the Cut Nail has a better adhesive quality than the Wire Nail, and that at present prices the former is the cheapest of the two.

**Wrought-Iron Pipe.**—The Pipe trade continues active, the mills being all busy; some of them are sold several months ahead, and the combination prices are being faithfully adhered to. As stated in our last report, the Pipe mills are now all in the combination, and the market is in a very satisfactory condition. Prices remain unchanged. Discounts on Black Butt-Welded Pipe, 52½¢; on Galvanized do., 45¢; on Black Lap-Welded, 65¢; on Galvanized do., 52½¢; Boiler Tubes, 1½ inches and smaller sizes, 57½¢ off; 2 inches and larger, 62½¢ off; Casing, 5½ inches, 62½¢ off; other sizes, 60¢; 2-inch Tubing, 13¢ per foot net; 3-inch Line Pipe, 20¢ per foot; 6-inch do., 56¢; 8-inch, 90¢. The next regular monthly meeting of the Pipe Association will take place in Pittsburgh on June 8.

**Old Rails.**—The demand for Old Iron Rails continues light, while prices remain unchanged; sales of 1200 tons at \$21.50 @ \$21.75. Consumers say that they can buy all that they want at the inside quotation. Old Steel Rails are still quoted \$17 @ \$17.25 for short and \$19 @ 19.50 for long lengths.

**Steel Rails.**—Both of the mills here are pretty well supplied with orders, and the market is reported firmer. Heavy sections may be quoted at \$25 @ \$26, cash orders, at works. It is thought the very low price of Rails will stimulate railroad building, and that in this respect there will be a better showing the latter part than during the first half of the year.

**Billets, Blooms, &c.**—Sales of Bessemer Billets and Blooms at \$27, cash, which appears to be the ruling price. Nail Slabs, \$26.50. It is stated that a firm at Wheeling has contracted with a mill here to convert Slabs into Skelp Steel, paying freight on the Slabs from Wheeling to Pittsburgh, and on the Skelp Steel from Pittsburgh to Wheeling, where it is to be made into Steel Pipe and shipped back to New York. Bloom Ends and Rail Crops ruled at \$17 @ \$17.25.

**Railway-Track Supplies.**—There is a fair business at unchanged prices; Spikes 2¢, 30 days; Splice Bars, 1.65¢ @ 1.75¢; Track Bolts, \$2.75, with Square, and \$2.85, with Hexagon Nuts.

**Old Material.**—Demand for everything in this line continues light, and prices are weak but unchanged; No. 1 Wrought Scrap, \$18 @ \$18.50, net ton; Car Axles, \$24 @ \$24.50; Wrought Turnings, \$18; Cast Scrap, \$14 @ \$14.50 gross; Old Car Wheels, \$18 @ \$18.50 gross.

## Louisville.

LOUISVILLE, KY., May 20, 1889.

**Pig-Iron.**—The market has been very quiet during the past week, with very little buying. Different views are expressed by consumers in regard to the course the market will take. Some hold that the conditions are such that a strong advance may take place during the course of the year. Others feel that the large number of furnaces, the accumulation of Iron, and the fact that so far there has not been a general movement to shut down, will necessitate extremely low prices for several months, and their fears are that Iron will go even lower. Buyers would prefer higher prices, as the low purchases are of no advantage, they in turn having to make

extremely low prices to consumers. The Lady Ensley Furnace, at Sheffield, is now in blast and running largely on Nos. 1 and 2 Foundry, with some No. 3 Foundry. The furnace is using all-brown Ore and Pocahontas Coke, and the intention is to make one of the best Irons South. The Trussville Iron has been on the market for some time, with very satisfactory results. The Iron is strong and well graded, and consumers rank it with the best Southern Irons. We quote as follows:

Southern Coke, No. 1 Foundry, new classification.....	\$14.75 @ \$15.25
Southern Coke, No. 2 Foundry, new classification.....	14.25 @ 14.75
Southern Coke, No. 3 Foundry, new classification.....	13.75 @ 14.25
Gray Forge.....	13.25 @ 13.75
White and Mottled, different grades.....	12.75 @ 13.25
Silver Gray, different grades.....	13.00 @ 13.50
Southern Charcoal, No. 1 Foundry No. 1 Mill.....	16.25 @ 16.75
Southern Car-Wheel, standard brands.....	14.75 @ 15.25
Southern Car-Wheel, other brands.....	21.75 @ 22.75
Hanging Rock Coke, No. 1 Foundry.....	18.00 @ 19.50
Hanging Rock Charcoal, No. 1 Foundry.....	15.50 @ 16.00
Hanging Rock Cold Blast.....	19.50 @ 21.00
	20.75 @ 22.75

## Detroit.

WILLIAM F. JARVIS & Co., under date of May 20, 1889, report as follows: Business has been dull during the past week, and while there have been inquiries for a fair amount of Coke and Lake Superior Charcoal Irons, the sales have not been as large as usual at this time of the year. Notwithstanding the dullness, there are very few furnaces that desire to contract for deliveries very far ahead, unless at higher prices than are ruling at present. In most cases Lake Superior is held firm, but in a few instances we have heard of some cutting having been done, but are not prepared to say whether report is true or not. With a quiet market we quote as follows:

Lake Superior Charcoal, all numbers.....	\$19.50 @ \$20.00
Lake Superior Coke, all ore.....	18.00 @ 19.00
Lake Superior Coke, cinder mixed.....	17.25 @ 18.25
Standard Ohio Black Band.....	18.00 @ 19.00
Southern No. 1.....	17.00 @ 17.50
Southern Gray Forge.....	15.00 @ 15.50
Southern Silvery.....	16.00 @ 16.50
Jackson County (Ohio) Silvery.....	18.00 @ 18.75
Old Wheels.....	18.50 @ 19.00

## Cleveland.

CLEVELAND, May 20, 1889.

**Iron Ore.**—The sales reported for the past week have included a considerable quantity of non-Bessemer Ore at an average price of \$3.75 per ton, Cleveland delivery. A few thousand tons of this Ore brought \$4 per ton, but a larger quantity \$3.60 @ \$3.75. Scattering orders for non-Bessemer Specular and Magnetic Ores at \$4.75 @ \$5 per ton have also been placed. Additional sales to Eastern furnacemen have brought the aggregate purchases of buyers in that locality up to nearly 700,000 tons. Gogebic Bessemer Ores are in fair demand at \$4.90 @ \$5.25. The total business for the past week has, however, been considerably below the record for the preceding seven days. A large amount of Ore was sold, but the orders placed were mostly for rather small amounts, and the aggregate sales did not exceed 200,000 tons, bringing the total amount sold since the opening of the market for new Ore up to about 3,500,000 tons. Pittsburgh furnacemen are still buying sparingly, hoping for the same decline in prices that characterized the midsummer market in 1888. A scarcity in ready tonnage to load Ore has led to some talk of higher lake freights, but the charters reported for the week have been at the prevailing rate of 90¢ from Escanaba; \$1.10 from Marquette, and \$1.25 from Ashland and Two Harbors. The amount of Ore being shipped from the Lake Superior district is something enormous, over 600,000

tons having already been forwarded, against about 150,000 tons shipped up to a corresponding period last year. Dealers to-day report sales of Gogebic Ore from the Aurora and Ashland mines at \$3.25, f.o.b. vessels Cleveland.

**Pig-Iron.**—The slightly encouraging features of the market have been retained, although there is little in the present situation to justify any enthusiasm or a very large measure of hope for the immediate future. There is a disposition on the part of the sellers to stand by the present quotations for desirable Irons for which the demand has improved. The following are the quotations:

Nos. 1 to 6 Lake Superior Charcoal.....	\$20.00 @ \$20.50
No. 1 Strong Foundry, Bessemer quality, per ton.....	16.50 @ 17.00
No. 1 Strong Foundry, per ton.....	16.00 @ 17.00
No. 2 Strong Foundry, per ton.....	15.00 @ 16.00
No. 1 American Scotch, per ton.....	16.50 @ 17.00
No. 2 American Scotch, per ton.....	15.50 @ 16.50
No. 1 Soft Silvery, per ton.....	17.00 @ 18.00
Mahoning and Shenango Valley Neutral Mill Irons, per ton.....	14.00 @ 15.00
Mahoning and Shenango Valley Red Short Mills, per ton.....	14.50 @ 15.50

**Old Rails.**—Sales of Old American Rails at \$21 are reported and the inquiry is improving.

**Manufactured Iron.**—Sheets are firm and in good demand; Common Bar is still quoted at 1.60¢.

(By Telegraph.)

The official announcement to-day that freight rates for carrying Iron Ore from Lake Erie ports to the Pittsburgh and Mahoning Valley furnaces had been reduced breaks the deadlock between mine owners and the Carnegie interests, and 1,000,000 tons of Ore will consequently be sold within the next few days. Orders are already announced for the best grades of Gogebic Bessemer at \$5.25, Cleveland delivery; for Menominee Bessemer, \$4.90 and \$5.15, and for large quantities of high-grade Bessemer Ores. The new rate to Pittsburgh is \$1.05 per ton, a reduction of 20¢, and to the Mahoning Valley 62½¢, a reduction of 10¢. Cleveland furnacemen will immediately ask for a corresponding reduction in Coke freights in order to compete with the manufacturers of Pittsburgh and the Mahoning Valley.

## St. Louis.

OFFICE OF The Iron Age, 214 N. Sixth st., St. Louis, May, 20 1889.

**Pig-Iron.**—The market remains in about the same condition as last noted. One sale of 500 tons Southern Gray Forge was made a few days ago at \$13, four months' time, delivered at a point close by the city. This makes the price at furnace about \$9.50 per ton, which, to say the least, is not very encouraging. Of course sales of this character do not entirely represent the condition of the market, but they go far toward showing how anxious some furnaces are for business and what figures will be accepted to obtain same. The outlook is not very promising, and unless the demand improves prices are liable to go still lower, although this hardly seems probable, as buyers are sending in inquiries for some good round lots, which, if sales are consummated, will have a beneficial effect on prices, which are quoted as follows for cash, f.o.b. St. Louis:

Southern Coke, No. 1 Foundry, \$15.25 @ \$15.75	
Southern Coke, No. 2 Foundry, 14.75 @ 15.25	
Southern Coke, No. 3 Foundry, 14.25 @ 14.50	
Gray Forge.....	13.25 @ 13.75
Ohio Softeners.....	17.00 @ 19.00
Lake Superior Charcoal.....	19.75 @ 21.50

### Missouri.

Charcoal Foundry, No. 1.....	16.00 @ 16.50
Charcoal Foundry, No. 2.....	15.00 @ 15.50

### Tennessee.

Charcoal Foundry, No. 1.....	17.00 @ 18.00
Charcoal Foundry, No. 2.....	16.50 @ 17.00
Connellsville Coke, f.o.b. East St. Louis, \$4.55; St. Louis, \$4.70.	

**Bar-Iron.**—The demand continues to improve, and there are some pretty fair orders being booked for the railroads, which appear anxious to a certain extent to place their orders, now that bottom seems to have been reached. Consequently there is a better feeling and mills are more hopeful. Prices show some signs of improvement in the near future, and are quoted with more firmness than for some time. Small lots from store, \$1.80; carload lots, from \$1.60 to \$1.70, according to circumstances.

**BarbWire.**—The demand keeps up strong for the season and mills are being kept well employed, and in some cases are pushed to make deliveries. Prices are firm and generally adhered to. Mills quote from \$2.80 to \$2.85 for Painted and from \$3.40 to \$3.45 for Galvanized. Carload lots are quoted at from \$2.70 to \$2.75 for Painted and \$3.30 to \$3.35 for Galvanized, f.o.b. St. Louis.

John W. Good, late with Sligo Iron Stone Company, St. Louis, and L. McGilvray, for a number of years agent for P. L. Kimberly & Co., Sharon, Pa., have formed a partnership as manufacturers' agents, and established themselves in the Laclede Building, St. Louis, Mo. Among the well-known firms represented by them are P. L. Kimberly & Co., Sharon, Pa.; Standard Iron Co., Bridgeport, Ohio; Lawrence Iron and Steel Company, Ironton, Ohio, and Calumet Iron and Steel Company, Chicago, Ill., for whom they represent the P. C. P. Steel Nail.

## Chattanooga.

Office of *The Iron Age*, Carter and 9th Sts., CHATTANOOGA, May 20, 1889.

**Pig-Iron.**—Much to the surprise of many of our Pig-Iron men the past week has developed a spirited demand, and prices are decidedly improved—i.e., there is not the same disposition to accept offers that existed before, and upon the whole the atmosphere is somewhat brighter. This is about all that can be said of the situation now. Several round lots have been sold for future deliveries, and the idea has gone out that if large desirable lots are bought a little higher figure will be paid. There appears to be no letting up in the disposition of Northern capital to come down here to invest in mineral property, and many of them say as soon as they get matters straightened out they intend erecting furnaces.

## New York.

Office of *The Iron Age*, 66 and 68 Duane street, NEW YORK, May 22, 1889.

**American Pig.**—The majority of sellers report the market quiet, with only a few comparatively large transactions reported. A feeling exists among a number of consumers that the much-talked-of contest between Northern and Southern furnaces still contains possibilities of lower prices. They argue that if all which is said in connection with the ability to place Pig-Iron on the market at low cost is true, there is still considerable margin for another cut. Southern Iron is being freely offered at \$16, ex-ship, for No. 1 Foundry, and reports of prices below that figure are freely circulated. Thus far they have a foundation only in isolated instances. The Thomas Company report deliveries quite active, and they are taking new business very cautiously, it being claimed that the capacity is pretty well engaged. We understand that two more furnaces of the company are about to be blown in. We quote Standard Northern Iron, \$16.50 @ \$17.50 for No. 1; \$15.50 @ \$16 for No. 2, and \$14.50 @ \$15.25 for Gray Forge. Southern Iron is

selling at \$16 @ \$16.50 for No. 1, \$15 @ \$15.50 for No. 2, and \$14.25 @ \$14.75 for No. 3.

**Scotch Iron.**—The market is very dull, with Coltness nominally \$21.50 @ \$21.75; Summerlee, \$21.25 @ \$21.50, and Dalmellington, \$20.25 @ \$20.50.

**Structural Iron and Steel.**—The volume of business in the way of small orders for Architectural-Iron Work is quite satisfactory, and some larger orders are still pending. There is quite a lively inquiry for bridge work, but, in spite of the fact that the shops are well employed, competition is very keen and prices are low. We continue to quote Sheared Plates, 1.9¢ @ 2¢; Universal Mill Plates, 2¢ @ 2.1¢; Angles, 1.9¢ @ 2.1¢; Tees, 2.35¢ @ 2.5¢, and Channels and Beams, 2.8¢, on dock.

**Plates.**—There are a number of good orders in the market. We quote Iron Tank, 1.9¢ @ 2.2¢; Shell, 2.25¢ @ 2.4¢; Steel Tank, 2.15¢ @ 2.25¢; Shell, 2.35¢ @ 2.4¢; Flange, 2.55¢ @ 2.75¢, and Firebox, 3¼¢ @ 4¢.

**Bar-Iron.**—The market remains dull. We quote: Carload lots on dock, Common, 1.6¢ @ 1.65¢; Medium, 1.65¢ @ 1.7¢, and Refined, 1.7¢ @ 2¢.

**Steel Rails.**—There is quite a run of small orders, which, it is claimed, can be filled at \$27.50 at tidewater, which would net the active mills from \$26.50 to \$26.75, at mill. From the South there is considerable inquiry. But little business on a large scale is reported either East or West. We quote nominally \$26.50 @ \$27.50 at Eastern mill.

**Wire Rods.**—No business whatever is reported. quotations remaining nominally \$41.50 @ \$42 for Foreign Rods.

**Old Rails.**—We hear of no sales, and continue to quote the market nominally \$22 @ \$22.50 for Tees.

**Fastenings.**—We quote \$1.90 @ \$2 for Spikes, and 1.7¢ @ 1.9¢ for Angles, Iron or Steel.

**Scrap-Iron.**—The demand still remains unsatisfactory, and the amount of business being placed is very small. We continue to quote: No. 1 Scrap, \$20 @ \$21, according to the location of yard, for cargo lots, delivered; Turnings, \$18.50 @ \$14; Cast Scrap, \$15 @ \$16; Borings, \$9.50 @ \$10.

**Spiegeleisen and Ferromanganese.**—The market is very dull, with 20 % Spiegeleisen being offered at \$27.50. A small business is being done in 80 % Ferromanganese at \$57.50 @ \$58.

G. H. Hull & Co. have established themselves at 71 Broadway as Pig-Iron merchants, Jared N. B. Reis being manager.

## Financial.

General trade advices, excepting as encouragement is derived from the prospect of abundant crops, incline to a somber hue. A serious drawback is the difficulty of realizing profits on a declining market, especially in manufacturing, where rates of wages do not readily become adjusted to correspond with a shrinkage in values, expenses in other respects often remaining as before. It appears from a comparison of the average prices prevailing now and in 1860 that in a wide range of commodities entering into ordinary competition in about seven-eighths of all descriptions there is a decline of something like 24 %, and in casting about for an explanation the theory is advanced that the depression is a legitimate and inevitable consequence of the collapse of combinations designed to resist the downward tendency. Breadstuffs, grain and provisions are this week again quoted dull, weak and lower.

In these lines continued fine weather for growing crops and corn planting has a depressing influence, taken in connection with a slack demand. A very large surplus in the yield of wheat this year is now considered assured, and this in addition to some 45,000,000 bushels of the old crop still in reserve—as a consequence of an artificial blockade of the export market at a time when more remunerative prices were possible. Just now the corn movement West is unusually large. Cotton is very strong, and spots are advanced ½¢ on quotations, with a good export demand. Groceries are quiet, coffee dull, sugars steady, teas moderately active, other goods slow. Dry goods jobbers are in the transition period between fall and spring, with indications of an early development. In an opinion of the Interstate Commerce Commission, just printed, reference is made to the question of uniform classification of freight. The commissioners say this subject is now under consideration by a standing committee organized by selection from the railroads and associations in all parts of the United States, which is working in the direction of uniformity throughout the entire country. In this city favorable opinions are expressed by the railroad men of the practical workings of the law and the association over which Mr. Walker presides.

In the Stock Exchange markets interest has centered in the movements of the belligerent factions seeking to control the Oregon Transcontinental. An issue of \$10,000,000 preferred stock was enjoined by the courts, and the Villard party then sought to retain control through purchases of stock. On Friday a partial corner was covered by purchases for non-delivery, and on Saturday the market became animated throughout. Chicago, Burlington and Quincy came to the front with a net advance of over 2 %. Atchison ranked second, closing 1 % higher, while Oregon Transcontinental, which was third in point of activity, closed with a net gain of 7 %. St. Paul preferred was a feature, and so was Rock Island, both at materially higher prices. The reorganization of the Wabash was completed by the sale of the last of the property in the hands of the receiver for \$15,550,000. On Monday the excitement in Oregon partly subsided. The supposition that President Villard had gained a point had a marked effect upon the securities of the Northern Pacific. On Tuesday stocks were very active, and a reaction in the forenoon was followed by renewed buoyancy. Reading was the feature. Oregon Transcontinental had a further decline and the Northern Pacific lost a fraction of Monday's advance, but the markets closed strong.

Government bonds closed as follows:

U. S. 4½s, 1891, registered.....	100½
U. S. 4½s, 1891, coupon.....	107½
U. S. 4s, 1907, registered.....	120½
U. S. 4s, 1907, coupon.....	120½
U. S. currency 6s.....	121½

The bank return for the week shows an increase of \$5,231,750 in surplus reserve, which now stands at \$14,082,325, the largest since February 23 last. The loans show a contraction of \$3,645,500; the specie is increased \$3,469,300; the legal tenders are up \$2,477,400; the deposits other than United States are increased \$2,859,800. The shipment of nearly \$3,000,000 in specie will be reflected in the forthcoming statement. Despite the outward movement, money is extremely easy, time money, 2½ % for 60 days, 3 % for four months, 3½ % for six months and 4 % for eight months. Commercial paper in good demand, but offerings are light. Quotations are 4 % @ 4½ % for prime double name and 4½ % @ 5 % for best single name.

The market for sterling was steady. Recent shipments of gold resulted from small foreign purchases of securities, and further specie exports are looked for. Cot-

ton bills will appear in a few weeks. Posted rates are \$4.88 @ \$4.89½.

The total amount of bonds purchased from August 3, 1887, to date is \$168,639,100, of which \$61,590,250 were 4 per cents and \$107,048,850 4½ per cents. Their cost was \$194,859,750, of which \$78,928,883 was paid for the 4 per cents and \$115,930,866 was paid for the 4½ per cents.

The United States Savings Bank, Constant A. Andrews president, was opened in East Fifty-ninth street.

Failures during the week number 252, against 189 for the same time last year.

## Metal Market.

**Copper.**—The conference that was being held among representatives of the Copper mining companies at the time of our last report resulted in an agreement that the price for deliveries made to consumers since the collapse of the syndicate is to be 12¢ for Lake Ingot, the same figure to apply to all fresh business up to July 1. As a basis for determining the selling price of their goods this figure suits the manufacturers very well, but they, on the other hand, do not exhibit the least anxiety for new business in Ingot Copper at the price fixed on Lake as long as the agreement exists between the companies and European bankers as to the disposal of accumulated supplies of American Copper on this side under control of the latter, nor among these about the enormous amounts held by bankers in Europe. Our consumers consequently try to get along as well as they may without buying a pound of Lake Copper at 12¢, feeling confident that the latter figure cannot be long sustained; if it were 10¢ instead, or less, it would be different. Under the circumstances we are not much nearer a practical solution of the general situation of the metal than we were a week since. A conference between the mines was held last night, at which "progress was made." London improved from £38.12/6, spot, at our last writing to £39.15/ yesterday, and futures from £38.10/ to £39.10/, sales summing up 1000 tons. The visible supply in England and France on May 15 was 122,740 tons. The price on Copper Tubing has been reduced 4¢, and on Brass Tubing 3¢. On Sheets the reduction has not yet been announced.

**Tin.**—London once more took an upward turn, with spot rising since our last from £92.12/6 to £93.17/6 yesterday, whereas futures gave way from £93.10/ to £92.10/, with sales aggregating 500 tons. During the day or two when the cable reports from the other side were a little more buoyant some 250 tons of Tin were sold, 150 of which on 'Change at 20.70¢ down to 20.60¢, spot; 20.90¢ @ 21¢, July, and 20.85¢, spot deliveries. At the Exchange, between calls, 30 tons spot were sold at 20.40¢. The closing price for spot Tin is 20½¢ @ 20¼. **Tin-Plates.**—Our market has been unexceptionally dull, with slightly lower figures in a few instances. Liverpool is nominally unchanged, but orders at a slight grading are being booked. We quote large lines, ordinary brands, 30 box: Siemens-Martin Steel, Charcoal finish, \$4.75 @ \$5.50; Coke finish, \$4.55 @ \$4.65; Terns, \$4.12 @ \$4.30; Coke Tins, \$4.25 @ \$4.35, and Wasters \$4.12½ @ \$4.15.

**Lead.**—As decision on the part of the Secretary of the Treasury in the Mexican Ore duty question may tarry for a month or more, the market here and in the West at once took a downward course once more; still there is a firm undertone at the reduced closing figure. Sales for the week amounted to some 600 tons, taken by consumers in the open market at from 3.75¢ down to 3.70¢, the market winding up at

the inside figure. St. Louis quotes 3.50¢ @ 3.55¢.

**Spelter.**—The demand out West, for galvanizing purposes in particular, is described as being unusually cheery this spring; as at the same time the demand East is improving, we cannot quote Common Domestic any lower than 4.85¢, at which a moderate trade is being done. Silesian is worth 5½¢.

**Antimony.**—Has remained moderately active and steady at 13½¢ for Cookson's brand, and 12½¢ for Hallett's.

## New York Metal Exchange.

The following sales are reported:

THURSDAY, May 16.	
10 tons Tin, September.....	20.85¢
20 tons Tin, July.....	20.90¢
25 tons Tin, July.....	20.95¢
25 tons Tin, June.....	21.00¢
FRIDAY, May 17.	
20 tons Tin, spot.....	20.65¢
10 tons Tin, spot.....	20.60¢
10 tons Tin, delivery May 20.....	20.60¢
25,000 pounds Lake Copper, September.....	11.50¢
MONDAY, May 20.	
10 tons Tin, spot.....	20.00¢
TUESDAY, May 21.	
100 tons Lead, September.....	3.80¢
WEDNESDAY, May 22.	
30 tons Tin, spot.....	20.40¢

## Coal Market.

The large Anthracite Coal companies appear to be making a spasmodic effort to put new life in the trade so far as this end can be brought about by increased activity at the mines. After many weeks of comparative idleness nearly all the collieries of the Pennsylvania Coal Company at Pittston have resumed on half-time, and those of the Delaware and Hudson Company in Carbondale and vicinity on three-quarters time. The Reading Company are prepared to put on the market 1,000,000 tons of Coal per month, equal to about 25% of the total monthly production heretofore, but it is stated that the number of working collieries will not be increased before June, as the stock on hand at Port Richmond is about 200,000 tons. The railroad company have added 1200 cars and 60 locomotives to its equipment. In the Lackawanna Valley several breakers started up during the week. The reported production for the week ending 18th inst. is 673,500 tons, an increase of about 90,000 tons compared with the previous week and the largest output recorded for a long time. Compared with the same week last year the increase is 56,000 tons. The aggregate is still about 1,500,000 tons behind the corresponding date in 1888. The principal gains last week were in the Lehigh Valley and in the Reading district. Better employment will

prevent the threatened migration of colliers to other districts. Shippers are detained by the scarcity of vessels, and freights are high.

Respecting prices the Philadelphia *Ledger* says: "Many of the contracts for Anthracite placed recently are for Coal for delivery during the next 90 days at the 'cut' prices which were ruling in the latter part of April and the first or second week of this month."

A. Pardee & Co. put about 50,000 tons on the Philadelphia market at 10¢ reduction, but offered none outside.

Bituminous Coal is plenty at lowest quotations.

A meeting of sales' agents was called for Wednesday to consider the expediency of an advance. Outsiders believed no chance in this direction would take place before July 1.

## British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]

LONDON, WEDNESDAY, May 22, 1889.

Merchant Bar Copper for immediate delivery has been scarce on the open market and the fluctuations in price have been small. The producing companies are still supplying the consumptive demand at fair rates, but decline to sell for forward unless covered. The French banks have apparently kept out of the market.

Fully 3000 tons Anaconda Matte have been offering on the market, and at last accounts only 1800 tons had been sold. The price realized was 8/.

Negotiations are in progress for the formation of a syndicate to purchase the assets of the Société des Métaux. English and French financiers are interested in the project. If successful, a public issue will be made in Paris and London.

Small shipments from the Straits, due to dealers there retaining supplies, served, in connection with continued purchases for America, to impart strength to the Block Tin market early in the week. Subsequent realization and very dull demand caused a reaction, and prices are today about £1 lower than a week ago, with the market rather depressed.

There has been no improvement in the business in Tin-Plate, but makers are hopeful, and anticipate a larger demand. Ordinary sorts are still a drug on the market.

The strike at the Worcester and the Forrest works has terminated, and the mills will be started up shortly. Six of the largest firms in Midlands have joined a combination to advance prices.

The Pig-Iron market has been rather dull, particularly in the warrant speculation, and the "bears" have sold freely. Prices for makers' brands of Scotch are barely steady, and Middlesboro' has sold 3d off. Six furnaces have been relit in Scotland. The Dixons' works have sold 25,000 tons Cumberland Hematite for Italy recently, and further business of magnitude for the same market is said to be under negotiation.

In the Steel trade there is a very good business, more particularly in Rails, Blooms, Billets and shipbuilding descriptions. Prices are firm all through, but no higher than last week.

Old Material is difficult to buy, except at full figures, but there is no business of importance passing in Rails or in Scrap.

**Scotch Pig.**—Business has been rather slow and prices have varied but little.

No. 1 Coltness, f.o.b. Glasgow	55/6
No. 1 Summerlee, " "	54/6
No. 1 Gartsherrie, " "	52/6
No. 1 Langloan, " "	54/6
No. 1 Carnbroe, " "	47/8
No. 1 Shotts, " at Leith	53/8
No. 1 Glengarnock, " Ardrossan	51/8
No. 1 Dalmellington, " "	46/
No. 1 Eglinton, " "	44/

Steamer freights, Glasgow to New York, 2/6; Liverpool to New York, 10/.

**Cleveland Pig.**—The trade moderate at present and prices barely steady. No. 3 Middleborough, G.M.B., quoted 39/ prompt.

**Bessemer Pig.**—A very fair business in this line and prices steady. West Coast brands, mixed numbers, 49/, f.o.b. shipping point.

**Spiegeleisen.**—The market remains firm, with demand good. English 20 % quoted 82/6, f.o.b. at N. W. England shipping point.

**Steel Rails.**—Demand fairly active, and the market very firm. Heavy sections quoted at £4. 12/6, and light sections £4. 17/6 @ £5, f.o.b. at N. W. England shipping point.

**Steel Blooms.**—There is still a good business at firm prices. We quote £4. 2/6 for 7 x 7, f.o.b. at N. W. England shipping point.

**Steel Billets.**—Prices firm and the demand fairly active. Bessemer, 2½ x 2½ inch, £4. 10/, f.o.b. at N. W. England shipping point.

**Steel Slabs.**—Only a moderate trade in these, but sellers firm. Bessemer, £4 2/6, f.o.b. at N. W. England shipping point.

**Old Rails.**—The trade moderate, but sellers firm. Tees quoted at £3. 5/ @ £3. 7/6, and Double Heads, £3. 12/6 @ £3. 15/, c.i.f., New York.

**Scrap-Iron.**—Sellers firm on prices, but the demand moderate. Heavy wrought quoted at £2. 2/6 @ £2. 5/, f.o.b.

**Crop Ends.**—A moderate business and prices unchanged. Bessemer quoted £2. 10/ @ £2. 12/6, f.o.b.

**Tin-Plate.**—Rather more business than last week, but the movement still moderate. We quote, f.o.b. Liverpool:

IC Charcoal, Allaway grade	15/3 @ 15/6
IC Bessemer Steel, Coke finish	13/6 @ 13/9
IC Siemens	14/ @ 14/3
IC Coke, B. V. grade	13/ @ 13/3
Charcoal Terne, Dean grade	12/ @ 12/3

**Manufactured Iron.**—Trade rather slow this week and prices without change. We quote, f.o.b. Liverpool:

Staff. Marked Bars	£ s. d. 2 s. d.	8 2 6
Common	6 0 0	
Staff. Bl'k Sheet, singles	7 15 0	
Welsh Bars (f.o.b. Wales)	5 5 0	5 7 6

**Copper.**—Less stock moving, but prices held quite firmly. To-day's prices for Bars were £39. 12/6, spot; £39. 7/6, three months' futures. Best selected, £44. 10/.

**Tin.**—There has been a fairly active business at irregular prices. Straits quoted to-day at £91. 12/6 @ £91. 17/6, spot, and £92. 10/ for three months' futures.

**Lead.**—Business fairly active and prices quite firm. Quoted £12. 15/ for Soft Spanish.

**Spelter.**—There continues to be a brisk demand and prices are strong. Quoted at £18 for ordinary Silesian.

H. H. Mansfield, 36 Pine street, has been appointed agent for New York and vicinity of the Frankford Steel Company, of Philadelphia, for their Steel Forgings, Steel Castings, Tool Steel and other products.

## Foreign Markets.

### EQUIVALENTS.

Franc, Peseta or Lira	Cent.	10.3
Florin (Netherlands)	Cent.	40.2

Wills (Portugal)	Cent.	1.08
Milreis (Brazil)	Cent.	54.6
Mark (Germany)	Cent.	25.6
Picogram	Pounds	2.205
Picul	Pounds	134.

### BRAZIL.

**PARA, May 4, 1889.—India Rubber.**—The season on the Madeira and Cayari rivers is reported to be very healthy, and thus Rubber receipts this year are expected to be exceptionally heavy. The importance of the Rubber trade in Brazil can be judged by remembering that the export of Rubber from this port during the past year amounted to 15,014 tons, of which 8890 went to the United States and 6124 to Europe.—*Diario*.

### EAST INDIES.

**SINGAPORE, April 9, 1889.—Tin.**—Our last report was dated the 26th ult. We have to report a continued scarcity of all our staples, and a very small business in consequence. The market for Tin opened at \$35.75 per picul, but with moderate arrivals it quickly reflected the firmer feeling in London and advanced to \$36.75, at which several transactions have been made. To-day there are buyers, but no sellers, at \$36.12½. The supply during the next six weeks will be on a reduced scale, and it is estimated that the year's production will not be over the average. **Gum Copal.**—A few odd lots have been sold at full prices for low qualities, but the bulk of the arrivals goes to swell the already considerable stock which dealers hold for higher prices. **Tonnage.**—Rates to London by steamer are steady at 40/ @ 45/ for dead weight and light freight respectively. **New York via Cape.**—The Liguri is a full ship and the Edward Kidder only requires a little more light freight to be similarly situated. For Boston the berth is filled by the fixture of the Obed Baxter. The Oanfa, which steamer left hence for New York on March 30, took 1262 piculs of Tin, so that the shipments from the Straits Settlements to the United States to date sum up 31,563 piculs. **Exchange.**—Touched 3/0½ for six months' sight credit drafts, but closes firm at 3/.—*Gilfillan, Wood & Co.*

**MANILA, May 13, 1889.—Hemp.**—There are buyers at \$15.25, against \$8.12½ per picul same date last year, equaling ½ ton, cost and freight, £50, against £27. 10/. Since January 1 there cleared for the United States 105,000 bales, against 71,000 in 1888, while there remain loading 20,000, against 4000. Cleared for Great Britain since January 1, 105,000; loading for do., 4000; cleared for all other ports, 16,000, against 28,000; receipts at all ports since last cable, 2000, against 5000 and since January 1 283,000, against 208,000 in 1888 and 158,000 in 1887. **Freight,** \$7.50, against \$5.50. **Exchange,** six months' sight, 3/6½, against 3/5.—*Ker & Co., to their agent in New York, Mr. Charles Nordhaus, 89 Water street.*

**COLOMBO, Ceylon, April 4, 1889.—Plumbago.**—Greater firmness has developed during the week. We quote at the close in rupees per ton: Large lumps, 145 @ 170; ordinary lumps, 125 @ 160; Chips, 80 @ 95, and Dust, 40 @ 65. Shipments since October 1 have been as follows: To England, 78,162 cwt.; to Hamburg, 5418; to Bremen, 659; to Antwerp, 5101; to Holland, 487; to India, 63; to Australia, 208, and to the United States 76,340—together, 163,388, against 119,125 in 1888, 114,207 in 1887, and 104,504 in 1886. **Cair Yarn** Nos. 1 to 4 remains steady at 7 @ 13 rupees per cwt. **Exchange,** six months' sight, 1/4 11-16.—*Volkart Bros. to their agent in New York, Mr. John W. Greene, 82 Wall street, New York.*

### BELGIUM.

**BRUSSELS, May 8, 1889.—Iron.**—The Chamber of Deputies referred the Pig-Iron duty to the Minister of Finance, who proposes to reduce it one-half, from 5 francs to 2½ francs per ton, and abolish the drawback hitherto allowed Bessemer Pig, of 2½ francs henceforth, also to pay 2½ francs duty. The Chamber will have to decide in the matter. Rolling-mills in the North of France still compete with our's in Belgium for the lack of orders at home. They have reduced working days by half, and Belgian operatives begin to return, as even at lower wages here they do better, work being more than sufficient in our Iron districts. The quotations are for Foundry Pig, 5.10 @ 6.50 francs per 100 kg.; Forge ditto, 4.80 @ 5.80 francs; Merchant, No. 1, 12.50 francs; Beams at Antwerp, 11.75 francs; Angles, 13 francs, and Sheets and Plates, 16 @ 25 francs.—*Moniteur des Interêts Matériels.*

### HOLLAND.

**ROTTERDAM, May 2, 1889.—Tin.**—The 14,000 piculs Billiton offered at auction at Batavia

on April 24 averaged 63.45 guilders per picul, costing to sell here 55.62½ per 50 kg. per steamer. The next sale of a similar quantity will come off toward the end of next month. The following statement shows the position of Banca Tin in Holland on the 30th April from the official returns published by the Dutch Trading Company:

Import in April	Slabs	1889. 14,000	1888. 24,000	1887. 23,790
Total four months		60,973	88,138	65,909
Deliveries in April		17,888	4,500	13,457
Total four months		61,188	26,600	50,488
Stock second hand		23,761	28,955	16,368
Unsold stock		151,235	114,436	75,706
Total stock		175,046	153,391	92,077
Afloat	Piculs	4,300	6,400	4,500

### Statement of Billiton:

Import in April	Slabs	9,550	15,300	5,500
Total 4 months		31,078	41,076	30,374
Deliveries in April		6,885	4,275	7,237
Total 4 months		25,628	16,171	31,062
Stock		25,348	41,088	21,333
Afloat	Piculs	24,500	21,000	16,000

### Quotation 30th April:

Banca	£ 55	£ 70	£ 62
Billiton	£ 54½	£ 65	£ 61½

(De Monchy & Havelaar.)

### GERMANY.

**HAMBURG, May 8, 1889.—Iron.**—Pig-Iron has on the whole continued active in Rhenish Westphalia, including Spiegel for home use, at 66 marks per ton, less so for export. Forge Pig is scarce and wanted at 58; Foundry ditto sustained, Thomas is in lively request at 47, and Bessemer at 58 and even above these figures. English on the West Coast, 50/. Finished Iron is doing well. Southern rolling-mills have raised their price 3 marks per ton for Merchant. Thin Sheets are, however, neglected, and the Wire branch is still repressed, exportation still flagging. The quotation at Dortmund for Wire Rods is 110 @ 120; for Steel Rails, 120 @ 125.—*Borsenhalle.*

### Ore Freights Reduced.

At a meeting of the Pittsburgh agents of the lines controlled by the Pennsylvania Company, the Baltimore and Ohio Railroad, the Pittsburgh and Western Railroad, the New York, Pennsylvania and Ohio Railroad, and the Lake Shore and Michigan Southern Railroad, held in Pittsburgh on Tuesday, the 21st inst., a considerable reduction on freight rates on ore from Lake Erie points was made. We give below the principal points of shipment to which reductions were made, and also the old and new rates. They are as follows:

Point of shipment.	Old rate.	New rate.
Pittsburgh, Allegheny, Chartiers, Beaver Falls, Sharpsburg, Rankin, Bessemer, Munhall, Cochran, Demmeler, McKeesport	\$1.25	\$1.05
Sharpsville, Sharon, New Castle	.72½	.62½
Struthers, Youngstown, Girard, Haseltin, Lowellville, Niles, Johnstown, Conemaugh, Dunbar, Scottsdale, Everson, Oilphant, Uniontown, Fairchance	.72½	.62½
Leechburg, Apollo	1.60	1.34
* Kittanning	1.35	1.22
	1.40	1.40

\* The rate to Kittanning will not be charged for the present.

The above rates are per ton of 2000 pounds, and will go into effect on Tuesday, the 28th inst.

It is stated that the Pennsylvania Railroad Company have decided to make another innovation in their service by placing on the engines a connection with the steam pump, by which a hose can be attached, and in case of fire be of great service. Whenever a smash-up or wreck of passenger cars takes place, especially in the winter, when the car stove is doing its best, a great many lives are lost by fire. The new arrangement, it is hoped, will prevent a great many casualties. A few days ago it was given a test. The apparatus was attached to an ordinary shifting-engine and at a given signal the pump was put in motion. The trial was made at the West Philadelphia yards and the pump had force enough to throw the stream over the highest buildings. It has now been decided to put the apparatus on all the shifting-engines. The hose, which

will be about the length of six cars, will be carried on the tender. It is also proposed to equip the crews of the various trains and train them in the fire drill. If they prove successful a number of the passenger engines will also be equipped.

### The Sweating System in England.

However opinions may differ as to what is termed the "sweating system," few will dispute the value of the inquiry into it, its effects and the remedies by the Lords' committee, appointed at the instance of Lord Dunraven. That committee of inquiry will, at any rate, elicit the facts, and facts must be the basis of legislation if the measures proposed are to be of any service whatever. The sweating system, as practiced more especially in connection with the tailoring trades in the metropolis, was dealt with in a powerful novel by the Rev. Charles Kingsley in 1849, now 40 years ago. From that day to this, says *Engineering*, the evils of the system have been recognized and frequently denounced; but the system has grown; it has extended to many other trades—it is, indeed, almost universal wherever domestic industries are carried on. It is an almost inevitable incident in connection with modes of manufacture carried on under the domestic system at the homes of the producers or in small workshops attached thereto. The factory and workshop acts may and do touch many of those small workshops where children and young persons are employed, but they fail to reach the evil where it is most disastrous, and in cases where adults only are employed they do not touch it at all.

The nail and chain makers of Cradley Heath and its district have suffered and are suffering from many of the evils incident to a domestic industry. Indeed, in some respects there is a concentration of nearly all the evils associated with and arising from this mode of manufacturing. Wages are low; the hours of labor long; women and children are employed to an extent and under conditions which remind us of their employment in mines at the date of the Commission of Inquiry, in 1840-41. And, then, the sanitary condition of the district appears to be almost worse than it was when the sanitary inquiry into the condition of the laboring population was instituted in 1840. A recent witness before the committee stated that the death-rate of children in this district was, in 1888, equal to 10 per 1000, while the general death-rate was 18.2 per 1000. The child mortality is thus considerably over one-half the total death-rate, whereas, taking the whole of England and Wales, it is under one-third. The condition of the dwellings is described as most dilapidated, the sanitary arrangements most defective and the water-supply foully tainted with sewage soil. The whole population is described as "overworked and underfed." Overcrowding is general, decent sleeping accommodation is the exception and utter wretchedness, misery and privation are the usual lot of the people.

Turning to the reports of the commissioners appointed to inquire into the sanitary condition of the laboring population in 1840 we find a similar state of things in connection with the nail-making and cognate trades. The cottages generally consist of one room down-stairs and two up-stairs, with a nail-shop attached. Nailers' children at 10 years of age earn about 2/ per week. The price paid for making nails has been reduced to one-fifth within the last three years, cut nails being now much used. The sanitary condition of the district is described as so bad that a serious outbreak of typhus fever occurred, attributable to want of proper drainage, the filthy habits of the people and the cellar

accommodation. The nailers, it is stated, did not pay much rent, their wages were low and their condition was filthy and ragged in the extreme; the latter fact, it is said, may be attributed to the fact that girls are put to the nail-block before they have learned to sew. The children never went to school, as on week-days the parents could not afford to lose their earnings, and on Sunday they were so ragged that they were ashamed to send them to school. In many instances the whole family, male and female, sleep in one room, of not more than 12 feet square, including father and mother and grown-up sons and daughters, to the number of from seven to nine, and even more, persons. Such was the condition of things in 1840, some 50 years ago; according to recent testimony matters have not materially changed for the better in the nail and chain making districts.

The wail of woe from the Cradley Heath and surrounding districts is no new experience, though it is a sad one. Some 30 years ago a great strike took place in this district, nominally in consequence of an employer insisting upon the workmen making good some damage caused by rattening. But the real cause of the strike and of the rattening was the deductions made from the poor wages of the workpeople, on one pretense and another, then so common in this industry. The strike assumed a demand for an increase of wages. After a prolonged struggle the men obtained a substantial advance in wages, although at great cost, much suffering and after many serious outrages. In 1886 another prolonged struggle took place, when the men regained a trifle of the wages lost during the preceding ten years. At that time the men, women and children were in a state of semi-starvation for nearly six months.

The Duluth *Herald* reports that S. P. Ely, of Cleveland; G. C. Stone, of St. Paul, and others are developing iron-ore property in the mountains on the east coast of Cuba. Breakwaters and harbor works will have to be constructed at a cost ranging between \$750,000 and \$800,000. Stripping is now being carried on, but no ore will be shipped for a year or a year and a half. Analyses show the ore to carry 62 to 66 per cent. of iron, with 0.006 to 0.026 of phosphorus and 0.02 to 0.04 of sulphur. It is estimated that the cost will be \$4.20, f.o.b. ship United States harbors, duty paid.

A vertical wall 100 feet high in St. Louis was thrown 18 inches out of line by a high wind. The building was easily righted by diagonal trussing on the upper floors and the application of jack-screws, while 12 heavy I-beams fastened by channel bars were placed in position in the first floor and basement.

Fully 200 members of the American Society of Mechanical Engineers convened in Erie, Pa., on Tuesday, and heard an address from Hon. Horace See, of Philadelphia, the retiring president. The address was devoted to industrial education.

The new building for the great smelting works at Anaconda, near Butte City, to replace the one recently burnt, will be composed entirely of iron. According to contract with Connecticut men, the material is to be shipped and the building completed in 57 days.

The fourth Ensley Furnace of the Tennessee Coal, Iron and Railroad Company, near Birmingham, Ala., has been recently blown in.

### The Silver Question.

Even the most far-seeing confess themselves beclouded when attempting to predict the future of silver, but somewhere in the distance grave difficulties may be discovered. Shall we have bimetalism or monometallism? Very few of the strenuous advocates of a silver currency have conceded that this question was in any way involved. Their simple demand is give us silver, and without stint. Meanwhile, as the accumulation in the Treasury vaults have increased to enormous proportions, the silver champions have become more outspoken, and it is boldly proclaimed that the gold standard must ultimately be abandoned, in which event "while both metals will continue to be legal measures of value, silver will predominate, and we shall practically have all our assets measured by the silver dollar." This event we are told "is surely coming" under the system of coinage now being pursued, and that the sooner this agony is over the better. This language is none other than that of the veteran financier, John Thompson, of New York, under whose presidency the first national banking institution, under the new law, was organized. It would thus appear to be the avowed purposes of the silver kings like Senator Stewart, of Nevada, to substitute silver for gold and they now feel themselves strongly enough entrenched behind their silver barricade of \$328,000,000, that sum being the total coinage of silver dollars under the act of February 28, 1878, providing for the Bland dollar of 412½ grains. It has taken only about ten years of superabundant silver coinage to reach the point where the country is asked to open the sluice-way and invite the cataclysm. Scarcely was the new Secretary sworn in before Mr. Stewart in the special session of the Senate, presented the following resolution:

*Resolved*, That it is the sense of the Senate that the business of the country requires the purchase by the Secretary of the Treasury of \$4,000,000 worth of silver bullion per month for coinage during the provisions of the act of February 28, 1878.

The grand point made is that the coinage of \$4,000,000 a month would cause such an increased purchase of silver that the depreciation of the market value of the metal would be arrested, bringing the value of 412½ grains of silver bullion nearer to that of 25.8 grains of gold, thus tending speedily to restore the bimetallic standard of gold and silver as it formerly existed. This would be very fine for the constituency represented by Mr. Stewart: "Prior to 1878," Mr. Stewart reminds us, "both gold and silver were available in the hands of the debtor class to meet their obligations." As the Bland dollar can now be manufactured at a cost of about 70 cents each, the scheme has a close resemblance to a fraudulent trick, and it is reasonably assumed that the debtor class—all who have troublesome mortgages and the like—would regard the proposition with extreme favor. Meanwhile, how is the creditor class to be protected? The latter, it should be borne in mind, comprises not only "bloated bondholders," monopolists, owners of real estate, mortgages, &c., but thousands of the industrious poor who have small investments—the savings of a lifetime, and other thousands, comprising widows and orphans depending in like manner upon eventually receiving the full equivalent of a gold dollar. Possibly, however, these latter are of no political importance and not to be regarded. Despite these pessimist observations, however, we may hope the evil day is far off. The disturbing feature in the present circumstances is that the silver-dollar men, quite resigned to the situation, have only to say, "the sooner the better."

# Hardware.

The past week has developed comparatively few changes in price, the market being characterized by a rather weak tone, with a tendency toward lower quotations in several lines. The demand is only moderate, and is limited to assorted lots for immediate requirements. There is some complaint in regard to collections, which are rather sluggish.

## Wire Nails.

A great many Wire Nails were purchased early in the season, and we hear of many instances in which buyers are loaded up with enough of the goods to carry them for some time to come. In this condition of things, as would naturally be expected, the demand is somewhat limited, and comparatively few large orders are being placed. The aggregate of business is, however, referred to as fair. Prices are made on a basis of about \$2.20 to \$2.25, at mill, and small lots from store are sold at the usual advances.

## Barb Wire.

The demand in this market continues good, and some difficulty is experienced in filling orders as promptly as is desirable. Prices are without change on the basis of 3.5 cents for carload lots, 3.6 cents for 3-ton lots and 3.8 cents for small lots, with the usual deliveries.

## Cut Nails.

Lately resales of a block of 10,000 kegs bought from one mill by, another have created irregularity. It is believed that the lot in question is now marketed. We continue to quote \$1.80 to \$1.85 for carload lots in dock for Iron Nails.

## Tackle Blocks.

The manufacturers of Tackle Blocks have united in adopting a revised list, which we print below, this list having gone into effect on the 20th inst. It will be observed that the prices for the regular line of ordinary Mortise Blocks, inside iron strapped, is the same as that published in our issue May 2, the other lists being of subsequent revision, and the whole is now published as the standard list for this line of goods. All the principal makers have united in adopting this revised list, in which the inequalities of the old list are corrected, and the prices made to correspond with the present cost of the goods. The lists, as given below, are subject to the following discounts:

Per cent.

Ordinary Mortise Loose Hooks.....50  
Ordinary Mortise, other than Loose Hooks.....40  
Wide Mortise, 7 to 16 inches inclusive.....40  
Wide Mortise, 18 to 24 inches inclusive.....30  
Galvanizing Straps.....net  
Snatch Blocks, Boston pattern.....40  
Snatch Blocks, other than Boston pattern.....40  
Yacht Blocks.....35

### Composition Self-Lubricating Bushed.

Ordinary Mortise Loose Hooks.....30  
Ordinary Mortise, other than Loose Hooks.....25  
Wide Mortise, 7 to 24 inches inclusive.....30  
Snatch Blocks, Boston pattern.....30  
Snatch Blocks, other than Boston pattern.....30  
Hoisting Blocks, single only.....30  
Add extra for all Loose Swivel Hooks and Swivel Jaws as heretofore.

The following are the revised lists above referred to:

### STANDARD PRICE LIST OF INSIDE IRON-STRAPPED TACKLE BLOCKS, MAY 20, 1889.

#### Iron-Strapped Snatch Blocks. Composition Self-Lubricating Bushed.

Size.	Price.	Size.	Price.
6.....	\$5.25	14.....	\$16.50

## Miscellaneous Prices.

The Skinner Chuck Company, New Britain, Conn., quote the following prices on their Chucks:

Discount.  
Patent Drill Chucks.....30 %  
Patent Independent Lathe Chucks.....40 %  
Patent Combination Chuck, new model.....40 %

These goods are fully described in their neatly-printed and fully-illustrated catalogue.

Another improvement in the prices of Bright Wire Goods is to be noticed, the goods being now advanced fully 10 per cent. beyond the prices at which they have recently been selling, and are now quoted at discount 87½ per cent. The very low figures at which these goods have been for some time offering justifies this advance, which, we are advised, is made by all the leading manufacturers.

## Export Business.

The condition of the export trade generally may be considered satisfactory in South Africa and the Australian colonies. The situation of the present time is briefly explained. In the former country the success of the diamond mines has greatly stimulated shipments, and a heavy business has been the result. It has the appearance of something better than an unnatural boom. Manifests of vessels clearing for ports in South Africa show large shipments of Lumber, Doors, Sashes, Plows, Edge Tools, Canned Goods, &c., and exporters seem to be satisfied with the present outlook for continued prosperity in that field.

In Australia the business has been heavy during the last two years, perhaps never better, but a relapse has occurred in Victoria and New South Wales owing to poor crops and overloading by importers. Large stocks are now held by all classes of merchants, and they have been curtailing their orders to this country since the 1st of January to a considerable degree. The collapse of the land boom in Melbourne created considerable anxiety for a time, but no failures of consequence, with one exception, are yet reported. New Zealand is at present doing well. Good crops have improved the condition of af-

fairs, and orders from that market have been very satisfactory. Several merchants are at present in this country from the Australian colonies.

Freights have been rather slow on account of slack orders. This, coupled with high rates charged by the freighters, has a tendency to check free buying.

In the Argentine Republic business has been very good. Large shipments of Agricultural Implements and all classes of American Hardware have been made. How long the present good situation will continue is a matter of conjecture. The country has a grand future, and the trade relations with ours should be encouraged rather than rebuffed. This remark, however, may be considered rather ancient, but, as every exporter knows, it applies to almost every country with which we are now doing any business whatever.

### Trade Topics.

Goods exported by American manufacturers are generally satisfactory in quality, manufacturers appreciating the importance of sending out good goods on which reputation can be made in foreign markets, and there is no doubt that the quality and style of American goods exported will compare very favorably with those coming from any other country. Through mistake or otherwise goods of low quality and unsuitable finish may occasionally be exported, but the high character of American manufacturers, as well as their business judgment, makes such instances very rare. We have, however, received from a well-known house in Germany, buying a good many goods in this country, a complaint in regard to the quality of Hickory Handles which have been shipped to them. Omitting the names, what our correspondent says is as follows:

A year ago I bought from — a sample lot of Hickory Handles, first quality. This sample lot was satisfactory in every way, and I was very happy to have a good source of supply for this article, especially as it is my principle to sell only the best which can be secured. My former purchases through Bremen and Hamburg importers were not satisfactory. I was induced through the sample lot purchased to give a larger order. When the goods arrived I found, to my greatest regret, that I had been stuck, since three-fourths of the handles of 30 inches and above, instead of consisting of fine white hard stock furnished in the first lot, were ordinary redwood, which my experience has found break very easily. The result is that I cannot sell these goods at all. As in buying direct American articles in good faith I make immediate payment for them, such a method must be condemned the more. Under these circumstances a demand for damages would be without any result whatever, and therefore, in order to protect honest business men against such practices, I have no other means than to bring the matter before the public in this way, and would request you to print this statement.

The question as to the difference in price of goods to the jobbers and the retail trade is one that is constantly perplexing manufacturers, and on which there is apt to be some divergence of view on the part of those interested. That the same question comes up in Canada is indicated by an article in our esteemed contemporary, *Hardware*, in which it is stated that at a late meeting of the Hardware section of the Toronto Board of Trade a resolution was adopted instructing the secretary to communicate with certain manufacturers named, both of whom are engaged in making Shelf Hardware which is sold largely to retailers, with a view to arranging some better discount for the large trade. The following statement is made in regard to the matter:

Under the existing arrangement one class of retailers is sold to at list prices, and another class at 5 per cent. discount, while the wholesaler only receives 12½ per cent., thus leaving him a margin on the goods he sells of only 7½ per cent. What the wholesalers now want is 15 per cent. discount, and no concession to any class of the retail trade. The question is likely to be pushed by those interested, with what effect remains to be seen.

A good deal of care has to be exercised by manufacturers, or associations of manufacturers, in cases where lower prices are given for export than for domestic trade, as ingenious and unscrupulous buyers will sometimes endeavor to obtain the lower figures for the home market. There have been instances in which goods have been sold to Canadian purchasers at especially low prices, on the ground that entering Canada they have to pay a high duty. The goods thus purchased, however, instead of reaching their destination, have been sent to the purchaser's agent at Suspension Bridge, or else when shipped direct to the Canadian point have not been taken out of bond, but reshipped in bond to Suspension Bridge, and then sold to American merchants. In such a practice only houses without character on either side of the line would participate, but in a number of instances, we regret to say, this scheme has been carried out. In order to guard against it manufacturers in entering into combinations or making any agreement in regard to prices should make combination price apply to Canada as well as this country.

### What the Trade Think of Prices.

An important factor in determining the tone of the market is the opinion of the trade in regard to prices, it being very well known that frequently the trade, more or less generally, are pervaded by a certain confidence that prices are firm and will advance, or at other times become suspicious of prices and regard them as likely to decline. In the one case business is materially stimulated, and in the other it is repressed, the conviction, for which there is often very little ground, tending directly to bring about the condition of things toward which it points. This being the case, it is nearly as important for those who would have light on the business situation to know what the trade think about prices as it is to be advised as to their actual weakness or strength. In expressing their opinion upon trade matters this is a point on which our correspondents often touch, referring sometimes to prices in a particular line, and at others to prices in general. In a number of letters recently received this matter is touched upon many of our correspondents in connection with references to the business situation and other matters related to the trade. These letters represent every section of the country, and are from retail as well as wholesale merchants, whose business varies in extent from that of the village Hardware store to the largest jobbers in the great cities. The opinions expressed, accordingly represent those of the trade at large, so that the manufacturer or merchant may from them receive accurate advices in regard to the feeling of the trade as to prices. It will be seen that many varying opinions are thus expressed, and it is interesting to note the different ways in which the trade regard the matter.

*Michigan*.—Prices as they are ranging at present are good, and if maintained will afford a good per cent. profit.

*Connecticut*.—The general tone of the market is, we think, for lower prices. Competition and the bringing together of the manufacturer and consumer are gradually reducing prices.

*Maine*.—The general tone of the market is good, and there is little cutting in prices. Goods generally are being sold at small advance from cost.

*New York*.—Prices are low and going lower every week. Bottom has not been touched yet, and don't know as it ever will be. General market is lower than ever known in Hardware.

*Michigan*.—The tendency is downward. There is a general feeling that goods must be sold very close, and, by the way, they are down to rock bottom.

*Iowa*.—Prices are unsteady, with a tendency to cut on leading lines.

*Wisconsin*.—The general tone of prices is healthy, as all parties are satisfied that we are at the bottom.

*Pennsylvania*.—There is a disposition on the part of a few (as there always is) to disturb matters by some extremely low prices. No more so than usual, however.

*Tennessee*.—Prices have been low, but sales have more than made up the difference in prices.

*Alabama*.—The disposition is to obtain a fair margin in profits, but this depends upon the desire of competing points to cut, which, we regret to say, is very frequently done.

*Iowa*.—The feeling is that prices will soon take an upward turn.

*Kansas*.—Prices are low. Some jobbers are cutting for trade.

*Connecticut*.—There seems to be no confidence that prices will be any higher. The tendency seems to be downward on nearly all Hardware lines, and in buying we do not know but we are paying more than a neighbor.

*Michigan*.—Good buyers can almost make their own prices, and stocks are, therefore, well up.

*Ohio*.—Goods are too cheap. Deception is practiced all along the line.

*Ohio*.—Outside of Screws and a very few other articles there seems to be no effort made to advance prices. On the contrary, there is a downward tendency in several lines.

*Connecticut*.—Dealers want lower and lower prices, until with competition there is nothing left to manufacturer.

*Michigan*.—We have been looking for advances in some lines of heavy goods, but think now there is not much prospect of same before July or August.

*Indiana*.—There has been some cutting in prices by those anxious to reduce stock, but generally prices have been fairly maintained.

*Maine*.—Everybody seems anxious to get a better profit than last year, and is holding his goods rather than give them away.

*Kentucky*.—The market is dragging singularly, in view of the volume of business being done.

*Rhode Island*.—Prices have been much cut up since January 1. Unusual anxiety to sell noticed on part of manufacturers and jobbers.

*Vermont*.—Almost every article we buy shows a weak market with downward tendency.

*Indiana*.—Competition keener than ever, and consequently profits are very small. Prices have a downward tendency.

*Iowa*.—General tone of the market is downward on Hardware and Iron Goods. Iron and Steel Goods certainly as low, if not lower, than they should be, but supply as yet seems to exceed demand, and supply and demand always have and always will regulate prices.

*Massachusetts*.—We manage to sell close and make up in volume of business instead of getting high prices.

*South Carolina*.—We are being forced to sell goods at retail at a very small margin, though there is a growing demand for the better class of goods.

*Minnesota*.—Prices have been thus far much depressed. Salesmen are inclined to cut, thinking that demand will improve after season has fairly opened.

*Wisconsin*.—Prices are low. All goods, owing to excessive competition and close proximity of large towns, are sold at small margins. Chicago and Milwaukee jobbers solicit builders' business.

*Iowa*.—There is a very general feeling that prices are already as low as they can go, but at the same time there is very little confidence in prices of Hardware advancing in the near future.

*Illinois*.—Staples are sold on as close margins as we have ever known, but the profit on other goods is better than usual.

*Alabama*.—Prices are cut to the smallest margin possible.

*Iowa*.—All being eager to do business, profits are often foregone. This is the most unfavorable feature of the Hardware business.

*California*.—There has been considerable of a decrease in prices, but at present the tendency is toward a slight advance.

*Missouri*.—Large stocks of Hardware, bought in prospect of a fair demand, have induced low prices on a majority of articles. Cash has it all its own way.

*Tennessee*.—Prices are low and irregular. Heavy goods appear to be weakening.

*Massachusetts*.—Competition by manufacturers has caused some feeling. As soon as a party has purchased some one comes along and offers similar goods at a lower price.

*Pennsylvania*.—General tone is steady, but a little weakening in a few items. Most goods seem to be pretty close to cost.

*Iowa*.—Manufacturers and jobbers are all anxious to sell, but there is not much cutting on prices.

*Illinois*.—Prices are satisfactory with the exception of some articles controlled by combination—viz.: Screws, Bolts and Copper Goods.

*West Virginia*.—Prices are very weak. Little confidence as to the bottom. A gradual growth of skepticism in that direction.

**New York.**—At present we can see little encouragement to hope for higher prices, while in staple Iron Goods the prospect is not upward by any means.

**Minnesota.**—Prices are weak. Most any reasonable concession given if it will effect a sale. This results apparently not so much from competition as from fear of a break in prices, or more that a more limited demand than usual will leave them overstocked on goods limited to season.

**Ohio.**—Prices are being held up closer than for some time by both jobbers and makers of goods, with the exception of some few leading articles, such as Nails, Strap and T Hinges, Wire, &c.

**Kansas.**—Prices on staple Hardware are tending lower, small trade seeming to cause lower prices.

**Minnesota.**—Prices in most lines are well maintained, but there is no sign of firmness except in Nails, Barb Wire and Wagon and Carriage Wood stock.

**Wisconsin.**—Most stable articles are lower than ever known before. This is especially true of Iron and Nails and Barb Wire.

**New York.**—The general tone of the market, we think, is depressed. It would be hard to make sales at advanced prices.

**Minnesota.**—Prices are steady, and there is a hopeful feeling that they have reached bottom, and that we are on the eve of more prosperous times.

**West Virginia.**—Prices are lower than they were at this time last year, though advances lately made are firmly held and show no tendency to cut.

**Kansas.**—Prices are lower than ever known in the retail trade here.

**Indiana.**—Very few lines of goods are held firm. We think there is a greater effort made in allowing "special concessions" to move goods than at any time for many years. Quantity secures low prices.

**Maryland.**—We can hardly believe it possible for lower figures to be reached than now prevail, except it be with such goods as are held in combination or pools.

**Illinois.**—Prices are too weak. Margins too close for size of trade. Profits are given to the class that does not appreciate them.

**Kansas.**—While prices are not demoralized, good values can be got of reliable houses. Desirable customers are no doubt able to get goods under the general market.

**Nebraska.**—Locally there is no indication of demoralization in prices. The breaking down in prices usually follows overstocking of manufacturers or dealers.

**Nebraska.**—Prices as a rule are holding their own. Changes are few and nominal and usually in the direction of lower prices.

**New York.**—On many heavy and leading goods sold largely at this season prices are very low, and the general tone of the market indicates that values will rule low this year; hence, buyers are not anticipating their wants as much as heretofore by placing orders in advance.

**Dakota.**—Prices are not as good as usual. Merchants are so anxious to sell that many cut the bottom out of prices.

**North Carolina.**—Prices are very close. Margins are small on leading goods.

**Missouri.**—The tone of the market as regards prices is very discouraging, but as it has been getting worse from year to year for a long time we have almost ceased to grumble.

**Florida.**—Prices have been very good, but there has been some cutting on staple goods.

**Colorado.**—Have looked for prices to advance, but have now no faith in same.

**California.**—Prices are very low, Eastern competition being such that goods are sold at close margin by jobbers.

**Colorado.**—Some dealers being overstocked on Barb Wire, Nails and other heavy goods are cutting prices for cash sales, though prices in general are moderately firm.

**Maine.**—Prices are a good deal cut up, and the lower they go the harder it is to sell at fair profits. We regard prices as unsatisfactory on the whole.

**Illinois.**—Prices are at present weak, but think we can see indications of its bettering before fall.

**Pennsylvania.**—Prices are low, low, very low. We believe a little firmness in price would encourage everybody, manufacturers as well as dealers, and would stimulate trade now only waiting for some impetus of the kind.

**Iowa.**—Prices are very low and we see no prospect for any advances. We notice jobbers' prices on the Mississippi River are very nearly the same as New York jobbers' prices, especially on staple goods.

#### Items.

The strength of the eight-hour day movement is shown by the adoption by the Illinois Legislature of an amendment to the ship-canal bill, making eight hours a day's work in the construction of the proposed

water-way between Lake Michigan and the Mississippi River. The amendment was adopted in the State Senate by an overwhelming vote, only two names being recorded in opposition to it. It seems to be the purpose of the labor leaders to compel in every way the recognition of eight hours as a legal day's work. In the city of Chicago eight hours has constituted a day's work on all public work for some time past by ordinance of the City Council.

The well-known Chicago Hardware House of Kellogg, Johnson & Bliss has undergone a reorganization during the past week. Messrs. Kellogg & Johnson have retired from the company, and their stock has been transferred to Bullard & Gormley, who have for several years past conducted a Hardware store at 106 Lake street. The stock of Bullard & Gormley will be removed to Kellogg, Johnson & Bliss' store, at 108 and 110 Randolph street. The corporate name will be retained by the new company for the present, with Bliss, Bullard & Gormley as managers. This is a very important consolidation of Hardware interests in Chicago, as these two houses have been competing with each other in precisely the same line of trade—namely, Builders' Hardware and Mechanics' Tools. They, of course, carried a general line of Hardware, but made a specialty of the branches mentioned. The stock of the new house will be very large, and will probably exceed that of any other retail Hardware house in the West.

The leading Hardware and Iron and Steel houses of Chicago will, as usual, close their places of business at 1 o'clock on Saturday hereafter until August 31. The Saturday half-holiday during the summer now seems to have established itself as a permanent institution among the business houses of that city.

Announcement is made by the Cleveland City Forge and Iron Company, the Avery Stamping Company, the Chapman Jack Company and the Bronson Supply Company, all of Cleveland, Ohio, that owing to the large extension of their business in the South they have established a special agency for the South for their different lines of goods in the Neal Building, Baltimore, Md., with Alfred Ely as manager.

Lake Erie Iron Company, Cleveland, Ohio, have made an arrangement with Surpluss, Dunn & Alder, 97 Chambers street, New York, by which they will represent their interests in the East and South, and will solicit orders on their account, quoting as low prices as the home office. The Iowa Barb Wire Company also have appointed Surpluss, Dunn & Alder, 97 Chambers street, New York, their agents for Southern and export trade.

Simmons Hardware Company, St. Louis, Mo., have purchased the stock and good-will of Caruth & Byrnes Hardware Company, of the same city. The negotiations for the sale have been carried on for some time past, but in such a quiet manner that the announcement was a complete surprise to the trade. The transfer was made on Monday, the 20th inst.

Thomas S. Krall, Lebanon, Pa., has invented and is about to manufacture a Spring to be put on a single-tree, so that the trace cannot slip off. It is a contrivance made of spring brass wire, the two arms of which are inserted in the hole in the single-tree, making a simple and apparently secure contrivance for the purpose indicated. Two patterns of this Spring are made. When desired the Spring may be attached to the single-tree by a small chain, or its form is such as to permit its being easily carried in the pocket.

The decision of the Circuit Court of the United States, Eastern District of Pennsylvania, in the case against Paine, Diehl & Co., for infringements of the patents on

the Henis Fruit and Vegetable Press, owned by the C. F. Henis Company, is to the effect that the defendants have violated and infringed the first and third claims of the patent, and an injunction is granted against making, using or selling the goods thus infringing. The amount of damages sustained is left to the decision of a referee.

C. J. Bailey & Co., 132 Pearl street, Boston, Mass., whose Rubber Dauber is described on page 791, issue circulars describing a variety of Rubber Brushes, including Bath, Flesh-Tooth and Hand Brushes, &c., Pen-Holders, Pant Guards, Erasers and other goods, all of which are more or less closely constructed on the same principle as the Dauber.

The trade will note with interest the advertisement of the Shepard Hardware Company, Buffalo, N. Y., in which the merits of their Lightning Freezers are enumerated with a unique setting.

Wells Bros. & Co., Greenfield, Mass., advise us that they have accepted the exclusive sale of the well-known Stratton Bros. Improved Spirit Levels. These Levels have been on the market for more than 20 years, and are referred to as occupying a high place. Catalogues and quotations will be furnished the trade upon application to Wells Bros. & Co.

O. W. Graves, 19 Cliff street, New York, agent for the American Brass Kettle manufacturers, issues a circular in which the new line of Tinned Inside Kettles, to which we referred in our last issue, are represented, specific information being given of the sizes, weight and capacity. The regular goods are also similarly described.

We are informed that W. G. Avery, president of the W. G. Avery Mfg. Company, Cleveland, Ohio, and inventor of the Seamless Elevator Buckets and Troughs, contemplates soon putting on the market his new Cattle and Horse Troughs. These Troughs are referred to as a decided improvement over the ordinary ones now in use, and are claimed to be equal, if not superior, to the seamless ones.

Columbiana Pump and Machine Company, Columbiana, Ohio, have issued a comprehensive and convenient catalogue, which represents their large and increasing line of Force and Lift Pumps, as well as other specialties of their manufacture. In their opening circular they refer gracefully to the patronage they have received, and allude also to the quality of their goods and their purpose to incorporate improvements from time to time. Very satisfactory descriptions are given of the different Pumps, with list prices and other information which will be of service to the trade.

Wire Goods Company, Worcester, Mass., issue new pages for their catalogue describing recent additions to their line, including Dog and Halter Chains, Handled Pot Chains, Cake Coolers, Portable Pie Rack, Fishing Hook Attachments, Hooks of different kinds and the patent Take-up Twine-Box.

R. Wallace & Sons Mfg. Company, with factories at Wallingford, Conn., have established a salesroom at 104 State street, Chicago, Ill., under the management of O. F. Bridges. They will carry a complete line of the company's goods, adding frequently the latest productions in Silver and other metals, so that their stock will represent the most recent and artistic efforts in this line.

Cordley & Hayes, 173 Duane street, New York, agents for the sale of Monroe Bros' Refrigerators, state that the fire at the factory last week damaged only the wood-working department, the total loss being estimated at \$20,000. Their stock of Refrigerators and a lot coming through were

not injured, so that they are able to fill orders promptly. On two or three sizes they were low, but have arranged for the cabinet-work to be made for them, and hope to be able to meet all demands. The sale on these goods this season is referred to as beyond expectations, and they are said to be meeting with favor among the best trade.

The American Oil Stove Company, Gardner, Mass., issue a catalogue for 1889, which they claim illustrates a still better and more complete line of Oil Stoves and Lamps than that of 1888. The company state that for a number of years past they have felt the need of better distributing facilities, and announce to the New England trade that they have opened an office at 9 Broomfield street, Boston, where they will carry a full stock of Stoves. The catalogue consists of something over 30 pages of letter-press, profusely illustrated with their leading specialties. Among the latter we find what the company are pleased to term a Lamp Stove Range. It presents very much the appearance of a Vapor Stove, but is made up of a number of Lamp Stoves placed upon a frame in such a way that their tops practically coincide with what would be the top surface of a Vapor Stove. The range is made in sections about 12 inches square, is provided with castors and finished in japan and nickel.

### Important Business Changes.

The Trenton Vise and Tool Works, for the past 30 years established in Trenton, N. J., and owned solely by Hermann Boker & Co., of New York, has been organized as a stock company. Herman Funke, Sr., of Hermann Boker & Co., New York, is president, and David W. Van Tine, of G. W. Van Tine & Son, of Philadelphia, is secretary and treasurer. During the past three weeks the works have been closed, in order that extensive alterations and improvements, made necessary by largely-increased business, might be made. These changes are now completed, and the new company assure their friends that they will soon be able to execute all orders with prompt dispatch. The special products of this company are Solid Box Vises, all kinds of Parallel Swivel and Coach Vises, Picks, Mattocks, Hoes, Hammers, Sledges, Tongs, Pincers, and similar goods, which have quite an extended reputation for superior excellence, and the new management advise us that they propose to keep up the high standard already attained, and if possible to improve it. The Trenton Vise and Tool Works emphasise the quality of their Solid Box Vises, and say that no effort will be spared to maintain the high reputation that their goods have enjoyed for a quarter of a century. As heretofore, the sale of the product of this company will be through Hermann Boker & Co., of New York, and G. W. Van Tine & Son, of Philadelphia.

An important change has taken place in the John Russell Cutlery Company, Turners Falls, Mass. Richard N. Oakman, Jr., who for the past 15 years has been treasurer and manager of the company, has disposed of his stock to W. P. Dustin and will retire from the management at the annual meeting in July. It is understood that for the present, at least, Mr. Oakman will continue manager of the Lamson & Goodnow Mfg. Company, Shelburne Falls. His management of the John Russell Cutlery Company is generally regarded as having been exceptionally skillful and successful. This change, together with that noted below in the firm of Landers, Frary & Clark, is not regarded as likely to result in weakening the arrangement between the manufacturers, but is interpreted generally as likely

to tend toward the continuance and strengthening of the close relations already existing. Mr. Dustin, of the John Russell Cutlery Company, and Mr. Landers, of Landers, Frary & Clark, while sharp competitors, understand thoroughly the art of pulling together when desired, and any demoralization of prices is not anticipated. The understanding which has existed among the manufacturers is regarded by the trade as desirable, as by it prices, while kept above the unprofitable level to which they fell during the intense and unrestrained competition, are also kept at a moderate figure and not unreasonably high.

At a meeting of the Board of Directors of Landers, Frary & Clark, New Britain, Conn., held on May 6, J. A. Pickett, who has been president of the company since the retirement of J. D. Frary, in 1875, tendered his resignation, which was accepted, and Hon. Francis B. Cooley, of Hartford, was chosen president for the unexpired term.

### Exports.

PER BRIG RAPID, MAY 8, 1889, FOR PORT NATAL, SOUTH AFRICA.

By *Arkell & Douglas*.—6 crates Stoves, 2 cases Nails, 1 crate Handles, 6 cases Hardware, 13 bundles Wash-Boards, 6 dozen Tools, 15 cases Plows, 1 case Brooms, 6 cases Plows, 6 cases Agricultural Implements, 12 dozen Handles, 20 boxes Clothes-Pins, 1 case Brooms, 12 cases Agricultural Implements, 1/2 dozen Wringers, 4 crates Ranges, 4 cases Stove-Ware, 14 cases Tools, 8 dozen Saws, 6 dozen Hammers, 8 dozen Shelf Brackets, 6 crates Sad-Irons, 5 cases Hardware, 10 boxes Shade Rollers, 25 cases Plows.

FOR EAST LONDON.

By *Arkell & Douglas*.—12 cases Scales, 1 case Blacking, 1 case Hardware, 4 cases Miter Boxes, 1 case Razors, 1 case Hardware, 1 keg Braces, 295 kegs Nails, 84 cases Agricultural Implements, 13 cases Axes, 2 cases Brooms, 1 bundle Sash Cord, 6500 pounds Sash Weights, 13 packages Lamp Goods.

PER SHIP GRANITE STATE, MAY 11, 1889, FOR SYDNEY, N. S. W.

By *Simpson, Hall, Miller & Co.*—6 cases Silver-Plated Ware.

By *H. S. Chipman*.—1 crate Churns, 1 Stepladder.

By *E. K. Alburdis*.—10 gross Blacking, 1 case Hardware.

By *McCoy & Sanders*.—84 dozen Handles, 1 Planer, 1 Cutting Machine.

By *Healy & Earl*.—4 boxes Sawmills, 2 Stationary Engines, 6 boxes Steam Pumps, 4 cases Saws, 1 case Wood-Working Machinery, 2 packages Die Plates.

By *Coombs, Crosby & Eddy*.—1318 Blocks, 500 pieces Tin-Ware, 1/2 gross Traps, 2 dozen Lamp Goods, 5 dozen Axes, 20 gross Blacking, 126 Velocipedes.

By *Ilseley, Doubleday & Co.*—12 1/2 gross Axes, 12 1/2 gross Axle Grease, 7 1/2 gross Axle Grease, 224 pounds Glue, 6 1/2 gross Axle Grease, 16 dozen Horse Brushes, 8 dozen Hardware, 5 gross Glass Cutters.

By *Strong & Trowbridge*.—2 packages Carpenters' Tools, 12 cases Axes, 3 cases Hatchets, 66,000 Cartridges and Primers, 3 cases Rifles, 3 packages Grindstone Parts, 2 cases Plated-Ware, 1 case Tin-Ware, 1 case Wire Goods, 1 case Tools, 13 crates Barrow Parts, 2 cases Corn Mills, 5 cases Handles, 5 cases Carpenters' Tools, 1 case Tinner's Tools, 1 case Hardware, 1 case Screw-Drivers, 10 packages Pumps, 2 cases Broom Handles, 4 cases Bolts, 1 case Rakes, 1 case Tools.

By *Morris, Strouse & Co.*—24 dozen Oil Cans, 2 dozen Hat-Racks, 250 cases Clothes-Pins, 200 cases Clothes-Pins, 28 dozen Carpenters' Tools, 1/2 dozen Sad-Irons, 22 dozen Knives, 7 dozen Coopers' Tools, 25 dozen Saws, 190 pounds Oil-Stone, 20 dozen Hammers.

By *McLean Bros. & Rigg*.—3 Miter Boxes, 12 Scales, 10 Pumps, 12 Gate Latches, 4 cases Wire Goods, 24 sets Axes, 6 dozen Oilers, 12 dozen Handles, 2 dozen Cork Pullers, 3 dozen Braces, 6 dozen Augers, 18 dozen Hoes, 12 dozen Parers and Corers, 30 bundles Carriage-Ware, 20 dozen Axes, 6 cases Agate-Ware, 6 dozen Bird Cages, 36 dozen Lemon-Squeezers, 24 dozen Curry-Combs, 66 dozen Handles, 56 Ice-Cream Freezers, 1 case Agate-Ware, 30 Refrigerators, 19 Pumps, 60 Ladders, 26 dozen Locks, 20,000 Cartridges, 12 dozen Hammers, 9 cases Fire-Arms, 18 Wringers, 4 1/2 dozen Meat-Choppers, 3 cases Wire Goods, 20,000 Bolts, 3 dozen Miter-Boxes, 2 dozen Lanterns.

By *Rogers, Smith & Co*.—9 packages Plated-Ware.

By *Lazarus & Rosenfeld*.—120 dozen Axe-Handles, 38 dozen Handles.

By *W. K. Freeman*.—18 Rifles, 4000 Cartridges, 12 sets Tools.

By *Nevius & Haviland*.—23 cases Spring Shade Rollers.

By *Welsh & Lea*.—8 cases Iron Bolts.

By *Manhattan Brass Company*.—9 cases Burners.

By *E. K. Alburdis*.—37 pairs Springs, 20 pairs Rims.

By *F. B. Wheeler & Co.*.—5 cases Hardware.

By *W. & B. Douglas*.—101 Pumps.

By *Bradley & Hubbard Mfg. Company*.—20 packages Lamp Goods.

By *Waterbury Clock Company*.—21 boxes Clocks, 15 cases Clocks, 13 cases Clocks.

By *B. F. Avery & Sons*.—2910 pounds Flow Parts.

By *Ansonia Clock Company*.—25 boxes Clocks, 19 boxes Clocks.

By *Edward Miller & Co.*.—16 packages Lamp Goods.

By *A. S. Lascelles & Co.*.—1 case Wrenches.

By *H. W. Peabody & Co.*.—59 dozen Wash-Boards, 24 dozen Brooms, 34 dozen Handles, 12 dozen Handles.

By *R. W. Forbes & Son*.—2 packages Agricultural Implements, 38 packages Wagons and Parts, 96 packages Sewing-Machines, 3 cases Pumps.

By *A. Field & Co.*.—10 dozen Axes, 8 dozen Tools, 10 dozen Hammers, 2 dozen Tools, 12 dozen Handles, 25 boxes Clothes-Pins, 6 dozen Washboards, 120 dozen handles, 6 dozen Harness-Ware, 12 dozen Rat Traps, 3 cases Harness-Ware.

By *V. Basanta*.—9 dozen Sieves, 21 dozen Thermometers, 9 sets Saddlery, 62 dozen Handles, 30 dozen Wrenches, 100 gross Paper Caps, 3 gross Toy Pistols.

By *Arkell & Douglas*.—80 dozen Tools, 1 case Brooms, 24 boxes Fruit Jars, 1 case Tin-ware, 17 boxes Tools, 2 cases Handles, 18 cases Edge Tools, 9 cases Chimneys, 1 case Traps, 10 cases Axes, 24 cases Carriage-ware, 55 bundles Rims, 10 bundles Shellers, 12 cases Bolts, 43 cases Edge Tools, 1 case Saw Sets.

By *Arnold, Cheny & Co.*.—1 barrel Twine, 5 cases Plows, 8 cases Brooms, 105 cases Handles, 2 cases Wagons, 1 case Gearing and Wheels, 1 case Buckboards, 1 case Harness, 6 cases Carriage Hardware, 91,791 pieces Roofing Slate, 5 cases Axes, 1 case Saddlery Hardware, 21 packages Carriage-Ware.

By *W. H. Crossman & Bro.*.—54 dozen Handles, 6 dozen Lemon Squeezers, 12 dozen Lemon Squeezers, 5 dozen Bush Hooks, 6 dozen Grindstone Fixtures, 24 dozen Mouse-Traps, 14 cases Hardware, 10 Rifles, 40 sets Tools, 50,000 Primers, 12,000 Metallic Cartridges, 1000 Handles, 1/2 dozen Bells, 7 cases Hardware, 25 dozen Axes, 33 dozen Brushes, 5 cases Hardware, 5 cases Hardware, 1 dozen Vises, 1310 pounds Iron Bolts, 80 dozen Handles, 1000 Handles, 5 dozen Iron Rails, 36 dozen Mouse Traps, 2 cases Hardware, 6 dozen Wringers, 2 1/2 dozen Corn Mills, 60 dozen Fruit Jars, 100 dozen Polish, 24 dozen Cotton Hooks, 24 dozen Lemon Squeezers, 3 dozen Carpet Sweepers, 84 dozen Fruit Jars, 1/2 dozen Tobacco Cutters, 1 case Hardware, 1 case Plow Parts, 25 Clocks 2 dozen Meat Choppers, 400 pounds Nails, 4 dozen Hammers, 1 box Hardware, 1 case Hardware, 1 case Hardware, 20 Handles, 1 gross Brushes, 2000 Handles, 5 cases Metallic Cartridges, 1 1/2 dozen Lawn Mowers, 21 cases Fruit Jars, 3 cases Hardware, 18 dozen Locks, 10 Pistols, 5 cases Carriage-Ware, 46 bundles Carriage-Ware.

PER BARK NANNY, MAY 13, 1889, FOR DUNEDIN, NEW ZEALAND.

By *Welsh & Lea*.—5 cases Saws.

By *Edward Miller & Co.*.—14 packages Lamp Goods, 11 packages Lamp Goods, 6 packages Lamp Goods, 50 packages Lamp Goods.

By *R. W. Forbes & Son*.—3 packages Hardware, 1 box Toy Banks, 10 dozen Snaths, 10 dozen Hay Rakes, 6 packages Churns, 33 dozen Tool Handles, 4 dozen Hatchets, 27 dozen Fork Handles, 3 dozen Manure Forks, 1 dozen Wringers, 11 cases Meat Choppers, 11,310 pounds Barb Wire, 120 dozen Axe Handles.

By *Chas. Brewer & Co.*.—16 cases Handles, 13 cases Tools, 9 cases Agricultural Implements, 12 cases Hardware, 2800 pounds Horse Nails, 1 bale Rubber, 2 cases Clocks, 2 packages Lamp-Ware, 4 cases and 11 kegs Axle Grease, 24 bundles Wash Boards, 3 1/2 barrels and 16 kegs Axle Grease, 10 crates Stoves.

By *H. W. Peabody & Co.*.—201 packages Agricultural Machines, 2 packages Hardware, 1 case Lamp-Ware, 2 bales Hammocks, 9 cases Hardware, 7 cases Axes and Springs, 18 packages Carriage-Ware, 1 case Plated-Ware, 2 cases Bolts and Nuts, 12 packages Hardware, 2 cases Pumps, 84 dozen Handles, 1 case Stone, 6 cases Hardware, 3 cases Wringers, 2 dozen Agricultural Implements, 7 packages Lawn Mowers, 1 case Stamped-Ware.

**A Rubber Dauber.**

C. J. Bailey & Co., Boston, Mass., are manufacturing a dauber which is quite different from those with which the trade are familiar. It is represented in the illustration herewith given. The head is made of rubber, including the part by which the

direct special attention is the mechanism for releasing the sash after it has been automatically locked in place. The spindle of the knob is pivoted at its upper end in such a manner as to allow of a little play within the knob. The opposite end of the spindle is bifurcated for the purpose of receiving the flat bar which actuates the

*A Rubber Dauber.*

blackening is applied, which consists of a large number of rubber bristles or points  $\frac{1}{8}$  inch long, constituting a soft, elastic surface, which seems well adapted for the purpose intended. On the edge are projecting spurs for removing the mud, and on the back there are ribs for the same purpose. The head is mounted on brass, by which also it is connected with the handle, which has a brass ferrule. The points made by the manufacturers in regard to this dauber are that it will not clog nor spatter, and that the blackening can be applied accurately, so that in use on a

lock shown in the sash groove at the right of the cut. When the device is operated, it is only necessary to move the thumb-nut upward, which gives to the flat bar above referred to a rocking motion, causing the bolt to be depressed, releasing the window sash. The construction is such that the device locks automatically, and when the window is once secured in place it cannot be opened except from the inside. The lock is made in three sizes, the smallest being intended for ordinary windows and dumb-waiter doors. It is carefully constructed of brass, and during the period it

*Dixon's Metal-Workers' Crayon.*

low shoe or a gaiter boot the blackening can be put on without soiling the stocking or the cloth top. It is neatly made and retails for 25 cents.

**Single Sash Lock and Ventilator.**

Some time since we presented to our readers several views of a sash lock and ventilator designed to work in connection with a double sash and to hold either or both in any position desired. The very common practice of constructing modern

*Single Sash Lock and Ventilator.*

buildings, however, with one large sash instead of two has induced the manufacturers, Jenkins & Timby, Oswego, N. Y., and 102 Chambers street, New York City, to put upon the market a sash lock and ventilator specially intended to meet this requirement. In the engraving presented herewith we show a section of window frame with the lock attached, an inspection of which will show its general arrangement. One of the peculiar features of construction to which the manufacturers

has been before the trade, met with a gratifying reception.

**Dixon's Metal-Worker's Crayon.**

Joseph Dixon Crucible Company, Jersey City, N. J., and 68 Reade street, New York, are putting on the market a soapstone crayon for marking metals, which is illustrated above. This crayon is sawed out of solid soapstone, which is referred to as especially adapted for marking on all dark-colored metals. It is covered with paper lettered as shown in the cut, which represents the crayon full size.

One of the immediate effects of the completion of the Poughkeepsie bridge will be to divert a large share of the coal trade which passes through Philadelphia over the Reading to New England from Port Richmond. It is expected that all of the coal for points in New England not on the seacoast will of necessity go over the bridge by the all-rail route it affords. Within two years it is expected that a road to connect with the bridge system will be built from Slatington across to Harrisburg. This would be practically the completion of the dream of the life of the late Edgar Thomson, president of the Pennsylvania Railroad Company—an air line from the West to Boston. The managers of the bridge system expect that 3,000,000 tons of coal will pass over their line annually, and arrangements have already been completed with nearly all the coal roads for a direct connection.

The contract for the Philadelphia and Reading Railroad's new iron bridge across the Schuylkill River below Manayunk has been given to the Pencoyd Iron Works. The bridge will be about 600 feet long.

**Chicago Incased Screen-Door Hinge.**

The Chicago Spring Butt Company, Union and Lake streets, Chicago, have brought out a new hinge for screen doors. It has an incased spring. The accompanying illustration shows a face of the spring-hinge and a blank hinge which goes with it, the two constituting a pair of hinges. This hinge has a powerful spring, from the fact that the spring or power is attached to one hinge-leaf and an extended bearing-

*Fig. 1.—Chicago Incased Hold-Back Screen Door Spring Hinge.*

plate or lever to the other leaf. As the hinge is closed the spring itself travels toward the outer end of the bearing-plate or lever, increasing its power to operate the door many times over a hinge with a stationary spring and a long arm reaching to the end of the lever or bearing-

*Fig. 2.—Back of Hinge.*

plate. The illustration above is a back view of the spring-hinge showing the case for the spring. As most screen doors are hung direct to the casing with no intermediate strips, this hinge is made so that it can be applied by cutting a notch from the door only. It has a plain surface, which can be polished in bronze metal or iron and plated for fine screen doors.

### Cyclone Tank Lift-Pump.

This pump is represented in the accompanying illustration, and is manufactured by F. E. Myers & Bro., Ashland, Ohio. Its construction embodies new and im-

proved patterns, and the manufacturers especially emphasize its efficiency in throwing a large quantity of water with a small amount of power. It has a 4-inch cylinder in which two plungers are operated, thus giving it the capacity of two single-acting 4-inch cylinder pumps. It has but one check-valve. It is designed especially for filling threshermen's tanks, the pump being permanently located on the tank and a piece of hose attached to it and connected with the stream or well from which the water is to be obtained. The manufacturers state that the pump has been thoroughly tested, and is fully guaranteed in every particular. The capacity of the pump is referred to as one barrel per minute.

proved patterns, and the manufacturers especially emphasize its efficiency in throwing a large quantity of water with a small amount of power. It has a 4-inch cylinder in which two plungers are operated, thus giving it the capacity of two single-acting 4-inch cylinder pumps. It has but one check-valve. It is designed especially for filling threshermen's tanks, the pump being permanently located on the tank and a piece of hose attached to it and connected with the stream or well from which the water is to be obtained. The manufacturers state that the pump has been thoroughly tested, and is fully guaranteed in every particular. The capacity of the pump is referred to as one barrel per minute.

### Soap-Shaker.

The Hamblin & Russell Mfg. Company, Worcester, Mass., are manufacturing the soap-shaker shown in the accompanying illustration. It will be understood that the piece of soap is to be inserted in this

Soap Shaker.

wire bag or pocket, when, by means of the handle, it can be conveniently agitated through the water in the wash-tub for the purpose of making suds.

### Greely's Cork-Extractor.

This article, which is represented in the accompanying illustrations, embodies, it will be observed, new features in a cork-

Fig. 1.—Greely's Cork Extractor.

Fig. 2 and 3.—Use of Cork Extractor.

extractor. It is represented in Fig. 1, while its use is indicated in Figs. 2 and 3. From these illustrations it will be seen that it consists of a piece of steel bent and

countered in drawing the cork the usual way. As indicated in Figs. 2 and 3, the extractor, the end of which is rounded so as to conform with the inside of the bottle neck, is inserted between the cork and the bottle, and when sufficiently far down the hook on the end is turned into the cork, as shown in Fig. 2, or as in Fig. 3, is placed directly under the end of the cork which may then be extracted. It is obvious that in the use of this article the cork is not as liable to be injured as with the ordinary corkscrew, and it is referred to as doing its work efficiently. These cork-extractors are made in eight different sizes and styles, giving a requisite variety for the different uses for which they may be required.

### The Leonard Cleanable Refrigerator and Creamer.

This article, which, as its name indicates, is intended to serve both as a refrigerator and a creamer, is made by the

two sides. One of these, the creamer side, is shown in the accompanying illustration. The other, the refrigerator side, is similar to the usual refrigerators. The interior construction is illustrated in Fig. 2, which gives a sectional view of the arrangement. From this it will be seen that the ice is placed in the middle of the creamer, and comes in contact with the milk-cans shown on the right, these cans being covered with a cloth jacket, which, as the can stands constantly in ice-water, draws the melted ice-water up around the can, producing the same effect, it is claimed, as though the cans were immersed

Fig. 1.—Creamer Side of Leonard Cleanable Refrigerator and Creamer.

in water. At the same time the opening in the bottom of the ice compartment permits the cold air to enter the refrigerator, the construction thus adapting this article to its double use. The waste-pipe, by which the water is carried off, is shown in the sectional view. An idea of the dimensions of this refrigerator can be

Fig. 2.—Sectional View.

gained from the fact that it stands 3 feet 6 inches high, has a width of 30 inches and length of 48 inches, and holds four 5-gallon milk-cans, 9 inches in diameter and 19 inches high, leaving room, as above explained, for a family refrigerator. One of the points emphasized in regard to this article is that it is, as its name implies, cleanable, as every part can readily be taken out to clean—the milk-cans being lifted out, the cover being entirely removable, the ice-rack sliding out, and the provision-shelves coming out readily, leaving a plain metal-lined box to clean and readily accessible in every part. The cases of the creamers are made of solid ash and finished in

the new antique finish, being two complete boxes one inside of the other, and the packing of non-conducting material between. Then follows a lining of water-proof paper

stead of to the tin, as in others, thus making no holes in the tin to cause rust. The hoops are beveled, being thicker at the bottom than at the top, making a substan-

ure and binding of the parts is avoided, making the operation of extracting the cork easy and simple, so that a lady or a child can pull a hard cork with ease. Fig.

Fig. 1—Walker's Improved Cork-Puller.

Fig. 2.—Showing Method of Extracting Cork.

and a lining of zinc, making five walls. As indicated in Fig. 1, the cans skim from the bottom by means of the faucet and the cream gauge shown. A small vial brush is sent out with each creamer to clean the faucets, and the company emphasize the importance of absolute cleanliness in butter-making, and allude to the fact that it is secured by the proper use of this creamer. Another point is that this method of cooling the cans is better than that of sinking them in water as less liable to cause rust holes in the cans. The utility and convenience of the refrigerator are also emphasized. The circular of the company gives also directions for the use of this creamer and refers to other points in regard to it.

#### Cooley's Patent Wood-Jacket Butter Packages.

These goods are made by Ball Bros. Glass Mfg. Company, Buffalo, N. Y. They are described as made from prime charcoal

tial base for the jacket to sit on. They are made in sizes 10, 20, 36 and 50 pounds.

#### Walker's Improved Cork-Puller.

This cork-puller, which is shown in the illustrations herewith given, is the invention of E. Walker, of the Erie Specialty

Mfg. Company, Erie, Pa., by whom it is manufactured. Fig. 1 represents it attached, and the corkscrew in process of insertion in the cork, while Fig. 2 shows the use of the lever by means of which the cork is extracted. From these cuts it will be seen that the machine is fastened by screws to a table or shelf, the cork being

Fig. 3.—Pattern of Corkscrew.

to be used on marble and in other places where the machine is to be moved often.

**The Clock Trade.**—One of the largest manufacturers of American clocks, Seth E. Thomas, in sketching the history of the clock trade, speaks of the substitution 47 years ago of brass wheels for the "grandfather's clock," and the marvelous changes that followed. The tower-clock attached to Independence Hall, Philadelphia, in centennial year, and which was donated to the city by Henry Seibert, cost \$6000. The largest one now being constructed is in St. Paul, Minn., which, aside from the chime of bells, will cost \$3000. The largest one in the world is in the new Parliament building in London. It was built by Dent, of that city, has a dial 27½ feet in diameter, and cost \$60,000. Plans are now preparing for a clock for the new City Hall in Philadelphia, to have a dial 30 feet across. This will be made for between \$40,000 and \$50,000. Our best foreign market is China and Japan, which take about \$150,000 annually. A few go to Russia and Constantinople. They take almost wholly the middle grades—those which cost by wholesale from \$4 to \$8. The more artistic affairs have little demand there. South America comes next. Then some go to Australia and the South Sea Islands—in fact, wherever ships go. The decrease in the price of silver was an immense factor in decreasing the foreign demand.

Cooley's Patent Wood-Jacket Butter Packages.

tin-plate, and incased in selected ash jackets firmly made, with the grain running up and down, so as to avoid splitting. The point is made that the fastener, as shown, is attached to the wood jacket in-

serted by means of the handle at the top, which revolves freely and is connected directly with the corkscrew. The power is applied by a crank-and-lever movement, and the point is made that all side press-

## Legal Decisions.

### CHATTEL MORTGAGES.

There were two mortgages on certain personal property, and the holder of the first mortgage foreclosed his lien and bought the goods for \$232, at the regular legal sale thereof. The junior mortgagee, claiming that the property was worth \$2500, sued the first mortgagee for the amount of the debt secured by his mortgage, on the ground that by the levy on this property the first mortgagee was chargeable with the actual value of the property, which, after satisfying his mortgage, he was bound to apply to the payment of subsequent incumbrances, and he recovered judgment for the amount of his debt. The case—*Dehority vs. Paxson*—was carried to the Supreme Court of Indiana, where the judgment was reversed. Judge Mitchell, in the opinion, said: "A levy on goods is not an absolute satisfaction, but is to be considered an apparent payment or satisfaction in that manner. If it appears that the levy has been regularly exhausted by a sale duly made, and that the sale has failed to produce a sum sufficient to satisfy the judgment, the levy and sale will be regarded as satisfaction for the amount realized, and a new execution may be had for the residue. The most that can be said is that a levy upon goods of sufficient value to pay the judgment raises the presumption that the execution is satisfied; but this presumption is overcome, as we have stated. If the price was so grossly inadequate as to shock a correct mind, this inadequacy might furnish a strong presumption of fraud or irregularity, and entitle any injured party to have the sale set aside upon reasonable application. The plaintiff has not taken this course, but, on the contrary, has pursued a course which defeats him. He has affirmed the decree taken by the defendant in this action, and that affirmation has the effect to affirm the price at which the property was sold. Besides, he was made a party to the foreclosure proceedings. He cannot have any help in the present suit, and the judgment must be reversed."

### PLEDGE—SALE BY MISTAKE—DAMAGES.

W. deposited certain non-dividend-paying stocks as collateral security for the payment of a loan made to him, and the holder of his note and these securities sold the securities before the debt or note fell due, contrary to instructions, but under an honest mistake of fact. The debtor sued to recover the value of the securities, though their proceeds had been applied to the payment of the debt, on the ground that the creditor had converted the stocks to his own use, and he recovered a judgment for the amount. In this case—*Wright vs. Bank of the Metropolis*—the case was carried to the Court of Appeals of New York, where the judgment was reversed. Judge Peckham, in the opinion, said: "The verdict in this case gave most unreasonable damages; they are positive in character and degree. We cannot see any question in the case showing bad faith, or indeed any reason for its existence. The fact is uncontradicted that the defendant sold the stock upon what its officers supposed was sufficient authority to sell it, and it cannot be punished for an honest mistake of fact. The plaintiff is entitled to recover his reasonable loss, and that reasonable loss must be ascertained. In our opinion that reasonable loss is to be determined in this way: The plaintiff should have gone into the market and bought the stocks within a reasonable time after he had learned that they had been illegally sold, and, having performed this just duty to the defendant, he would have had a claim for any loss he suffered by the application of the proceeds of the illegal sale to the payment of his debt, which

would be the difference between what he paid to get the stocks again and the amount of his debt with interest. There must be a new trial, and the judgment must be reversed."

### The Montreal Trade Schools.

The schools where trades are taught are in this country far fewer than those providing a course in manual training. Of the latter there are, comparatively speaking, a large number, for, in addition to the institutions specially devoted to it, the public schools are adopting manual training as a course in their regular curriculum. There are, however, not many trade schools proper in this country, and it is this class for which there is the greatest present need. The Montreal school provides instruction of the sort required. Through the courtesy of S. C. Stevenson, secretary and director of the Council of Arts and Manufactures of the Province of Quebec, we are supplied with a catalogue and circulars of the Montreal school, which enable us to present a summary of the courses of instruction. The season that has just closed began November 8, 1888, and ended April 8, during which period the school was open every week-day evening for one or more classes. There are two classes in free-hand drawing (junior and advanced), besides mechanical and architectural drawing, while the other courses are modeling and wood-carving, lithography, decorative painting, stairbuilding and building construction, plumbing and boot and shoe pattern making. In each of these classes instruction is given from two to four times a week, between the hours of 7.30 and 9.30 o'clock in the evening, the teachers being practical men, who, we believe, contribute part of their time gratuitously for the benefit of the scholars. There is a nominal fee of one dollar charged when the scholar was not in attendance at the preceding session, but even this amount is returned at the end of the course, except in the case of many absences. Furthermore, the material worked in is provided by the school, the student only having to supply tools and implements. With the exception of plumbing, the courses enumerated do not immediately concern many of our readers, but we do not think they will be the less interested in this brief account. There are two classes of people who are interested in industrial schools, boys and young men who want to learn a trade and parents who want their children taught a trade. The former class do not see *The Metal Worker*, while the latter are, for their children's sake, interested in other trades than their own. Because a man is a tinsmith there is no reason why his son should not be a shoemaker. We would like to be able to give a general summary of the courses of all the trade schools, day and evening, in this country, and we would be glad to receive circulars and catalogues from which we could compile such notices.

A smoke-burner has been tried with satisfactory results on one of the engines of the Wisconsin Central Railroad. A jet of superheated steam is introduced over the fire-box, causing an intense heat, so that the combustion is excellent.

American sailing vessels in the foreign trade are again good property. In this respect a marked change has taken place within a year or two, the supply of tonnage being now short of the demand and the rates of freight are again remunerative. A Newburyport (Mass.) paper says: "Ex-Mayor William A. Johnson owns in at least three barks, perhaps more.

Two of them have recently arrived home and been placed under favorable charters. The H. G. Johnson, Colby, has already begun loading freight for Java that will give her \$15,500, and leave her at Java just when the sugar crops will come off, assuring a good freight for home or Europe. The B. F. Hunt arrived only last Saturday, and as soon as possible will sail again for Australia, with a \$10,000 freight out, to be there just in season for a wool freight home, or any better that she may find. Three months will carry her back to Australia, and \$10,000 for a ship that a year ago would not have brought a dozen thousand, though worth more now when there is a use for her, will be a good paying business. The third, the Obed Baxter, Colby, is on her way home with a good freight and a better charter awaiting here." Builders of wooden ships will gather encouragement from these facts.

Emperor William received the delegates of the striking Westphalian miners. He assured them that the Government would use its influence to settle the dispute, but added that if necessary he would himself give the order to the military to shoot down rioters.

# CURRENT HARDWARE PRICES.

MAY 22, 1889.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers' prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers, at the figures named.

# THE IRON AGE

THURSDAY, MAY 30, 1889.

## Subways in New York.

The net-work of overhead wires that disfigured this city is rapidly disappearing, about 10,000 miles having been put underground within the last five months, under peremptory orders from Mayor Grant. At the last report the Metropolitan Telephone Company had about 7000 miles of wire in the subways, the Western Union Telegraph Company about 2000 miles, the Edison Company and fire telegraph each about 200 miles. There are two kinds of subways. One is used for electric lighting

forever. The subways for telegraph and telephone wires extend much further than the subways for electric lighting. They cover ground from the Battery to Fifty-ninth street, having four trunk lines at present toward the central portion of the city and many crossways, especially downtown. The big cables that are put in the subway look very much like the electric lighting cables, but they are quite different in construction. The telegraph and telephone wires are much smaller than the others, and some of these cables contain as many as 200 wires each. Thus far

## Portable Coal Lift.

The accompanying illustrations represent a portable coal lift so arranged that it can be run over the line of the dock and dropped into the hatch of the vessel; it can further be shifted from one hatch to another without requiring the moving of the vessel, as the elevator proper is mounted on a car which traverses the line of the face of the dock. From the side elevation it will be observed that the elevator is carried by two systems of trucks or wheels which permit of its

THE CLARK-HOWARD PORTABLE COAL LIFT.—SIDE ELEVATION.

wires alone, and no telegraph or telephone wires can be put in the same box. Generally speaking, the subways for the electric lighting conductors extend from Fifty-ninth to Fourteenth streets and from Fourth to Sixth avenues, with crossways at a dozen streets. Into these boxes are put only the conductors for lighting and power, and they are quite different from the telegraph or telephone wires. The Edison Company use a heavy cable, in the center of which run two pretty stiff copper rods, completely insulated, so as to prevent contact with any other wire or with moisture. What is called the Callender conductor, for electric light and power, is composed of 12 strands of copper bound together. These cables are inclosed in lead pipe, not only to give strength, but mainly to protect the insulating material and prevent the intervention of moisture. Some of the cables cost \$1 a foot, but they are intended to last almost

there have been about 80 miles of subway laid, covering 600 blocks. Each subway contains about 300 miles of wire, but none of the subways is full, and each can contain as many as can ever be required to meet the demands of trade. About 1200 poles have been removed.

Advertisements for bids for building three new 2000-ton unarmored cruisers for the navy are being prepared at the Navy Department. The vessels will be known as cruisers 9, 10 and 11, and are to be built at a cost not exceeding \$700,000 each. It was left discretionary by Congress with the Navy Department to build either gunboats or cruisers, and the latter were chosen.

A revision of the Cuban tariff has been completed by the Spanish Government, but the nature of the changes made is not stated.

being projected beyond or moved parallel with the line of the dock. The elevating buckets are carried by endless chains traveling over sheaves placed as shown. These chains pass around a sheave at the foot of the leg, over stationary sheaves at the outer end of the frame and around a traveling sheave moving on tracks along the top of the frame. The traveling sheave moves forward or toward the front end of the machine while the leg is being lowered into the vessel, so that the chain is always under the same degree of tension. The boiler and engine operating the machine are placed on the car, with which they move. All the movements of the machine are completely under the control of the engineer. The coal can be taken from either side of the boat. When raised to the top the coal is emptied into either one of two shutes placed at the sides of the elevator. The coal is not dumped violently from the

buckets, but by a peculiar arrangement the buckets are, so to speak, withdrawn from their load, thus reducing the risk of breaking the coal to a minimum. The machine illustrated, which was made for one of the largest coal handlers in the East, has a capacity of 200 tons per hour, the speed of the buckets being 75 feet per minute; it has a lift of 74 feet and an adjustment of 50 feet. When not in operation the elevator is raised and housed on top of the coal pockets inside of the dock line. A similar machine to the above has been in operation at the coal piers of the Philadelphia and Reading Railroad for the past six months, working every day and handling from 100 to 360 tons of coal per hour. The coal is lifted from storage piles and delivered to cars for shipment, and is also taken from the cars as they come from the mines and stored in piles 50 to 100 feet away.

This machine forms only a part of the system of handling coal designed by the Clark-Howard Excavator and Conveyor Company, of 137 Broadway, New York. Each machine is constructed upon the principle of directly lifting the coal, which, as the motion is in all cases slow and the load large, is not broken. The speed influences in no way the discharging of the buckets, which are as perfectly emptied when at a speed of 10 feet as when running at 70 feet per minute. Provision is made to prevent the breaking of the machine if from any cause the buckets should become caught, and the construction is such as to permit the easy renewal of those parts most liable to wear.

#### The Competition of Canadian Roads.

The recent inquiry at New York into the traffic methods of Canadian and American railroads by the United States Senate investigating committee elicited some important testimony. Charles Francis Adams, president of the Union Pacific, said the carrying trade of the road was strongly competed for between Denver and Cheyenne. As far as the opposition encountered from roads connected by steamships was concerned, Mr. Adams said it was a subject too big to go into. All the Pacific lines had steamship connections. "Time will settle the commercial problem on the Pacific Coast, as it has already settled it on the Eastern Coast," he said. "San Francisco is the New York of the Pacific Coast, and I don't believe its supremacy can be shaken any more than that of New York." Mr. Adams stated, further, that it was impossible to tell exactly what the effect of the Interstate Commerce law was on railroads. In some respects the law is good, in others it is crude. Some roads which have enforced it have lost business, but it would be different if all the roads honestly tried to enforce the conditions of the law. For the first time in the history of railroads the managers do not dare to reduce their rates, and shippers cannot get the usual low rates. The Canadian Pacific road takes a great deal of the American trade away. Mr. Adams was asked his opinion of the Canadian roads which build lines through the United States to act as feeders to their big trunk lines. He said that he did not see why they should be opposed. He favored a fair field and no favor, and if American roads were not able to compete with the Canadians, then they ought to go to the wall. He was not in favor of a free entry into the country by the Canadian roads, however. He knew of no remedy, but favored the suggestion that joint legislation by the United States and Canadian Governments might accomplish some good.

President Roberts, of the Pennsylvania road, contended that any foreign corporation doing business here should be subject

to the same laws as the roads of this country. It would be a fair demand that they should either conform to the laws of the country or stay out of it. A fair competition under proper legislation would be better than any pool. Mr. Roberts was in favor of pooling if only the different roads in the combination would keep their agreements.

President Van Horn, of the Canadian Pacific, when called to the witness chair, stated that his road, aside from the coal traffic, takes a very small percentage of traffic from the United States. Although the Dominion Government has granted a little over \$62,000,000 in subsidies and aid, it has not made any money. An object of the Imperial Government in sub-

Portable Coal Lift.—End Elevation.

dizing a steamship line on the Pacific is to have vessels there in the event of war with Russia.

The presidents of the Lake Shore and Michigan Southern and the Michigan Central roads were heard with special interest with reference to the Grand Trunk, which, they agreed in stating, has wonderfully increased its traffic out of Chicago at their expense, and this, too, in violation of the Interstate law.

President Smith, of the New York Chamber of Commerce, spoke of the lack of confidence in each other as a great source of trouble. If the Interstate Commerce law were rigidly adhered to it would be better than pooling as far as the interests of shippers are concerned. In regard to Canadian roads, he said they "are constantly increasing their amount of traffic between New England and Chicago, to the detriment of American roads, and it seems unfair to allow such advantages to the Canadian roads over the American lines. All we ask is that the foreign roads be put on an equal footing with our own.

Then we can fairly compete with the Canadian lines." The committee adjourned to meet in Boston July 5. To a reporter Senator Cullom said that he and his colleagues were very well satisfied with the information they had gathered. The committee was on a tour of investigation. It was not likely that the Interstate Commerce law would be soon amended at the instance of the committee, for the latter felt that the facts it had gathered and would gather were to be used rather for guidance when further legislation was asked for than as a basis for further legislation. The weight of opinions, so far, had been in favor of giving the law time to prove its efficiency. There was no thought of shutting out the Canadian roads, at any rate. More pacific measures would probably answer all purposes. Before the committee finished its labors it would obtain a fair conception of public feeling on the question at issue in the chief centers of the country.

#### The New Croton Aqueduct.

Eight lines of 48-inch iron pipes, advancing side by side from 125th street toward Central Park, show that the new Croton Aqueduct approaches completion. The aqueduct proper is, in fact, finished save for a little brick-work, and a tunnel more than 30 miles long extends to Croton Lake, 5 miles northeast of Sing Sing. The aqueduct starts out in horse-shoe form, with a capacity equivalent to a cylinder 14 feet in diameter. This form is maintained to Jerome Park, where a great reservoir with a capacity of 2,000,000,000 gallons is to be constructed. Thence the aqueduct is a cylinder 12 feet 8 inches in diameter. The tunnel is from 40 to 400 feet below the surface. It dives under the Harlem at about 179th street, between the High Bridge and the new Washington Bridge. The tunnel's depth beneath the stream is 300 feet. The stream once cleared, the tunnel rises vertically to within about 100 feet of the surface and runs southward to 135th street. Here a gatehouse is built, and into this the pipes from the old aqueduct will be turned. The new aqueduct will leave a great volume of water at Jerome Park for the annexed district, and then pour the remainder into Central Park reservoir. The total capacity of the two reservoirs is more than 400,000,000 gallons in 24 hours. This is more than the summer output of the Croton River, and unless storage reservoirs are constructed in the Croton Valley New York will have, as an engineer has happily said, "a big spout and a small kettle." The question of storage reservoirs is unsettled. One plan contemplates several small basins; another the great Quaker Bridge Dam.

The aqueduct has been four years in building and cost about \$15,000,000. At several points "blow-offs" have been constructed, so that the water may be discharged preparatory to cleaning or repairing, and at other points vents are made so as to provide for automatic relief in the case of sudden pressure. On the west bank of the Harlem a great pump will extend to the lowest point of the tunnel, so that the portion under the river may be emptied.

A machine for cutting down trees is said to be coming into vogue in Oregon. It is run by electricity, and, unlike steam machinery, can easily be moved about in the woods, as the motor is placed on a high cart and runs a cutting drill, which sweeps from side to side, and is advanced as the work progresses. The electricity can be supplied from a stationary steam-engine or a water-power, and conducted by insulated wire to any reasonable distance or over any kind of ground.

### The Lake Superior Iron-Ore Trade.

A correspondent of the New York *Herald* furnishes a very exhaustive report of the condition and prospects of the Lake Superior iron-ore mines, of which the following is an abstract:

The outlook for the mines for the present season is fairly good. A certain amount of ore must be used this year, and the Lake Superior mines must furnish a very large part of it. It is certain that more ore will be mined this year than last, and it is almost certain that 5,500,000 to 6,000,000 tons will be shipped by the mines of the four ranges. Nearly or quite 1,000,000 tons of this ore will be taken by Western furnaces. The balance will go to Ohio, Pennsylvania and New York. The mines may not make as much money as in years past, but they will all make something.

In the line of new mines the Vermillion range will make the best showing this year. In the Gogebic district few new mines will come to the front this year. The same is true of the Menominee range. In the Marquette district the Queen, South Buffalo and Prince of Wales mines on the East Negaunee range will come to the front as ore producers, and the East New York Mine, of Ishpeming, and Riverside, of Republic, promise to develop into large mines in a short time. There are a number of explorations, such as the Norwood, East Jackson, Kilworth, North Republic, &c., that will mine some ore each this year. The Hamilton Ore Company, of Iron Mountain; the Marquette Ore Company, of Ishpeming, and the Republic Reduction Company, of Republic, are all getting ore by the simple means of sorting over the waste dumps of big mines and shipping the good ore thus obtained. They will market from 10,000 to 30,000 tons each this season.

The Marquette is the oldest of the four ranges and still the principal seat of ore production. The present year will see a larger amount of ore taken out than ever before, and for the first time over 2,000,000 tons of ore will be mined, sold and shipped by Marquette County mines. This immense amount of ore will be raised from 45 mines, and they will mine all the way from a few hundred tons to nearly 300,000 tons each. Twenty-five mines will produce nine-tenths of the ore raised.

The mines of the Menominee range will produce between 1,250,000 and 1,500,000 tons of ore this season. The Dunn, a new mine, but a big one, will get out 200,000 tons; the Norway, 100,000 tons; the Vulcan, 125,000 tons; the Chapin, 300,000 tons; the Iron River, 125,000 tons, and the Florence, 150,000 tons, leaving a quarter to half a million tons to be produced by the 30 other mines of the range. The output of the Chapin Mine may exceed 300,000 tons, as it has produced 336,000 tons in one year, but the condition of the mine is such that it is not probable that the 300,000 figure will be passed.

The mines of the Gogebic range have suffered much on account of the big boom and the reaction that followed, but the district is recovering and can show some good mining properties, prominent among which are the Colby, the Norrie, the Aurora and the Ashland. There will be 35 or 36 producing mines in the Gogebic this year, perhaps a few more before the close of the season, and they will mine and place on the market 1,500,000 to 1,750,000 tons of ore this season. The smallest mines of the range are laboring under many disadvantages, principal among which are a lack of capital and the disinclination of moneyed men outside of the district to invest in anything bearing the name of Gogebic.

In the Vermillion district the Minnesota Iron Company shipped 400 tons daily to

Western furnaces during the winter by all-rail routes, and consequently have made a big start on shipments for the present year. The same company have already sold 600,000 tons of ore for this season's delivery. The balance will go to other points. The Chandler Mine is good for the production of at least 250,000 tons more, and the Pioneer will ship a few thousand tons. Several smaller mines may make slight shipments before the close of the year. It is safe to predict that the Vermillion mines will produce at least 875,000 tons of ore this year, and may mine nearly 1,000,000 tons. The principal properties on which explorations have shown ore and on which work is now being done are the McComber, James & McComber, Zenith, Garden Lake, James & Longstorf, Adams, Bole & Meggins and Minnesota Exploration Company. The Minnesota Iron Company are, of course, doing a large amount of exploring work all the time. The Vermillion district is being rapidly developed, and there is a prospect of another railroad reaching the district, which will facilitate matters there.

Freight charges for lake transportation of ore are as low as last year, and lower than in 1886 and 1887. Over 800,000 tons of ore have already gone forward from five shipping ports of the Lake Superior district this season. Instead of waiting until October to begin heavy shipments the mines are rushing their ore forward as early as possible. The saving to the mining companies on transportation alone will amount to millions, unless freights are arbitrarily raised early in the season by the vessel men. In the fall, when wheat shipments from Duluth grow heavy, ore shipments will slack off. Mine owners have learned from experience that it pays to be prompt in getting their ore to the receiving ports, whence it is distributed to the furnaces.

Wages of miners are lower this year than last. There has been a considerable decline in wages within the past few years, and miners now earn from \$1.75 to \$2.25 per day on the average. Miners' wages are higher than in the Eastern mines or in the Lake Superior copper mines, and lower than in the Far West. All the men needed, some 18,000, are now at work, and there is no apprehension of strikes or industrial troubles of any sort during the present season.

The best-informed mining men do not expect a return of the "good old times" of ten years ago, when iron ore was selling at \$9 and \$10 a ton and \$500,000 dividends were paid annually by the big mines. Southern pig-iron and the great increase in ore production caused by the opening of the Menominee, Gogebic and Vermillion districts have reduced prices, and they will stay down.

**The Post-Electric System.**—It is declared to be entirely feasible to dispatch the United States mails by electric power between points as far separated as New York and Boston in two hours. John T. Williams has invented a post-electric transportation car, constructed of light steel, which passes through a series of box-like frames resting upon a single rail, and in the model exhibited a car containing 1000 letters could be sent out from New York or Boston, for example, every five minutes. The manner of propelling the car is described as follows: "Assuming the front of the car to be the S-pole, like that of the simple bar of steel or iron, as it is drawn into the center of the helix it repels the S-pole of a pivoted magnet in the upper part of each helix, forcing it upward, and bringing the end-pole down in such a way as to make the circuit. This closing of the circuit through the helix tends to draw the car in with a sucking action. The contact of the end-pole of the magnet with the closed circuit is maintained up to

the time that the center of the carriage arrives at a short distance from the center of the magnet, when the influence of the carriage on the magnet becomes neutralized and the contact is broken. This making and breaking of the circuit is thus repeated as the car enters and passes through each succeeding coil." In the model the car is about 4 feet long and weighs about 56½ pounds, but the dimensions could be increased, with a corresponding capacity for transportation. The power of the proposed system is 110 volts.

### The Northwest Empire.

The vastness of Alaska is the theme of ex-Governor Swineford, who made a journey of 10,000 miles within the limits of the territory, and proposes to write a book which is likely to be the standard Alaskan authority. "When I sat at my desk in Sitka," said Governor Swineford while on a recent visit to Washington city, "I was further from Attu Island, the westernmost point in Alaska, than I was from Portland, Me. This may serve to give some idea of the prodigious distances of Alaska. But I can furnish a more striking one. If the capital of the United States was located in the center of the United States—that is to say, at a point equi-distant from Quaddy-head, Me., and Attu Island, Alaska—it would be in the Pacific Ocean some 600 miles north by west of San Francisco." It has long been said that the sun never sets on the British Empire. But it is not generally known that it is equally true that the sun never sets on the domain of the United States. It is shining in the Aleutian Islands while it is the dead of night on Martha's Vineyard. The United States laps nearly half-way around the world. It extends from 67° west longitude to 169° east longitude. Alaska has between 800,000 and 900,000 square miles of land surface, and has also a great water area. It is nearly as large as the United States east of the Mississippi. Governor Swineford thinks there are now about 50,000 people in Alaska, at least 30,000 of them natives who are wholly uncivilized. Under the existing anomalous form of local government no taxes can be levied in Alaska for any purpose whatever; consequently there has never been any enrollment of real or personal property for the purposes of taxation. No portion of the general land laws having as yet been extended over the whole or any part of the Territory aside from a few mining claims either lately patented or for which applications for patents are pending, there are only 21 fee-simple titles in the whole of Alaska, and these do not embrace 100 acres in all. The property which could be taxed is at present, therefore, almost wholly personal, and will continue to be so until Congress by the necessary legislation makes it possible for claimants to secure titles to lands now occupied by them and upon which improvements have been made or placed to the aggregate value of millions of dollars. But placing a fair value on the mines already in operation and those in process of development, and all property usually subject to assessment in the States and Territories, there is \$15,000,000 of taxable property in Alaska, exclusive of the seals, which belong to the Alaska Company.

It is claimed by those who are familiar with the use of wire ropes that proper attention is not given to them. A very common practice is to use paint or tar as a covering to preserve them from the action of the atmosphere, but in spite of this dampness penetrates between the strands, rusting commences, and sudden collapse is a frequent result. A grease in which is incorporated the best lubricating graphite is a material strongly recom-

mended by superintendents of mines and by manufacturers of wire ropes. The grease prevents the wire from rusting, and the graphite, finding its way into the minutest spaces, lubricates the strands and protects them from abrasion

### Making Steel in India.

In forwarding to the Government Central Museum samples of steel manufactured at a village in the Trichinopoly district, together with the ordinary earthenware crucibles used in the operation, the Board of Revenue has also furnished the following communication from the collector of the district on the method of manufacture, which is printed in the *Indian Engineer*:

The industry is carried on at a small village called Venkatanaikampatti, about two miles from Parvarankurichi, occupying a favorable situation for obtaining charcoal from the surrounding hills of the Marangapuri Zemindari. It affords employment for about 16 families of smiths and is altogether in the hands of a Musulman named Mahomed Routhen, who holds a monopoly of the right to collect charcoal for the purpose in the jungles of the estate, for which he pays \$4.50 per annum. Beyond the convenience of its situation as regards the jungles and the existence of tolerably fine sod earth in the vicinity, the site possesses no special advantage.

The process employed is very simple. Small quantities of iron are inclosed in a small earthen crucible with a few pieces of the wood of the avaram plant and two or three green leaves. A top is luted on, and when dry the whole is exposed to the heat of a small charcoal furnace till the iron is melted, a fact which the operator ascertains by picking up the crucibles in a long pincer and shaking them. The vessels are allowed to cool and then broken open, when a knob of steel is found at the bottom. Two sizes of ingots are made, weighing about 8 ounces and 10½ ounces, respectively. The crucibles are made of a mixture of red earth and charcoal made of paddy husks kneaded together. They are shaped on a wooden plug about 5 inches long and 2 inches in diameter for the smaller size of ingot and slightly larger for the other size, having a conical end, which forms the bottom of the cavity in which the steel collects while fluid. The lid is of the same material and put on wet. It appears hardly to contract at all in drying, and a fairly air-tight vessel is consequently produced. The clay is not nearly refractory enough for the heat it is exposed to, as the crucibles are completely vitrified and spoilt at the end of a single operation.

The iron used is brought from the Namakal Taluk, of Salem, and appears to be a rough description of wrought iron. For the smaller size of ingot it is cut into pieces weighing as nearly as possible 10 ounces (a small piece is added to make up the weight if necessary), and this quantity is placed in each crucible with ¼ ounce weight of pieces of the dry wood of the avaram plant. Two or three green leaves (the kind is a matter of no consequence) are placed on top, and the charge closed up with a lump of clay carefully plastered all round. Great care is taken in putting in the correct proportions of iron and avaram wood, and the operators assert that if less is used the iron is not melted, and if more it will not stand being worked afterward. The green leaves probably serve in some way toward retarding the drying of the lid and preventing it from cracking.

The furnace consists of an inverted cone of earthwork about 2 feet in diameter and the same in depth, the apex opening into an ash-pit below. At one side, and pro-

tected from the heat by a mud wall, is a small shed in which two bellows-men sit and work a couple of skin bellows most vigorously. The air is admitted into the furnace through a hole near the bottom. In preparing a furnace, some straw is first placed at the bottom below the air-hole, and charcoal is then thrown in to a suitable height. On this 25 of these conical crucibles are placed with the points downward, and when all are in position they appear to form a sort of circle and to be independent of the layer of charcoal below. More charcoal is placed above, and the furnace is then lighted through the air-hole. Fresh fuel is thrown on above from time to time, and one or two of the crucibles are occasionally lifted with long-handled pincers to allow the burning charcoal to fall through and replenish the supply below. The straw remains untouched by the fire throughout the process. The crucibles are given a sharp shake on these occasions, which is said to assist the process and toward its conclusion allows of the operator's ascertaining whether the iron is melted or not. As the mouth of the furnace is open the waste of fuel is enormous, and I do not believe that one-fourth of the charcoal used exercises any effect on the crucibles. In the absence of good fine clay this fault seems irremediable, as there is no sufficiently refractory material available from which a separate opening for the supply of charcoal to the furnace below could be constructed.

After about an hour or an hour and a half the feel of a crucible when lifted shows its contents to be liquid. The process is then considered to be completed and the crucibles allowed to cool, after which they are broken open, a knob of steel being found at the bottom of each. The ingots are reheated and hammered into oblong pieces, in which shape they are sold. All the crucibles do not remain absolutely air-tight during the process, the lids becoming cracked without affecting the result. I had the contents of one of these poured out through a crack, and was surprised to find the steel in a state of extreme fluidity—a thing which the heat produced hardly led me to expect. The estimated cost of making 200 pounds of steel is about \$13.95, and the value realized for the produce about \$16.20, the manufacturer netting a profit of \$2.25. The annual output of the manufacturers in the village is about 28,000 pounds.

### Ventilation of London's Under-ground Railways.

The unventilated condition of our under-ground railways is, says the *London Times*, a matter of public notoriety, and the sulphurous fumes emitted from the locomotives doubtless deter many from using those otherwise excellent means of transit. It is true that an attempt was made some years since to mitigate the evil by making openings at various points along the line of route of the Metropolitan District railways through which the obnoxious vapors are now largely discharged. It is true also that on the Metropolitan Railway there are a few openings which slightly relieve the tunnel of the products of combustion. The fact, however, remains that our under-ground railways, in spite of their blow-holes and street disfigurements, are a source of great discomfort, if of nothing worse, to passengers using them. Numerous projects have been devised for remedying this evil, but none appear to have been found sufficiently practical for adoption. We have, however, recently inspected a system of extracting the noxious vapors from a locomotive directly they are formed, and of discharging them into the air, which appears to meet the case of under-ground railways, inasmuch as these vapors never

enter the tunnel at all. This system is the invention of Mr. Chris. Anderson, of Leeds, and the desired object is accomplished by making a connection between the smoke-box of the moving locomotive and a stationary exhausting flue by means of a long sliding box placed under the locomotive, and working with its open under side in contact with the upper surface of the flue. The flue is fitted at intervals with valves, over which the sliding box travels, and which are opened by it, the box being of such a length as to enable it to cover a second valve before it has quite passed over the previous one. The flue is placed in the center of the road between the rails, and is exhausted by fans situated at intervals along the line and driven by stationary engines. The exhausting-fan having been set to work and the train started, as the locomotive passes over the valves the steam and products of combustion are sucked from the engine through the valves in the exhausting-flue, and are drawn from it and discharged into the atmosphere through suitable shafts. By this means it is claimed that the fouling of the atmosphere of under-ground railways by the products of combustion would be entirely prevented without any prejudice to the working of the traffic or detriment to the running of the engines or trains. A working model of this invention was recently inspected by us, as applied to a 60-foot length of line, and the feasibility of the system was, so far, fully demonstrated. In view of the very objectionable condition of our under-ground lines as regards ventilation and of the simple character of the present invention, it would seem desirable to test its efficacy on a short length of line to start with.

The New Birmingham Iron and Land Company, of New Birmingham, Tex., are making vigorous efforts to build up that new iron-making district. They have recently issued a circular calling attention to the advantages of the town which they are building for the location of manufacturing enterprises of varied character. The company are building a 50-ton charcoal furnace, which is nearing completion and which will be an entirely modern plant. They have also erected a hotel, which is described as one of the handsomest hotels in Texas. A \$25,000 electric plant has been established for the illumination of the town, and a charter has been granted for a company proposing to build an electric street railroad. It is estimated that nearly 200 houses have been built or are nearly completed. A planing mill, three brick-yards with modern machinery, and a wagon factory are some of the industries already completed and at work. The first sale of lots made in this town occurred on November 12, 1888, at which time not a house had been built upon the town site. The growth of the town up to the present time is regarded as phenomenal, and it appears that this will be one of the important business centers of the South if the hopes of its projectors are realized, of which there now seems to be a reasonable certainty.

A German company—the Bochumer Verein—has secured the order for the construction and equipment of Ferntree Gulley Narrow-Gauge Railway, Victoria, at the price of £22,000. It is claimed on German authority that this is the first occasion upon which German contractors have been concerned in the construction of a railway in Australia. The Bochumer Verein had exhibited its system of narrow-gauge railways in the recently closed International Exhibition at Melbourne, and it is to this circumstance that the success in carrying off the order mentioned may be attributed.

### The Taylor Revolving-Bottom Gas Producer.

A gas producer is about the simplest of all metallurgical furnaces—in fact, almost anything capable of containing a heavy bed of coal under which a blast of air, or air and steam, can be forced is a good gas

producer. 12 years, W. J. Taylor designed a solid circular bottom or table arranged to revolve in the lower part of the producer; the revolving of this bottom discharges the ash and clinker over its edge into a sealed ash-pit beneath. This device, all the practical details of which were worked out at the Chester Furnace, at Chester,

noticed that the lower part of the ash-chamber is of smaller diameter than the producer proper. This reduces the size of the revolving table and also the diameter of the casing of the lower part, besides requiring less power to grind. An iron hopper is used to form the walls of the lower part of the ash-chamber and an annular space is thus formed between the hopper and the outer casing. Doors are provided in the casing and punching holes through the iron hopper, both for observation and access to the bed of ash, with bars for breaking up clinker that is too large to pass through the 9-inch space between the bottom of the hopper and the revolving table. The grinding is done as fast as the ash accumulates too far above the central air and steam discharge, say every six to twenty-four hours, according to the rate of working. The door of the ash-pit is opened once a day for taking out the ash and clinker. This requires but a few moments and interferes but little with the continuous working of the producer.

The conduit for air and steam acts as a central post or support on which the bottom revolves, actuated by a crank and pinion. The injected air and steam are discharged radially from the center, in order to prevent too much travel of the gas next to the walls, which is the line of least resistance. It enters at a point sufficiently high to carry the required bed of ash, which should never be brought below the air discharge. Sight or test holes are placed in the wall, so that the dividing line between the ash and incandescent coal can be ascertained at any time. It will thus be seen there is no grate to waste coal through, and there is practically no waste in cleaning. In practice the carbon is gasified down to less than one-half of 1 per cent. of the original carbon in the coal. Cleaning or discharge of ash is under the control, even to passing large clinker, without any disturbance or manipulation, or interference with making gas. The producer is therefore continuous (it has been run for four months without stopping the making of gas), and at the same time it may be used intermittently. It is also simple of construction, consequently cheap and durable.

The blast is generally furnished by a Korting jet steam-blower, and the producer will usually carry more steam than the blower gives. One ton of anthracite buckwheat coal produces about 166,000 feet of gas, containing, say, 135,000 heat units per 1000 feet. The composition will average as follows:

Carbonic oxide.....	23.00 to 27.50
Hydrogen.....	15.00 to 10.50
Marsh gas.....	1.00 to 2.00
Carbonic acid.....	1.00 to 3.00
Nitrogen.....	60.00 to 58.00

Total..... 100.00 101.00

Gas made from bituminous coal has nearly the same composition, except that marsh gas is a trifle higher. The sizes now being built are 4, 5 and 6 feet inside diameter. They will gasify from 2½ to 5 tons and more coal in 24 hours. The producers are built much higher where soft coal is used, as a very much heavier fuel bed is necessary on bituminous than on anthracite.

American machinery manufacturers find the foreign demand for their products increasing as electric lighting becomes more general throughout the world. The new plant of the Spanish-American Light and Power Company, of Havana, Cuba, which is now in successful operation, obtains its power from one 13 and 22 x 13 (125 horsepower) and one 10 and 18 x 10 (65 horsepower) Westinghouse automatic compound engine. A 12 and 20 x 12 engine of similar construction is also being used as the motor for the electric lighting of the mammoth Theater Tazuela, at Madrid, Spain.

THE TAYLOR REVOLVING-BOTTOM GAS PRODUCER.

producer for a short time; but all those having practical experience in making either producer or water gas, from either bituminous or anthracite coals, know well the difficulties of getting rid of the ash and clinker in the coal without great waste, labor and loss of time, aside from making much poor gas. After contending with this difficulty in making producer gas continuously from anthracite coal for some

N. J., during an experimental period of over one and a half years, has since been successfully applied to heating furnaces of various kinds, sugar house kilns, pottery kilns, lime kilns, boilers, &c. It is being introduced by the Taylor Gas Producer Company, Brown Building, Philadelphia. The accompanying illustration represents this producer, of large size, designed for anthracite buckwheat coal. It will be

### The Aiken Hydraulic Crane and Tongs.

During the past few years a large number of American iron and steel works have been equipped with the Aiken hydraulic crane, designed by Henry Aiken, who is

is made of two I beams, which serves as a vertical guide for the plunger. It is stepped at the base so as to be axially rotated by means of the hydraulic cylinder *u'* and a rack and pinion. The cylinder *a* is provided with projecting lugs, *a'*, Fig. 1, which fit against the upright of

strains are taken by the plunger, which always rests upon a fluid cushion.

Mr. Aiken has also designed an ingenious method for handling steel ingots, our illustrations showing it as applied to soaking-pits or vertical heating-furnaces.

Two of the chains, *m*, Fig. 1, are at-

Fig. 1.—Sectional Elevation of Aiken Crane.

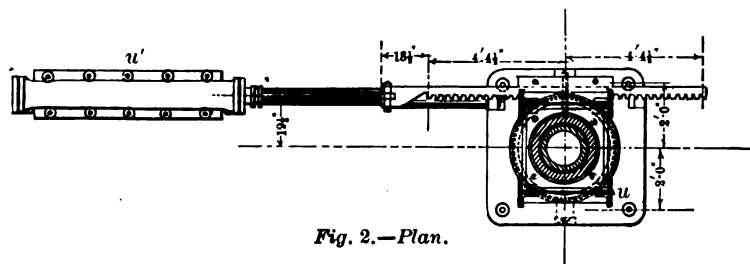

Fig. 2.—Plan.

### THE AIKEN HYDRAULIC CRANE AND TONGS.

connected with the Homestead Steel Works of Carnegie, Phipps & Co. Its characteristic features are shown in the accompanying engravings, from drawings of the crane as built for the slab mill of the Homestead Mill. It consists of an upright cylinder containing a hollow plunger *a*, the supply-pipe for the pressure water entering at the base. The mast-frame *u*

the mast-frame, so as to allow the plunger to move vertically without producing motion of the mast-frame and cause the plunger to rotate on its vertical axis within the cylinder when the mast-frame is turned. The jib *i* of the crane is set on the top of the plunger *a*, and moves vertically with it. The principal advantage of this construction is that all vertical

tached directly to the jib, and the other chain *s'* is attached to the projecting arm *s* of the plunger *S* of a hydraulic cylinder, *R*, which is set in suitable supporting brackets on the jib. The plunger of this cylinder is adapted to move vertically within its cylinder, which is supplied with water by a pipe which leads from the hollow plunger *a* of the crane along the jib

to the cylinder R, and is provided with a valve, *q*. The stem of the valve *q* is operated by a connecting-rod, *v*, which is attached to a crank-arm, *v*, of a vertical shaft, *w*, which is square or polygonal in cross section. The shaft *w* is journaled in horizontal brackets, *w'*, which project from the mast-frame.

The construction of the tongs with reference to that form which is shown in Fig. 1 may be described as follows: They consist of two lever-arms, *n n' n'' n'''*, which are bent into the angled form shown in the drawings, and for the purpose of enabling them to have a wider grasp are pivoted separately to a cross frame or bar, *b*.

The arms *n n' n'' n'''* are set in between the side bars of this frame, being pivotally secured thereto by bolts or rivets, *o'*, and the chains *m m* are attached to the ends of the arms *n n'*. At the ends of each of the parts *n' n''* of the tongs is a tooth, *c*, to enable the tongs to grasp firmly the sides of the ingot or other object intended to be raised.

The operation of the tongs is as follows: Normally the tongs hang from the jib of the crane, suspended by the chain *s'*, and the gravity of the arms *n n'* of the tongs is such as to cause the gripping portions or arms to remain spread, as shown in the drawings. When it is desired to raise an ingot which may be in a soaking-pit or furnace the crane is moved so as to bring the jib directly over the same, and the crane is lowered until the separating jaws *n' n''* lie on opposite sides of the ingot. The plunger *r* of the hydraulic cylinder is now lowered by exhaustion of the water from the cylinder by means of the valve *q*, the effect of which is to cause the weight of the tongs to be borne by the chains *m*, which, acting on the ends of the arms *n n'*, tend to raise them into an upright position, and thereby to close the jaws *n' n''* upon the ingot, and if the jib of the crane is raised these jaws, biting upon the ingot and clasping it firmly, will lift it from the pit. The jib of the crane may now be moved to carry the ingot to the place desired—for example, to the conveying-rolls or feed-table of a rolling mill—and when the jib has been lowered the tongs may readily be released from the ingot by admitting water into the cylinder R, thereby elevating the plunger *r* and causing the chain *s'* to draw upon the cross-bar or frame *b*. The effect of this is to take the weight of the tongs off the chains *m*, and the arms *n n'*, being thus relieved, will drop by gravity so as to disengage the jaws *n' n''* from the ingot. The tongs are thus released automatically, and may be removed from the ingot by shifting the position of the jib of the crane. By the saving of this labor it avoids the necessity of the workman approaching closely to the highly-heated ingot, and is otherwise a valuable and economical appliance. The tongs are susceptible of various modifications in construction and in the manner in which they may be operated. Thus Figs. 3 and 4 illustrate one of such modifications. In this form of the apparatus the construction of the tongs is similar to that shown in Fig. 1, except that the angular form of each of the arms *n n' n'' n'''* may be more nearly a right angle. The side bars of the cross-frame *b* are connected at the ends to give greater strength thereto. The chains *m m* and *s'*, instead of extending directly to the jib of the crane, may be attached to a ring or link, *d*, at the end of a chain, *e*, which is attached either directly to the jib or to a trolley thereon. The chain *s'* is provided with a hook, *s*, at its lower end, by which it may be detachably secured to an eye or ring, *f*, at the extremity of the projecting arm *o*.

The operation of this form of tongs is as follows: Normally the chain *s'* is attached to the eye *f*, and the weight of the

tongs, as it hangs from the crane, is borne by this chain, so that the arms *n n'* are free to drop by gravity and hold the jaws open, as shown in Fig. 3. The tongs may now be brought by movement of the crane directly over the ingot, and as the jaws are open the crane may be lowered to cause the cross-bar *b* to rest on top of the ingot and the jaws *n' n''* to straddle the same (See Fig. 3). If, now, the hook at the end of the chain *s'* be disengaged from the eye *f* the weight of the tongs is put upon the ends of the arms *n n'*, and if the crane be raised the jaws of the tongs will hold the ingot. When the ingot has been carried by the crane to the place desired, the slackening of the chains *m m* and the weight of the arms *n n'* will cause the latter to drop, so as to open the jaws of the tongs, and then if the hook at the end of the chain *s'* be attached to the eye *f* the crane may be raised or moved away from the ingot, the tongs being held open for this purpose by the chain *s'*. This form of the apparatus may not be so well adapted for some purposes as the form shown in Fig. 1, because it does not afford means for automatically closing the tongs; but as it is adapted to hold the tongs open, so as to enable them to be adjusted in position on the ingot without manipulation other than movement of the crane, it is of utility, as it dispenses with the work of pulling into position the tongs themselves, which may be of great weight, and requires only the inconsiderable labor of attaching or detaching the chain *s'* from the tongs. In some cases it may be desirable to render the tongs adjustable, so that they may have a wider or narrower grasp, in order to accommodate them to the size of the ingots to be carried. For this purpose the cross-frame *b* may be provided with several pairs of bolt-holes for the pivotal bolts *o'*, as shown in Fig. 4, and by setting these bolts nearer to the middle of the tongs the jaws may be brought more closely together and their width of grasp thereby adjusted. The pivots of the jaws may be brought as closely together as desired for the class of work which the tongs are designed to perform, and by suitable modifications in the form of the jaws it is possible to set both on the same pivot.

#### Andrew Carnegie on the Condition of Trade.

The New York *Herald's* European edition published the following interview with Andrew Carnegie on the 27th inst.:

"I am one of the delegates from the United States to the American International Conference which will meet in Washington next fall to consider the question of commercial and other relations. I want to make a study of the products of the countries of Central and South America to prepare myself to participate in the conference. I hear that the exhibits at the Paris Exposition are extensive, and so I shall have an excellent opportunity to get the knowledge I wish. I believe the conference will be one of the most important events of President Harrison's administration. Heretofore America has been unable to supply her own market, much less export; but just now the situation is novel. Prices which have risen and are rising in Europe have fallen and are falling in America.

"Steel rails recently sold in Pittsburgh as cheap as delivered in London by the English manufacturers—namely, £5 a ton. The prices we are getting for steel plates are about the same that prevail here. Hitherto English prices have depended on the American demand. Now the demands of the rest of the world, exclusive of America, together with the British wants, are sufficient to keep the manufacturers here busy. As long as this condition continues and prices keep advancing America

will be able to export to South American countries articles in which heretofore she has not been able to compete with Europe, so there appears now to be a great chance for America to establish more extensive commercial relations with her neighbors.

"It is a curious fact that the steel rails that Canada will require this season will in all probability be furnished by American manufacturers. I predict that such will be the case. This can occur only at times when European prices are high under great demands and American prices low under a state of depression such as now exists. It has never occurred before in my time, though once before we sold rails in Canada because the English manufacturers, by combining, forced prices up. The present situation results from natural causes and promises well for America."

"Would you use the same words in speaking of articles other than steel rails? Will America export them also?"

"Yes. Why, the day before I left home Senator Warner Miller told me he had exported a large quantity of paper to Liverpool to be used by a Liverpool newspaper, and that he netted as good prices as he received at home. But, understand me, this is not likely to be permanent, for whenever Great Britain's capacity to manufacture cannot be absorbed at home or abroad she will throw her surplus to America as heretofore. I read what ex-Mayor Hewitt said about the basic process. It is true that the basic process is the only one known which will make the ores of the South suitable for steel; but as long as Lake Superior is able to supply pure ore steel manufacturers will probably stick pretty closely to the present acid process. The basic process is good only as a substitute. I do not think that rails can be made by that process and sold for \$25 per gross ton, as they can now by the acid process."

"You and Mr. Hewitt do not seem to agree on the steel question."

"Well, he doesn't know. I do. I am not holding that the manufacture of rails by the acid process at \$25 per ton can continue profitably, for it cannot. Such prices are only reached by the throes of competition. But I do think that steel can be made by the acid as cheaply as by the basic process."

"Do you think America will share in the boom in manufactures which England is having?"

"No, I think not. The two countries have become much more independent industrially than formerly, and America must find within herself her conditions of prosperity."

**The Haytian Navy.**—Geo. B. Plumer, ex-Chief Engineer of the Haytian Navy, who recently returned to this country, reports that of the 18 American officers sent out by Minister Preston a few weeks ago, only a few escaped imprisonment on various pretexts, besides experiencing many indignities. The so-called navy he pronounces a burlesque. Although the men had signed a contract for six months' service, they were given the option of accepting half-pay for two months or nothing at all, as the Legitimate Government was virtually bankrupt. Advices from another source indicate the early triumph of the "North," which has a full equipment of arms, and is reported to have two fine gunboats purchased in the United States ready for action, both of the latter in command of officers well known in New York. Numerous surmises are afloat respecting the objects of the Washington authorities in sending a commission to Hayti. The acquisition of a coaling station would be a poor equivalent for an "entangling alliance." Perhaps a fair estimation of Hayti's population, all black or colored, is about 750,000.

### The Old Locomotive "Sampson."\*

At the Albion coal mines in Pictou County, Nova Scotia, may be found a curious collection of old machinery, notably three old locomotives, built by Timothy Hackworth in the shops of the Stockton and Darlington Railway, in England, in the year 1838. One of the locomotives referred to, the Sampson, was in use as late as the year 1882, is in a fairly good state of preservation, and as it is a good example of the first English locomotives, a brief description may not be uninteresting. As previously stated, it was built at the repair shops of the Stockton and Darlington Railway at New Sheldon, Durham County, England, and was brought out with two similar locomotives, in 1839, to run on a railway built for the Albion Mine to convey coal from its pits at Stellarton to Pictou harbor, a distance of 6 miles. The Sampson has three pairs of driving-wheels, coupled in the usual manner, and not differing very much in appearance from the driving-wheels of the modern "mogul" locomotives. These wheels consist of a cast-iron center and an outer rim, also of cast-iron, 12 wooden plugs being

original pins and brass bushes in the levers and sliding block are still in place, and show very little wear, after 40 years of almost constant use. The valve-gear consists of four eccentrics, attached to the axle to which the cylinders are connected; the eccentric-rods, extending up into the hood on the front end of the boiler, have forked ends which engage the pins of a rock arm, which is connected with the slide-valves; these eccentric-rods are controlled by the reversing lever, respectively engaging or disengaging them for the forward or backward motion, Fig. 1. The feed-pumps, two in number, are connected with the eccentric-rods, and were thus brought within the hood in full view of the driver; in fact, this arrangement of cylinders and valve motion gave the driver a convenient oversight of all the working parts of the engine while in motion, and without leaving his place; but, strange to say, he was compelled to go outside to ascertain the height of water or pressure of steam, the water-gauges and steam-gauge being located on the side of the boiler. The steam-gauge consists of a spring scale attached to the lever of the safety-valve. The pressure of steam did

air-brakes, &c., and delights to recount a feat of hauling a train of about 189 tons of coal out of a crooked siding on a wet day, which one of the Intercolonial Railroad engines failed to move. In reply to the writer's inquiry as to the effect of winter weather on the unprotected, cableless Sampson, the veteran replied: "Au' the rain an' wind an' snow for 40 year never made auld Donald Tampuson shiever yet." Further interrogation as to the care of his engine elicited the following: "'Deed an' I was far more carefu' o' her than of the gude wife.'" The sand-box of the Sampson consisted of two buckets of sand, one at each end of the locomotive, the sand being thrown by hand on the rails. This duty was attended to by the driver when moving ahead and by the fireman when moving backward.

How Great Britain is distancing all competitors is a subject viewed with complacency by the *Montreal Gazette*: "A glance at the United States navigation tables, the editor says, will show how greatly the British flag has monopolized the ocean carrying of the United States. Nearly half the tonnage carrying cargo between

### THE OLD LOCOMOTIVE SAMPSON.

driven between the center and rim to hold the rim in place. The tires are of iron or steel, shrunk on in the usual manner. The axles, which are 5½ inches in diameter, run in ordinary journal-boxes, bolted to brackets made of boiler-plate, which are riveted to the shell of the boiler, Fig. 2. The boiler is a plain cylindrical shell, 54 inches in diameter and about 18 feet long, containing a single return flue 20 inches in diameter; one end, being fitted with grates, was used as a furnace. The products of combustion following the flue to the front end of the boiler were then returned direct to the smoke-stack, which is at the rear end of the locomotive, Fig. 1. The cylinders and driving-gear are at the front end of the locomotive, and the driver's place was at the front, so that he could keep a good lookout ahead. The fireman was stationed at the rear.

The cylinders (15½ inches diameter by 18-inch stroke) are vertical, resting on cast-iron box-like frames, forming part of a bonnet or hood which partially incloses the valve-gear, pumps, throttle and reversing levers and other working parts. The cross-heads, instead of being guided by slides in the ordinary way, have an arrangement of levers and sliding block, Fig. 3. That this device caused very little friction is shown by the fact that the

not exceed 40 pounds, the spring scale being graduated to 50. The exhaust steam after leaving the cylinders was conveyed within the shell of the boiler, Fig. 1, to the smoke-stack. The reason for thus reheating the exhaust steam is difficult to understand. Probably the idea was that the heat of the exhaust could be utilized within the boiler, the designer overlooking or not clearly understanding the higher temperature of the live steam within the boiler.

That the engineers of that date (1838) had to some extent grasped the requirements of locomotive construction may be gathered from the many devices made use of in this early representative of the "species locomotive" which are still in use, such as the three pairs of coupled driving-wheels, placed as near together as possible, the center pair being without flange, the forced draft obtained by means of the exhaust in the smoke-stack, and the cylinders connected outside the frame.

One of these locomotives was driven by George Davidson, who worked on them while being built in England, and came out to Nova Scotia with them in 1839; he is therefore one of the oldest, if not the oldest, locomotive driver in America. He is still hale and hearty and tells many reminiscences of his 40 years on the rail. Donald Thompson, a "canny Scot" and another faithful veteran, scorns the modern locomotive, with its complicated gauges,

the Argentine Republic and the United States was under the British flag, and there was not a single vessel flying the Stars and Stripes engaged in this trade in 1888. In the trade between Germany and the United States the Stars and Stripes floated over not one steamship, Great Britain and Germany doing the greater part of it. The trade between England and the United States was participated in by 100,000 tons of steam shipping flying the Stars and Stripes, while the Union Jack floated over 8,044,000 tons of English steam shipping engaged in the business. In the trade between England and Scotland there was not a single United States steamship, all but a small fraction being done by vessels carrying the British flag. The same experience is with Ireland as with Scotland. In the trade between Brazil and the United States 61,000 tons of steam shipping were American, while 164,000 tons were British. So whether we study the North Atlantic trade generally, the trade of the United States with other countries on this continent, or the trade of the United States with Asiatic countries, the same fact of British supremacy stands out prominently." It is a trite remark that it is sometimes profitable to see ourselves as others see us.

At the New York Custom House Collector Erhardt is putting all employees handling money under bonds.

\* Paper read by D. W. Robb, of Amherst, N. S., at the Erie meeting of the American Society of Mechanical Engineers.

## THE WEEK.

The freight house, wharves and other terminal arrangements of the Housatonic Railroad at Wilson's Point, Conn., on the line of the contemplated direct through route to New York, were entirely destroyed last week, excepting the floating dock, which had not yet been used. The loss is serious, but the work of restoration will begin at once. Estimated loss \$200,000.

Origen Vandenberg and other parties interested in the proposed under-ground railroad in this city have no exclusive rights to construct and operate the road, independent of the authority of the municipal corporation. So decides Judge Truax, of the Supreme Court, in a suit brought to test the binding force of a former judgment favorable to the under-ground scheme.

It should be noticed that forcing steam into the hold of a vessel for the extinguishment of fire, as was done on the British steamship *Rugia*, is an American idea, made compulsory under the Revised Statutes of the United States, section 4470.

The high speed recently recorded in the performance of some of our first-class ocean steamers is gained at an enormous cost. The *Augusta Victoria* "used only 220 tons of coal a day," so the account reads.

For the protection of vessels during the prevalence of heavy fogs no adequate means have yet been devised, as lately shown in the lamentable fate of the New York pilot boat *Charlotte Webb* when run down in this harbor by a French steamer. The rescued men declare that they used flash-lights, rockets and fog-horns, but to no purpose. It is thought that the use of a suitable signal-gun would answer the purpose better than the present devices.

Several schemes contemplating improvements in Persia, including a bank, railway, water-works and electric lights, have been organized under the laws of the State of Maine, by Frank Clergue, each with \$1,000,000 capital, and the author hopes to secure for them a successful introduction.

The iron centers of Alabama will be connected with Mobile by a new railroad shortly to be commenced by a company with \$2,000,000 capital, thus securing a short outlet to the sea.

The pioneer steamship, with men and materials to commence the actual work of construction on the Nicaragua Canal, sailed from this port on Saturday. The resident engineer at Greytown, F. P. Davis, will establish his headquarters at that point. The cargo comprises every variety of stores, such as provisions, roofing materials, nails, hardware, &c., also a dozen or more iron boats, an exact counterpart of the native craft except as regards material.

A committee of the Illinois State Penitentiary Commissioners, who were instructed by the Legislature to inquire as to the feasibility of assisting the farmer in his fight against the binding twine manufacturers, report that a plant that would employ 75 convicts could manufacture one-third of the twine used by the farmers of the State at a cost of 11½ cents per pound.

In 1832 the Morris Canal, then one of the greatest works of civil engineering, was opened for business between Phillipsburg, N. J., and Jersey City. It enhanced the prosperity of the country through which it runs largely and rapidly. Even after railroads began to extend across and hither and thither through that part of

New Jersey, the canal continued to prosper and benefit the industries it had called into being. It passed finally into the hands of the Lehigh Valley Railroad Company, and has been kept in operation regularly during the water transportation season. The announcement is now made, however, that the old canal, after nearly 60 years of existence, is to be closed, as last season the business it transacted did not pay its running expenses.

Ten English workmen who came to this country under a labor contract, landing in New York, were sent back by Collector Erhardt. They were discharged convicts.

The Ordnance Bureau of the Navy Department has completed two of the 10-inch steel breech-loading rifles for the monitor *Miantonomoh*. These are the largest and most powerful built-up guns yet turned out for the navy. One of them is at Annapolis awaiting trial. The other has been fully tested with gratifying results.

The Government's net holding of silver dollars unrepresented by certificates in circulation decreased to about \$8,000,000 in January last. Since the latter date the accumulation of silver has gone on, and at the present time the coinage is at least \$10,000,000 in excess of the certificates issued. The question, therefore, becomes pertinent whether the limit of possible absorption has not been reached.

The steamship *Cynthia* was sunk in the St. Lawrence River, near Montreal, by a collision with the *Polynesian*, and the latter was saved only by her strong iron bulkheads and water-tight compartments.

For aught that appears to the contrary, the steamer *Alaskan*, which recently foundered on the coast of Oregon, had no other "structural weakness" than might become apparent in any steamer designed for sound or river navigation if exposed on the open sea. The reputation of the late John Roach, her builder, is in no wise affected.

New oil line projects are multiplying. the idea of manufacturing both fuel and illuminating gas from the crude material affording the incentive. An 8-inch pipe line is now being laid from Parker, Pa., to Signet, Wood County, Ohio, where it will connect with the Lima line running to Chicago. From Parker a 6-inch line will be laid to Coal Grove, McKean County, Pa., where it will connect with a 6-inch line already laid to New York City. It is said the oil will be pumped from the Ohio field to New York, where gas will be manufactured from it to supply the city with fuel and light. Another phase of enterprise is the absorption of gas companies by syndicates proposing to introduce natural gas as a substitute. Closely following the purchase by Eastern capitalists of all the gas companies in St. Louis, those of Rochester, N. Y., have in like manner been seized upon by a syndicate in New York, who propose to introduce natural gas from the Pennsylvania fields, 100 miles distant, and it is intimated that Buffalo, Elmira and Syracuse may eventually be supplied from the same source.

During April there were 62,605 immigrant arrivals at the ports of the United States, against 79,670 for the corresponding month last year.

Those interested in marine architecture will have a rare opportunity for observation during the process of building the new cruiser *Maine* at the Brooklyn Navy Yard.

All the silk looms in Paterson, N. J., are reported to be actively employed. The operatives number about 2000.

Capt. C. G. Lundborg wrote in 1882 that "it is beyond dispute that the maximum efficiency of the single screw propelling wheel has been already reached in sea-

going steamers. More propelling power, and its consequent speed, can be achieved only by the use of twin screws." This prediction seems to have been fully verified in the exploits of the City of Paris and other steamers propelled by the twin screw.

The steel rails for the new Mexican railroad from the Gulf of California to Chihuahua, on the Mexican Central, a distance of 220 miles, will be imported from Antwerp.

Brazos River, Texas, will be the new deep-water port on the Gulf, where railroads will center. The capitalists interested are vigorously at work.

The largest cargo of iron ore ever received in Philadelphia arrived by the steamship *St. Fillans* from Elba, comprising 3816 tons.

A new arrangement in lake and rail traffic has let the Canadian Pacific into Chicago. The line is from Vancouver by rail over the Canadian Pacific to Port Arthur, and thence to Chicago by the Lake Superior line of steamers. The rail haul is 1912 miles and the lake run 850 miles.

Proposals for the construction of three cruisers for the navy were on Saturday issued from the Navy Department. Bids will be opened August 1, 1889. These vessels are to be of 2000 tons displacement, and are to exhibit a maximum speed of at least 18 knots an hour for four consecutive hours. They are to be finished within two years from the date of contract, and payments will be made in 20 equal installments as the work progresses. The cost of the vessels, excluding any premium that may be paid for increased speed and the cost of armament, but including equipment, is limited to an amount not exceeding \$700,000 each. The proposals are divided into four classes, the first being for a vessel in accordance with the plans of the Secretary of the Navy, the second for the plans of the contractor, the third being for the Secretary's hull and the contractor's machinery, and the fourth for the contractor's hull and the Secretary's machinery. This last class is an innovation in naval advertisements.

The scrap-iron value of several vessels at the Brooklyn Navy Yard will soon be determined by an appraisal by Government officers appointed for this purpose.

The Hell Gate electric light tower, 265 feet high, and representing about 125 tons of structural iron, from Carnegie's works, at Pittsburgh, and which was erected by the Government in 1883 at a cost of \$20,000, has been doomed to the scrap heap. The electric glare only blinded the mariner.

Ten leading coal shippers of Pittsburgh engaged in the river trade to New Orleans and intermediate points have been consolidated into the Pittsburgh and Southern Coal Company, and propose to buy out all the little operators, their steamers and barges, coal mines and tipples, by an expenditure of about \$12,000,000, and secure a monopoly by which they can dictate prices to consumers. The river coal business is said to be much demoralized.

Three barrels of oil poured into the sea saved the United States steamship *Yantic* during the hurricane of May 21. Several officers agree with Ensign Ashman in stating that the oil had a wonderful effect.

The cruiser *Chicago*, it is reported from Washington, has been selected to carry the body of John Ericsson, the inventor, to his native land.

The French torpedo cruiser *Vantour*, just launched at Toulon, is expected to attain a speed of 20 knots, and the steel cruiser *Lalande*, launched at Bordeaux, is nearly as fast.

## MANUFACTURING.

### Iron and Steel.

Under recent date the Globe Mfg. Company, of Youngstown, Ohio, write us as follows: "We are now operating our fine hoop mill, making a specialty of the various sizes of fine hoops, rolled in about 1000 foot lengths and put up in coils hot, and may at some later day go into the manufacture of other sizes."

A charter was filed in Pittsburgh last week for the Pittsburgh Reduction Company. It is formed for the purpose of reducing refractory ores and producing bronze and commercial alloys. The capital stock is \$20,000, divided into 200 shares of \$100 each. The directors are A. E. Hunt, H. W. Lash, Robert J. Scott, Willard Hunsiker and W. S. Sample.

William Swindell & Bros., engineers and contractors, of Pittsburgh, have recently received a contract to construct three tube welding furnaces for J. C. Hodgson, of Montreal, Canada. The new plant will have a capacity of from 25 to 30 tons per day.

Sharon Furnace, at Sharon, Pa., operated under lease by Spearman, Collord & Co., was blown out last week. It has been turning out about 75 tons of metal per day. The lease expires in July next, and although the lessees have the privilege of renewing it at present terms, it is thought that they will not do it. The furnace is owned by Boyce, Rawle & Co., of Sharon, Pa.

The puddling department of the Terre Haute Iron and Nail Works, at Terre Haute, Ind., has been in operation only two weeks since April, 1888. The nail-plate department resumed operations a few weeks ago.

The plant of the Whitaker Iron Company, at Wheeling, W. Va., manufacturers of the Crescent brand of sheet-iron and sheet-steel, is being operated triple turn to its utmost capacity. A large addition to the galvanizing department is now under way, which is almost completed.

Lucy Furnace, No. 1, of Carnegie Bros. & Co., Limited, at Pittsburgh, was blown out last week after a very successful blast of 2 years, 11 months and 14 days. In that time it has cast over 192,000 tons of pig-iron. The furnace will be relined and otherwise thoroughly repaired, and will be ready for blast again about July 15 next.

The plant of the Oil City Tube Company, at Oil City, Pa., which has been running single turn for some time, was put on double turn last week. The report that a strike had recently occurred at the works is without foundation.

A charter has been issued to the Logan & Strobbridge Iron Company, of New Brighton, Beaver County, Pa. The capital is \$75,000 and the incorporators are: John H. Logan, Allegheny City; Turner Strobbridge, Big Beaver Township; Charles C. Robinson, L. Roggen Strobbridge and Persifer D. Hall, New Brighton.

The work of improving the Emma blast-furnace of the Union Rolling Mill Company, at Cleveland, Ohio, is well under way. The new smoke-stack, 152 feet high from the base, is completed, and workmen are now busily engaged on the new hoist-house. Work is going on day and night.

Owing to the depression in the iron market, and in view of the vast amount of iron now in stock at their various furnaces in the valley, the Columbus and Hocking Coal and Iron Company shut down on the 23d inst. their Winona and Buchtel furnaces indefinitely. This leaves the Bessie, at New Straitsville, and the

Hattie, at Greendale, the only furnaces now in blast in the valley. Four hundred men are thrown out of employment.

The Iowa Barb Wire Company, whose new plant is to be located at Allentown, Pa., near their present wire works, have awarded the contract for the entire machinery, embracing three roll trains, roll lathes, shears, shafting and pulleys and numerous other parts to the Lewis Foundry and Machine Company, Limited, of Pittsburgh.

Lucy Furnace (charcoal), at Mount Union, Pa., has recently been thoroughly repaired and improved, and will be started up in a few weeks under the management of John Whitehead, the owner of the furnace.

The new buildings of the National Forge and Iron Works, East Chicago, Ind., are about completed, and the new machinery is now being put in place. The officers of the company expect to get the works in operation about the 1st of August.

The Ellis & Lessig Steel and Iron Company, of Pottstown, Pa., have announced the closing of their nail works at the end of the present month, due to the demoralized state of the market. The company have over 100 machines and have always been free from labor troubles.

The Brooke Iron Company, of Birdsboro, Pa., after a run of two weeks, following an idleness of nearly two months, were compelled to again suspend operations recently owing to the giving out of nail-plates, caused by the plate-mill hands being on a strike.

A number of well-known iron capitalists are expected to lay before the Association of Business Men of Ashland, Wis., a project to establish a rolling-mill plant at that place. It was estimated some time ago that for a plant worth \$1,000,000 the city of Ashland would be expected to devote a site worth not less than \$25,000 and \$100,000 in city bonds running 20 years with interest.

After a continuous run of 14 months, the National Furnace, at De Pere, Wis., was blown out on the 18th inst. During the last two weeks of its run the furnace produced 989 tons of pig-iron.

The Keystone Rolling Mills and Seyfert's rolling-mill, both of Reading, Pa., have resumed operations, the former on Monday of last week, each mill giving employment to some 250 men. It will be remembered that the Keystone mills shut down at the time of the Reading Iron Works failure, but will hereafter run independently of the latter, seeking the open market to dispose of their product. On the other hand, the status of the blast-furnaces in the Reading district is very low, leading to the stoppage indefinitely of a number of ore mines at Farnington, Kline's Corner and all through the Macungie Flats, and the closing down of several quarries from which the furnaces drew their supply of limestone for smelting purposes.

From Sharon, Pa., come reports of a general reduction of 10 per cent. in the wages of furnace employees throughout the Shenango Valley, made necessary, the manufacturers claim, by low prices and general depression in the iron trade. The 1200 men affected have accepted the reduction, and the different works are running steadily.

### Machinery.

The Canton Mfg. Company, of Canton, Ohio, have just shipped one of their well-drilling machines to South America, and are finishing up another fine one for shipment to a Southern Ohio point. One of

these machines is being used by the water-works department of the city in drilling the wells at the water-works station for a supply of water. Another special article of manufacture by this company is Poorman's patent Columbia steam-heating or hot-water boiler. Among the patents granted recently was one to E. W. Poorman for a rock and earth drilling-machine, which will also be manufactured by this company.

The works of the Niles Tool Company, at Hamilton, Ohio, are being operated 23 hours per day with all the workmen that can be conveniently employed.

The capital stock of the Standard Under-ground Cable Company, at Pittsburgh, has been reduced from \$3,000,000 to \$1,000,000. The company have recently received large orders for electric-light wires from Portland, Ore., and from Washington, D. C.

Theo. Smith & Bro., of Jersey City, have closed a contract with the Central Stock-Yard and Transit Company to build the engines, boilers, hauling-tracks, &c., for the Meadows Abattoir, which was recently destroyed by fire.

The Chicago representatives of the New York Belting and Packing Company, W. D. Allen & Co., have just issued a new and attractive catalogue, containing description of a full line of vulcanized rubber goods, including belting, packing and hose. The cover is a buff tint, is very attractive, and is printed in red and bronze. A view of the company's extensive warehouse and sales-rooms, 151 Lake street, is shown on the back. It is a pamphlet of 40 pages, profusely illustrated, typographically correct in every particular, and great care and much labor have evidently been bestowed in its preparation and production. Its possession cannot fail to be of benefit to those interested in the line of goods which Messrs. Allen & Co. handle. They also represent the Hoyt leather belting at Chicago.

The Marietta (Pa.) Foundry has been succeeded by the Marietta Casting Company, a new charter having been granted. Additional buildings are being erected and equipped with the most improved machinery for the manufacture of castings, hollow-ware and enameling, and a two-story building, 178 x 40 feet, will be used as the finishing department. The foundry is in full operation, turning out light and medium castings. The officers of the company are: President, B. F. Hiestand; treasurer, J. L. Brandt; secretary and manager, Geo. F. Stibgen.

The Magnolia Anti-Friction Metal Company, of 74 Cortlandt street, New York, have published a circular containing a great deal of information relative to tests made of their metal in competition with similar metals manufactured by other establishments. All of the certificates in this circular are exceedingly complimentary to the merits of the Magnolia metal, while some of the tests show remarkable results in favor of the product of this company. A very interesting certificate is that of the Chicago Tire and Spring Company, who state that they have used the Magnolia metal in the journals of their mill for rolling locomotive tires where there is a pressure of 5000 pounds to the square inch, and that it has given better satisfaction than anything used heretofore.

James W. Queen & Co., of 924 Chestnut street, Philadelphia, have issued a circular containing important information for scientists who are about to visit the Paris Exposition and the International Congress of Electricians. They call their attention to the fact that the firm have representatives in Paris who have had many years'

experience in the selection and purchase of scientific apparatus of every description. They will furnish letters of introduction to their agents in Paris, which will enable much valuable time to be saved in hunting up prominent makers of such apparatus and making bargains with them. Those not thoroughly conversant with the French language will find this arrangement especially advantageous. The details of shipping and passing through the United States Custom House will also be carefully arranged by the representatives of the firm.

The rapidly-increasing demand for large compound engines has necessitated the fitting up of a new machine shop by the Westinghouse Machine Company, of Pittsburgh, Pa. A large planer has been erected by William Sellers & Co., and a cylinder-boring machine of special design, made by the Pond Machine Tool Company, will be delivered in June.

The Grand Avenue Cable Company, of Kansas City, say that probably the hardest line in that city on cable ropes is their Walnut street line, which hauls both the Fifteenth street and Westport cars. On October 25 they put in a wire rope manufactured by the Broderick & Bascom Company, of St. Louis, which lasted 114 days, making a mileage of 16,441 miles. This showed a gain over the rope previously used, which was manufactured by another company, of 6377 miles, which is 89 per cent. longer, and assuming the cost of the cable to be \$4400, made a saving of \$1716.

The Wainwright Mfg. Company, recently organized under the laws of Massachusetts with a capital stock of \$100,000 paid in, succeed to the business of the late concern of the same name, of Medford, Mass. The officers of the new company are Jere Abbott, president; John A. Loring, vice-president; George D. Hall, Jr., treasurer and manager. They will continue the manufacture of feed-water heaters, filters, surface condensers and fittings, and also a general foundry and machine business, with offices at 34 Oliver street, Boston, and factory at Medford, Mass.

#### Hardware.

The Allentown Hardware Company have been chartered at Allentown, Pa.

The Hartman Mfg. Company, of Beaver Falls, Pa., have recently made a steel mat for the office of the Hotel Richelieu, Chicago, 41 feet long and 4 feet wide, the largest ever made in the world in one piece. A somewhat smaller one was recently made for the Palmer House, of that city.

It Governor Hill signs the Fassett Prison bill the hollow-ware shop at Auburn prison will be started at once, and arrangements will be made for the manufacture of brass fittings for plumbing.

On Wednesday, the 15th inst., the Columbia City Mfg. Company, of Columbia City, Ind., consolidated their interests with those of the Akron Hardware Company, at Akron, Ohio, and will at once remove their plant to the last-named place.

The building occupied by the Fish Mfg. Company, at Columbus, Ohio, devoted to the manufacture of buggy and carriage hardware, was burned on the 23d inst. The loss is estimated at \$25,000 upon building, machinery and finished work. The firm carried an insurance of \$11,500.

The Arms Bell Company, of Youngstown, Ohio, manufacturers of nuts and bolts, whose plant was destroyed by fire some weeks since, have decided not to rebuild, and will go out of business.

Joseph Ehart & Son, Fort Madison, Iowa, are putting on the market a line of

tin fruit cans, to seal with wax, for which they are expecting a good demand the coming season. They have increased their facilities for making the goods and put them on the market conveniently crated.

The Chelsea File Works, Norwich, Conn., manufacturers of the Chelsea hand-cut horse rasps, report business so brisk that they are compelled to run their works overtime to keep up with orders. This concern make hand-cut goods exclusively, for the quality of which they have an excellent reputation. The material used is made specially for them, and great pains are taken with the workmanship to insure uniform cutting properties and durability.

#### Miscellaneous.

The employees of Russell & Co., Massillon, Ohio, are agitating the organization of a local mutual insurance society. Formerly it was the invariable custom upon the death or disabling of a comrade to make up a subscription list. The men now realize that it would be a better method to provide a fund by small, regular assessments, and that plan will be at once adopted, as it is working well in numerous manufacturing establishments in various parts of the country.

The strike of the railroad coal miners, at Pittsburgh, which was commenced several weeks ago, has been settled. The men struck for a uniform yearly rate of 74 cents a ton, but a compromise has been effected by which the men are to receive 73 cents. Over 7000 men have gone back to work.

The new Asbestos steam-pipe and boiler covering recently put upon the market by the Chalmers-Spence Company, New York, is meeting with pronounced success wherever a thoroughly reliable, non-conducting, water and fire proof material is needed for covering purposes. For electric-lighting stations it is looked upon with especial favor. The Chalmers-Spence Company have just completed a contract for covering pipes at the new stations of the Edison Electric Illuminating Company, of this city, one of which is located at Twenty-sixth street and the other at Thirty-ninth street. The materials used were their patent fire-felt covering for steam-pipes, and the same material as supplied in sheet form, for drums, heaters, &c.

#### The Carpenter Steel Company, of Reading.

From the Reading (Pa.) Times of the 21st inst. we take the following:

The old P. & R. rolling-mill on North Ninth street, which has been idle for seven or eight years, will be started in a few weeks as a steel plant. For some time past it has been known that negotiations were pending between the railroad company and J. H. Carpenter, of New York, to start the mill, and the consummation of the bargain will be good news for the unemployed iron-workers of the city, as well as the entire business community. A force of men will be put to work this morning and the necessary repairs, improvements and alterations which are required will be pushed forward to an early completion. This will be a work of about six weeks. All the old machinery except the engines will be torn out and the furnaces will be rebuilt. The new machinery for the manufacture of cutlery and tool steel has already been purchased and will be put in as soon as the old can be removed. The business will be conducted under the name of the Carpenter Steel Company, and not the Superior Steel Company, as has been heretofore announced, and the processes to be used are those invented by Mr. Carpenter. A gratifying

feature of the new industry is that large orders have already been booked from prominent parties and that local labor will be employed in the new industry, with the exception of a few experts who will be brought from New York. It is the intention of Mr. Carpenter to add to the mill a complete nail and tool works, which products will be manufactured from the steel which the mill will produce. When the combination of plants is completed the number of men employed will be sufficient to give a decided boom to the northern portion of the city. Mr. Carpenter is an engineer of high standing and has been employed in some of the most important engineering enterprises in the country. He is a graduate of the Annapolis Naval Academy and was the youngest naval officer in the service of the country, having entered the service when he was but 15 years of age. He was also an engineer with the Roeblings, who built the East River bridge.

#### Spur Gears.

The Brown & Sharpe Mfg. Company, of Providence, R. I., have issued the following valuable data on spur gears:

Having the number of teeth and the diametral pitch, to obtain the pitch diameter divide the number of teeth by the diametral pitch.

If the number of teeth is 40, and the diametral pitch is 4, divide 40 by 4, and the quotient, 10, is the pitch diameter.

Having the number of teeth, and the diametral pitch, to obtain the whole diameter or size of blank add 2 to the number of teeth, and divide by the diametral pitch.

If the number of teeth is 40, and the diametral pitch is 4, add 2 to the 40, making 42, and divide by 4; the quotient, 10½, is the whole diameter of the gear or blank.

Having the number of teeth and the diameter of the blank, to obtain the diametral pitch add 2 to the number of teeth and divide by the diameter of the blank.

If the number of teeth is 40, and the diameter of the blank is 10½ inches, add 2 to the number of teeth, making 42, and divide by 10½; the quotient, 4, is the diametral pitch.

Having the pitch diameter and the diametral pitch, to obtain the number of teeth multiply the pitch diameter by the diametral pitch.

If the diameter of the pitch circle is 10 inches, and the diametral pitch is 4, multiply 10 by 4 and the product, 40, will be the number of teeth in the gear.

Having the whole diameter of the blank and the diametral pitch, to obtain the number of teeth in the gear multiply the diameter by the diametral pitch and subtract 2.

If the whole diameter is 10½ and the diametral pitch is 4, multiply 10½ by 4 and the product, 42, less 2, or 40, is the number of teeth.

To obtain the distance between the centers of two gears, add the number of teeth together and divide half the sum by the diametral pitch.

If two gears have 50 and 30 teeth, respectively, and are 5 pitch, add 50 and 30, making 80, divide by 2, and then divide this quotient, 40, by the diametral pitch, 5, and the result, 8 inches, is the center distance.

William Kerr, treasurer of the Crane Mfg. Company, Chicago, died at his residence, No. 65 Laflin street, on the 23d inst. His death is attributed to exhaustion from overwork. He had been recreating at Colorado Springs for some time past, and returned home only a few days prior to his death. He was associated with the company for a long time, and had many intimate acquaintances throughout the West.

# The Iron Age

New York, Thursday, May 30, 1889.

DAVID WILLIAMS, - - - PUBLISHER AND PROPRIETOR.  
CHAS. KIRCHHOFF, JR., - EDITOR.  
GEO. W. COPE, - - - ASSOCIATE EDITOR, CHICAGO.  
RICHARD R. WILLIAMS - - HARDWARE EDITOR.  
JOHN S. KING, - - - BUSINESS MANAGER.

## The Late Meeting of the Iron and Steel Institute.

Two subjects were brought up at the meeting of the Iron and Steel Institute, full accounts of which have just reached us, that deserve to be brought to the attention of those interested in the trade on this side of the Atlantic. The first was the publication of sufficient evidence to show that alloys of steel and nickel possess properties which are very likely to make them valuable to the constructor and the engineer. James Riley, of the Steel Company of Scotland, Glasgow, the well-known metallurgist, submitted a paper on this "nickel-steel," the manufacture of which is the invention of a Frenchman, M. Marbeau. During the discussion of the paper, however, the fact was developed that J. F. Hall, of Sheffield, has been working independently on the same lines for a considerable period, reaching results equally extraordinary. Mr. James Riley reports that no difficulty was experienced in making, in the open-hearth, in as short a time as is required for the ordinary scrap charge, nickel-steel containing up to 50 per cent. of nickel. Nor are any special appliances necessary. The mechanical properties are certainly very extraordinary. The following tests will convey an idea of the quality of the metal:

Number.	Analysis.			Mechanical tests.		
	Nickel Per cent.	Carbon. Per cent.	Manganese. Per cent.	Elastic limit. Gross tons.	Tensile strength. Gross tons.	Elongation in 8 inches. Per cent.
3....	3.0	0.35	0.57	28.0	48.5	20.3
4....	3.0	0.60	0.26	30.3	42.9	7.5
6....	4.7	0.22	0.23	28.0	40.8	20.0
7....	5.0	0.30	0.30	28.0	42.8	15.0
8....	5.0	0.50	0.34	32.5	46.8	13.5
10....	25.0	0.27	0.85	12.7	45.8	29.0
11....	25.0	0.82	0.52	15.1	42.1	40.0
12....	49.4	0.35	0.57	21.0	37.0	20.0

The tests chosen from those submitted were all from specimens as rolled and annealed, the original document giving additional details. Mr. Riley dwells with particular emphasis upon the qualities of the alloys under 5 per cent., pointing out what economies might be realized in large structures by having a material possessing a tensile strength of 40 tons coupled with an elastic limit of 28 tons. In the discussion J. F. Hall gave some interesting tests with nickel-steel for gun-bombs, conducted by Holland & Holland, of London. Both of the experimenters brought up testimony to prove that the new alloy possesses greater resistance against corrosion. No data were submitted bearing on the cost of the new steel, but it is not difficult to reach the conclusion that on that point the future

will allow of serious reductions, so far, at least, as the nickel is concerned. It is pretty generally known that the narrowness of the market for the metal has been the only obstacle to a very heavy increase in the production of nickel. Very large quantities could be readily supplied by the Canadian Copper Company, for instance. With a heavy demand insured larger quantities could be supplied at a marked lowering in the price without lessening the profits of the producer.

The second important paper read was that of J. H. Darby, of the Brymbo Steel Works, on the manufacture of basic open-hearth steel. After years of experimenting success attended the efforts to produce steel by the "pig and ore" process, the work in other countries and by other establishments having been directed almost exclusively to making basic steel by the "pig and scrap" method. Here, too, as in the Bessemer process, the pig must approach a certain chemical composition, the specification to which the Brymbo works ran being 3 per cent. of phosphorus, 0.04 sulphur, 0.40 silicon and 1.75 manganese. It was found that any kind of ore, provided it is low in silicon, may be used, the phosphorus contents being of no importance. Mr. Darby states that the quantity of ferro which must be added is less in the basic open-hearth than in the basic Bessemer, 10 to 12 pounds of 80 per cent. ferromanganese being enough to produce the same result as 30 pounds per ton of steel in the basic Bessemer vessel. This, he claims, indicates a striking difference in the purified metal from both processes. Mr. Darby states that after an experience in making 60,000 tons of basic open-hearth steel he has not observed any red-shortness in the usual soft quality produced. So far as the life of the bottom is concerned, he cites the case of one furnace still running which has cast 3660 tons of dead-soft steel without relining. It is evident that the basic open-hearth is making rapid progress, justifying the favor with which it is regarded in this country.

It is intimated by those who are conversant with the progress of affairs in the Vermillion range of the Lake Superior iron-ore district that there is danger of a mining-stock craze in that section similar to the disastrous Gogebic speculation which prevailed some two years since. The vast extent of the Vermillion ore field and the remarkable richness and purity of the ore have attracted the attention of professional boomers and restless speculators, and already more iron mining companies are said to have been organized to operate in it than in any other iron district in the country. These companies have been chartered in many States, so that it is very difficult to ascertain their full number; but enough has come to light in this regard to warrant the assertion above made. Of course a number of these companies will become actual producers, but others will be used only for the purpose of conducting a speculation in mining stocks. It will be well for those who are tempted to invest in Minnesota iron-ore companies to investigate thoroughly the schemes presented to them, and not to purchase mining stock too hastily. With the Gogebic collapse so fresh in our recollection, it seems almost idle to utter words of warn-

ing when a similar movement in a neighboring district comes forward. But there appears to be good reason for it, and those who are willing to receive advice will take heed.

## A New Experiment in Profit-Sharing.

Much interest has been aroused in New England labor circles by the announcement that the Bourne Cotton Mill, at Tiverton, R. I., which is in the Fall River district, will hereafter share its profits with its employees. Not less than 6 per cent. of the amount of cash dividends declared and paid to the stockholders of the corporation is to be divided among the operatives in proportion to the wages they will earn in a semi-annual period. The capital of this mill is \$400,000. In 1885 it declared a dividend of 2 per cent.; in 1886, 6 per cent.; in 1887, 14 per cent.; and in 1888, 16 per cent. On the basis of the earnings in the last year, therefore, \$1920 would be divided among the employees as their share for six months. While the amount received *per capita* would be small, the principle which is embodied is hailed by those interested in the welfare of the wage-earners as a most important one. If it were universally adopted by the Fall River mills, it is believed that much of the antagonism now existing between labor and capital in that important manufacturing center would be removed.

The division of profits with employees has long been held by students of the labor problem as the correct solution of labor troubles in manufacturing establishments. Wherever it has been tried, this method of cultivating the good-will of the toilers has been attended with satisfactory results. Workmen thus become directly interested in the operations of the establishment in which they are employed and may naturally be expected to perform their several functions more conscientiously. They may be expected to guard the interests of the concern, turning out a larger or a better product according to circumstances, exercising prudent economy in the use of material furnished them and jealously observing shortcomings on the part of their fellow-workmen.

Co-operation, in the broad sense of the term, has been demonstrated in numerous instances to be impracticable, but as carried out in this guarded way it is attended with advantages which are appreciated by all the interests concerned. The employees do not participate in the management of an establishment which they have not helped to create, neither do they risk their savings in its maintenance; but they know at each dividend period whether the business of the term covered has been fairly profitable or discouragingly unremunerative. They may be inclined to ask for a heavier percentage of the profits if the term has been extraordinarily prosperous, but they will hardly force an issue on this point when they know that they will not be called on to bear a share of the losses incurred in a period of depression and very low prices.

The growth of public sentiment in this direction has been slow but none the less sure. The circle widens every year, including more and more enterprises of prominence in their respective localities. The very slowness of its growth is a good indication. If it were rapidly spreading

it might be regarded as merely spasmodic and ephemeral. But it seems destined to secure more and more converts who will thoroughly believe in it as a remedy for labor troubles and who will adopt it as a permanent institution in carrying on their enterprises. It may not result in the millennium, and labor disputes may still be expected to occur even where profit-sharing is in force; but abuses will have to be grave indeed to make employees thus favored abandon their posts and go out on a strike.

#### Mr. Hewitt and the American Iron Trade.

While the economic views of the Hon. Abram S. Hewitt have the approval of but a comparatively small number of his colleagues in the American iron trade, he is, nevertheless, held in universal esteem, and whatever he says receives thoughtful consideration. He is known as a man of earnest convictions, and his long experience in the manufacture of iron, as well as his prominence in national affairs, invest his expressions of opinion with more than the usual importance attached to the utterances of the sages of the trade. He is now in Europe, and has been interviewed there with regard to the future of the American iron and steel industry, and also upon the special business which has called him abroad at this time.

Upon the first point he declares that the tariff prevents the United States from becoming the great iron and steel producing country of the world; that if the "preposterous tax" of protection was taken from iron we should, in a short time, not only supply ourselves with this metal, but would supply a great part of the world besides. He asserts that the effect of the change would be the closing up of a number of iron mines and iron and steel plants located in certain parts of the country, but he maintains that these individual losses would be much more than made good by the establishment of new industries throughout the center of our country, from Michigan and Wisconsin on the north to Tennessee and Alabama on the south. It will naturally occur to our readers, who are in full possession of facts not necessary to recount here, that this very movement is going on at present, irrespective of the tariff. If the development of new iron districts in the South and West continues for but a few years longer at the present rate of progress, and the cost of producing iron and steel steadily cheapens, as there is reason to believe it will, the exporting point may be reached without any change in the economic policy of the country. To most people it looks as though the United States is destined to become "the great iron and steel producing country of the world," and nothing can stop it. If the tariff is really a bar to our progress in that direction it seems to be one that is very easily surmounted.

The second point in Mr. Hewitt's interview is that he has gone abroad to look into matters connected with the manufacture of steel, more particularly into the basic process of making open-hearth steel. He says: "My visit will probably result in time in a general adoption in America of the basic process. It is well adapted to the Southern States. I have seen the prin-

cipal steel manufacturers of England and have gained all the information I hoped to get, and I am well satisfied. I am convinced that America will make iron and steel for mankind in the long future. We have the iron, coal, capital, skill and energy necessary to do it." The Southern newspapers are particularly well pleased with this statement. They are highly gratified that a Northern iron manufacturer of such eminence as Mr. Hewitt should thus express himself, and they are doubtless impatient for his return home to secure for their section the practical results of the investigations to which he alludes.

Whether Mr. Hewitt's researches into the method of manufacturing basic steel may lead to important consequences for this country or not, it is reasonably certain that more decided efforts than have yet been made will soon be inaugurated in that direction in one or more localities. The new Illinois Steel Company have in contemplation the erection of a basic Bessemer plant at Milwaukee. Should such a company embark in this new industry there is little doubt that it would be made a success, in which event other works of the same character would be speedily undertaken in sections possessing the requisite ores for the process. Mr. Hewitt is therefore in line with progressive members of the iron trade who believe that the time has come for decided action with regard to the manufacture of basic steel on this side of the Atlantic. If he renders important assistance to this movement, and the manufacture of basic steel becomes an important feature of our domestic industry largely through his instrumentality, he will have performed a service to his fellow-citizens which will add greatly to the honorable distinction he now enjoys.

#### Our Trade with Japan.

Trade between the United States and Japan is considerable. While our domestic export thither is steady and capable of expansion, our import fluctuates according to the position of tea in our markets, this country being the only foreign consumers of Japanese tea. Japanese silk we take in increasing amounts. What the possibilities of enterprise and trade in that direction are may to some extent be gathered from passages we extract from J. J. Rein's recent work on Japan.

Japan is neither a large country nor a rich one. It offers no encouragement to the builders of great railroad lines, for the surface is mostly mountainous, the people travel very little, and they do not have much freight to move. The entire area of the country is not as great as that of the State of California, and only about 10 per cent. of the soil is under cultivation, the remainder being forest, desert and mountain. Nor is it a land abounding in precious metals, as some published reports have led Americans to believe. Many years ago much gold was found there, but by persistent efforts, continued through centuries, the leads were worked out, and careful "prospecting" has failed to discover new ones. There are no great accumulations of wealth waiting to be put into "public works" or other bonanzas, such as enterprising Americans and Europeans have inflicted upon communities unaccustomed to Western ways. The people live comfortably, but they are poor; they work persistently but live simply; otherwise they could not live at all. The principal exports to European and American ports are raw silk and tea. These two articles constitute almost the

entire export trade, except to China and Asiatic islands, for Japanese ceramics, though often esteemed as curiosities, make a very small showing on export lists. Yet, as has already been said, the people are industrious. The reason they have so little to sell—and to buy with—is that home demand consumes almost all they can produce. Nearly 40,000,000 people must subsist on the products of less ground than is under cultivation in the single State of New York. With all their agricultural industry the Japanese do not always succeed in raising enough rice for home consumption. With the reclamation of more soil and more attention to forest products the country's resources may be increased, but these facts offer no inducement to Americans to organize drainage companies for Japan or go into the business of destroying forests on our own unrivaled plan.

Japan covers an area of 382,418 square km., and, according to the census of Jan. 1, 1887, the population was 38,507,177, including 6807 foreigners, 4071 being Chinese, 1200 Englishmen, 621 Americans, 318 Germans, 220 Frenchmen and 377 belonging to other nationalities. There are 28 cities of over 30,000 inhabitants, the largest being Tokio, with 1,552,457; Osaka, with 353,970, and Kioto, with 255,408. The public indebtedness (including \$67,263,274 paper money in circulation, \$20,000,000 cost of the Nakasendo railroad and \$7,522,032 foreign debt) was \$249,108,578 on July 1, 1887. The budget for 1888 showed an expenditure of \$79,935,553, squared by an income of \$79,936,870. The Japanese silver dollar is worth 80 cents American gold. The strength of the army is 45,954 rank and file; the navy is composed of 36 men-of-war of a total tonnage of 50,090, with 50,979 horse-power and mounting 221 guns. Japanese foreign trade has during the past five years been steadily on the increase, as is shown in the following table:

	Import.	Export.	Excess of export.
1888.....	\$65,456,234	\$65,705,570	\$250,336
1887.....	51,699,769	52,408,228	708,454
1886.....	37,346,743	48,870,371	11,523,628
1885.....	29,346,379	36,152,008	6,805,624
1884.....	23,777,895	32,129,499	4,351,554

Reduced to thousands of dollars, the export in 1887 consisted of raw silk, 19,280; tea, 7349; coal, 2387; rice, 2255; copper, 2031, and porcelain, 1811; the chief articles of import were cotton goods and woollens, cloth, sugar and petroleum. In the latter Russia begins to compete with ours. The trade with this country has been as follows in the past two years:

Calendar year.	Import into the United States.	Domestic export to Japan.
1888.....	\$17,623,573	\$4,081,218
1887.....	17,742,238	4,150,777

The number of sea-going vessels arrived in 1886 was 1067, with a joint tonnage of 1,162,988; 88 being under the American flag, jointly registering 151,150 tons. The railroads of the empire made the following showing on January 1, 1888, in kilometers:

	In running order.	Building.	Projected.
Government lines.....	500	332	130
Private lines.....	485	64	1,995
Totals.....	985	396	2,115

The nature of the country puts unusual difficulties in the way of construction. One line of 205 miles in length involves the construction of 14 tunnels, 18,000 feet long, and the bridging of 11 rivers. One of these has a velocity in time of flood of 27 feet per second, and in another the brick piers have to be sunk to a depth of 80 feet. A range of mountains is crossed at a height of 1468 feet. Part of the line ascends a height of 8144 feet, and during

five months of the year work is rendered impossible by the snow, and sometimes in the summer months by an epidemic of cholera.

The length of telegraph lines is 9810 km.; of wire, 24,790; there were forwarded in the interior in 1886 1,790,282 telegrams and cable messages to the number of 39,028. The internal postal service forwarded simultaneously 115,068,846 items of mail-matter and the foreign 1,036,902. The Japanese are enterprising, but they now proceed more cautiously after the severe lessons experience has taught them in financial matters during the last decade. Commercial relations with them are, therefore, safer at present, and Japan is generally looked upon as a desirable country to trade with.

The temporary character of advantages secured by manufacturing establishments in the reduction of freight rates on raw materials is well illustrated by recent occurrences at Pittsburgh. The rate on Lake Superior ore from Cleveland was reduced after a long and hard fight between the consumers of ore and the railroad authorities. The reduction was small, but it was regarded as very important by those who used large quantities of ore, and they were very well pleased at the prospect of even this saving in the cost of manufacturing iron. But they had a very short season of rejoicing, for immediately their trade rivals in other iron-producing sections insisted on a corresponding reduction in coke rates to enable them to compete with the Pittsburgh manufacturers. They will probably get it, the balance will be restored to its former equilibrium, and neither set of manufacturers will have any advantage over the other.

There is a probability that the rush to Oklahoma will be repeated to some extent about August 1, when 3,500,000 acres of the finest land in Dakota, known as the Sisseton and Military reservations, are opened for settlement in tracts of 160 acres. The Military Reservation is a rectangular tract located in Marshall County. The great Sisseton Indian Reservation is a tract in the shape of a wedge, the point of which rests on Lake Kampeska. The western boundary runs through the counties of Codington, Grant, Day, Marshall and Sargent to the forty-sixth parallel. The northern boundary lies in Sargent, Richland and Robert counties. Lake Traverse, on the Minnesota border, is the eastern boundary for a distance of 30 miles, the boundary line running thence through Roberts, Grant and Codington counties to Lake Kampeska again. The land is watered by numerous lakes and small streams and is sufficiently hilly to be well drained. The soil is a black loam. It is the most fertile on the eastern border of the Territory, where large crops of wheat are raised. Stock fares well also, as there is excellent grazing both summer and winter. Oak and cottonwood trees abound on both reservations. Building stone is plentiful along the central ridges. The rainfall is usually plentiful, the average for several years being 17.27 inches.

Wm. M. Home & Co., 74 India street, Boston, have been appointed sales agents for the New England States for Warr's patented straightened shafting and bar-iron of all kinds, manufactured by James C. Warr, at Wareham, Mass., and will carry a stock at their warehouse in Boston.

### The Engineers' European Excursion.

An important event in engineering circles is the visit to Europe this year of a very large representation of the engineering societies of the United States. The purposes of their visit have already been set forth in these columns. The first installment of excursionists left New York on the 25th inst., on the City of Richmond, one of the steamers of the Inman Line, destined for Liverpool. This steamer had been chartered on the joint account of the American Society of Mechanical Engineers and the American Institute of Mining Engineers. The list of passengers furnished by the agents of the steamship line embraces many familiar names and is as follows:

W. H. Adams,  
Robert Allison,  
Geo. I. Alden,  
Thos. W. Bakewell,  
D. L. Barnes,  
Geo. H. Barrus,  
Jerome L. Boyer,  
Morgan Brooks,  
W. F. Barnes,  
Chas. S. Beach,  
Giles Beach,  
W. H. Baldwin,  
Stephen W. Baldwin,  
Matt. A. Beck,  
C. M. Collins,  
Ralph E. Curtis,  
W. D. Cadwell,  
Barton Cruikshank,  
Jas. Christie,  
Fredk A. Canfield,  
Wm. H. Dodge,  
F. H. Daniels,  
Fredk P. Dewey,  
Victor E. Edwards,  
W. V. Fairbairn,  
Wm. Forsyth,  
Robt. Fraser,  
John R. Freeman,  
A. C. Fowler,  
H. Manning Fish,  
Edward O. Goss,  
Geo. A. Gray,  
Stanley D. Gifford,  
E. L. Gould,  
Geo. H. Hewitt (N. Y.),  
W. O. Hildreth,  
W. Hill,  
H. D. Hibbard,  
Edwin T. Howard,  
Wm. M. Habbishton,  
Sumner Hollingsworth,  
John T. Hawkins,  
Edward J. Hall,  
Edward J. Hall, Jr.,  
Chas. E. Hyde,  
Alfred E. Hunt,  
O. S. Harmon,  
O. J. Harmon,  
Geo. H. Hewitt (Col.),  
Jno. C. Humphrey,  
E. V. D'Inviillers,  
D. S. Jacobus,  
H. D. Johnson,  
E. P. Jennings,  
Frank E. Kirby,  
Chas. Kirchhoff, Jr.,  
William Kent,  
G. Lavagnino,  
Thos. H. McCollin,  
Edw. McIlvain,  
Howard McIlvain,  
Edwin Mickleby,

A. S. Mahoney,  
E. H. Mumford,  
W. T. Magruder,  
John H. Milholland,  
Allyne H. Merrill,  
Edward F. Miller,  
H. M. Montgomery,  
Aug. W. Newell,  
Edw. Nichols,  
John D. Ormrod,  
John C. O'Connell,  
Bernard O'Connell,  
Walter Phillips,  
C. D. Parker,  
Geo. P. Putnam,  
Andrew J. Provost,  
H. Roberts,  
Edgar Richards,  
Theo. W. Robinson,  
Walter S. Russell,  
D. W. Robb,  
Francis H. Richards,  
C. S. Ridgway,  
Henry I. Snell,  
Oberlin Smith,  
Archy A. Stevenson,  
Jesse M. Smith,  
F. F. Sharpless,  
Ambrose Swasey,  
Chas. Sperry,  
T. Jackson Shaw,  
Joseph Shaw,  
Geo. R. Stetson,  
H. H. Suplee,  
Peter Schwamb,  
Newell Sanders,  
W. P. Todd,  
J. Archie Taylor,  
Jas. A. Tilden,  
Leonard Thompson,  
Edward B. Thompson,  
Henry R. Towne,  
William N. Taintor,  
Starr Taintor,  
F. H. Underwood,  
E. A. Uehling,  
W. M. Whitney,  
Baxter D. Whitney,  
Maunsel White,  
Chas. Wilbraham,  
Wm. C. Williamson,  
J. D. Williamson,  
Jones Wister,  
Horace Wyman,  
H. Winfield Wyman,  
Geo. W. Weeks,  
Joseph J. White,  
Wm. Webster,  
C. J. H. Woodbury,  
V. F. Worcester,  
Walter Wood,  
John P. Zane.

The steamship City of New York, of the same line, which sailed for Europe on Wednesday, took out a large number of representatives of the American Society of Civil Engineers, together with some mechanical and mining engineers, bound on the same errand. We have obtained from Chas. E. Emery, of the committee, the following list of gentlemen who form this section of the excursion:

D. J. Whittemore,  
William Fox, M. D.,  
T. K. Thomson,  
Prof. R. Fletcher,  
Prof. C. L. Crandall,  
J. D. Hawks,  
C. E. Fogg,  
Max E. Schmidt,  
Sr. F. DeGaray,  
Chas. E. Emery,  
Jas. Archibald,  
John J. Hopper,  
D. E. McComb,  
Wm. H. Searles,  
A. B. Hill,  
Prof. J. V. Hazen,

Prof. Wm. Watson,  
Washington Jones,  
W. L. Ferguson,  
John Thomson,  
S. B. Downes,  
C. C. Martin,  
Robt. Cartwright,  
Chas. J. Morse,  
Fred. Brooks,  
Wm. F. Booth,  
Prof. L. L. Tribus,  
Wm. Starling,  
W. A. Brackenridge,  
N. M. Edwards,  
John T. Fanning,  
T. D. Lovett,

Julius Baier,  
Jas. B. French,  
E. A. Doane,  
Arthur S. Mahony,  
Arthur Pou,  
Arthur Hider,  
A. Dempster,  
Prof. Lewis M. Haupt,  
Wm. Gibson, Jr.,  
Thos. C. Clarke,  
John J. Hawks,  
W. H. Wiley,  
Prof. W. W. Johnson,  
Wm. White,

Chester B. Allere,  
Clark Fisher,  
Frank G. Darlington,  
Herbert G. Torrey,  
H. G. Reist,  
Chas. E. Wait,  
Chas. J. Hilliard,  
John F. Wilcox,  
Fred. A. Schaffer,  
Geo. M. Bond,  
Wm. Roberts,  
Geo. W. Miller,  
Geo. A. Barnard.

Many of the excursionists named in both the above lists were accompanied by their wives or other lady members of their families.

### Reading Iron Works Appraisement.

#### THE APPRAISEMENT FILED IN COURT.

The long-anticipated appraisement of the Reading Iron Works, which failed nearly three months ago, was filed at Reading on the 24th inst. The appraisers, W. C. Case, George E. Clymer and John Ruck, have been at work on it for over six weeks. They have appraised the personal property at \$568,567.93 and the real estate at \$715,042.50, a total of \$1,283,610.43. The personal property includes all the material on hand and finished goods. There is a mortgage of \$600,000 on the works, and after the payment of this, according to the appraisers' figures, there will be left \$681,610.43 for the creditors. The estimate claims of all the creditors is over \$1,500,000, which would give them from 38 to 40 per cent. The personal property account of the firm is very heavy. The personalty in the tube works, Reading, is appraised at \$219,353; in the steam forge, \$3326; sheet mill, \$35,686; blast-furnace, \$96,732; foundry, \$42,554; Gibraltar Iron Works, \$28,042; Camden Tool and Tube Works, \$1850; Philadelphia warehouse stock, \$51,212; Philadelphia warehouse book account, \$18,825; general ledger accounts, \$42,263. Among the heaviest figures in the real-estate appraisement are rolling mills and nail factory, \$60,858; tube works, \$148,532; steam forge, with machinery, \$40,600; sheet mill, \$57,500; two blast-furnaces, \$127,800; Scott foundry, \$126,700; one-half interest in Gibraltar Iron Works, with 715 acres of land, \$12,962; Camden Tool and Tube Works, \$5090; lots in the Twenty-eighth Ward, Philadelphia, \$60,000; lots in Chester and South Chester, \$18,000, besides numerous lots and houses in Reading, Philadelphia, Lancaster, Delaware and Berks counties. The appraisement of the real estate is far below what the erection of the plant cost. The cost of erection was probably \$1,800,000, but the appraisers' figures are what it would bring at a sale under the present state of the iron market.

Now, since the appraisement has been completed, it is believed that the affairs will be wound up with all possible speed. All the material that will not sell to advantage will be worked up into saleable goods, but staple merchandise, like pig-iron and the like, will be sold as rapidly as possible. An effort will be likewise made to dispose of the plant, because the longer it remains the more it will depreciate in value. There seems to be no prospect of reorganizing the concern. There are a number of parties ready to buy the works as a whole or piecemeal, and when they pass into the hands of the new owners they will be speedily put in operation. The pipe business, which was one of the principal branches of production engaged in by the company, has stiffened up since the suspension. It appears that the Reading Iron Works, in their anxiety for ready money, had for a long time been selling for whatever they could get. This demoralized the trade and made it un-

profitable everywhere. Since the suspension, however, the trade has become healthy and all the tube works in the country are being run at a fair profit.

### New Process of Softening Steel.

A new process of softening tool steel has recently been brought forward, and has attracted much attention because of the remarkable softness produced. By this process any of the ordinary steels, of the usual lengths and shapes, for making machine tools, punches and dies will, when treated, become so soft as to effect a most material saving in the cost of making the desired tool. After having been softened and cut to the required form, the steel is handled in precisely the same way as any of the well-known brands, such as Jessup or Black Diamond. It is claimed that the process, which is kept secret, affects in no way the chemical composition of the metal, but so alters its physical structure as to impart the qualities mentioned. A piece of Jessup steel which had been softened by this method was taken to the Stiles & Parker Press Company, who made a punch to cut a five-pointed star  $\frac{1}{2}$  inch in diameter and unusually sharp at the points. According to the instructions given, the punch was to be made and then tested by the Stiles & Parker people. In the making of this punch they saved about 20 per cent. in the cost, owing solely to the softness of the metal. After having cut it, they tempered it in the usual way in water. The punch was then forced through German silver  $\frac{3}{4}$  inch thick and through wrought iron  $\frac{1}{4}$  inch thick, and as a final test was forced through metal which cut only a part of the star, thus giving an unbalanced pressure tending to bend the punch. It was given a series of tests, not only unusual but which would not be tried except under like conditions where the manufacturer is instructed to give the tool the severest trial possible, and where, as is natural, he passes from one test to another more severe. The tool came out at the last as perfect as when it left the makers' hands.

According to this it seems evident that the process while softening the steel at the same time so changes it that when tempered it possesses greater strength than the same quality of metal untreated. The process is particularly applicable to die-sinking, where the hub, being of softened steel, can be made in much less time, while the die, also being softened, can be sunk cold instead of hot, as is now the common practice, thus saving time and labor. The die is then tempered and hardened in the usual way. It is claimed that this process changes what we might name the final quality of the metal so that its strength in high grades is increased at least 25 per cent. In handling the steel during the making of any tool it is absolutely necessary to perform all the operations cold, as the heating of the metal destroys the qualities imparted to it in the softening process. After having been treated the steel can be forged cold, can be twisted or bent in a way it would not stand before treatment, and can finally be tempered as desired. Any of the well-known brands of tool steel can be subjected to this process, and can afterward be treated in the usual way. The steel is treated by D. Cameron-Dalzell, of 7 Richmond street, Brooklyn, N. Y., the product being known as Dalzell's annealed improved cast-steel.

The new iron-ore bed at Mineville, Essex County, N. Y., operated by Messrs. Witherbees, Sherman & Co., has lately been producing from numerous openings iron ore of such remarkable purity as to be a wonder even to those familiar with

that unique deposit of Bessemer-iron ore. A sample taken so as to represent the average of a pile of about 400 tons was submitted to the company's chemist, T. R. Woodbridge, who found that it contained 72 per cent. of iron and 0.018 per cent. of phosphorus. Similar pockets of such ore have occasionally been found in the new bed, and from these pockets are often obtained unique crystals of magnetite, some of them 2 inches or more on the face. In the company's office at the mines is a perfect octahedral crystal,  $1\frac{1}{4}$  inches on the face, which can be readily lifted from its socket of granular ore.

### The Labor Troubles in Germany.

The workmen of Germany, who have long been remarkably tractable and apparently contented with their low wages, are rebelling against the conditions which have been so meekly borne. Westphalia has been the principal seat of an epidemic of strikes in the Empire, and the coal miners are taking the foremost part in the labor troubles. The object of their strike is to obtain an advance in wages of 15 per cent. and the establishment of a working day of eight hours.

With reference to this particular movement, *Kuhlows* says: "No indication has been seen that the miners in Rhénish-Westphalia are in a state of want similar to that in Belgium and certain French and English mining districts; their lot, of course, is but a moderate one, still they earn sufficient to live upon. It is not to be doubted, however, that they would endeavor to improve it should an opportunity for doing so arise. This is the first time that an organized strike has broken out in Germany which has not been confined to a single place. The movement has not arisen directly from among the workpeople themselves; according to all appearances it has been artificially produced through the machinations of agitators. It did not, however, require much trouble to organize the strike. The delegates of the Hibernia who put their demands before the chief president of the province, in answer to his invitation to resume work, observed that for the sake of honor they could not give in. It is clear that the strike is the work of the younger generation of workmen, the old miners being content with their lot. At the present moment the number of men idle is estimated at from 70,000 to 80,000."

"All things considered," says another authority, "the movement of the German miners is not at all surprising. They see on all sides evidences of great industrial activity, and hear of the prosperity of the coal and iron trades. They have endeavored to obtain advanced rates of remuneration and shorter hours of labor without avail, and as a last resort they have gone out on strike. That they should have taken this extreme step is a remarkable circumstance, seeing that the German artisans are not fond of strikes, besides which the laws of their country are not favorable to men who thus repudiate their contracts with their employers. Having struck, however, the behavior of the miners appears to have been somewhat riotous, and they have, in consequence, suffered severely at the hands of the soldiers, who have been called out to keep them in order. Many persons have been shot, indeed, and the whole of the Westphalian coal basin has been in a state of unrest. As a result of the cessation of adequate supplies of fuel many of the iron and steel works have been compelled to stop, although some of them lost no time as soon as the strike began in arranging for coal and coke from English or Belgian sources. It follows, therefore, that the German manufacturers and coal owners are just now passing through a period of

labor troubles which is more severe and more likely to affect their interests permanently than any previous dispute."

While these occurrences in Germany have a special interest for us only in connection with certain branches of the iron and steel trades, in which our manufacturers have felt the stress of German competition, the case is altogether different with British manufacturers, who have of recent years suffered from German competition in many lines. Referring to the German hold on international trade, the London *Ironmonger* says: "Aided by their undoubted perseverance, their considerable progress in certain branches of trade, and particularly by the long hours of labor and low wages of their workmen, they have made great progress. Now, however, Nemesis seems to have overtaken them. As they gained, so they seem likely to lose; but whether their present losses will be equal to their past gains is a knotty problem which has yet to be solved. That they must lose something so long as the strikes last is pretty certain; but the greater questions at issue will be determined largely by the broad outcome of struggle between the men and their employers. If the agitation brings about a general advance of the miners' wages and a reduction of the hours of labor, then it goes without saying that the cost of production in Germany must be enhanced, and to the extent of that advance the margin between their and our prices will be lessened. The German employers can scarcely expect that the agitation will be confined to the coal miners. On the contrary, it is only reasonable to assume that the iron-workers and other artisans will be so encouraged by the success of the miners that they will seek the like advantages for themselves. As a matter of fact, agitations for higher wages and reduced hours of labor are already reported from Berlin, Silesia and other parts of Germany, so that it may be taken for granted that the German manufacturers are on the eve of losing some of the advantages which they have so long enjoyed in respect of the cost of labor."

In view of the important consequences thus involved the outcome of the German labor trouble will be awaited with interest. The latest telegraphic dispatches from Berlin state that the situation at the Westphalia collieries continues critical and the proclamation of martial law is imminent. At some mines work had been resumed in the belief by the miners that the concessions demanded were to be granted, but the owners failed to give their assent and the strike was resumed. In the city of Berlin 19,000 men employed in the building trades have struck for higher wages and shorter hours of labor. The miners' strike seems only to be part of a general movement for increased wages and shorter hours of labor. Brewers, builders, carpenters, joiners, basket makers, furriers, tailors and other trades are affected. The tailors appear to have been the most successful. Many of the trades are coupling with their request for increased wages a demand for the reduction of the working day to ten hours. Others are denouncing Sunday work. In comparison with workmen in the United States, artisans of all classes in Germany are notoriously underpaid. Success in their endeavors to ameliorate their condition may temporarily disarrange some departments of industry, but it may have the effect, so far as this country is concerned, of equalizing differences which have made German competition severe.

A curious mixture of industries at one establishment is reported from Kansas. A \$100,000 mill, for the manufacture of sugar, salt and paper, is now being built at Arkalon, in that State. For three months it will make sugar from sorghum, then

work up the cane chips into paper, and the rest of the time turn out salt. To encourage sorghum sugar making the Kansas Legislature has exempted all sugar plants from taxation until 1895.

### Mexico's Material Progress.

The rapid accumulation by foreign capitalists of valuable Mexican properties, either in the form of ranching, agricultural or mining properties during the last two years, so remarks the *Boston Advertiser*, has been almost unprecedented. The modification of certain State or local laws as to alien land-holding and the more general and thorough understanding of these laws have contributed very largely to this result. Another cause of this outside investment, however, may be found in the great liberality and enterprise shown by the present Mexican Government in encouraging, so far as possible, every attempt made to develop the resources of the country, and to the undertaking by the Government itself, in part or wholly, of a number of measures calculated to aid in the national advancement. Although the sister republic has already had large railroad lines for some past years, the building of other and branch lines continues in a steady and satisfactory measure. Now that the opposition of the native race to the railway has been largely overcome by practical realization of the benefits accruing from such improvements, the work of further development has gone on steadily and uninterruptedly. Private as well as corporate capital has become largely interested in new schemes for transportation. The Government has continued its policy of financial or other aid to all projects of this nature, and both Mexico and Central America are being slowly embraced in a series of lines which promise, within the next ten years, to fully open up the country to the outside world.

Among the new companies, the Monterey and Gulf Railroad has recently railed 34½ miles, and constructed six miles more of roadbed, and is laying rails at the rate of ¼ mile a day. The Cordova and Tuxtepec has already completed part of its road, and is pushing on rapidly. The Tonala and Tuxtla Gutierrez has just commenced its road construction. Among the older roads the Inter-oceanic Company have nearly completed some sections of the road and intend to open them to travel within a short time. The Central Railway Company are working on the section from Aguas Calientes to San Luis Potosi. The Mexican Construction Company have their line from Manzanillo to Colima about ready for travel. In Yucatan the work of railroad construction is being pushed with great vigor. The total mileage of railroads in Mexico is estimated in President Diaz' message at nearly 5000 miles. In the matter of telegraph construction, the showing is still more favorable. The State construction of new lines for the last half year has amounted to an addition of about 900 miles, making the total length of the Federal system on April 1 over 13,000 miles, exclusive of double and triple wires and the lines temporarily transferred to the States.

At the annual meeting of the stockholders of the Quincy Copper Mine, on June 5, an increase in the capital stock will be asked for from 40,000 to 50,000 shares. The failure of the syndicate and consequent decline in copper have somewhat reduced the current earnings of the company, to which the building of a new railroad and stamp mill have been partly charged. Although the company have a surplus that could be made available, it is thought desirable to retain a surplus and increase the share capital.

## Washington News.

(From Our Regular Correspondent.)

WASHINGTON, D. C., May 28, 1889.

The permission granted by the Secretary of the Treasury to both sides in the lead-ore hearing to submit documentary testimony, to be closed in 15 days, has brought out a mass of information upon the subject pro and con. The limit of time will expire the latter part of the present month. Assistant Secretary Tichenor and the Solicitor of the Treasury will then go over the material to ascertain whether any new points of information or argument have been presented which did not appear in the arguments before the Secretary two weeks ago. The home producers then went on to show that the silver ore shipped into the United States from Mexico is really lead ore; that while the component metal of chief value was silver and therefore would be free, the article of greater weight is lead and hence subject to a duty of 1½ cents a pound. It is too soon to undertake to say what may be the end of the investigations of the Department, but the indications are that the free admission of silver ores with more than 5 per cent. of lead as silver ore will be stopped. It is possible that the Department may fix the maximum of lead in the ore to take it out of the free list at a trifle higher per cent. It is certain that some decision will be rendered which will prevent the importation of silver ores free for the purpose of supplying home smelters with lead ores without payment of duties and thus interfering with the American lead-ore producers.

The same question has been agitated in the case of many iron-ore producers and manufacturers of pig-iron, the former favoring a higher duty on foreign ores, and the latter in some cases favoring a lower duty on such ores, on the plea of mixing to improve the pig. The present administration of the Treasury will sustain a consistent policy of protection right through and not maintain duties on an article at the expense of its raw material.

The controversy over woolen and worsted cloths has been closed, and the result will be a decision placing worsted cloths in the same classification as woolen cloths, increasing the duties on the former. The Solicitor of the Treasury has submitted his report on this question to the Secretary. The report may be looked for in a few days. The lead-ore question will then be taken up and will be pushed to an early decision.

### DUTY ON STEEL CROP-ENDS.

The Department makes official announcement of the verdict against the Government in a case of duty on crop-ends. In his instructions to the Collector at New York the Secretary says: "The question involved in this case was whether certain steel crop-ends were dutiable at the rate of ¾ of one cent per pound for 'scrap-steel,' as classified by the Collector, or at the rate of 45 per cent. ad valorem under the further provision for 'steel not specially enumerated or provided for in this act,' as claimed by the plaintiffs, the importers. The merchandise consisted of pieces or ends cut from steel rails in the process of manufacture in order to make a perfect rail and ends of steel blooms. The plaintiffs claimed that it was not covered by said provision for 'scrap-steel,' because it is prescribed in said paragraph that 'nothing shall be deemed . . . scrap-steel except waste or refuse . . . steel that has been in actual use, and is fit only to be remanufactured,' it being alleged that the merchandise had not been in actual use, and consequently was not the scrap-steel covered by the said paragraph. The United States Attorney reports that notwithstanding the fact that he contended that the mer-

chandise was liable to duty as scrap-steel under decisions of the United States Supreme Court, the court ruled that as the merchandise had not been in actual use, as it was cut off in the ordinary process of manufacture, it did not come within the said decision, and thereupon directed a verdict for the plaintiff. The United States Attorney further reports that the ruling of the court is in accordance with the opinion of the United States Attorney-General and the decision of the United States Supreme Court, and that in his opinion it is correct and should be acquiesced in. Upon submitting the matter to the United States Attorney-General that officer advises acquiescence, and certifies that no writ of error shall be taken by the United States." The Department, in concurring in the decision, directs the liquidation of other entries where the time has not expired.

### PERSONAL.

F. M. Clark has resigned his professorship at the Massachusetts Institute of Technology, of Boston, Mass., and will hereafter devote himself to professional work in mining and metallurgy, with headquarters in Chicago.

Leonard Peckitt, for some years chemist of the Reading Iron Works, at Reading, Pa., has accepted a similar position with the Allentown Iron Company, of Allentown, Pa.

John E. Fry, for some years superintendent of the Wheeling Steel Works, at Wheeling, W. Va., has resigned his position and has been succeeded by C. S. Arnburg, of Illinois. Mr. Fry has not yet decided where he will locate, but will visit Springfield, Ohio, and other points before locating permanently.

Isaac Block, of the firm of Block, Pollock & Co., Chicago, sails for Europe June 1. He will be away about six months, spending much of his time at the popular resorts in Germany for the benefit of his health.

Engineer C. C. Martin, of the Brooklyn Bridge, sailed for London to attend the convention of the Society of Civil Engineers.

Commissioner A. L. Fink, of the Trunk Line Association, sails for Europe very shortly for his usual summer vacation.

O. F. Nichols, general manager of the Brooklyn elevated roads, is a graduate of the Rensselaer Polytechnic Institute, at Troy, N. Y., and a civil engineer of wide repute.

Henry McCormick, of Harrisburg, Pa., sailed for Europe yesterday, accompanied by his wife. Their two sons, now at college, will follow them in a month or so.

The experiments in the economy of burning powdered coal side by side with natural gas, at the works of Moorhead Bros. & Co., in Pittsburgh, on Monday, are said to have been successful so far as they went. Among those present were G. W. Lord, of the Diamond State Iron Company, Wilmington; T. M. Stammer, of the Cambria Iron Company; George Coleman, of the Niles Iron Company; Mr. Maxwell, of Long & Co., and others. Erastus Wiman and J. G. McAuley, who control the process, were also present. The amount of coal consumed in the first test was 684 pounds and the amount of iron heated was 4600 pounds. The charge of natural gas is at the rate of \$1 per ton of iron, while the cost under the new process, it is claimed, would not exceed, including pulverization, 50 cents per ton of iron. Owners of the furnace will continue the device in practical operation for 30 days, after which they will decide whether to equip their entire plant with a pulverized fuel process or continue to use natural gas.

# TRADE REPORT.

## Philadelphia.

Office of *The Iron Age*, 220 South Fourth St.,  
PHILADELPHIA, Pa., May 28, 1889.

**Pig-Iron.**—The market shows a good deal of steadiness considering its surroundings. There is a disposition among large consumers to place orders at current rates for fall delivery, but holders are not willing to enter contracts of that kind, although they are prepared to do so for June and July. The impression that bottom prices have been reached is becoming deeply rooted, and the trade are closely watching the course of events, so that they may be in a position to avail themselves of any changes that may occur in the near future. With such a shaking up as the trade has had during the past month or six weeks, and with the steadily increasing capacity for production, there is a great deal of conservatism, even among the most sanguine. But every one feels that prices cannot, under any circumstances, go much below the figures now current, while there are great possibilities in the other direction. Consumption is undoubtedly on the increase, and although there may be more or less of a curtailment during the hot weather, there is every reason to believe that consumption during the last half of the year will be very much greater than that of the first half. Meanwhile the "blowing out" of furnaces has already decreased the supply considerably, although the effect may not be felt immediately, as there are accumulations of stocks to be worked off before the adjustment between supply and demand is complete. But the market has broadened to such an extent that it cannot be gauged as closely as in times past, owing to the wider field which it covers. Chicago looms up as an important center, and in fact nearly all the large cities west of Pittsburgh are in the aggregate becoming consumers of vast importance. The new Southern furnaces are so located that a variation of 25¢ or 50¢ per ton at any particular point enables them to turn their attention to it at once, so that contingencies which in former times led to sharp advances would now have very little effect. Under the conditions now prevailing advances and declines will of course be met with as before, but the fluctuations will be less frequent and less violent. The trade have felt this change coming for some time, and in fact the apathetic feeling which so generally prevails is in no small degree the result of these new conditions. For these reasons, therefore, consumers are very conservative and are not likely to carry things to any such extremes as during the boom of 1879 and 1880. A better market is confidently expected, but so far as this vicinity is concerned there is a disposition to keep in line with other markets, unless actual requirements force consumers to place orders at advancing prices. For the present, however, things are just about as they were a week ago. The undertone may be a little stronger, but for all practical purposes prices are unchanged, although bids for fall deliveries are not generally accepted at the figures named for June and July. Quotations for tidewater deliveries vary from \$17 to \$18 for standard to choice brands of No. 1 Foundry, \$16 @ \$17 for No. 2 and \$14 @ \$15 for Gray Forge. Southern Iron and brands not strictly up to standard may be picked up once in a while at about 50¢ per ton less money, but there is not much demand, and under any pressure to realize still lower figures would probably have to be accepted, as buyers are not inclined to take anything that is not absolutely in ac-

cordance with their ideas as regards both price and quality.

**Blooms.**—The demand is only fair, and prices barely steady, with sales chiefly within the following limits: \$28 @ \$28.50, at mill, for Nail Slabs; \$30 @ \$31 for Tank Slabs; \$32.50 @ \$33.50 for Shell Slabs; \$36 @ \$37 for Flange, and \$38 @ \$40 for Fire-Box; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite, \$41 @ \$42.50; Scrap Blooms, \$32 @ \$33 per "Bloom" ton of 2464 lb.

**Muck Bars.**—The market is again somewhat in sellers' favor. Several lots were picked up a few days ago at about \$27 at mill, but latest transactions were at \$26.50 at mill, and at \$27 Philadelphia. Some hold for \$27.50 delivered, with nothing available to-day at less than \$27.

**Bar-Iron.**—The demand is improving and the majority of the mills are now employed pretty well up to their full capacity. Prices are a shade better, but still very low, without any special indication of much improvement for the present. There is a good inquiry, however, and at the low prices recently ruling there would be no difficulty in securing some very large orders, but as the mills are provided with work well up to midsummer they are disposed to await developments before taking anything beyond that, unless some advance in prices can be secured. Ordinary quotations are 1.75¢ @ 1.80¢ for Best Refined Bars, but there is some irregularity yet, and on desirable orders cutting in extras is very general. Skelp Iron begins to move again, with sales of Grooved at about 1.75¢ and Sheared at 2¢, delivered.

**Plate and Tank Material.**—There is a continued good demand for Plates, and mills are all comfortably supplied with orders. The number of inquiries coming in and the general outlook for business are considered of a most encouraging character, so that sellers are inclined to ask more money for their product. The continued firmness of prices has resulted in a gradual advance of about a tenth from the lowest, with indications of further improvement in the near future. Quotations about as follows: 1.90¢ @ 2¢ for Ordinary Plates and Tank Plates; 2¢ @ 2.1¢ for Universal Plates; Shell, 2.3¢ @ 2.4¢; Fire-Box, 3.5¢ @ 3.7¢; Steel Plates, Tank and Ship Plate, 2.2¢ @ 2.25¢; Shell, 2.5¢; Flange, 2.4¢ @ 3¢; Fire-Box, 3.1¢ @ 4¢.

**Structural Material.**—The same general remarks would apply as under the previous heading. Mills are all fully employed, and as a rule at somewhat better prices than ruled earlier in the season. The outlook is such as to warrant the expectation of steadily improving prices, which for the present are about as follows: Bridge Plate, 2¢ @ 2.05¢; Angles, 1.95¢ @ 2¢; Tees, 2.4¢ @ 2.6¢; Beams and Channels, 2.8¢ for Iron or Steel.

**Sheet-Iron.**—The demand is said to be quite satisfactory, and mills are fully employed in meeting the demands made upon them. Inquiries are coming in from all sections, and it is not unlikely that there will be some scarcity before the season is over. Prices are firm as follows:

Best Refined, Nos. 14 to 20. .... 3¢  
Best Refined, Nos. 21 to 24. .... 3.20¢  
Best Refined, Nos. 25 to 26. .... 3.40¢  
Best Refined, No. 27. .... 3.50¢  
Best Refined, No. 28. .... 3.60¢  
Common, ¼¢ less than the above.  
Best Soft Steel, Nos. 14 to 20. .... 3½¢  
Best Soft Steel, Nos. 21 to 24. .... 3¾¢  
Best Soft Steel, Nos. 25 to 26. .... 3¾¢  
Best Soft Steel, No. 27. .... 4¢  
Best Bloom Sheets, ¼¢ extra over the above prices.  
Best Bloom, Galvanized, discount. .... 65 %  
Common, discount. .... 67½ %

**Steel Rails.**—There is a very unsettled feeling in this department, and it is hard to say what would be the actual selling prices on offers for large lots. About \$27 @ \$27.50 at mill is asked, but at other

points \$26 @ \$26.50 is mentioned as being nearer to the actual market. Quotations, therefore, are nominally as above quoted.

**Old Rails.**—The market is dull but steady on the basis of last week's prices. Sales are reported at \$23 for T's, delivered at mills near the city, and \$22 bid for spot lots.

**Scrap-Iron.**—There is no change in this department. Prices are steady, with sales within the limits named below, as follows: \$20 @ \$21 for cargo lots; \$21 @ \$21.50 for carload lots, delivered, or for choice, \$22; No. 2 do., \$14 @ \$15; Turnings, \$14 @ \$15; Old Steel Rails, \$18 @ \$19; Cast Scrap, \$15 @ \$16; do. Borings, \$9 @ \$10; Old Fish-Plates, \$23 @ \$24; Old Car-Wheels, nominal, \$17 @ \$18, Philadelphia.

**Wrought-Iron Pipe.**—Business continues favorable to the selling interests and prices show increasing strength. Discounts as follows: Butt-Welded Black, 52½ ¢; Lap-Welded Black, 65 ¢; Butt-Welded Galvanized, 45 ¢; Lap-Welded Galvanized, 52½ ¢; Boiler Tubes, 60 ¢.

**Nails.**—The market is steadier than it has been for some time, but there is still a good deal of irregularity in outside brands. Steel Nails are firmer and command comparatively good prices, but Iron Nails of standard quality remain at about \$1.80 @ \$1.85 for carload lots, and \$1.90 @ \$2 for lots from store.

## Chicago.

Office of *The Iron Age*, 59 Dearborn street, (CHICAGO, MAY 27, 1889.

**Pig-Iron.**—Some dealers report a more active market both in sales and inquiries, while others complain of the extreme quietness. The feeling that there will be an improvement in business the last half of the year is spreading and strengthening, and this constantly adds consumers to the list who have been and are now making inquiries for large blocks of Iron to cover deliveries for the balance of the year. Sales agents who are most firm in their belief of a better business repudiate the idea of lower prices, and contend that large contracts cannot be placed at less than carload orders, but there is another class whose faith would not be strong enough to stand much temptation. There is no scarcity of Iron in any grade, and the fact that the supply is abundant and some grades pressed upon the market by the weaker furnaces holds in abeyance large buyers who are inclined toward placing orders for long-time delivery at present prices. There is considerable effort on the part of Southern furnaces to market their product in this territory, and sales of small quantities are reported at figures supposed to be too low to net the manufacturers a profit. The price of local Irons suffers in consequence, but not enough has been sold at a reduction to warrant any change in our quotations. The cuts which were made are claimed to be in exceptional circumstances. We quote as follows for cash, f.o.b. Chicago: Local Coke, No. 1, \$16; No. 2, \$15; No. 3, \$14; Chicago and Bay View Scotch, \$16.50; Lake Superior Charcoal, \$18.50; American Scotch (Blackband), No. 1, \$18 @ \$18.50; Southern Coke, No. 1 Foundry, \$16; No. 2 Foundry and No. 1 Soft, \$15; No. 3 Foundry, \$14.50; No. 2 Soft, \$14.25; Gray Forge, \$13.50 @ \$14; Tennessee Charcoal, No. 1, \$19; No. 2, \$18; Alabama Car-Wheel, \$25.

**Bar-Iron.**—Orders during the week consisted almost exclusively of small lots. Implement and wagon manufacturers are making occasional inquiries for lots covering three to six months' delivery, but find the market in such an unsettled condition that they do not place their orders. Prices

are weak and no uniform quotation can be relied upon. Nearly every manufacturer is governed by the amount of work on hand and financial condition. Jobbers have pretty full stocks, from which they are able to supply most of the orders they are receiving. Jobbers' prices from store range from 1.75¢ to 2¢, according to quality. Common Iron is quoted at mill at 1.45¢, half extras; Single-Refined Iron, guaranteed tensile strength, 1.70¢.

**Structural Iron.**—There appears to be a great deal of figuring done in this branch of trade. Manufacturers say that they have to work so close to cost that when they get a job they frequently have a loss when it is completed. They have no complaint to make against the quantity of work that is in the market, but contend that it is impossible to get a job of work that pays them for the material and labor. Mill lots are quoted f.o.b. Chicago as follows: Angles, 2.12¢ @ 2.15¢; Universal Plates, 2.15¢ @ 2.20¢; Sheared Plates, 2.20¢; Tees, 2.55¢; Beams and Channels, 2.90¢. Small lots from store are sold at 2.25¢ @ 2.30¢ for Angles, 2.65¢ @ 2.70¢ for Tees and 3.40¢ for Beams.

**Plates, Tubes, &c.**—The demand for Steel Plates is reported very fair and no disposition on the part of manufacturers to accept orders at less than prevailing prices. Consumers of Wrought-Iron Pipe seem to be more in want of it since the price has been advanced. Manufacturers having had the nerve to advance the price indicates to many of the consumers that with an increased trade they probably would want to take another step upward and they are inclined to buy in anticipation of present wants. Quotations from store are as follows: Nos. 10 to 14 Iron Sheets, 2.50¢ @ 2.60¢; Nos. 10 to 14 Steel Sheets, 2.75¢ @ 3¢; Tank Iron, 2.40¢ @ 2.50¢; Tank Steel, 2.50¢ @ 2.60¢; Shell Iron or Steel, 3¢; Flange Iron, 4¢; Flange Steel, 3.50¢; Fire-Box Steel, 4.75¢ @ 5.50¢; Ulster Iron, 3.75¢; Boiler Rivets, 3.75¢ @ 4.25¢; Boiler Tubes, 5 1/4 % off for 1 1/2-inch and less and 6 1/4 % off for 2-inch and larger.

**Sheet-Iron.**—There is more firmness and a better business in this branch of the Iron trade than in any of the others. The demand for Sheets is increasing every day. Many of the mills are not taking orders for large quantities and those who are accepting orders for delivery beyond July 1 are taking them subject to cancellation in case there is a strike. Mill price for No. 27 is 2.85¢ @ 2.90¢. For Common Sheets store quotations on No. 27 range from 3.10¢ to 3.20¢, according to quality.

**Galvanized Iron.**—There was less doing last week in Galvanized Iron than the week previous. Business seems to be of a spasmodic character. Manufacturers of the better grades have instructed their agents not to press for orders. They anticipate that there will be much improvement in the business within the next six months, and they prefer taking their chances on getting better prices to accepting orders at present rates. Trade has been from store largely in bundle lots, which are quoted at 65 % off for Juniata, and 65 % and 5 % off on Charcoal.

**Merchant-Steel.**—Business consists entirely of small orders for immediate delivery. Manufacturing consumers are still pursuing the same policy of feeling the market, but do not contract for anything beyond immediate necessity. The demand for Tool Steel is greater than for any other grade, with less fluctuation in price on established brands. We make the following quotations from store: Soft Steel Bars, 2.20¢ rates; Tool Steel, 7.75¢ @ 8¢; Specials, 12¢ @ 25¢; Crucible Spring Steel, 3.75¢; Open-Hearth Spring, 2.35¢ @ 2.50¢; Open-Hearth Machinery, 2.30¢ @ 2.40¢; Sheet-Steel, 7¢ @ 10¢; Tire Steel, 2.20¢ @ 2.25¢.

**Steel Rails.**—Business is still confined to small orders, but on paper and under negotiation there are some large orders that encourage manufacturer in the belief that they will yet have a fair year's tonnage. Quotations range from \$29 to \$30, but the low prices made at Pittsburgh recently do not aid in sustaining these figures. The Illinois Steel Company have at present only the large mill at South Chicago running on Rails. Should contracts that are now being considered be consummated it would be necessary to start up another mill in the next two or three weeks.

**Track Supplies.**—The demand for Rail fastenings is very light. Some manufacturers have instructed their agents to not force business at the expense of prices, as they preferred to wait for a better market. The following quotations are made on small lots: Steel Fish-Plates, 1.90¢; Iron Fish-Plates, 1.70¢ @ 1.75¢; Bolts with Square Nuts, 2.55¢; Bolts with Hexagon Nuts, 2.65¢; Spikes, 1.95¢ @ 2¢.

**Old Rails and Wheels.**—There were no important transactions in Rails and Wheels last week. Several small lots were taken by consumers at distant points at prices that would be equivalent to \$19.50, Chicago. The demand for Old Steel Rails is very light. Short lengths are quoted at \$15.50 and long lengths at \$18 @ \$20. Old Car-Wheels are not in demand. A nominal price would be about \$16.50, but there is quite a surplus of Wheels, and there probably would be no difficulty in shading this price on round lots.

**Scrap.**—Unless there is an early and heavy movement of Scrap of all classes some of the large dealers in Chicago will have to rent additional yards. Their stocks have been accumulating so rapidly and so little is going out that the question of storage is becoming an important one. Some sales of small lots of Forge Iron, No. 1 Mill and Mixed Steel were made during the week, but the whole would aggregate only a few hundred tons. Dealers quote consumers 3/4 ton of 2000 lb as follows: No. 1 Wrought, \$17.50; Fish-Plates, \$18; Axles, \$22; Horseshoes, \$17; No. 1 Mill, \$13; Cast Machinery, \$11; Stove Plates, \$9; Cast Borings, \$8; Wrought Turnings, \$10.50; Axle Turnings, \$12; Mixed Steel, \$10.50 @ \$11; Coil Steel, \$13.50; Leaf Steel, \$15.

**General Hardware.**—The demand for Builders' Hardware, House-Furnishing Goods and Roofing Plates is quite good. Haying and Harvesting Tools are beginning to move more freely. Copper Goods are unchanged in price, but it is not unlikely that some change will be made soon. Novelty Clothes Wringers are now quoted at \$20 per dozen. The demand for Cutlery is improving, though too early in the season to expect much trade. In Heavy Hardware trade is very dull. Wagon-wood stocks and Carriage material are in good demand. There is a weakness in prices which makes an unsatisfactory business on the whole line.

**Nails.**—The Nail market is more unsettled than it has been for some time past. At the meeting of the Western Nail Association an attempt was made to advance the price to \$1.35, mill. The project did not receive the unanimous support of those present, and consequently nothing was done that will assist in maintaining prices. Before the meeting it was predicted that the association would virtually disband. Some portion of the penalty agreement was annulled, and from what has happened since it is presumed that manufacturers intend dealing with the subject of prices and product as best suits their individual purpose. Nails have been offered in this market in the last few days at prices so much below former figures that one is led to believe that there will be important

changes before this week closes. In carload lots jobbers are quoting \$1.90, regular terms, and in small lots \$1.95 @ \$2. Wire Nails, carload lots, are quoted at \$2.30, and small lots 5¢ @ 7¢ keg advance. Carload orders are usually for half of each kind.

**Barb Wire.**—Manufacturers are working on orders and have no stock on hand. Consequently the market is steady at 2.75¢ for Painted in small lots and Galvanized at 3.35¢, with no discount for large lots, as neither jobbers nor manufacturers want them.

**Pig-Lead.**—There was little if any change in the market last week. Sales of some 400 tons are reported at 3.70¢ for spot and future delivery.

## Chattanooga.

Office of *The Iron Age*, Carter and 9th Sts., CHATTANOOGA, May 27, 1889.

**Pig-Iron.**—There is very little to offer beyond the fact that the atmosphere appears to be clearing up a little and a somewhat better feeling prevails. Inquiries are more frequent, and it is probable that more sales are being effected. The stocks are gradually being shipped away, and the yards are clearer at the present time than for some weeks past. It would be difficult, however, to establish a definite figure as the basis of the market, as the prices at which different lots are being sold vary considerably. There are some brands of Southern Irons that are bringing \$17.50 in New York, while others are being sold as low as \$16.50; and the same rule applies to many of the inland sales through the West and South, though the spring sales to the Southern furnaces fell off a little, evidently showing a falling off in business, but for the past two weeks sales to the Southern districts have increased considerably. The Pipe furnaces that are located South report a greater demand than ever for Water and Gas Pipe, and they are all crowded with orders. This of course affords a source of large consumption for Southern Pig-Iron, and their orders are beginning to be of considerable importance to the Southern furnaces. Upon the whole the outlook is brighter than it has been during the past month or two.

## Cincinnati.

Office of *The Iron Age*, Fourth and Main Sts., CINCINNATI, May 27, 1889.

**Pig-Iron.**—The past week has witnessed further depression in the local Pig-Iron market. There has been more pressure to sell, and lower prices have resulted. Those most interested unite in the assertion that the level now reached is the lowest which has been touched in the past ten years, while some hazard the opinion that the lowest prices ever experienced have been made during the week under review. Gray Forge has been sold at \$12.50, No. 1 Southern Foundry at \$14.50, No. 2 ditto at \$13.75, and No. 3 ditto at \$13. There are also rumors of sales of No. 2 Foundry at \$13.50 for 600 tons, cash, prompt shipment, but this is regarded as a forced sale. As a rule trading has been light, of a hand-to-mouth character, but in a few instances buyers have overstepped the ordinary bounds of conservatism, and with temerity placed orders to cover contracts running from two to ten months. The Lafayette Car Works are said to have bought 13,000 tons Soft Foundry Iron at low prices, and a Northern concern has taken 3500 tons Lake Superior Car-Wheel Malleable Iron at about \$20, cash, here, for delivery extending through ten months. Other buyers have bought 1000 tons Gray Forge at \$12.50 and 1000 tons No. 2 Southern Foundry at \$13.50, spot cash. Freight

rates from Northern stacks to the Pittsburgh district have been reduced 15¢, giving such furnaces some little advantage within a limited range. Production of Pig-Iron is being gradually reduced, and not until it shall have dropped below the level of consumption can a permanent turn for the better be reasonably expected. The month of April showed a surplus, but the record of May will probably give statistics more favorable to producers of Pig-Iron. The following are the approximate prices current here at the close for cash, f.o.b.:

**Foundry.**

Southern Coke, No. 1 (new classification).....	\$14.75 @ \$15.25
Southern Coke, No. 2 (new classification).....	14.00 @ 14.50
Southern Coke, No. 3 (new classification).....	13.25 @ 13.75
Ohio Soft Stone Coal, No. 1.....	15.50 @ 16.00
Ohio Soft Stone Coal, No. 2.....	14.50 @ 15.25
Mahoning and Shenango Valley.....	16.00 @ 16.50
Hanging Rock Charcoal, No. 1.....	20.00 @ 22.00
Hanging Rock Charcoal, No. 2.....	19.00 @ 21.00
Tennessee and Alabama Charcoal, No. 1.....	17.50 @ 18.00
Tennessee and Alabama Charcoal, No. 2.....	16.50 @ 17.00

**Forge.**

Strong Neutral Coke.....	12.75 @ 13.00
Mottled Neutral Coke.....	11.75 @ 12.00
Gray Forge.....	12.50 @ 12.75

**Car-Wheel and Malleable Irons.**

Southern Car-Wheel.....	20.00 @ 24.00
Hanging Rock, Cold Blast.....	22.00 @ 26.00
Lake Superior Car-Wheel and Malleable.....	20.00 @ 21.00

**Manufactured Iron.**—There has been some little increase in the demand for Bar-Iron recently, but prices are barely sustained.

**Nails.**—A weaker tone has prevailed, and lower prices have been accepted, with a moderate demand. Steel Nails, 12d and 40d, sell at \$1.80 @ \$1.90  $\frac{1}{2}$  keg, with 10¢ rebate in carload lots at the mills, and Steel Wire Nails at \$2.40 @ \$2.50  $\frac{1}{2}$  keg.

**Old Material.**—There has been little trading. Old Rails are quotable at \$20, spot, and small lots have sold at this rate. Old Wheels have been unsettled, with sales recorded at \$15 @ \$16, cash.

**Cleveland.**

CLEVELAND, May 27, 1889.

**Iron Ore.**—Only a moderate amount of Ore has been sold during the past week. High-grade Gogebic Bessemer at \$5.25, Cleveland delivery, has found a ready market, and the Aurora Mine has made several sales at that figure. Non-Bessemer Ores seem a little weaker, and the range of prices has declined to \$3.50 @ \$4, with only a few particularly rich grades commanding the latter figure. The Pittsburgh and Mahoning Valley furnace men are expected to enter the market this week with substantial orders. Ore is still being pushed forward from the mines at a tremendous rate, over 1,000,000 tons having already been shipped, against less than 400,000 tons up to a corresponding period last year. Although the tonnage demand is heavy, there is no change in lake freights, and vessels are still being engaged at 90¢ from Escanaba, \$1.10 from Marquette and \$1.25 from Ashland and Two Harbors.

**Pig-Iron.**—Prices are not improved, but considerable Iron has been sold during the past week. These sales have included about equal quantities of Foundry and Mill Irons, but the prices paid furnish no basis for an estimate of actual quotations for round lots of Iron. Buyers ask for quantities so small that stocks are but slightly reduced, even with an almost constant demand.

**Manufactured Iron.**—There is a steady demand for combination shapes, and particularly for the smaller grades of Channels. Common Bar-Iron is still selling at 1.60¢, with only a fair inquiry reported.

**Scrap-Iron.**—A few sales of old American Rails at \$21 are reported, although buyers are asking \$21.50. Old Axles, at \$23, are selling freely, but there is little call for Wheels.

**Pittsburgh.**Office of The Iron Age, 77 Fourth Ave. {  
PITTSBURGH, May 28, 1889. }

A good deal is being said and written in regard to the general Iron situation, and there is a wide conflict of opinion in regard thereto. That the volume of business is increasing there is no doubt, but as yet there is no improvement in prices, which are irregular and unsatisfactory. General business hereabouts will compare well with what it was at this time last year, and our manufacturing interests, with the exception of Iron and Steel, are in better condition.

The labor outlook is unsettled, and as regards the Iron business it is difficult to foretell at present what the outcome will be. There is not much doubt that the rest of the Pittsburgh manufacturers will follow in the wake of Carnegie, Phipps & Co. and demand a reduction in the wage-scale, but it is not likely that the Amalgamated Association will submit to a reduction without a struggle. Carnegie, Phipps & Co. are very determined in their demands from the men employed at the Homestead Mill, and they want to know by the close of this month what the men propose to do. If their men refuse to accept the reduction the firm will have to do one of two things—shut down the mill or run it with non-union men. Carnegie, Phipps & Co. say it is simply out of the question for them to continue to pay the present wage-scale and compete with other mills paying considerably less. The Allegheny Bessemer Company's mill, at Duquesne, is being operated by non-union men, which means success for the company, as the great object sought after was to make it a non-union mill. The leading and active members of the firm, Messrs. Park and Clarke, have for years been very much opposed to organized labor, and they were determined to make the mill at Duquesne non-union.

The reduction in the freight rate on Iron Ore from the lakes to Pittsburgh of 20¢  $\frac{1}{2}$  ton will go into effect June 1. The railroads have discovered that they must do something for the relief of the Iron interest, hence the reduction some weeks ago in the rate of Pig-Iron from the Shenango and Mahoning valleys to Pittsburgh, and now the reduction in the rate on Ore. The rate on the latter has been reduced from \$1.25 to \$1.05  $\frac{1}{2}$  ton, which is equal to about 30¢  $\frac{1}{2}$  ton on Pig-Iron.

The June meeting of the Wrought-Iron Pipe Association will take place in Pittsburgh.

**Pig-Iron.**—There has been a further decline, furnace men having already given away to a considerable extent the reduction in Ore freight. There is liable to be a spurt at almost any time, however, for just as soon as there is a reasonable assurance that the market has touched bottom there will be a largely increased demand, as consumers are all low in stock and will want to replenish. We now quote as follows:

Neutral Gray Forge.....	\$13.75 @ \$13.85, cash
White and Mottled.....	13.00 @ 13.50, "
All-Ore Mill.....	14.50 @ 15.00, "
No. 1 Foundry.....	15.25 @ 15.50, "
No. 2 Foundry.....	14.75 @ 15.00, "
No. 1 Charcoal Foundry.....	23.00 @ 23.50, "
No. 2 Charcoal Foundry.....	21.50 @ 22.00, "
Cold Blast Charcoal, No. 1.....	27.00 @ 28.00, "
Bessemer Iron.....	15.75 @ 16.00, "

In regard to Bessemer Pig there have been no sales reported recently; \$16, cash, is still the asking price, but there is no doubt that it can be bought for less. Buyers for this, as well as other grades,

are holding off in expectation of still lower prices.

**Spiegel.**—Is still quoted at \$30 @ \$30.50 for 20%, and Ferromanganese at \$58 @ \$58.50 for 80%.

**Muck Bar.**—There is no improvement in the demand, nor is it likely there will be as long as there is a possibility of prices going still lower. We continue to quote at \$26, cash, at which it is being offered pretty freely, but so far as we are aware there have been no sales below that figure.

**Manufactured Iron.**—The demand for Merchant-Iron is increasing, but prices show no improvement. We continue to quote first-quality Iron upon a basis of 1.60¢ @ 1.70¢ for Bars and Old Rail Iron at 1.40¢ @ 1.50¢, 60 days, 2% off for cash. Skelp Iron, for which there is a continued good demand, is steady at 1.62½¢ @ 1.65¢ for Grooved and 1.90¢ @ 1.95¢ for Sheared.

**Nails.**—There is no change to note in the situation; business here in Pittsburgh continues light and prices for Cut Nails continue unsatisfactory; may be quoted at \$1.85 @ \$1.90, 60 days, 2% for cash. There are only two firms here paying attention to the Nail business; one quotes at \$1.85 and the other at \$1.90. Wire Nails in carload lots are still quoted at \$2.15 @ \$2.20, 60 days, 2% off for cash, and \$2.30 @ \$2.35 in a jobbing way. As stated in a former report, it is claimed by some who have made an investigation of the matter that at present prices Cut Nails are very much cheaper than Wire Nails, and it is intimated that the former sooner or later will supplant the latter. This, however, is a matter that time alone will determine.

**Wrought-Iron Pipe.**—This important interest continues much the same as noted in our last report. The mills are all busy, some of them sold several months ahead, and the combination prices are being faithfully adhered to; but it is claimed that they are low, and afford but very little margin for profit. There is a possibility of prices being advanced at the next meeting of the association, which takes place in this city next month. It may be stated that the Pipe trade is about the only branch of the Iron interest here in which there is any particular activity. We continue to quote prices as before: Discounts on Black Butt-Welded Pipe, 52½%; on Galvanized do., 45%; on Black Lap-Welded, 65%; on Galvanized do., 52½%; Boiler Tubes, 1½ inches and smaller, 57½%; do., 2 inches and larger, 62½%; Casing, 5½ inches, 62½%; other sizes, 60%; 2-inch Tubing, 13¢  $\frac{1}{2}$  foot, net; 3-inch Line Pipe, 20¢  $\frac{1}{2}$  foot; 6-inch do., 56¢; 8-inch, 90¢.

**Old Rails.**—Old Iron Rails continue neglected, but there has been no further change in prices. We are advised of sales of 700 tons at \$21.50, which for the time is the ruling price. Old Steel Rails are weaker, especially as regards short lengths, which we now quote at \$16.50 @ \$17. Long lengths remain as last quoted at \$19 @ \$19.50.

**Railway Track Supplies.**—There is a fair business, but no change in prices. Spikes, 2¢, 30 days, on cars at works in Pittsburgh; Splice Bars, 1.65¢ @ 1.75¢; Track Bolts, 2.75¢ with Square and 2.85¢ with Hexagon Nuts.

**Steel Rails.**—The mills here are pretty well filled up with orders, and a stronger feeling obtains in consequence; prices, however, are still quoted at \$25 @ \$26, cash, at mill, the inside figure only for desirable orders. Indeed, we are not so sure that an order would now be accepted at the inside or outside, as the mills are not as anxious for business as they were a

few weeks ago. The belief obtains that the very low price of Rails will stimulate railway construction, and that the Rail market will be better during the last half of the year.

**Blooms, Billets, &c.**—Bessemer Steel Billets may be quoted at \$26.50 @ \$27, as to size, quality and delivery; Nail Slabs, \$26.50; Rail Crops, \$17 @ \$17.25.

**Old Material.**—The demand for all kinds of Old Material continues light and prices are weak. Sales No. 1 Wrought Scrap at \$18, net ton; Old Car Axles at \$24; Wrought Turnings may be quoted at \$13; Cast Scrap, \$13.75 @ \$14, gross; Old Car-Wheels, \$18, gross.

## St. Louis.

Office of *The Iron Age*, 214 N. Sixth st.,  
St. Louis, May 25, 1889.

**Pig-Iron.**—There is no change to note in the general conditions governing this department. Trade is light and sales of small lots are occasionally made mostly for local delivery. Prices remain unchanged, and in the absence of sales of any moment are to a certain extent nominal. Regarding the future, the general impression seems to prevail that after the summer months a revival of business will be in order, and the various industries connected with the iron trade will then be in a position to buy. Careful inquiries fail to show any large accumulation of stock at the furnaces, and they all appear to be pretty well sold up, but are not disposed to book any orders for delivery after July 1, as they are desirous of receiving the advantage of any advance in prices, which they confidently expect to occur at no distant period. The stove founders anticipate a large fall trade, and while some of them have bought all the iron they will need for the next six months, there are others who have held off, for the reason that they have expected a lower range of prices. These latter will soon be in the market to replenish their stocks, and the impetus given the demand from this quarter is likely to make itself felt in regard to prices. For ordinary-sized lots we quote as follows for cash, f.o.b. St. Louis:

Southern Coke, No. 1 Foundry,	\$15.25 @ \$15.75
Southern Coke, No. 2 Foundry,	14.75 @ 15.25
Southern Coke, No. 3 Foundry,	14.25 @ 14.50
Gray Forge.....	13.25 @ 13.75
Ohio Softeners.....	17.00 @ 19.00
Lake Superior Charcoal.....	19.75 @ 21.50

### Missouri.

Charcoal Foundry, No. 1.....	16.00 @ 16.50
Charcoal Foundry, No. 2.....	15.00 @ 15.50

### Tennessee.

Charcoal Foundry, No. 1.....	17.00 @ 18.00
Charcoal Foundry, No. 2.....	16.50 @ 17.00
Connellsville Coke, f.o.b. East St. Louis,	\$4.55; St. Louis, \$4.70.

**Bar-Iron.**—The demand, which has been fairly strong for the past three weeks, continues to be the feature. The mills, which have been making low prices and temporarily demoralized the market, have evidently booked sufficient orders to keep them out of the market for the present at least, and as the result prices are quoted with more firmness than heretofore. Small lots from store are quoted at \$1.80; carload lots from \$1.60 to \$1.70, according to circumstances.

**Barb Wire.**—The volume of business is large, and manufacturers state they have never in the history of the trade known it to be so busy at this season of the year as at present. Jobbers who bought stocks which ordinarily would last them well into the summer have duplicated their orders, and prices are being quoted with some degree of firmness. The American Wire Company, who have been shut down for some weeks, have advertised the plant to be disposed of at sheriff's sale. Mills quote from \$2.80 to \$2.85 for

Painted and from \$3.40 to \$3.45 for Galvanized; carload lots at from \$2.70 to \$2.75 for Painted and \$3.30 to \$3.35 for Galvanized, f.o.b. St. Louis.

## New York.

Office of *The Iron Age*, 66 and 68 Duane street,  
New York, May 29, 1889.

**Pig-Iron.**—Inquiries are in the market for considerable quantities of iron, and a sale of 2000 tons of Southern is reported, but most of the commission houses have found business very dull. The situation of the Thomas Iron Company is of special interest at this juncture. They have been shipping heavily of late and now have 6000 tons less on hand than three months since. The heavy orders which they are filling have obliged them to draw on their reserve capacity. They blew in one of their idle furnaces last week and will start another this week, when all their stacks will be running except one which they hold on lease, but do not expect to operate. They have withdrawn from the market for the present, and announce that the special prices recently made are only good until the end of June. Their policy after that time will then be determined by the condition of the market. Other Northern Irons are being held at old figures—namely, \$16.50 @ \$17.50 for No. 1; \$15.50 @ \$16 for No. 2, and \$14.50 @ \$15.25 for Gray Forge, at tidewater. Southern Irons are quoted at \$16 @ \$16.50 for No. 1, \$15 @ \$15.50 for No. 2 and \$14.50 @ \$15 for No. 3.

**Scotch Pig.**—Very small quantities are selling at the following rates: Dalmellington, \$19.50; Summerlee, \$21.50; Coltness, \$21.75.

**Structural Iron and Steel.**—Architectural iron works are very busy. A number of heavy contracts, involving the consumption of a large quantity of iron and steel, were secured during the past week, and still more work is in sight. Quotations are as follows, on dock: Sheared Plates, 1.95¢ @ 2.1¢; Universal Mill Plates, 2.1¢ @ 2.15¢; Angles, 2¢ @ 2.1¢; Tees, 2.4¢ @ 2.6¢; Beams and Channels, 2.8¢.

**Plates.**—More orders have been taken in the past ten days than for the whole of the previous month, but prices are still very low. We quote on dock as follows: Iron Tank, 1.95¢ @ 2.1¢; Shell, 2¼¢ @ 2.5¢; Steel Tank, 2.2¢ @ 2.3¢; Shell, 2.4¢ @ 2.5¢; Flange, 2.65¢ @ 2.75¢; Fire-box, 3.25¢ @ 4¢.

**Bar-Iron.**—In this line but little is doing to form a basis for quotations, which are nominally as follows for carload lots on dock: Common, 1.6¢ @ 1.7¢; Medium, 1.7¢ @ 1.75¢; Refined, 1.75¢ @ 1.9¢.

**Merchant Steel.**—Competition for business is very keen, and some of the manufacturers are credited with having made sales at prices lower than anything heretofore reported. Inferior grades of Tool Steel are selling at 6¼¢, in large lots; good brands bring 7¢ @ 7¼¢; Open-Hearth Machinery, 2¼¢; Open-Hearth Spring, 2¼¢ @ 2½¢; Crucible Spring, 3¼¢ @ 4¢. Small lots command ¼¢ @ ½¢ advance on these rates.

**Spiegeleisen.**—Nothing is doing in this line at present. Quotations are nominal at \$27 @ \$28 for 20 %.

**Wire Rods.**—Agents for foreign manufacturers are disturbed by the cessation of operations at German works on account of the strike now in progress there, which interferes with contracts that might be made for future delivery. A nominal quotation is \$42.

**Steel Rails.**—Several large contracts were closed by Eastern mills since our last report. The Bethlehem Iron Company secured the heaviest, consisting of 40,000 tons for the Oregon Pacific. This con-

tract has been the subject of negotiation for some time, and it is understood that the question of marketing a considerable quantity of the railroad company's bonds formed an important element of the transaction. The manufacturers who are in a position to combine a modicum of financing with their regular business probably have opportunities to realize better returns from such sales than if they were obliged to insist on all cash. The Lackawanna Iron and Coal Company stand next to the Bethlehem Iron Company in the magnitude of their transactions, reporting sales for the week under review aggregating 32,000 tons, of which 20,000 tons go to the Pacific Slope and the remainder to several Eastern roads. Scattering sales of a few thousand tons are reported by other mills. Altogether the week has been one of much interest to the steel rail manufacturers, who are inclined to believe that the tide has turned and the extreme depths of the depression have been passed. They are further encouraged to take this view by the large orders still under negotiation, and which they expect to see placed at an early day, amounting to at least 85,000 tons. It is estimated on good authority that 100,000 tons can safely be depended on in the West in the next six weeks, most of which will go to the Chicago mills. Efforts are being made to advance prices, as it is believed that a good foundation now exists for an upward movement if the manufacturers could be brought to act together. Quotations continue at \$26.50 @ \$27, at Eastern mills, with some naming \$28 for delivery after September 1, to which time their capacity is fully covered.

**Track Supplies.**—Dealers are anticipating an early revival of activity in this line in consequence of the recent heavy sales of Rails. Fish-Plates are quoted at 1.80¢ @ 1.90¢, with some sellers naming 1.85¢ as their bottom rate; Track Bolts with Square Nuts, 2.70¢ @ 2.75¢; with Hexagon Nuts, 2.80¢ for Common Iron and 3¢ for Refined Iron; Spikes, 1.90¢ @ 2¢, according to quality.

**Old Material.**—A better movement is reported in Wrought Scrap, but at very low prices. Considerable quantities of No. 1 have been sold at \$20 gross ton, delivered at Jersey City and Brooklyn. Of Old Iron Rails the only sale reported was a lot of 500 tons, which brought \$22. Inquiries for Old Rails are being received from Ohio consumers, who contemplate securing a supply for future wants while prices are low. Stocks are light, but a few thousand tons now remaining in bonded warehouses, and as they have been held for some time the owners will hardly part with them at present rates. Old Steel Rails are in fair demand, with bids of \$17.50, Jersey City. Old Car-Wheels are flat, with latest sales at \$19 @ \$20. Turnings are quoted at \$13.50 @ \$14, delivered; Cast Scrap, \$15 @ \$16; Cast Borings, \$9.50 @ \$10.

## Financial.

In commercial circles there is rather more animation, and as compared with the corresponding date last year the volume of business in the country at large is increased. In the West and Northwest there are several large reported gains, and in New York City the more active speculative movement is strongly reflected. Still the feeling generally is conservative, influenced by the low range of prices. At industrial centers a readjustment of wages is being effected in some instances, causing more or less disturbance. The proposed reduction at Carnegie & Co.'s now substantially agreed upon is about 20 per cent. Rather more attention is being given to the silver question, as foreign bankers in time contracts

for money now insert a clause specifying payment in gold. Touching this subject the *Financial Chronicle* says: "We acknowledge we have ourselves begun to think that it matters little what future action Congress takes with regard to silver unless it is willing to suspend the present coinage. As matters are now going we are already on the down grade toward the white metal, and will no doubt reach that level for our currency whenever a prolonged depression in business occurs." At the same time there is an abiding conviction among the conservative class of financiers that Congress will interpose to preserve the basis of valuation as it exists to-day. Remark has been excited by the small offerings of Government bonds, and the possible inadequacy of this resort as a means of disbursing the accumulating surplus, but Secretary Windom is believed to be master of the situation at least for months to come.

On the Stock Exchange the market opened more actively and stronger, influenced by favorable crop reports, easy money and confidence in the general situation. Gold exports had no perceptible effect. The grangers led in the speculation, with St. Paul and Northwest most prominent. A rumor obtained currency that the manufacturers' prices of steel rails would be advanced. On Monday the movement was more restricted as to volume, but there was much irregularity caused by buying and selling in quick succession. The reactions were generally due to realizations, London taking a part. On Tuesday the market was more active and stronger, San Francisco common, St. Paul and the other grangers continuing to lead, and one feature was a rise in Lake Shore, in Michigan Central and in Canada Southern. The tone was strong in the late trade and at the close. There was good buying of Chesapeake and Ohio common.

United States bonds are quoted as follows:

U. S. 4½, 1891, registered.....	106½
U. S. 4½, 1891, coupon.....	107½
U. S. 4, 1897, registered.....	129½
U. S. 4, 1897, coupon.....	129½
U. S. currency 6s.....	121½

The market for sterling was dull and steady. Posted rates closed at 4.88 for 60 days and 4.89½ for demand.

The Government returns of the foreign commerce of the United States for April show a balance against this country of only \$2,500,000, as compared with upward of \$11,000,000 for April, 1888. The total exports were \$65,544,575 and the imports \$68,057,697. For ten months ending April 30 the comparison is as follows:

	1888.	1889.
Total exports.....	\$65,088,387	\$69,262,411
Total imports.....	67,328,261	68,630,512
Excess of exports.....		\$2,234,150
Excess of imports.....	\$22,239,874	

The continued shipments of specie despite this showing evoke various explanations. "The true explanation," the *Journal of Commerce* says, "is undoubtedly to be found in the apprehensions entertained in Europe, and especially in Great Britain, concerning the action of our Government on the silver question, and its effect on capital owned abroad and loaned or invested here. . . . This distrust of our market is likely to increase instead of diminishing when the policy of the silver men is more fully exposed."

According to the Custom-House report the exports of specie last week amounted to \$4,816,735. Since January 1 the total is \$27,667,700, as compared with \$16,835,000 for the same time in 1888. The exports of specie for the week were \$100,000, and the total since January 1 is \$3,579,000, against \$4,919,000 for the same time last year. Saturday's steamers took out \$4,000,000.

The weekly statement of the associated

banks shows a steady gain in reserves, despite the loss of gold by shipments to Europe, the surplus now being \$15,055,350. An addition of \$978,025 was unexpected. In loans there was a contraction of \$612,300. Specie decreased \$1,287,000, and legal tenders increased \$1,884,200. Deposits decreased \$1,503,300. It is remarked that a year ago gold exports were larger than now. Bankers report that money was never easier than at the present time. One loan of \$250,000 for four months was at the rate of 3½% on single-name paper without collateral. Rates are 3 @ 3½% for 30 to 90 days and 3½ @ 4% for four to six months. Commercial paper is scarce, and the quotations are 8½% for indorsed bills receivable and best city names and 4½ @ 6 for single names. The total bank clearings of 39 cities last week show an increase of 23.4% compared with last year. Outside of New York the gain was 12.8%. New York increased 29.5%.

In general merchandise the market is quiet, as if awaiting more stability in prices. In breadstuffs and wheat some parties are willing to sell a shade lower and shippers have taken hold rather more freely. Corn was pressed for sale. Exports from New York comprised 181,000 bushels of wheat and 710,000 bushels of corn. Raw sugar advanced ¼¢ and in refined business is much larger, without change of quotations. New Texas and Michigan wool is coming into market. Cotton is firm and in active demand. The trade sale of colored cotton goods in this city realized about \$1,500,000, prices averaging better than anticipated, although about 7½% below the regular. More than any other event of the season the flannel sales have been looked forward to with keen interest. The prices realized seemed to show an advance of 2½ to 5 per cent. above the prices at last year's sale and within about that range below agents' net prices of the present season. The importation of merchandise at this port during the week amounted to \$7,030,000, of which \$1,327,000 represents dry goods. Since January 1 the total is \$202,276,500, as compared with \$197,051,000 for the same time in 1888 and \$191,782,000 in 1887. Exports amounted to \$6,000,000.

The annual report of the Produce Exchange shows that net receipts were \$269,388, and that the surplus is \$70,170. The gratuity fund amounts to \$1,086,767. The site chosen for the Appraisers' Stores is condemned.

The Scranton City Bank, of Scranton, Pa., is in the hands of an assignee. A dispatch says there is due depositors \$322,000, and that the assets are trifling, mostly on paper.

## Coal Market.

The June schedule for Anthracite Coal as agreed upon in this city last week is as follows: Steamer and Broken, \$3.85; Egg, \$4; Stove, \$4.30; Chestnut, \$4, f.o.b. In anticipation of this movement there was a temporary stir among buyers, so that more activity in the trade was apparent than for some time past, but the usual quietness again prevails, and no business of any importance at the advanced prices will be looked for immediately. There is considerable urgency in forwarding Coal privately purchased, under apprehension that freight rates may be increased, as the scarcity of vessels continues. The production of Coal at the mines is being gradually increased, the total for the week ending May 25 being 708,000 tons, as compared with 678,000 tons for the previous week and 652,600 for the same time last year. Since January 1 the aggregate is 11,502,750 tons—a falling off of nearly 1,500,000 tons compared with 1888.

The official statement of Anthracite

production for April has come out in its abbreviated form. Output by regions for the month compares with output for the same month last year as follows: Wyoming, 1,148,455 tons; decrease, 858,781; Lehigh Valley, 476,202; increase, 106,807; Schuylkill, 619,542; decrease, 289,800. Total for month, 2,274,199 tons; decrease, 582,394 tons. Total for year to date, 9,097,453 tons; decrease, 1,228,888 tons. The stock on hand at tidewater shipping points on April 30 was 964,628 tons; increase, 65,845 tons during month.

Now that the several companies connecting with the Poughkeepsie bridge have been virtually consolidated and that other arrangements for business for the new route are nearly complete, the expected diversion of Coal traffic will be watched with interest. Bituminous Coal is unchanged.

The Bell, Lewis & Yates Company have been awarded the New York Central and West Shore contract for Coal for delivery at Buffalo and Rochester for the ensuing year, 400,000 tons. The same concern has the contract for the Michigan Central road, 110,000 tons.

The Waddell Colliery, at Miners' Mills, near Wilkesbarre, employing 400 men and boys, was sold on Saturday to Parke & Watkins for \$50,000 cash.

## Metal Market.

**Copper.**—Since our last report it was cabled from Paris, under date May 23, that the delegates of American Copper mines with the exception of the Tamarack representatives have ratified the provisional arrangement concluded with M. Moreau, the liquidator of the Comptoir d'Escompte, but that the arrangement is binding on all parties interested even without the Tamarack adhering to it. M. Moreau was to have an interview with the agents of the English mines, and the *Temps* is of the opinion that an understanding with them is probable. The Rio Tinto, it was added, had given their assent. What precedes relates to claims for differences against the Comptoir d'Escompte in liquidation. Since then nothing further has transpired about the old syndicate's surplus supply which is being carried here by bankers. It is stated that efforts continue being made to have it shipped abroad, but that for the present holders are unprepared to follow the suggestion. At any rate there is no Lake Ingot obtainable from the mining companies under 12¢, at which moderate deliveries are made, while outside buyers have to pay 12½¢ @ 12½¢ as to quantity, and casting brands sell at 11½¢ @ 11½¢. In a speculative way September Lake brought 11½¢. Under the stimulus of an active consumptive demand London advanced from £39. 15/, spot, at the time of our last week's report to £41. 5/ yesterday, and futures from £39. 10/ to £41. 5/; sales, 1300 tons. During the first quarter the shipments of Pyrites from Spain reached 257,909 tons, against 195,735 in 1888 and 197,425 in 1887; of Precipitate they were 6358 tons, against 6168 and 7215. The import of Copper into Liverpool and Swansea from the United States from January 1 to May 16 was 11,181 tons Fine, against 11,154 in 1888 and 1789 in 1887. The general impression in New York is that the position of Copper will after awhile regulate itself by diminished production. Copper closed on the Metal Exchange to-day at 12.45¢, asked.

**Tin.**—Has been ill-sustained during the week on the spot in the London market. At the time of our last report spot stood £93. 17/6 and reached £92 yesterday, whereas futures improved from £92. 10/ to £93, sales aggregating 500 tons. Here the volume of trade has been quite restricted, 10 tons spot selling at 20.40¢ and

## GERMANY.

HAMBURG, May 18, 1889.—*Iron*.—The strikes in the Rhenish-Westphalian coal region have for the moment upset the regular trade in Iron and Steel there; quotations, though firm, are therefore more or less nominal. To judge from the orders now arriving from the United States the stock of Spiegel there must be very much reduced, and 66 marks per ton for 10 to 12% has been obtained without difficulty. The English demand for higher-grade Spiegel has also been on the increase. Forge Pig has been advancing rather too fast of late. Orders have been received for delivery all the way to November 1. The present quotation is 58 marks; for Bessemer on the West Coast, 50/6, and for Luxembourg, 36/ @ 43/. The price of Boiler and Tank Plates has been raised to 185 and 160 respectively, being an advance of 5 marks. The Wire branch has remained dull and unaltered. The nominal quotation for Wire Rods is 110 @ 120; Steel Rails, 120 @ 125, and in a few instances higher.—*Borsenhalle*.

## BELGIUM.

BRUSSELS, May 18, 1889.—*Iron*.—The Belgian markets have remained firmly sustained during the week. Structural Iron works have booked a good many fresh orders; the rolling-mills continue very busy. Steel works decline further engagements, being loaded down with contracts for many months to come. The demand for Steel Rails has gone on improving. French competition in the Finished-Iron trade is still felt to some extent in the Charleroi basin, and the latter, in its turn, competes at Liège. The Iron and Steel movement in Belgium during the first quarter has been as follows:

Imports.		Exports.	
1889.	1888.	1889.	1888.
Tons.	Tons.	Tons.	Tons.
Iron Ore.....	419,370	389,033	24,434

—*Moniteur des Intérêts Matériels*.

**Steamer Speed on the Lakes.**—The fine steel freight steamer Owego has just made the run from Buffalo to Chicago in the unprecedented time of 58 hours. As the distance between the ports named is 889 miles, it will be seen that in order to accomplish the run in 58 hours the Owego had to make an average speed of 15½ miles an hour. The Milwaukee *Wisconsin* says: "Nothing could more clearly illustrate the immense strides taken by the shipping interest of the great lakes during the past decade than this achievement of the Owego. The speed of our large freight carriers during the '70s ranged from 9 to 10 miles, with perhaps ability on the part of a few steamers to accomplish 12 miles during spurts when in proper trim. Nowadays the Owego, the Chemung, the Jewett and a number of other freighting steamers of large size are accounted good 14-mile boats. This increase in the steaming ability of the heaviest of our lake steamers is an important factor in the competition between the rail and water routes. Tonnage with improved engines is worth nearly 50 per cent. more in carrying ability than it was ten years ago; and the water route for freight to the seaboard is now more attractive to shippers than it has ever been. In time the commercial navy of the great lakes will be equal to the best that may be cited on the salted seas."

Gen. John Hammond, of Crown Point, N. Y., died on the 28th inst. of consumption. He was president and chief owner of the Crown Point Iron Company. During the civil war he was colonel of the Fifth New York Cavalry. He was a member of the Twenty-sixth Congress from the Essex and Franklin district.

Here in Mexico, says the *Financier*, we have seen a steady improvement in business for over a year, and, indeed, it may truthfully be said that the exterior and interior trade of Mexico is now in a very satisfactory condition. For this happy state of things the country is largely indebted to the peaceful and progressive policy of the Diaz administration, to its strenuous maintenance of the national credit in the face of appalling difficulties, and to its firm suppression of civil disorder at home. Four years ago the country was practically bankrupt; the nation, despite its magnificent endowment of natural riches, was so poor that it had credit neither at home nor abroad.

The rapid increase in the export movement of American goods over the Canadian Pacific Railroad is shown by the statement in a report of the Bureau of Statistics to the effect that exports from the United States by this route during the last six months of 1888 were greater by 90 per cent. than during the first six months, and were nearly 50 per cent. of the total for 18 months. During the last half of the year more than 5,000,000 pounds of merchandise found this outlet to foreign countries, more than 80 per cent. of the total being of cottons.

## Remarkable Decline in Population.

The latest statement of the population of Ireland by the Registrar-General is 4,777,555. This estimate is undoubtedly about as accurate as a census, and it indicates a decrease of nearly 400,000 since 1881, when the last enumeration was made. Heavy as the emigration from Ireland has been in the last eight years, it by no means accounts for such a shrinkage, if considered merely in regard to numbers and the nature of the emigration is not taken into account. What produces such an effect is the fact that the vast majority of the emigrants are young and vigorous, leaving the infirm and the aged behind to constitute an abnormal proportion of the population of Ireland. In this way it has come to pass that the fecundity for which the people of Ireland were long famous has largely vanished, except in so far as it is preserved among the Irish in other parts of the world. The density of population in Ireland, which was very remarkable in 1841, when the island had 8,295,061 inhabitants, is no longer extreme in any sense. Belgium has a much greater population on one-third of the area, and even the State of Massachusetts, with naturally inferior soil, has nearly twice as dense a population. In ten years more, at the rate things are going now, Ohio will have as many people as Ireland, and nearly as many in proportion to its area. These facts are a remarkable proof of the decline of a country of Western Europe possessing many natural advantages, and they go far toward justifying the demand for a radical change of some sort in the government of the island.

The city of Providence, R. I., has just contracted for 800 electric lamps at a cost of 44 cents per lamp per night, the contract to run for three years. This is the cheapest rate any city has yet obtained, with the exception of St. Paul, Minn., where the cost is 41 cents per lamp per night, and New York, where the cost is 40 cents. Philadelphia pays 47 cents, a number of cities from 50 to 60 cents, while Boston pays 65, and Sacramento, Cal., touches the limit at 69 cents.

A Washington dispatch says it is probable that the monitor *Puritan*, which for years has been a monitor only in name, never having been supplied with turrets or guns, will soon be transformed into an armored vessel of modern type and of great power. To allow for increased weight of ordnance it is proposed to reduce the thickness of the armor belt considerably below the water-line, while slightly increasing its thickness above, and to dispense with two boilers.

The Hamburg-American Steam Packet Company have contracted for two more twin-screw express steamers, one to be built by the Vulcan Shipbuilding Company at Stettin, Prussia, which constructed the *Augusta Victoria*, and the other by John Elder & Co., at Fairfield, the builders of the *Etruria* and *Umbria*. The new vessels will be 520 feet long, 57½ feet broad and 41 feet deep, and in every other respect will be like the *Augusta Victoria* and her sister steamer, the *Columbia*.

It is said that the State of Georgia alone has 55 cotton mills, and that the city of Augusta contains 13 cotton manufacturing plants, which represent \$5,500,000 of capital. It is the opinion of the *Manufacturers' Record* that the present year will be the greatest thus far in the development of the industries of the South.

## Hardware.

There is only a moderate movement in trade, and purchases are for the most part limited to small lots to complete assortments or meet immediate wants. While few changes in prices are reported, the tone of the market is not strong, and manufacturers are desirous of securing orders, and in some cases are making inducements in the way of slight concessions in prices, better freight allowances, &c.

### Barb Wire.

The demand continues fair, and a good volume of business is doing without specially new features. Prices in this market are well maintained on the basis of 3.5 cents for carload lots, delivered, but the effect of the Western prices is felt to a certain extent.

### Cut Nails.

A fair trade is in progress, but the market can by no means be called active. Wire Nails are competing vigorously with Cut Nails in this locality and are securing an increasing proportion of the business. Yet a tendency to harden is asserted by dealers to be perceptible in Cut Nails, and they are of the opinion that bottom has been touched. The restriction of production recently made is probably accomplishing this result. Four of the five largest factories in the Atlantic States Nail Association have been shut down, and several of the smaller concerns are also idle. This will cut down the supply of Cut Nails very considerably, as the warehouses are understood to be lightly stocked. Iron Nails are quoted at \$1.80 @ \$1.90 in carload lots on dock.

A special meeting of the Western Cut-Nail Manufacturers' Association was held in Wheeling, W. Va., on the afternoon of the 23d inst., for the purpose of taking action on the notice given by the La Belle Iron Works last month of its intended withdrawal from the organization unless certain modifications in the existing arrangement and restrictions were conceded. The La Belle concern has been a large seller of Nails since the organization of the association, and each month has had to pay 10 cents per keg for every keg of Nails sold in excess of its allotment. The officials of the concern became dissatisfied with this arrangement and gave notice of their intended withdrawal. As before stated, the object of the meeting was to take action in the matter, and after a lengthy session it was finally decided that the 10 cents per keg feature of the agreement would be abandoned in the future. Each mill can now market its production without any restrictions whatever. This action means that the association has practically been dissolved.

### Wire Nails.

Representatives of most of the largest manufacturers of Wire Nails met in Cleveland, Ohio, May 23, about 90 per cent of the capacity of the country being represented. This meeting was called for the purpose of considering the advisability of adopting a new card which would meet some of the difficulties which have been experienced in the use of the present one and the list for Miscellaneous Wire Nails. A revised card was accordingly submitted, which, after consideration and some slight modifications, was unanimously adopted by the manufacturers present to go into effect June 1. In the new card the price of 60d Common is made the base, the smaller sizes of the different Nails having extras according to the increased cost of manufacture. This is to permit Nails being sold on a certain base price without regard to the assortment,

and thus remove the necessity for the manufacturer insisting in taking an order on an average advance of from 40 to 50 cents, as has heretofore been the case. It is also claimed that at the base price, which has for some time been ruling, a large part of the output was sold under cost, the manufacturers endeavoring to come out even by the large advances on the smaller Nails. In the new list accordingly the extras on the larger Nails are advanced, while on the smaller Nails they are reduced. The manufacturers also propose a new departure in making the card cover shelf goods, and doing away altogether with the miscellaneous list subject to discount.

In the part of the card relating to shelf goods, extras are given for 100 pounds in 1-pound papers, with deductions for the goods in bulk in 25 and 50 pound boxes, and also in 100-pound kegs, with additions also for  $\frac{1}{4}$  and  $\frac{1}{2}$  pound packages. This change is made for the purpose of simplifying matters and avoiding the confusion which has been found difficult to regulate, as between goods purchased by the card and from the list with discount.

### Sheet and Bolt Copper.

The Association of Copper Manufacturers of the United States adopted May 23 new prices on Sheet and Bolt Copper, &c. In these prices a reduction is made of 5 cents per pound, which makes the present list the same as the one in force during the fall of 1887. This action has been anticipated on account of the decline in the price of raw material. The new prices are as follows:

Cold or Hard-Rolled Copper lighter than 14 ounces per square foot, 2 cents per pound over the foregoing prices.

### TINNING.

Tinning sheets on one side, 10, 12 and 14 x 48, each..... 8¢  
Tinning sheets on one side, 30 x 60, each... 30¢  
For tinning boiler sizes, 9 inches, 14 x 60, each..... 15¢  
For tinning boiler sizes, 8 inches, 14 x 56, each..... 12¢  
For tinning boiler sizes, 7 inches, 14 x 52, each..... 12¢  
Tinning sheets on one side, other sizes, per square foot..... 2½¢  
For tinning both sides, double the above prices.

A revised list on Seamless Brass Tubing has also been adopted, bearing date May 15. The lists were not, however, sent out to the trade until last week.

### Miscellaneous Prices.

The market for Tin-ware, Pieced and Stamped, is not in a very satisfactory condition, and there is considerable diversity in the prices made by the different manufacturers. A large business is being done by the manufacturers direct with the retail trade, and in several sections there appears to be an increase in such trade, the prices given to the small buyers being nearer those given the jobbers than was formerly the case. Pieced Tin-ware is being sold largely at net prices, and the same remark applies to a considerable extent to Stamped-Ware. The list of the Central Stamping Company is the one in general use, and this is subject to a discount of from 75 per cent. to 75 and 10 per cent.

There is some irregularity in the market for Wrought-Iron Pipe, but the volume of business is good, and it is expected that it

Circles over 60 inches diameter up to 96 inches diameter, inclusive, 5 cents per pound advance over the lowest prices of Sheet Copper of the same thickness.

Circles over 96 inches diameter, 6 cents per pound advance over lowest prices of Sheet Copper of the same thickness.

Segment and Pattern Sheets, 3 cents per pound advance over price of sheets required to cut them from.

Cold or Hard-Rolled Copper, 14 ounces per square foot and heavier, 1 cent per pound over the foregoing prices.

will so continue through the season. It is not expected that prices will rule high, as the capacity of the mills is in excess of the regular demand.

Bean's Compact Home, which is put on the market by E. D. Bean, 147 Washington street, Boston, Mass., and described on page 830, is made in two styles, plain and fancy, the former being sold at \$35 and the latter at \$50, both of these prices being subject to a discount of 25 per cent.

The market for Manilla Rope gives some evidence of weakness and prices are a shade lower.

A large quantity of Lawn-Mowers has been sold during the season, but at dis-

counts representing a wide range of prices. The standard machines have been held more firmly than some of the newer makes, on which some low quotations have been made.

In the description which was given in our last issue of Greely's Cork Extractor the address of the manufacturer was inadvertently omitted. These goods are put on the market by B. J. Greely, 715 Washington street, Boston, and are made in the following sizes and styles and sold at the prices named. It will thus be seen that a sufficient variety is offered to meet the demands of the trade.

No.	Price per gross.
1, Small, Wire.....	\$2.00
2, Medium, Wire.....	2.00
3, Medium, Bessemer Steel Enamel Handle.....	8.00
4, Large, Bessemer Steel Enamel Handle..	9.00
5, Medium, Bessemer Steel Mahogany Handle.....	10.50
6, Medium, Fine Imported Steel.....	13.50
7, Large, Fine Imported Steel.....	15.00
8, Medium, Folding.....	18.00

The following revised quotations are made on the tools made by the W. G. Avery Mfg. Company, Cleveland, Ohio:

	Discount.
Sawset and Punch.....	50 %
Revolving Punch.....	40 %
Flush Bevel Squares.....	40 %
Flush Bevel Protractors.....	50 %

#### Items.

Hibbard, Spencer, Bartlett & Co., Chicago, Ill., have issued a 24-page price-current, referring principally to seasonable goods, of which a varied line is represented, including Lawn-Mowers, Scythes, Spring Hinges, Refrigerators, Ice-Cream Freezers and Ice Tools, with many other specialties. Tin-Plate and Caldwell's patent Steel Roofing are also given a prominent place.

The following circular, issued to the trade under date May 16, is the formal announcement of the consolidation in question to which we referred in our last issue:

Having caused the stocks of Hardware of Kellogg, Johnson & Bliss, Incorporated, and of Bullard & Gormley to be consolidated, and having assumed the management of the corporation of Kellogg, Johnson & Bliss, we shall in future continue the business of both concerns under the franchise of the corporation, at 109-110 Randolph street, Chicago, but without change in our former business policy. We desire to thank our friends for past favors, and to assure the customers of both concerns that we expect with our enlarged facilities to merit a continuance of their patronage.

GEORGE E. BLISS,  
CHAS. W. BULLARD, } Managers  
JAMES H. GORMLEY,

The Francis T. Witte Hardware Company, 106 Chambers street, New York, are putting on the market an Ice-Making Machine of German manufacture for which they are agents. It is made in sizes for producing from  $\frac{1}{4}$  pound to 18 pounds of ice in the regular machines.

Landers, Frary & Clark, manufacturers of Cutlery and Hardware Specialties at New Britain, Conn., have opened a sample-room at No. 72 Lake street, Chicago, and placed it in charge of R. K. Hitchens, who has represented them as traveling salesman in the States of Iowa, Illinois, Wisconsin and Minnesota during the past nine years. They will carry a full sample line of Table Cutlery and Carvers in buckhorn, ivory, pearl and celluloid handles, and Case Goods. It is their intention to sell the wholesale and retail trade in Chicago, but will sell only to the jobbing trade outside of that city. J. M. Pool, of Clinton, Iowa, is representing the firm in the territory where Mr. Hitchens has been so well and favorably known.

Cordley & Hayes, 173 and 175 Duane street, New York, issue a circular relating to their Fire-Pails of indurated fiber, and

showing their adaptation for this use and superiority over the common goods. They also illustrate their Indurated Fiber Fire-Extinguisher, of which a description is given on another page.

In addition to the houses mentioned in our last issue as represented by Alfred Ely, Baltimore, Md., the Standard Tool Company, of Cleveland, Ohio, may also be mentioned, for whom he is agent for the sale of their Twist Drills and other specialties.

McIntosh, Huntington & Co., Cleveland, Ohio, send out a budget containing a large number of new pages for their catalogue, which are gummed for insertion in the proper places. They allude to a large variety of specialties and standard goods which they have added to their line. Among these may be mentioned the Wrought-Steel Mortise Door Locks and Latches of the Russell & Erwin Mfg. Company, Gate City Water Coolers and Filters, and others. Several of the pages relate also to revised price-lists, among which are the new lists on Screws and Granite Iron-Ware. The Screw list is also printed separately on a card for use in the store or office.

W. E. Lewis, Corry, Pa., issues circulars describing Electrical Apparatus, including Le Clanche Battery and Battery Supplies, Giant Sounder, Pony Relay, Key Perfection Telegraph Sounder and a set including vibrating Electric Bell, Wood Push-Button, Le Clanche Battery, 75 feet of Insulated Wire, Screws and Staples, this set being sold at \$1.50, subject to a discount of 10 per cent. to the trade. The Le Clanche Battery, Crow-Foot form, 5 x 7, is sold at 85 cents, and 6 x 8, \$1, subject to a discount of 10 per cent.

H. A. Knox & Co., Houndsditch, London, England, issue an exceptionally interesting catalogue of 'Cycle Accessories, showing the line of these good which they are putting on the market the present year. It represents a very complete assortment of Lamps, Saddles, Bags of many different patterns, Tool-Bags, Bells, Wrenches, Ball Pedals, Bearings, &c., Locks and Chains, Oil-Cans, Whistles and Tools for the 'Cycle trade. This catalogue is issued in two forms, which are precisely the same, except the prices, one giving net trade prices, and the other, intended for the use of their customers, giving retail prices. This feature is deserving attention from manufacturers and merchants. The extent of the line shown in the catalogue under review is indicated in the fact that it contains 434 illustrations.

The announcement in our last issue of the retirement from the John Russell Company of R. N. Oakman, Jr., and the purchase of his interest by W. P. Dustin, was received by the trade with much interest, who regarded it as an important change in a leading and successful company. Mr. Oakman is regarded as having been influential in bringing the affairs of this establishment into excellent shape, and so managing matters as to give the company their present prosperity and position, and also contributing much to the understanding which exists among the other manufacturers in this line. The part in this development which was taken by Mr. Dustin is also recognized, and it is conceded that while he was not as prominent in the direction of affairs his wisdom, energy and tact had much to do in accomplishing the result achieved, and it is anticipated that under his direction there will be a continuance of the same policy which has lately been pursued and the maintenance of the position attained by the company. Referring to his qualifications, a recent issue of the Turner's Falls Reporter says:

Mr. Dustin was brought up from youth in the Cutlery business as a salesman for one of the leading houses in the State and traveled

the country over time and again, had a personal acquaintance of untold value, had studied the needs and necessities of every section of the country, even to the peculiarities of sections of individual States, and in early manhood stood at the head of a class of business men possessed of indomitable perseverance coupled with rare intelligence and foresight. A magnificent physique, with perfect health, he was simply a marvel of energy and endurance and a happy disposition that made friends at every turn, success could not be avoided, and he was always forehanded financially as well for himself as for others, and Mr. Oakman's native shrewdness soon discovered the need of such a man in placing the institution in the forefront of the manufacturing industries of the country, and thenceforth the product of the mill was marketed by Mr. Dustin, and with such a master hand in control of the life-giving spring, the old established institution made such strides as it never knew before. Mr. Oakman and Mr. Dustin were a strong team together, but ill-health made a division necessary, and Mr. Oakman retires with the respect and confidence of all his associates, and Mr. Dustin takes on additional burdens of care, with large investments of stock, with the ease born of confidence in his ability to command success in any undertaking in which he might engage. A man who has from boyhood traveled in one straight track, and that leading to honor and success, in whom the most unlimited confidence is bestowed by all classes, whose methods are methodical to a degree bordering on the marvelous, a democratic man whose only distinctions of caste are right and wrong, Mr. Dustin will assume the management of this great corporation with the hearty sympathy of the entire village, who never cease admiring his manly ways, and the associate stockholders, who feel that their investments cannot be otherwise than safe in his hands.

Baker & Hamilton, San Francisco and Sacramento, Cal., who have for a number of years been represented in this city by Charles D. Graham, 88 Wall street, have issued a catalogue of 1008 pages, which gives evidence of careful compilation, as well as of the extent of the manufactures and trade of the house. The volume opens with illustrations of their San Francisco stores, Market, Pine and Davis streets, and of their Sacramento stores and the Benicia Agricultural Works. After the index, which is clearly printed with black-faced letters for the principal classes of goods, 200 pages are devoted to Wagons, Agricultural Implements, Machinery, &c., many of which are of their own manufacture, including a variety of Wagons, Hand and Road Carts, Buckboards, Mowers, Benicia Headers, Barley Crushers, Plows, Cultivators, Harrows, &c., an important line made in their Benicia factory. The Hardware department is prefaced by a circular to the trade, and opens with an extensive assortment of Tools, in which Disston's Saws are given the first place, followed by a large variety of other Tools, after which come Handles, Steel Goods, Rakes, Forges, Nails and an extensive line of Builders' Hardware. Then comes an assortment of miscellaneous goods, including Cutlery, Guns, Ammunition, &c. The volume closes with tables giving information in regard to Cabinet Locks and Padlocks, of which comparative lists are given, and tables of the weight of Iron, number of Nuts, Washers, &c., to the pound, and other matters of interest. The volume, which is creditably printed and well bound, is a specimen of the work of J. R. Brodie & Co., San Francisco, and illustrates the important position occupied by the house issuing it and the enterprise with which they are still pushing their business.

Announcement is made by Wm. A. Ives & Co., Hamden, Conn., that they have disposed of their factories and plant to the Hamden Mfg. Company, of the same place, who will continue the manufacture of their well-known line of goods. The supervision of the mechanical department will not be changed.

The New York School Book Clearing House, 65 Duane street, New York, are contemplating a new enterprise with a special relation to Hardware. With the

space at their command they advise us that they can provide a satisfactory sample-room where traveling salesmen can show their goods. The convenience of the location, its proximity to the center of the Hardware trade and the pleasant accommodations they can furnish are mentioned.

Hamilton & Mathews, Rochester, N. Y., issue a circular of the Rival Apple Parer, Corer and Slicer, manufactured by Kelsea & Co., Antrim, N. H., for whom they are general agents. This machine, it will be remembered, was put on the market last year, when an illustrated description of it was given in these columns. The circular in hand illustrates the machine and gives a full description, pointing out the features of its construction and its advantages, with testimonials from the parties who have used it. The experience of last season is referred to as indicating that the Parer is exceptionally satisfactory and an excellent trade is anticipated. The moderate price at which it is offered is one of the points made in regard to it. Last season all the machines were made to pare, core and slice with four turns of the crank, and this is referred to as being in general the best construction, but as some desire a Parer which will do its work with three turns of the crank, they have made one in which this is accomplished, which they designate their Rival No. 2. It is the same as the other excepting the crank gear and the fork-shaft gear.

#### Trade Topics.

The Legislature of Iowa, as is well known, established a tariff for freight, in order to protect shippers, which, when the railroads endeavored to have an injunction served against its operation, was sustained by the courts. In this condition of things the railroads are reported to be making it as unpleasant for shippers as possible, subjecting them to annoyance and inconvenience, and it is also intimated that they have withdrawn a portion of their passenger service and are changing their time-tables frequently. As an example of the annoyance caused in shipping goods it is mentioned that in a shipment of Wheelbarrows, K. D., the wheels were taken off and billed separately at a higher rate, making the freight on each Barrow more than the profit which would result to the retailer in its sale. The railroads, by this policy, hope so to disgust the public that the freight rates will be left with them entirely.

From the same State we have the following report in regard to the condition of business, with reference also to other matters of trade interest:

We find all, both jobbers and retailers, are complaining of dullness in business. March and April were both busier months than May has been. Low values on goods seem to be the ruling state of affairs, and buyers are reluctant to enlarge their stocks by additional purchases. The prospect for crops of all kinds is very encouraging throughout the State, and a good business is anticipated in the fall.

The majority of the Hardware stores through Iowa are nicely arranged, and rather ahead, if anything, of the towns where they are located. Wood boxes sampled with shelf-ware usually occupy one side of the store, while Tin-Ware and House Furnishings are on the other side. The proprietors as a rule are young, energetic men.

Almost every town of over 3000 inhabitants has one or more stores that job goods to the small surrounding towns, the Interstate Commerce law making this possible in the way of freights to these small jobbers. Traveling men are very numerous in all lines, every train bringing more or less of them, and the query is often made, How do they all live?

In connection with the sale of goods to Canadian purchasers, which are illegally diverted from their intended channel and given a market in this country, we have received information in regard to an amusing instance in which the scheme

failed to accomplish its desired purpose and resulted in a loss instead of a gain by the American recipients of the goods. In this instance the goods purchased by the Canadian firm were controlled by a combination, so far as the dealers in the United States were concerned, and were sold to the Canadian house at some 10 per cent. under the combination price. They were then sold to a leading house in the West, but before they had received the goods the combination referred to had broken, and the goods, therefore, cost the jobber fully 5 per cent. more than if they had been purchased direct from the manufacturer.

A correspondent writes as follows with reference to an objectionable practice which in his experience has been resorted to by more than one manufacturer:

For a long time it has been the custom of some manufacturers when they know there is to be a decline in their goods to send their agents over the country and persuade the dealers that there is a probability of an advance in prices. This, of course, has a tendency to make retailers purchase, and frequently largely in advance of their wants, only to find in a short time there is a decline, instead of an advance. Instead of trying to help the trade who distribute their goods they have very frequently done them an injury. I do not say all manufacturers do this, but still the practice is not uncommon.

#### Referred to the Trade.

From a Hardware house in Alabama who are placing a new stock of goods on their shelves and desire in the arrangement of their store to follow the most approved methods we have an inquiry in regard to the proper place on the boxes to mark cost, selling price, &c., whether on the front, side or bottom. We shall be glad to have replies to this inquiry from the trade.

#### Export Business.

Ex-Consul Porch is referred to as speaking as follows in regard to American trade with Mexico and the apparent lack of enterprise and push on the part of manufacturers in introducing their goods:

American Iron and Steel manufacturers are not aggressive enough to capture the trade of other countries. A large amount of our Iron and Steel Manufactures could be sold abroad if their merits were only published to the world. American Saws are in the Hardware stores at Birmingham, England, and so with many other special articles of American make. They can compete with the world. Of course there is no denying that the existing tariff arrangements hamper this competition, but foreigners will still buy many of our products when they are once convinced of their worth. I know of no manufacturers who are really pushing with any energy their goods into markets beyond our own boundaries. The Britisher has his representatives in Mexico, in Japan, in South America, in the Indies, and forces his goods on the attention of the consumer. This is what our representative men must do. He who is first in the field will reap the benefits. Mexico offers a particularly favorable field for the operations of our manufacturers. There is a wide sale for Hardware particularly. The Germans now principally control this business, and the Hatchets and other edge tools which they offer are worthless as pewter. In my mind it would be an excellent thing for manufacturers of this country to club together and establish an American Iron and Steel Goods emporium in Mexico, where our manufactures could be exhibited for sale, not with the idea of making money at first, but in the hope of rich returns in the not distant future. We may feel that the higher price of labor in this country puts us at a disadvantage, but let us be as energetic and aggressive as our competitors, and the market for American-made articles will be expanded immensely.

From a recent financial report from Adelaide we have a description of things in South Australia which refers to abundant rains as giving exceptional promise of large crops. It is added in regard to the business situation:

The wheat market locally has been very dull, shipments to the United Kingdom have virtually ceased, and what we have to spare will be required for the consumption of the eastern colonies, and for our usual customers

in the East Indies and the Cape Colonies. The quotation at Port Adelaide is quietly steady at 5/ to 5/1 for shipping parcels; in Melbourne quotations have advanced to 5/8 per bushel. Until the aspect of the coming harvest in the Northern Hemisphere is more definite there seems little chance of any serious fall in prices here. The fine rains we have been favored with have exercised a marked effect in restoring confidence in every department of our community, and there are many signs of returning prosperity—steady increase in the savings bank deposits, gradual improvement in retail trade and the tenantry of small tenements long untenanted. The community has learnt a lesson of provident economy; expenses of all kinds have been cut down, and the lesson of self-help been effected by the majority of households. There is abundance of capital for investment, and though there are more securities offering, caution is the first care of capitalists or their representatives.

The last issue of the *Ironmonger* which has reached us refers to the lack of statistics relating to the British Nail trade similar to those which are issued in this country by the American Iron and Steel Association. In the absence of such statistics they are able only to conjecture what their annual output of Nails may be, but it is intimated that the English manufacturers in this line are not doing as much as they ought to be doing, and this point is enforced by complaints which have been received by them from South Africa and elsewhere as to the replacement of British-made Nails by those of American brands. Referring to the position of Nails in this country the *Ironmonger* adds:

In the United States the Nail trade is certainly an important industry, seeing that of Cut Nails alone (not including railroad or other Spikes made from bar iron, Wire Nails of any size, or machine-made Horseshoe Nails) the aggregate production in 1888 amounted to 6,493,591 kegs of 100 pounds each, or equal to very nearly 200,000 tons. This large production was much smaller than that of 1886, but was owing to the increased competition of Wire Nails, of which last year the output was 1,500,000 kegs, or nearly 67,000 tons. Of the Cut Nails 2,170,107 kegs were of iron and 4,323,484 kegs of steel, thus showing that last year the steel Nails counted two-thirds of the total production, whereas in 1884 steel was used for only 5 per cent. of the total. Of iron and steel combined about 218,000 kegs were made in the States last year, almost the whole of them being produced in California; but for what purposes they are specially used or preferred is not stated by Mr. Swank. The leading Cut Nail-producing district is that of Wheeling, which covers two counties in West Virginia and two counties in Ohio, all bordering on the Ohio River. The next most important center of the trade is the central part of Pennsylvania, and third on the list (although at one time it was first) is Allegheny County, Pa. It is not shown that the American Wire-Nail works are located in any particular part of the country, but it is stated that 47 of them were in operation in 1887 and probably a greater number last year. The figures we have reproduced are interesting of themselves, but they also serve the purpose of directing the attention of our Nail-makers to the two central facts they illustrate—namely, the overwhelming substitution of steel for iron in respect of Cut Nails, and the steady displacement of Cut Nails by Wire Nails. In saying this we are well aware of the greatly extended use of steel for Cut Nails in Great Britain, but we are not so sure that Wire Nails have received or are receiving the amount of attention which is being bestowed upon them in Germany and Belgium, as well as in the States.

#### Exports.

PER BARK NANNY, MAY 13, 1889, 10B  
DUNEDIN, NEW ZEALAND.

By Dunbar, Hobart & Co.—6440 pounds Nails, 9240 pounds Nails.  
By Reed & Barton.—4C3 pounds Plated-Ware.  
By Rogers, Smith & Co.—10 packages Plated-Ware, 1 box Plated-Ware.  
By Manning, Maxwell & Moore.—388 pounds Rail Saws, 36 pounds Iron Levers.  
By Fairbanks & Co.—1470 pounds Scales.  
By Coombs, Crosby & Eddy.—36 dozen Hardware, 1040 Rubber Tubes.  
By A. S. Lascelles & Co.—1 case Handles, 1 gross Razor Straps.  
By R. W. Cameron & Co.—4 boxes Machinery, 1 box Dairy Goods, 1 box Dairy Goods.  
By W. K. Freeman.—2½ gross Axle Grease, 1120 pounds Axle Grease, 4 cases Hardware, 684 pounds Wringers, 6 cases Hardware, 8 cases Scales, 22 Lawn Mowers, 3016 pounds Axles, 261 pounds Hardware, 22½ pounds Handles, 1069 pounds Horse Nails.

By *W. H. Crossman & Bro.*— $\frac{1}{2}$  dozen Mangles, 2 dozen Apple Parers, 5 boxes Hardware, 4 dozen Hatchets, 3050 pounds Horse Nails, 18 dozen Handles, 1 box Hardware, 13,536 pounds Barb Wire, 12,286 pounds Barb Wire, 22,420 pounds Barb Wire.

By *Mailler & Quereau.*—50 boxes Clothes Pins, 200 boxes Clothes Pins, 22,375 pounds Barb Wire, 2 cases Cultivators, 7 cases Axes, 31 packages Reapers.

By *Arkell & Douglas.*—29 packages Dairy Goods, 6 crates Ranges, 1 dozen Wrenches, 12 dozen Brushes, 1 case Snaps, 1 case Whips, 1 box Hardware, 12 cases Axle Grease, 4 bundles Blacking, 1 case Hardware, 10 cases and 10 kegs Axle Grease, 3 cases Nails, 1 case Hardware, 14 cases Nails, 2 cases Saws, 1 case Hardware,  $\frac{1}{2}$  dozen Wringers, 2 cases Hardware.

By *Charles Brewer & Co.*—1 case Hardware, 6 cases Agricultural Implements, 10 cases Hardware, 9 cases and 1 bundle Hardies, 7 cases Horse Nails, 2 cases Tools, 1 case Stone, 20 bundles Washboards, 20 cases Agricultural Implements, 13 cases Nails, 6 cases Horse Nails, 2 crates Handles.

By *Strong & Trowbridge.*—1 case Spade Handles, 1 case Tacks, 1 case Spade Handles, 2 cases Wringers, 1 case Pumps, 14 cases Lawn Mowers, 2 cases Axle Handles, 2 cases Shade Rollers, 6 cases Scales, 1 case Forks, 20 cases Axes, 3 cases Castings, 1 case Hoes, 1 case Mangles, 10 cases Carpenters' Tools, 1 case Pumps, 1 case Locks, 1 case Toys, 2 cases Glue, 1 case Ice Cream Freezers, 1 case Rakes, 19 packages Lawn Mowers, 28 packages Stoves and Fire Brick, 1 case Rubber Goods, 2 cases Hardware, 3 cases Tools, 12 bundles Washboards, 1 case Rubber Hose, 1 bale Rubber Hose, 1 box Whetstones, 1 box Bolts, 1 case Wrenches, 1 case Screw-Drivers, 6 crates Churns.

PER SHIP MONROVIA, MAY 15, 1889, FOR MELBOURNE, AUSTRALIA.

By *Healy & Earl.*—2 cases Sand-Paper, 1 box Bolts, 1 Trip Hammer, 2 Iron Safes, 20 cases Wood-working Machinery, 4 crates Road-Scrapers.

By *L. Gershel & Bro.*—30 Carbines, 20,000 Metallic Cartridges.

By *W. K. Freeman.*—2450 pounds Lawn Mowers, 39 cases Handles, 20 dozen Forks, 47 dozen Handles, 16 $\frac{1}{2}$  gross Axle Grease.

By *W. James.*—77 Boxes Lawn Mowers.

By *Frank H. Idione.*—1 case Plows, 6 cases Springs.

By *McLean Bros. & Rigg.*—39 dozen Saws, 4 dozen Miter-Boxes, 1 $\frac{1}{2}$  dozen Boring-Machines, 8 dozen Gate-Latches, 130 dozen Axle Grease, 6 dozen Bench Screws, 1 dozen Sad Irons, 4 cases Agate-Ware.

By *H. W. Peabody & Co.*—8 cases Velocipedes, 12 cases Firearms, 12 cases Shovels, 8 cases Shovels, 50 bundles Washboards, 2000 pounds Nails.

By *Coombs, Crosby & Eddy.*—24 dozen Axle Handles, 22,870 pounds Sheet-Iron, 6 gross Traps, 474 dozen Carpenters' Tools, 72 dozen Thermometers, 25 dozen Padlocks, 150 dozen Traps, 50 dozen Traps, 200 dozen Hardware, 6 dozen Carpenters' Tools, 125 dozen Whip Stocks, 25 dozen Hardware, 50 dozen Strainers, 12 gross Glass Cutters, 76 dozen Thermometers, 72 dozen Carpenters' Tools.

By *A. Field & Co.*—6 dozen Blacking, 11 dozen Harness Tools, 6 dozen Harness-Ware, 3 gross Whips, 12 dozen Harness-Ware, 18 dozen Harness Dressing, 4 dozen Harness-Ware, 36 dozen Whips, 6 Saddles, 6 dozen Harness, 4 dozen Harness, 2 $\frac{1}{2}$  gross Harness-Ware, 2 gross 8 dozen Hardware, 27 Axes, 790 pounds Hardware, 50,000 Bolts, 170 sets Axes, 1700 pounds Hardware, 21 dozen Hardware, 3000 Hardware, 6 $\frac{1}{2}$  dozen Hardware, 31,000 Hardware.

By *Strong & Trowbridge.*—6 cases Whetstones, 16 cases Carpenters' Tools, 8 packages Grindstone Parts, 4 cases Carpenters' Tools, 1 case 1 bundle Whips, 2 cases Castings, 1 case Shovels, 5 cases Wringers, 2 cases Castings, 1 case Forks, 3 cases Locks, 7 cases Tools, 1 case Hardware, 50 kegs Nails, 1 case Pumps, 2 cases Pumps, 1 case Lamp-Ware, 1 case Hardware.

By *R. W. Cameron & Co.*—16 cases Pulleys, 1 case Bushings, 50 boxes Handles, 1 case Whips, 9 cases Velocipedes, 5 cases Hardware, 4 cases Whips, 2 cases Plated-Ware, 2 cases Hardware, 4 cases Wire-Work, 2 crates Blacking.

By *W. H. Crossman & Bro.*—7 cases Hardware, 18 cases Lamp Goods, 108 dozen Shovels, 1 dozen Scales, 4 dozen Tills, 12 dozen Latches, 9 cases Hardware, 2 packages Lamp Goods, 3 dozen Injectors, 8 dozen Pumps, 3 dozen Saw-Sets, 3 cases Hardware, 1 case Hardware, 6 dozen Lawn Sprinklers, 32 dozen Hoes, 24 Hand Spikes, 1 case Hammers, 28 dozen Wrenches, 3 dozen Trowels, 100 dozen Tacks, 24 dozen Hammers, 10 cases Hardware, 1 case Stocks and Dies, 1 package Chucks, 60 dozen Oilers, 1 case Carpenters' Tools, 17 crates Refrigerators, 19 dozen Axes, 1 $\frac{1}{2}$  dozen Ice-Cream Freezers, 250 boxes

Clothes-Pins, 1 gross Graters, 30 dozen Axes, 3 dozen Tills, 6 cases Hardware, 28 dozen Traps, 9 dozen Brushes, 3 cases Hardware.

By *R. W. Forbes & Son.*—23 packages Carriage Hardware, 4007 Bolts, 32 cases Sewing-machines, 2 packages Stamped-Ware, 1 case Rat-Traps, 1 case Fire-Arms, 1 dozen Hay-Knives, 22 packages Oil Stoves, 2 packages Carpet Sweepers, 17 packages Lawn Mowers, 9 dozen Oilers, 3 packages Lawn Mowers, 1 case Brass Goods, 3 packages Hardware, 1 box Pumps, 1200 Nails, 11 boxes Tools, 7 dozen Locks, 1 case Oil-Stones, 22 boxes Lawn Mowers, 55 boxes Lawn Mowers, 1 crate Lawn Pumps, 300 Handles, 1 package Sprinklers, 12 dozen Mattocks, 8000 Primers, 1 case Lamp-Ware, 16,000 Cartridges, 4 gross Sewing-Machine Oil, 1 case Hog-Wringers, 1 case Brass-Ware, 26 dozen Forks, 4 packages Hardware.

By *Winchester Repeating Arms Company.*—50,000 Paper Shells, 10,000 Metallic Cartridges.

By *Simpson, Hall, Miller & Co.*—6 cases Plated-Ware, 9 barrels Glass-Ware.

By *White Sewing Machine Company.*—3948 pounds Sewing-Machines and Parts.

By *Meriden Britannia Company.*—6 packages Plated-Ware, 4 boxes Plated-Ware, 2 boxes Plated-Ware, 8 packages Plated-Ware.

By *Welsh & Lea.*—9 cases Axes, 7 cases Iron Bolts, 4 cases Stone, 2 cases Shovels, 2 cases Hardware.

By *Joseph Dixon Crucible Company.*—2545 pounds Crucibles.

By *Peck, Stow & Wilcox Company.*—32 cases Hardware.

By *Bradley & Hubbard Mfg. Company.*—5 packages Lamp Goods, 59 packages Hardware, 10 cases Hardware, 17 cases Hardware, 40 packages Hardware.

By *Ansonia Clock Company.*—11 boxes Clocks, 34 boxes Clocks, 60 boxes Clocks.

By *Chas. B. Seabury.*—850 pounds Metallic Cartridges.

By *Lazarus & Rosenfeld.*—3 cases Pistols.

By *F. B. Wheeler & Co.*—29 packages Clocks.

By *Crane & McMahon.*—15 cases Spokes, 15 bundles Doubletrees, 2 cases Spokes, 1 case Hubs.

By *Edward Miller & Co.*—13 packages Lamp Goods, 32 packages Lamp Goods.

By *Isley, Doubleday & Co.*—5 reams Sand-paper, 112 pounds Glue, 5 gross Axle Grease.

By *Morris, Strouse & Co.*—9 gross Brooms, 6 gross Shade Rollers, 550 gross Pins, 53 dozen Hatchets, 36 dozen Hammers, 82 pairs Roller Skates, 54 dozen Carpenters' Tools, 36 dozen Iron Tacks, 36 dozen Brooms, 11 gross Sewing-Machine Oil, 46 dozen Mouse-Traps, 5 gross Kitchen Tools, 2 gross Gate Latches, 24 dozen Sad-Iron Stands, 4 dozen Locks, 1 dozen Cork Pullers, 6 dozen Gate Latches.

By *Mailler & Quereau.*—57,328 pieces Roofing Slate, 2 crates Fly-Traps, 30 cases Axes, 10 cases Hardware, 25 cases Axes, 70 cases Axes, 26 cases Axes.

By *Arkell & Douglas.*—21 cases Strops, 3 cases Shade Rollers, 1 case Saw Sets, 1 case Sad-Irons, 15 kegs and 11 cases Nails, 1 case Miter Boxes, 16 cases Hardware, 4 cases Axes, 1 case Washers, 1 barrel Glue, 3 packages Grease, 3 cases Hardware, 9 cases Axes, 4 cases Hardware, 8 cases Carriage-Ware, 5 bundles Rims, 50 cases Wringers, 5 cases Benches, 1 cases Blacking, 27 cases Lawn Mowers, 1 case Carpet Sweepers, 3 cases Tin-Ware, 5 cases Hardware, 8 cases Towel Rollers, 5 cases Wringers, 2 crates Handles, 10 packages Hardware, 8 cases Wringers, 12 dozen Traps, 24 dozen Forks, 4 cases Edge Tools, 3 cases Hardware, 4 cases Hardware, 3 cases Traps, 4 cases Hardware, 2 cases Axes, 4 cases Shovels, 1 case Sand-paper, 17 kegs Nails, 1 case Saws, 1 case Bolts, 6 barrels Glue, 2 cases Hardware.

PER BARK C. H. JAMES, MAY 17, 1889, FOR ADELAIDE, AUSTRALIA.

By *Welsh & Lea.*—2 cases Iron Bolts.

By *R. W. Forbes & Son.*—5 packages Lawn Mowers, 15 gross Bit Snaps, 1 box Hardware, 1 package Hardware, 445 pounds Axle Grease.

By *Walter A. Wood.*—10 Mowers, 10 Reapers, 4 Hay Rakes.

By *Healy & Earl.*—6 cases Reaper Extras, also 1 Pole and 9 Wheels.

By *W. James.*—3 cases Lawn Mowers.

By *Adrianne, Platt & Co.*—18 Reapers, 2 Mowers.

By *T. B. Moore.*—1400 pounds Nails.

By *Ansonia Clock Company.*—23 boxes Clocks, 4 boxes Clocks.

By *Strong & Trowbridge.*—4 bales Rubber Hose, 1 case Wire Goods, 7 packages Lamp Goods, 12 crates Pails, 10 cases Wringers, 2 cases Mangles.

By *Isley, Doubleday & Co.*—6 gross Axle Grease, 560 pounds Axle Grease, 1120 pounds Axle Grease, 7 $\frac{1}{2}$  gross Axle Grease.

By *McLean Bros. & Rigg.*—20 Reapers, 45 Harvesters and Binders and 16 cases Re-

pairs, 1 case Windmills, 1 case Emery Stones, 144 dozen Handles, 4 reams Sandpaper, 6 dozen Forks, 18 gross Handles, 3 dozen Handles, 15 dozen Handles, 1 case Lamp Goods, 3 Drills, 2 dozen Plumbs and Levels, 6 Mangles, 3 gross Door Buttons, 8 dozen Hoes.

By *W. H. Crossman & Bro.*—234 dozen Handles, 20 Meat Choppers, 33 dozen Axes, 24 sets Axes, 3 dozen Hay Forks, 6 dozen Hatchets, 6 dozen Saws, 4 cases Hardware, 10 gross Shade Rollers, 5 gross Polish.

By *Mailler & Quereau.*—41 packages Reapers, 2669 pounds Axes, 1 package Iron Castings.

By *R. W. Cameron & Co.*—4000 pounds Velocipedes, 4500 pounds Refrigerators, 10 cases Axes, 1 case Castings, 24 dozen Axle Handles, 5 gross Clothes Pins, 2 gross Clothes Pins, 5 gross Clothes Pins, 10 dozen Washboards.

By *H. W. Peabody & Co.*—1000 Handles, 2500 Handles, 15 cases Hardware, 6 cases Lamp-ware, 1 case Strops, 1 case Agate-Ware, 3 dozen Wash-Boards, 9 packages Clocks, 11 cases Perambulators, 4 cases Glass-Ware, 40 cases Hardware, 4 cases Lamp-Ware, 42 dozen Taps, 2 cases Stoves, 7 cases Glass-Ware, 2 bales Cordage, 7 cases Agate-Ware, 3 cases Traps, 3 cases Agricultural Implements, 12 packages Wringers, 3 cases Lawn Mowers, 1 $\frac{1}{2}$  gross Grease, 13 cases Fire Arms, 40 dozen Wash-Boards, 130 dozen Handles, 1500 feet Hose, 1 case Barometers, 1 case Sifters, 6 dozen Brooms, 7 rolls Wire Cloth, 49 packages Hardware, 71 packages Carriage-Ware, 50 dozen Handles, 3 crates Fiber-Ware, 9 packages Hardware, 600 feet Belting, 5 cases Wringers, 30 dozen Handles, 1 case Perambulators, 1 barrel Lamp-Ware, 1 case Stoves, 1 case Stamped-Ware, 7 cases Hardware, 1 case Agricultural Implements.

### Arrangement of Stores.

The accompanying illustration, Fig. 341, represents a method of displaying Brushes of all kinds in use by Geo. O. Hart & Son, Paducah, Ky. The racks or shelves for the Brushes are made of tin and are finished with a  $\frac{1}{4}$ -inch bead as shown in Fig. 342, and a steel bar  $\frac{1}{4}$ -inch round is inserted in the bead. The frame-work or

Fig. 341.—Brush Rack.

arches are made of iron which fit in sockets attached to the floor at each end. The first shelf is made of X tin and has a bead turned up on both sides, so that the brushes will not fall off. The upper ones are made in the same way, only they are turned over and have the bead down. In one-half of the shelves there are  $\frac{1}{4}$ -inch holes punched with tinner's punch and in the other half the holes are 1 inch, sizes which are referred to as admitting any

size of Brush handle. The hooks attached to the arches are 2 inches long and made of wire, and are soldered to the top of the arches and to the center of the frame above. The whole is painted black except that the hooks and all the shelf edges are gilded, which gives the rack the appear-

Fig. 342.—Beaded Shelf.

ance of one purchased, and in fact produces an attractive effect, and a very neat and satisfactory display is secured when the rack is filled. Its adaptation to all kinds of Brushes is another point made in its favor. The feet or sockets are made of galvanized iron. Since the rack has been in use in the store of Messrs. Hart & Son they advise us that it has attracted much attention, and they will be glad to give information to any who desire to use it, and thus contribute somewhat to the advancement of Hardware interests in the convenient and attractive display of goods.

We are indebted to J. R. Gallinger, of Osakis, Minn., for a description of the method of displaying bird cages in his store. He employs the same device for suspending strainer pails and coffee boilers, also for lanterns and gallon oil cans. The engraving (Fig. 343) herewith shows the general arrangement. The ring on which the cages are hung is made of  $\frac{1}{4}$ -inch round iron, is 4 feet in diameter, and provided with four No. 12 common wires attached at equal distances apart. The other end is attached to a 1-inch or  $1\frac{1}{4}$ -inch breeching ring, to which is attached in turn a  $\frac{1}{4}$ -inch rope. This rope runs to the ceiling through a common pulley at one side of the store, then across to another pulley and down to the second ring, from

Fig. 343.—Arrangement of Bird Cages, Pails, etc.

which are suspended a dozen pails. Two rings of this kind will hold a dozen bird cages and a dozen pails, the one balancing the other. The arrangement is such that one ring can be pulled down by means of a string attached, as shown in the engraving, to within 5 feet of the floor, while the other ring goes to the ceiling, which is about 10 feet. If it is desired both rings may be adjusted to a distance of  $7\frac{1}{2}$  feet from the floor, so as to be out of the way. This plan is said to be very convenient, and appears to fully meet all the requirements of the case.

#### Cheap Stove Truck.

Take 1 x 6 inch lumber and saw as shown in Fig. 344, which gives four right-angled triangles to be used for corner-pieces. Then get out four strips of suitable length,  $3 \times \frac{1}{4}$  inch, for ends

and sides, and nail to corner-pieces as shown in Fig. 345, the corner-pieces being nailed in the center of the strips, so they are 1 inch below the edge of strip, which

Cheap Stove Truck.—Fig. 344.—Triangular Pieces for Corners of Truck.

prevents the stove legs from slipping off. Take a set of Martin's casters, screw one to each corner-piece, and by painting black

Fig. 345.—The Finished Truck.

or red one has a truck that cannot be beaten for cheapness, lightness and durability.

#### Make the Store Attractive.

The following interesting article on the subject of store fittings and attractions we take from a late issue of the *Merchant World*:

Talking with an old retail merchant recently, we were impressed with the following remark, which had so much common sense and good philosophy in it. He said: "The way to make the store attractive is to have the articles on hand when the people want them. I found this

perience that we dislike being told by the storekeeper that the article or articles we ask for are not on hand, and we form a sort of opinion not very favorable to the establishment. On the other hand, if we are promptly and efficiently served with the goods desired, there is at once a feeling of satisfaction and of good-will toward the merchant. At this time, when retail dealers are making out their memoranda for new goods, what an efficient aid such a book would be to them. After they had gone through the stock to get posted as to what goods to buy and what not, a daily memorandum of "articles not on hand" would fit in nicely, and the buyer would go to market with more definite and minute information as to the stock to be purchased than ever before.

A nice, well fitted up and convenient store building is not all that is required to increase and hold trade: a well-selected stock of goods is the most important matter. It is the variety and nicety of assortments which form the center of attraction. Store fittings and fixtures pleasant and agreeable are valuable accessories, but the main feature of interest to customers is the stock. In so far as the surroundings create a favorable impression, to that extent they are of value; it is, however, the goods for sale that are the chief consideration. Are they well selected and well bought? Do they possess styles, quality and general adaptness to the wants of the community in which they are to be sold? If in the buying of them all these essentials are fully met, the merchant can feel assured that he will have customers who will appreciate his skill and judgment in purchasing new assortments.

No merchant can make his store attractive who does not have an attractive stock. A nice, well-arranged store building and an ill-assorted stock of goods would form a bad partnership. The firm would not long continue in business, for it would expire for want of patronage. The period has again arrived for selecting new goods. Retail merchants are preparing to visit the large wholesale markets. Their success in business depends on their success in buying. To this department their special attention should be given. We have deemed it opportune, therefore, to dwell on this important feature of store attractions—the most important of all. Become fully posted as to the stock on hand, so that the same class of goods will not be repurchased; note the styles and fabrics that have not sold freely, so as to avoid them in future; get a clear idea as to the quantity of new goods required, so as not to overbuy, and finally, be determined that this autumn you will have the best assorted stock on sale you have ever kept.

Ex-Consul Withers, representative of the late Administration at Hong Kong, remarked the other day that in some respects the United States is commercially gaining a better footing in Hong Kong, while in others it is rapidly losing ground. "In cotton goods particularly," he said, "we are not nearly as strong as a few years ago. The English and Germans seem to be crowding American cotton goods products out of the market. Then in the petroleum supply America once sent China through Hong Kong nearly all of this oil. Refining in Russia has advanced to the point where her product is taking the place of Pennsylvania oil, and this trade has fallen off unmercifully. In one thing the United States holds her own. The Chinese have taken a great fancy to clocks and watches, and so country seems to be able to compete with Yankee enterprise in this direction. Americans monopolize this branch of trade wholly, and indications are that they will continue to do so."

## Paints and Oils.

### Paints and Colors.

The rapid advance in the price of National Lead Trust Certificates on the Stock Exchange, and the announcement in explanation thereof that the Collier and the Southern companies have joined the trust, has been the uppermost feature of interest in the White-Lead market. Persons conspicuous in the speculation assert that the trust, with these acquisitions, will control 60 % of all of the corrodors of the country and that the "combine" would be in a fair way to dictate to the White Lead Manufacturers' Association on all matters of production and prices. Not only that, but a suspicion is created that with the companies named and the Atlantic Company secured the trust will fall into Standard Oil control and ultimately force independents into the fold or freeze them out of the business by methods in which the Standard interest is highly accomplished. As for business in Leads, there is little to note apart from the fact that it is of good average volume, with former prices and rebates current.

*Red Lead* and *Litharge* continue to meet with good, steady sale, and prices for pigments are well maintained, both by manufacturers and jobbers.

*Paris Green* is moving quite freely in delivery on back orders, and manufacturers report a good amount of new business as well. The association prices and discounts remain unchanged, and no underselling by jobbers is attempted.

*American Zincs* continue to meet with quite a liberal sale, and prices for the several grades are well maintained. Foreign Zincs are selling in a satisfactory way and at firm prices.

The high price of *Quicksilver* has stimulated purchases of Quicksilver Vermilion to some extent, but manufacturers are filling current orders at old prices. Lead Vermilion is selling very fairly at steady prices.

*Venetian Red* of the lower grades is a trifle weak, with sales of both English and American reported at as low as 90¢ per 100 lb, but the high grades are quite firm and selling fully as well as the cheaper article.

In other dry Colors there is little or no business of other than routine character, and prices are showing no material variation. Colors in oil move steadily at former prices.

*Chalk*, *Whiting*, *Paris White*, *Talc* and *Terra Alba* are not better than barely steady at previous prices, and meet with rather slow movement in other than jobbing quantities.

In order to serve the convenience of the trade in these lines, it will be observed that on pages 888 and 58 we give quotations on an extended assortment of paints, oils, colors, &c.

### Oils.

City crushers are experiencing a good, steady demand for *Linseed Oil*, which, apart from other conditions, keeps the market for their product in a strong position. The cost of Seed, however, figures in no small degree as a factor, and the advices from foreign markets, as well as the reports from the West, indicate that the price of the raw material is more likely to advance still further than to decline during the next three months. As yet orders are filled at 59¢ for raw Oil and 62¢ for boiled, but an advance to 60¢ for the former is liable to be made any day. Comparatively little Western Oil comes this way, and 57¢ is the lowest price at which any of it is sold. Jobbers are said to be selling considerable Rosin Oil in mixture with pure Linseed, and the consumption of the latter is thereby cut down fully 20 %.

*Cotton-Seed Oils*, after a somewhat protracted period of dullness, are selling with greater freedom, and the increased business has led to a decided hardening of prices, particularly for the crude article. There have been transactions in the article the past week involving fully 2500 barrels, at from 34¢ @ 35¢ for inferior qualities, up to 40¢ for prime. Several hundred barrels of Summer Yellow have been placed also, mainly on the basis of 48¢ for prime. The American Cotton Trust interest is said to have purchased more or less "independent" Oil and thereby toned the market up considerably. In connection with the rise on Cotton Oil certificates on the Stock Exchange, these purchases are looked upon as ominous by some parties, but the advance was really due to reports of a probable dividend announcement.

*Lard Oil*—Has ruled quite firm during the week, under the support of a good steady demand, together with harmonious relations between city pressers and moderate offerings from the West. Present make prime brings 56¢ in round lots and 57¢ in jobbing quantities, while Winter Pressed is strong at 60¢ and the low grades fairly steady.

There has been no change whatever in *Sperm* or *Whale Oils*. The crude products are very firmly held at New Bedford, although the supply on hand is quite liberal, and the manufactured Oils have steady sale at unchanged prices.

*Crude Menhaden Oil*—Is looking rather weaker; manufacturers have been free sellers of Pressed, Bleached and Tanners' Oils at low prices, while holders of crude manifest some anxiety to unload in view of the near approach of the new fishing season. New Southern crude has been offered at 25¢, with indifferent results, and over 28¢ is exceptionally high on Sound.

Three cargoes of *Cocunut Oil* have been detained at distant points by disasters to ships, and no fresh arrivals prior to August are expected. Prices are therefore strong and tending upward.

In other Oils there has been merely the routine business, and prices have undergone no striking changes.

It is claimed that the recently-completed San Diego flume in California is the most stupendous ever constructed in the world, being only a little short of 36 miles long. An idea of the gigantic character of the work may be obtained from the fact that the amount of lumber consumed was more than 9,000,000 feet, or, allowing the very considerable yield of 1000 feet to each tree, not less than 9000 trees were required. In the course of the flume there are some 315 trestles, the longest of these being 1700 feet in length, 85 feet high and containing 250,000 feet of lumber. Another trestle is of the same height and 1200 feet long, the main timbers used in both of these being 10 x 10 and 8 x 8, being put together on the ground and raised to their position by horse power. The number of tunnels in the course of the flume is eight, the longest of which is 2100 feet, the tunnels being in size 6 x 6 feet, with convex-shaped roofing. Each mile of the flume required an average of 250,000 feet of lumber for its construction, and the redwood used entirely in the box is 2 inches in thickness throughout.

Consul Bissinger, at Beirut, Syria, in a report to the Department of State, says that Syrian silk growers now look covetously toward the United States as a market for raw silks. Silk reellers in Syria are manifesting much anxiety to establish direct intercourse with manufacturers in the United States. The silk cultivator, however, is puzzled to know why the United States manufacturer should want to pay an advance of 8 to 10 per cent. for Syrian

silk in the form of commissions to Marseilles and Lyons firms, when he could put himself in direct communication with reputable Syrian firms which are eager to establish mutually profitable relations.

### An Elegant Passenger Steamer.

The Continental Iron Works, of Brooklyn, N. Y., launched on the 21st inst. the hull of a new propeller for the passenger line plying between Albany and Catskill-on-the-Hudson. She was christened the General Butterfield, in honor of that gentleman, who is financially interested in the line and one of its principal managers. The Butterfield is the usual type of an iron and steel vessel as is generally constructed at the present time. She is 180 feet on the water-line and 140 feet over all, 28 feet beam and 9 feet 6 inches depth of hold. The motive-power will consist of compound engines, with 17-inch high-pressure and 32-inch low-pressure cylinders and 2 feet stroke. The boilers will be of the ordinary horizontal tubular type. She will have three water-tight bulkheads and steam steering apparatus. Her joiner work will be of the most elegant and costly character, and her entire furnishings will be in keeping with the munificence displayed of late years in the adornment of river craft, including electric lights and bells. The Continental Iron Works are located in what is known as the Eastern District of Brooklyn, and are historical for having launched from their capacious yard some of the largest and most important iron vessels built in this country, among which were many ships of war. The officers of the company are: Thos. F. Rowland, president; Warren E. Hill and Chas. E. Corbett, vice-presidents, and Thos. F. Rowland, Jr., secretary and treasurer.

A new company, organized for the purpose of conducting transportation on the lakes, propose to put 12 mammoth steel steamers into the water as fast as they can be built. A telegram from Duluth says the boats will be constructed at Sandusky, on Lake Erie, and will cost in the neighborhood of \$325,000 each. They will be 326 feet long each, with a carrying capacity of 3500 tons. They will be named after States, the six Eastern States being the names of the freight boats and the six Western ones being the passenger craft. This line will be called the States-Anchor Line, and the capital is said to be \$12,000,000. Prominent railroad men, principally of the Pennsylvania system, are the projectors of the line, which, when completed, will be by far the most complete on the chain of lakes.

It is said that proof of serious discrimination in import rates against the port of New York has been gathered by the New York trunk lines. Tin-plate furnishes the most glaring instance of the ocean and rail rate combined being less than the inland rate alone from New York and Philadelphia. Early in May the rate on tin-plate from Liverpool to Chicago by way of Philadelphia was 22/6 per ton of 2240 pounds. This is equivalent to a through rate of 24 1/8 cents per 100 pounds, against a rate from New York to Chicago of 30 cents per 100 pounds, and from Philadelphia to Chicago of 28 cents. The through rate from Liverpool to Indianapolis is 23/6 per ton—equal to 25 1/8 cents per 100 pounds, against a New York rate of 28 cents and a Philadelphia rate of 26 cents. From Liverpool to St. Louis a rate of 27/6 per ton, or 29 1/8 cents per 100 pounds, has been allowed, while the New York rate is 35 cents and the Philadelphia rate 33 cents.

### The Empire Tea-Kettle Handle.

The Empire State Mfg. Company, of Buffalo, N. Y., have placed upon the market a patent handle designed for use in connection with tea-kettles and similar utensils. This handle is made of brass and

Empire Tea-Kettle Handle.—Fig. 1.—General View of Handle, Showing Method of Connecting Ears with Bail.

provided with ears of such construction that the bail may be retained in any position desired. In Fig. 1 of the accompanying illustrations is shown a general view of the handle, bail and ears, the manner of joining the latter being clearly indicated. Figs. 2 and 3 show the

Fig. 2.—Showing Handle in Horizontal Position, with Dotted Line Indicating Range of Positions.

handle attached to a kettle, and indicate by means of the dotted lines the range of positions in which the handle may be placed. The work of combining the ears and bail of the handle is performed by

Fig. 3.—Handle in Vertical Position.

means of a press, thus insuring accuracy and uniformity of execution. The ears are so shaped as to readily fit a tea-kettle breast, and are connected to the bail without the use of rivets. The peculiar manner of effecting this junction is one of the principal features of the device to which the makers direct attention. The portion of the article which comes in contact with the hand is made of wood carefully enameled and of the proper size. The Empire tea-kettles upon which this handle is used are made in two styles—full copper and half copper. The former style is made

of heavier stock and higher breast than the latter, and has a copper spout, while the latter has a tin spout. Extra brass is used in making the handles for the copper kettles, while tin is employed in those for the half-copper kettles. The device is very simple in construction and is claimed to possess advantages in the way of convenience and utility which cannot fail to be appreciated by all in the trade.

### Bean's Compact Home.

The accompanying illustration, Fig. 1, represents an outfit for camping, beach parties, lawn use, and also for surveyors, trappers, &c., which is put on the market by E. D. Bean, 147 Washington street,

Fig. 1.—Bean's Compact Home.

Boston, Mass. When packed and ready for shipment its appearance is similar to an ordinary water-proof canvas-covered trunk, as shown in Fig. 2, which gives also, it will be observed, the weight and dimensions of the outfit. When ready for occupancy it is arranged in the form of a tent, as shown in Fig. 1. The end covers when opened form a support for the bed, which is 3 feet wide, 6 feet 4 inches long and 18 inches from the ground, and is readily removable. The trunk or box is constructed so that it forms two seats when open. The front side is hinged to the bottom and turned down to the ground, with half of the covers forming the floor. The tent poles stand on the outer edge of the side covers. The trunk is made of

Fig. 2.—Compact Home Packed for Shipment.

matched lumber, has 19 wrought-iron hinges and is braced throughout. The home or tent thus provided is referred to as large enough for the accommodation of two persons, with ample room for packing guns, fishing-rods, &c. This home is

manufactured in two grades from the same material, the difference being in finish. One is plain with a white tent and the other finished in colors, said to be very attractive in appearance. The home thus furnished is 6 feet 4 inches long, 5 feet wide and 6 feet 6 inches high. Its adaptation to the purposes for which it is intended, its convenience and comparative inexpensiveness are points made in regard to it. Prices are referred to in the Trade Report.

### The Little Giant Axle Setter and Straightener.

This article is manufactured by Wells Bros. & Co., Greenfield, Mass., and is

Little Giant Axle Setter and Straightener.

as not to mar the paint. In use the straightener is placed on the axle, and with the bearing on the round bolt tight the square-head bolt is turned up and the axle forced into position. The straightener can be applied in any position necessary to make the axle straight. The manufacturers mention that by this means axles bent in any shape can be set, without removing the axle, to their original shape, and claim that four axles can be straightened in less time than is usually required to remove one axle preparatory to setting it.

**Indurated Fiber Fire-Extinguisher.**

Among the latest novelties in indurated fiber-ware offered to the trade by Cordley & Hayes, 173 Duane street, New York, is a fire-extinguisher of this material, which is illustrated in the accompanying cut. The apparatus as shown consists of a deep bucket covered with a proper arrangement to prevent evaporation and fitted with a hand force pump at one side, the Johnson patent fire-pump or the Hydrostatic Champion being used. The receptacle is charged with water, either pure or mixed with salt or other material to prevent

*Indurated Fiber Fire-Extinguisher.*

freezing. The chief advantages of this apparatus, as compared with other forms of extinguishers, are: It is very simple in construction, having no valves, cocks or appliances to be understood before using; is durable and easily re-charged, even when in use, and throws a large stream of water. The apparatus holds from 5 to 6 gallons of water, and has an extreme height of 2 feet 6 inches and diameter of 10 inches. The method of using it is indicated in the cut.

**Fray's Ratchet Brace.**

John S. Fray & Co., Bridgeport, Conn., are manufacturing the ratchet brace shown in the accompanying illustration, which shows some of the features of its construction. It is put on the market as embodying many advantages and as meeting the want for an article of this kind of excellent quality. The manufacturers call special attention to the arrangement of the ratchet. In it there are two hinged pawls of steel, which are kept in position with the ratchet-wheel, which is also of steel, by means of spiral springs, but are raised out of contact therewith by a concealed or

internal cam formed on the inside of a rotating ring, which fits into the ratchet frame. This ring, when in a central position, permits both pawls to be in contact with the ratchet-wheel, locking it and preventing any ratchet motion. Turning the ring to the right or left permits a forward or backward ratchet motion, as desired. The chuck or bit-holding device is Barber's style of socket and jaws. To these steel jaws a spring made of music

*Fray's Ratchet Brace.*

steel wire is added, and performs a double duty. Passing through the rear or inner ends of the jaws it acts as a pin, holding them in place with each other, while it permits the free movement of each to the full extent of the sleeve in adjustment to the different sizes and shapes and bit-shanks, and passing back of the jaws, in which a spring cavity is formed, the ends of the spring engage and act upon the jaws adjusted forward of the centers, holding them open through their length. The sweep, jaws, pawls and ratchet are of steel, the handle is of cocobolo, the head of lignum-vitæ, the whole well finished and the metal parts nickel-plated. The manufacturers allude to the advantages of this construction, and refer to the favor with which the brace has thus far been received. It is made in 8, 10, 12 and 14 inch sizes.

**Walker's Improved Cigar-Cutter.**

This article is made by the Erie Specialty Mfg. Company, 345-351 West Twelfth street, Erie, Pa. It is the invention of E. Walker, and a patent is pending covering its special features. Its form and appearance are shown in illustration below. It is constructed with holes of different sizes, under which a revolving knife is operated by a projecting lever,

*Walker's Improved Cigar-Cutter.*

which is to be pressed down to cut the cigar, and springs back to place when the pressure is removed. As will be seen by the cut, the front of the machine is set at an angle, where, when ordered in quantities, a polished bronze plate of raised letters advertising the customer's business is fastened, or it may be used to call attention to any desired brand of cigars.

The attractiveness of the design and the fact that the cutter is finely finished in nickel and bronze are points made in regard to it.

**Cream City Grater and Slicer.**

The Geuder & Paeschke Mfg. Company, of Nos. 162 and 164 West Water street, Milwaukee, Wis., are offering the trade an interesting novelty in the way of

a kitchen utensil, known under the name of the Cream City grater and slicer. Fig. 1 of the accompanying illustrations shows the grater, while Fig. 2 shows the other side of the device, which is used as a slicer. This article is strongly made throughout and is provided with a substantial handle and is claimed to be very rapid in operation. The statement is made that it is entirely self-cleaning, it only being necessary to rinse it in

*Fig. 1.—Front View of Grater.**Fig. 2.—View of Slicer.*

water. The slicer is so arranged as to be admirably adapted for slicing potatoes, apples, cucumbers and the like. Fig. 3 represents the Cream City revolving machine, adapted for grating and slicing purposes, but so constructed as to perform the work in much less time than by the use of the device first mentioned. This machine

*Fig. 3.—Revolving Grater and Slicer.*

is well made in all its parts, and is placed upon the market as a device well calculated to grind almonds and cut small vegetables for pickling. Patents are now pending covering the principal features of novelty.

## Legal Decisions.

### TELEGRAPH COMPANY—NIGHT MESSAGE—DELIVERY—DAMAGES—MESSAGE BURNT.

F. sent a night telegram to the office of the Union Stock Yards, at Chicago, at which there was a day office only. The message was received at Chicago during the night and put on the Stock Yards hook, whence night messages were taken and transmitted about half-past 6 in the morning. During the night, through atmospheric influences, a fire broke out in the Chicago offices and burnt everything up, this message included, the efforts to save these Stock-Yards-hook messages having failed. By the terms of this message it was taken at reduced rates on condition that it should not be delivered until morning, and there was in this same stipulation this provision: "The sender will not claim damages for errors or delays or for non-delivery of the message, happening for any cause, beyond a sum equal to ten times the amount paid for transmission." The sender, who had wired for a cargo of hogs, demanded damages for losses suffered by reason of the stock not reaching him, which caused him to break his contract to deliver it, and the company denied any liability for the failure to deliver the dispatch. An action was brought—Fowler vs. the Western Union Telegraph Company—in which two defenses were set up: 1. That by the terms of the blank used they were not liable beyond ten times the sum paid for the transmission of the message. 2. That they were not liable for non-delivery of the message at all, because of the destruction of the message by fire, which did not arise from their negligence. The Supreme Judicial Court of Maine in deciding the case ruled the first point against the company and the second in their favor. Judge Foster in the opinion said: "1. We are clearly of the opinion, however the courts of other States have decided, that the stipulation of the message-blank that the company shall not be liable for the failure, for errors, delays or omissions, 'happening from any cause,' is against public policy as unreasonable and void, because it protects the company from liability for their own negligence. Though the stipulation is part of the agreement to send the message at a reduced rate it is not valid, notwithstanding we hold the agreement to transmit it at the reduced rate binding on the company, there being a sufficient consideration therefor in the delay in delivery. 2. The company, however, are liable for negligence only, and we cannot see how they have been negligent in this case. They could not guard, so far as we are informed by the evidence in the record, against the fire which burned this dispatch, with the other contents of the Chicago office. It does not appear that the company had any reason to expect this calamity: at the most it was a possibility only. In any event there was no negligence on the part of their agents or agencies, chemical or mechanical, which must be clearly established to give the plaintiff the damages he demands."

### PARTNERSHIP—DISSOLUTION—MAIL AND COLLECTIONS.

A., who owned a soapstone quarry, made a partnership agreement with B., who had a mill to grind the stone, by which he was to supply the stone to be ground, and A. was then to receive the product and sell it on a commission, but all the money was to be paid to B., who was to manage the financial part of the business. The business was carried on under an assumed name, and the agreement came to an end. B. sued for an injunction to prevent A. from receiving and opening the mail addressed to the name of the business, though A. continued business in the same name. A preliminary injunction was

granted and a motion was made in the case—Wagoner vs. Warne—which the New Jersey Court of Chancery refused to vacate. It ordered that the mail should be delivered to a disinterested party, to receive and deliver the letters to each party as he might be entitled.

### COVENANT IN RESTRAINT OF TRADE—UNREASONABLE RESTRICTION.

P. entered into an agreement not to "manufacture, sell nor cause to be sold any seed-preparing machines of any description," and a suit was brought for an injunction to restrain him from violating this covenant. P.'s demurrer to the complaint was sustained, and the case—Berlin Machine Works vs. Perry—went to the Superior Court of Wisconsin, where the judgment was affirmed. Judge Lyon in the opinion said: "It is contended that restrictions of this character, if made as incidental to the sale of patents and a business thereunder, are valid, no matter how general and unlimited such restrictions may be. The rule is otherwise. Such restrictions to be valid must not be unreasonable, due regard being had to the subject matter of the covenant. The restriction here is not reasonable, since it is not necessary to protect the plaintiffs or their assignor, for it goes beyond the sale of such machines and prevents Perry from exercising his powers of invention."

### INSOLVENCY—PROPER BOOKS OF ACCOUNT.

A discharge in insolvency was denied by the Supreme Judicial Court of Maine, in the matter of Merryfield, a manufacturer of barrels, who bought small parcels of timber lands, about 300 acres in all, from which he cut the timber and made it into staves and headings at his own saw-mill, on the ground that he had not kept proper books of account, the court deciding that he was a "trader," and that his books must show the application and use of the money for which he became indebted in his business.

### Use of Ropes.

The following suggestions regarding the use of ropes we take from a translation in the *American Architect* of an article in the *Bautechnische Zeitung*:

With hemp ropes the character and probable strength may be judged in some degree from the appearance. A good hemp rope is hard, but pliant, yellowish or greenish-gray in color, with a certain silvery or pearly luster. A dark or blackish color indicates that the hemp has suffered from fermentation in the process of curing, and brown spots show that the rope was spun while the fibers were damp, and is consequently weak and soft in those places. Sometimes a rope is made with inferior hemp on the inside, covered with yarns of good material, but this fraud can be detected by dissecting a portion of the rope, or, in practiced hands, by its behavior in use. Other inferior ropes are made with short fibers, or with strands of unequal strength or unevenly spun. In the first case the rope appears woolly, from the number of ends of fibers projecting, and in the latter the irregularity of manufacture can be seen by inspection. Occasionally a hemp rope is spun with a core or central strand, such as is used in the interior of many wire ropes. This somewhat increases the strength, but the core, shut in by the outside strands, is liable to rot and infect the rest, and any rope with a musty, moldy smell should be rejected.

The best hemp comes from Russia, Switzerland, Alsace and Northern Italy, and it is said that the strongest fibers are obtained from plants grown at the foot of high mountains. Ropes to be used on board ships, or where they are liable to be often wet, are usually soaked in tar to preserve them, but the

tarring diminishes the strength by about one-third and increases the friction of the rope. The injurious action of tar upon the hemp-fibers seem not to be clearly explained, but it is said to be lessened by subjecting the tar, before applying it to the rope, to repeated melting and washing with water. The effect on a rope of soaking with water is, however, worse than that of saturating with tar. According to accurate experiments, the tensile strength of a wet rope is only about one-third that of the same rope in a dry condition, and a rope treated with grease or soap is weaker still, apparently through the influence of the lubricant in facilitating the slipping of the fibers. It should never be forgotten that hemp cords contract strongly on being wet, a dry rope 25 feet long shortening to 24 feet or less when dipped in water or exposed to heavy rain.

Hawkrigge Bros., 22 and 24 Custom House street, Boston, Mass., have been recently appointed exclusive sales agents in New England for John Illingworth & Co. and New Jersey Steel Works, of Harrison, N. J. Hawkrigge Bros. carry a full line of the products of these mills in Boston.

# CURRENT HARDWARE PRICES.

MAY 29, 1889.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers' prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers, at the figures named.

**Fig. 2—Elevation of Cylinder, Showing Valves and Pipe Connections.**

THE AMERICAN ELEVATORS IN THE EIFFEL TOWER-PARIS EXPOSITION.

# THE IRON AGE

THURSDAY, JUNE 6, 1889.

## Elevators in the Eiffel Tower.

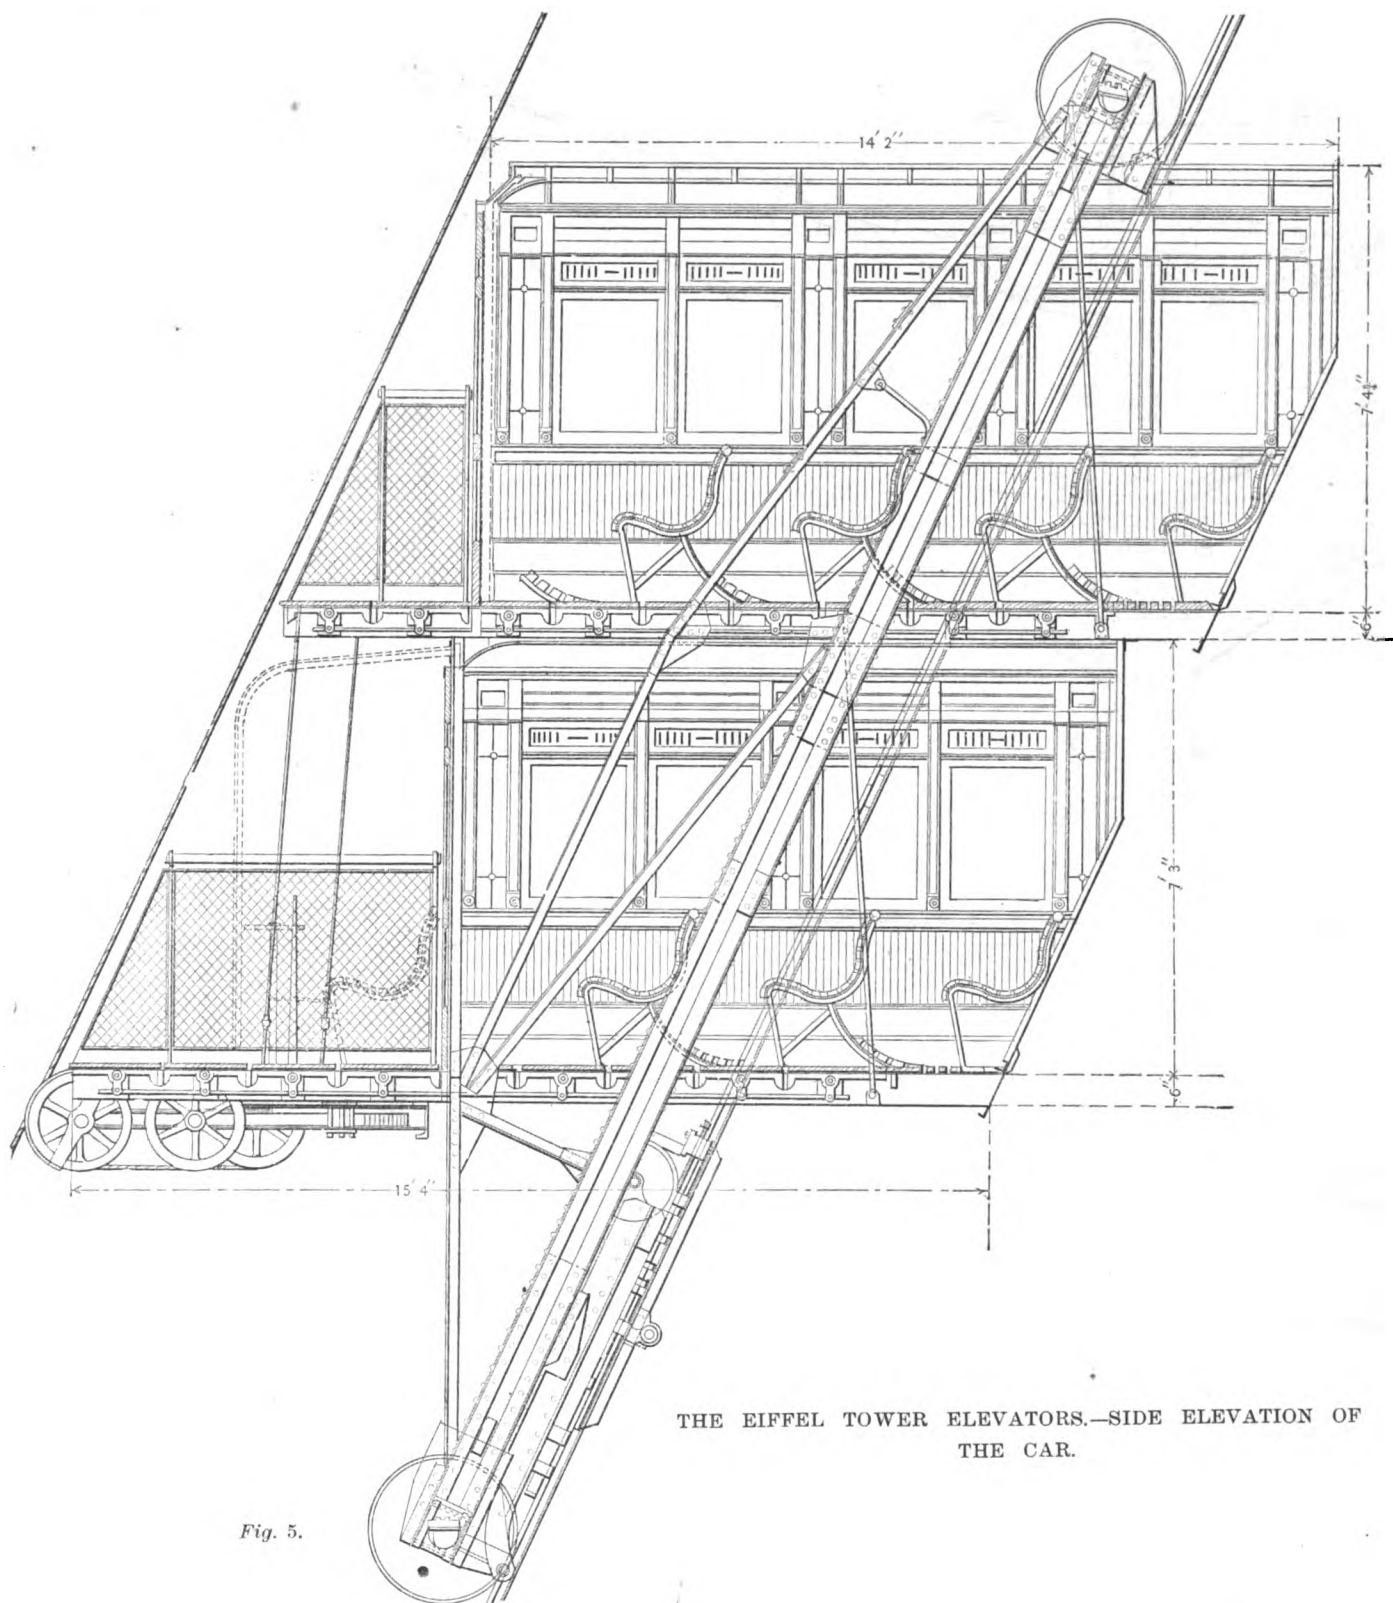

*With Supplementary Page of Engravings.*

Now that the Eiffel Tower, the greatest feature of the French Exposition, looking down as it does upon all the high struct-

general design of the work was adopted and well worked out, for unusual difficulties are presented by the nature of this design which render it impossible to use the ordinary lifts.

The four great legs of the tower spring from the corners of a square which measures about 375 feet on its sides, and they converge in a graceful vertical curve to-

neted by arches on each side of the square. These clear spans give architectural beauty to the design, and to avoid obstructing them, all means of ascent are placed in the legs and must conform to their curves and inclinations. In this respect the elevators are of the nature of inclined railways of very steep angle and varying gradients. The original design was to construct an

Fig. 5.

ures and monuments of the world, has been opened to the public, much interest centers in the various means supplied for its ascent. It would seem that little real thought was given to this necessary adjunct to the great structure until after the

ward the center of the square, meeting at a point some 400 feet above the foundation. Here is situated the middle landing, or second floor, and from this point the tower, more like ordinary structures, tapers to the top. The four legs are con-

ected by arches on each side of the square. These clear spans give architectural beauty to the design, and to avoid obstructing them, all means of ascent are placed in the legs and must conform to their curves and inclinations. In this respect the elevators are of the nature of inclined railways of very steep angle and varying gradients. The original design was to construct an

the middle landing. Here a change of cars is necessitated, and two elevators rise vertically in the center of the tower from the middle landing to the top. These could be of ordinary type, as only the usual conditions exist. The remaining two diagonal corners are occupied by machines rising on a straight incline to the first story, which is about midway between the foundation and the middle landing. Of these six elevators the two that present the greatest difficulties of construction, on account of their ascent at varying inclinations to the middle landing, are of American design, built by American manufacturers and successfully erected

under main-track structure, and shows the car as it approaches the level of the first landing. The profile starts at an angle of  $54\frac{1}{2}^\circ$  from the horizontal; it keeps this inclination for some distance, and then, conforming to the shape of the leg of the tower, it passes by a vertical curve to an inclination of  $78\frac{1}{2}^\circ$ . This is maintained to the end of the run, terminating at the middle landing, 395 feet vertically above the foundation. The length on the profile line, however, is about 420 feet, which is the actual distance traveled by the car.

The track structure consists of two regular girders, built in the tower legs especially for the elevator, upon which rest

precaution is necessary to prevent their displacement; hence extra anchorages are provided at intervals, so that the force of the descending car would be transmitted

Fig. 6.—View of One-Half of Rope Attachment through the Safety System.

Fig. 9.—Safety Device and Frame.

under their superintendence. Fig. 1 shows a diagonal section through one leg of the tower to the height of the middle landing, and gives a true profile of track and track structure upon which the car runs. It also shows hydraulic cylinder, multiplying gear, overhead work, position of counter-balance and track, which lies directly

the rails, which are of ordinary type and are fastened to the girders in adjustable chairs in order that perfect alignment may be assured. The ends of rails are allowed to butt, it being considered that the whole inner structure will expand and contract together. In the case of the safety-grips coming into action upon the rails, every

directly to the girders without causing too long a section of rail to act as a column. The motor of the machine is a hydraulic cylinder, 42 feet long and 38 inches inside diameter, shown in detail, Fig. 2. In this moves the piston, the machine being so geared that 1 foot of movement of the piston effects 12 feet of movement of the

car. This is done by the use of the traveler, Figs. 3 and 4, a large riveted iron frame on trucks, and supporting six multiplying pulleys, each one 5 feet in diameter. To this frame the two piston-rods attach, and all moves directly as the piston.

The multiplication of speed is made complete by the use of auxiliary pulleys, which are shown at the top of cylinder girders in Fig. 1. These girders that support the cylinder, and upon which the multiplying gear travels back and forth between cylinder-head and auxiliaries, form an independent construction, and are particularly designed for the peculiar duty they are called upon to perform. Owing to the multiplication of speed, the direct pull on the piston-rods, of which there are two, is about 200,000 pounds. It was not permissible to take this pull directly upon the tower structure; hence it is transmitted by the auxiliaries back through the cylinder girders to the foundations, only such portion coming directly upon the tower, at the overhead work, as is required to lift the car and its load. The tower is, therefore, only called upon

Fig. 10.—Side Elevation of Safety Device.

to support the cylinder girders and their load by means of hangers in the inclined position shown in Fig. 1, which is made as nearly vertical as possible to avoid friction and the deflection of piston-rods between supports. Four 1-inch steel ropes are fastened to an equalizing bar at the top of the cylinder girders, and after passing back and forth around each sheave of traveler and auxiliary system they lead

off the traveler to the overhead sheaves and thence to the car.

The water-pressure necessary to run the machine, 180 pounds per square inch, is obtained from tanks located near the middle landing, which are kept filled from a pumping system below. The pressure is thus admitted through the valve and circulating-pipe, Fig. 2, to act on the top of the piston, and the discharge being open from the bottom of the cylinder the piston descends, lifting its load. The valve being reversed, the bottom of cylinder connects with circulating-pipe, and the discharge being closed the car descends by its own overbalance, raising the piston and causing the water to circulate from the top of the cylinder down through the circulating-pipe to its original position under the piston; one charge of water thus answering for the complete round trip, which is the regular Otis system.

The cylinder is made of sections of cast-iron pipe 2 inches in thickness. Four 9-foot sections are jointed on the ends and bolted together through the flanges, asbestos gaskets being used between the joints to make them tight. Although 180 pounds is the working pressure, each section was tested to 450 pounds before shipping. In addition to the four 9-foot sections there is a short section at top and bottom where connection is made with the circulating-pipe and water-chest. The cylinder-head has a circle of screw-plugs, which, when removed, permit of the introduction of a long socket wrench by which the piston-packing can be tightened without removing the cylinder-head. On account of the inclined position of the cylinder and its length to avoid the consequent deflection of the piston-rods, which are 5-inch steel and over 40 feet long, supports are introduced both inside and outside of the cylinder. When the piston is at the bottom the inside spider is at the center of the cylinder and the outside spider near the cylinder-head. When the piston has risen to one-half its stroke it picks up the inside spider, which being connected with the outside spider by a rod through the cylinder-head, both are pushed along to the end of the stroke, the outside spider then being the support to the piston-rods at the midway point outside the cylinder. On the down stroke this is just reversed, the traveler at one-half the stroke picking up the outside spider and carrying it back to the cylinder-head, the inside spider being also pushed to its original position. Thus at no time during the stroke are the rods unsupported for a length of over 20 feet. The traveler with its six heavy sheaves weighs in all about 24,000 pounds, and is supported by a truck at each end, as shown in Figs. 3 and 4. A track is provided for these trucks, much the same as for the car trucks, the rails being on the cylinder girders. The position of the traveler at one-half stroke is indicated in the section Fig. 1.

Fig. 5 shows a side elevation of the car frame, with a section of the car, through the aisle and landing projections. The car is a double decker the arrangement in both top and bottom compartment being somewhat similar to an ordinary railway coach, having an aisle with the seats at right angles to it, one back of the other. The cabinet work is simply self-supporting, merely a protecting wall from the elements, and rests in the iron frame, which is designed to take all strains due to lifting or to the check of rapid motion in case the safeties are brought into action and grip the rail. To this iron frame the floor-beams of both decks are braced, upon it the ropes take their hold and in it the safeties are attached. The most peculiar feature of the car is the aisle floor, which projects out in front of the car from both upper and lower stories to meet the landing platforms, which are also double, one above the other, at each landing. This aisle

oor is constructed like a shutter, the position of the slats being under the control of the operator, by the lever indicated in the dotted lines. When the car is at the bottom it is in its most tipped-back position. The lever then being put in the proper slot, each floor slat is horizontal and makes a stairway which the passenger descends to enter the car. At the first floor the lever is placed in the middle slot; the slats are then horizontal, but form an even floor, the position of the car being a mean between its two extremes of inclination. This position is shown in the drawing. When the car is at the middle landing or the top of its ascent it may then be said to be in its most tipped-forward position. The lever being again adjusted, the slats when horizontal form a stairway which the passenger must ascend to enter the car. Thus the change of angle of the car frame is compensated for to effect landings. The seats, however, are stationary, but with such a curve to back and seat that the sitting passenger need experience no inconvenience from the change of inclination. When he takes his seat in the car at the bottom he leans well back. Upon reaching the top he finds his seat more like a straight-backed chair and his body erect.

In the lower part of the iron car-frame, down below the body of the car the safeties are attached, and through them the ropes take their hold as shown in Fig. 6, which is a view of one-half the attachment system looking at right angles to the general plane of the car-frame. It will be seen that six ropes pass from the center to the edges of the frame, three on each side, thence around saddles on the frame and up along each side of the track to the overhead work. Here by a system of sheaves they are collected and redistributed, four ropes, two from each side, passing to the first sheave on the traveler.

The remaining two ropes, one from each side, passing over and under the main car girders lead down to attach to the counter-balance, which is a riveted iron truck, Figs. 7 and 8, running on a track structure similar to main track structure and immediately back of it or below it. This loaded counter-balance frame, being thus directly connected to the car, forms a partial and adjustable balance to the weight of the car, thus decreasing by its gravity the actual load to be lifted by the action of piston in cylinders. The car, however, must not be fully counter-balanced, for as already stated a portion of its weight is necessary to the down trip and the raising of the piston. Owing to the construction of the tower the counter-balance track is but one-third of the length of the car track and does not extend above the first inclination of the grade line, hence the counter-balance frame is so geared as to travel but one foot while the car travels three feet. The weight of counter-balance is necessarily increased in the same proportion to be effective. The weight of the empty car uncounter-balanced, with all its attachments, safeties, &c., is 24,000 pounds; with full load 32,000 pounds. The water pressure is therefore required to overcome all friction, weight of ropes, &c., and lift the live load of 8000 pounds, plus the over-balance of car, at the rate of 400 feet per minute, which illustrates the net working power of the machine. The safeties are an adaptation of the compound wedge safety used on Otis passenger elevators, the action of these wedges when called into operation being to grip the rail, not with full power at once, but with constantly increasing force until the resistance becomes sufficient to overcome the momentum and weight of the car. In the present case these wedges are arranged upon shoes which when not in action clear the rail, the whole mechanism being contained in a riveted iron frame

pivoted to the car-frame at lower end, and supported by governor-wheel at upper end, the governor-wheel running upon the rail, and having a speed due to the velocity of the car. This is indicated in Fig. 5, and Figs. 9 and 10 show two views of safety frames more in detail. The initial power on the first wedge, which starts the compounding action of the wedges, is obtained from springs in car frame, Fig. 6. These springs are released from two causes, (1) the breaking of one or any number of the ropes, and (2) by undue speed from any cause. This latter is affected by the wheel-governor already mentioned, to which there are attached toothed weights. These weights, up to a car speed of 400 feet per minute, remain in the center of the wheel, but greater velocity throws the weights by centrifugal force to the outside rim of the wheel, where their teeth engage the necessary mechanism to release the springs. Figs. 11 and 12 show device for operating hand-rope. This is under the projecting aisle of car,

sons, Clarkson C. in Detroit, Fred F. in Chicago, and Theodore K. in St. Louis. The failure is laid wholly at the door of the Chicago branch. The Detroit house has been well managed and can meet all its liabilities, but the Chicago branch is badly off, and St. Louis is also somewhat behind. The total liabilities are placed at \$130,000, with assets estimated at \$45,000. The Detroit manager asserts positively that he will resume as soon as he can get freed from the present entanglements, and it is highly probable that the St. Louis branch will open again also.

#### The Western Wages Scale.

Advices from Pittsburgh state that there will be no conference this year between the iron manufacturers and the workers on the annual wage scale. This will be the first time in the history of the Amalgamated Association of Iron and Steel Workers, which was organized in 1874,

Association, Mr. Weeks replied that there was no way by which they can get together a committee to represent the Association of Manufacturers of Iron, Steel and Nails, as it is not now in existence. There is nothing now left for the Amalgamated Association to do but formulate its new scale and present it to each firm through the proper committees. Now let every member of the Amalgamated Association keep his own counsel. Do all your business with your firm through the proper committee, and in no other way, and await results.

The members of the Amalgamated Association do not anticipate any trouble this year, notwithstanding the fact that the manufacturers will not confer with them. None of them will venture a prediction as to what demand they will make, but all agree that it can be safely stated that the present scale, with some slight modifications, will be presented. The only hitch will be with the steel scale. The announcement of Carnegie, Phipps & Co. that they will postpone the date fixed for signing the Homestead scale until June 10, in order that the Amalgamated convention may consider it, is an indication

Fig. 7.—Plan View of Counter-Balance

Fig. 8.—Side Elevation of Counter-Balance.

with hand-wheel for operator, as shown in Fig. 5. The operating rope is continuous, and passes around the valve-sheave at foot of cylinder. This valve-sheave is balanced in position by a weight, which, if operating rope should part, would in falling close the valve.

Thomas E. Brown, Jr., chief engineer of Otis Brothers & Co., has devoted the better part of two years to the design, manufacture and erection of these machines, and it is due to his untiring energy that this American company supplied the great tower with these powerful inclines, for which no foreign competitors were able to present, even to their own governments, designs which could be accepted.

The old-established machinery firm of G. S. Wormer & Sons, of Detroit, made an assignment on the 31st ult. A dozen years ago it started branches in Chicago and St. Louis. All three stores are included in the assignment. The firm handled engines, boilers, wood-working machinery, &c., but the St. Louis house made a specialty of engines and heavy mining machinery. The senior partner retired several years ago, and the three houses have been since managed by as many

that a conference has been refused by the manufacturers. In past years the Manufacturers' Association handled all such questions and appointed committees to meet the workers. A. F. Keating was president and Joseph D. Weeks was secretary of the organization. This association, however, went to pieces last year, and when President Weihe, of the Amalgamated Association, addressed a formal note to Secretary Weeks announcing that they were about to draw up a scale of wages for the coming year and would appoint a committee to confer with a like committee of manufacturers, he received a reply from Secretary Weeks that there was no association of manufacturers and no committee could be appointed. There will, therefore, be no conference with the iron masters this year, and the lodges in each mill will present the scale to the different firms. The scale will be uniform, and if any firm objects to a clause in the scale and it is modified all other firms will have the same advantage. Secretary Martin has issued the following to the members of the association:

In reply to the request of President Weihe to the manufacturers, through Mr. Joseph D. Weeks, to name a day when they could meet a conference committee of the Amalgamated

that the firm do not intend to adopt a rough-shod course. This trouble may be satisfactorily settled. If war is declared it is claimed that the workers can stand a siege of eight weeks very comfortably, as the funds in the treasury are larger than usual. The *Labor Tribune*, in commenting on the wage question, editorially says:

There seems to be considerable trouble in the newspapers about the arrangement of the figures of the coming scale year, and it may be that this may extend into the iron and steel industries before the annual signing is done; however, it is hardly within the probabilities that there will be difficulties equal to those that have been in some years in the past. The situation has its main peculiarity in that trade has been so very good in England that wages have been advanced materially, while in America this has not been the case. As might be expected of business men, the mill owners take the opportunity presented by these conditions to endeavor to make a few points on wages and on the terms of labor. There is nothing surprising in this; it would be surprising were they to permit the chance to pass unimproved.

While it is yet a little early to predict the outcome, it is the impression among the manufacturers that a shut-down of the mills for two or three weeks will take place, after which a scale will be agreed upon that will be satisfactory to both manufacturer and workman.

## Cambria Iron and Steel Works.

### Magnitude of the Establishment.

The following description and history of the Cambria Iron Company's works, at Johnstown, Pa., partly destroyed by flood on May 31, is mainly taken from a report prepared by the Pennsylvania Bureau of Industrial Statistics:

The great works operated by the Cambria Iron Company originated in a few widely-separated charcoal furnaces, which were built by pioneer iron-workers in the early years of this century. The company's charter was granted in the year 1852. Johnstown was then a village of 1300 inhabitants. The Pennsylvania Railroad had only been extended thus far in 1852, and the early iron manufacturers rightly foresaw a great future for the industry at this point. Coal, iron and limestone were abundant. In 1853 the construction of four coke furnaces was commenced, and it was two years before the first was completed, while some progress was made on the other three. A mill for rolling iron rails was also built. England was then shipping rails into this country under a low duty, and the iron industry, then in its infancy, was struggling for existence. The furnaces at Johnstown labored under greater difficulties in the years between 1852 and 1861 than can be appreciated at this late day. Had it not been for a few patriotic citizens in Philadelphia, who loaned their credit and means to the company, the city of Johnstown would probably never have been built. Notwithstanding the protecting care of the Philadelphia merchants, the company in Johnstown were unable to continue in business, and suspended in 1864. Among their heaviest creditors in Philadelphia were Oliver Martin and Martin, Morrell & Co. More money was subscribed, but the establishment failed again in 1865. D. J. Morrell, however, formed a new company with new credit.

The year 1856 was one of great financial depression, and the following year was worse. To render the situation still more gloomy, a fire broke out in June, 1857, and in three hours the large mill was a mass of ruins. So great was the energy, determination and financial ability of the new company that in one week after the fire the rolls were once more in operation under a temporary structure. When the war came and with it the Morrill tariff of 1861 a broader field was opened up. Industry and activity in business became general; new life was infused into every enterprise.

### STEEL PLANTS ERECTED.

The Cambria Iron Company began the erection of Bessemer steel works in 1869, and sold their first steel rails in 1871 at the ruling price of \$104 a ton. The history of the company from that time on shows a constant increase in plant. About ten years ago the Gautier Steel Company, Limited, were organized to manufacture, at Johnstown, wire and various other forms of merchant steel. Within less than a mile from the main works extensive mills were erected, and the business soon grew to great proportions. In a few years much additional capital was required, owing to the rapidly-increasing business, and the Cambria Iron Company became the purchaser of the works, now known as the Gautier Steel Department of Cambria Iron Company.

### THE WORKS IN THEIR LATEST DEVELOPMENT.

The blast-furnaces, steel-works and rolling-mills of the company are situated upon what was originally a river flat, where the valley of the Conemaugh expanded somewhat just below the borough of Johns-

town, and now forming part of Millville borough. The arrangement of the works has been necessarily governed by the fact that they have gradually expanded from the original rolling-mill and four old-style blast-furnaces to their present character. The Johnstown furnaces, Nos. 1, 2, 3 and 4, form one complete plant, with stacks 75 feet high, 16 feet diameter of bosh. Nos. 5 and 6 blast-furnaces form together a second plant, with stacks 75 feet high, 19 feet diameter of bosh. The Bessemer plant was the sixth started in the United States (July, 1871). The main building is 102 feet in width by 165 feet in length. The cupolas are six in number. There are two vessels of 8½ tons capacity each, the products being distributed by a hydraulic ladle crane. The best average, although not the very highest work done, in the Bessemer department is 103 heats of 8½ tons each for 24 hours. The best weekly record reached 4847 tons of ingots, the best monthly record 20,304 tons, and the best daily output 900 tons ingots. All grades of steel are made in the converters, from the softest wire and bridge stock to spring steel. All the special stock—that is, other than rails—is carefully analyzed by heats, and the physical properties are determined by a tension test. A new two-vessel Bessemer plant was just completed this spring, and had incorporated in it the very latest improvements and appliances for the manufacture of steel.

The open-hearth building, 120 feet in width by 155 feet in length, contains three Pernot revolving-hearth furnaces of 15 tons capacity each, supplied with natural gas. A separate pit, with a hydraulic ladle crane of 20 tons capacity, is located in front of each pan. In a portion of the mill building, originally used as a puddle mill, is located the bolt and nut works, wherein are made track bolts and machine bolts. This department is equipped with bolt-heading and nut-making machines, cutting, tapping and facing machines, and produces about 1000 kegs of finished track bolts, of 200 pounds each, per month, besides machine bolts. Near this also are located the axle and forging shops, in the old puddle mill building. The axle shop has threesteam hammers to forge and ten machines to cut off, center and turn axles. The capacity of this shop is 100 finished steel axles per day. All axles are toughened and annealed by a patented process, giving the strongest axle possible. In the forging plant, located in the same building, there is an 18,000-pound Bement hammer and a 10-ton traveling crane to convey forgings from the furnaces to the hammer. There are two furnaces for heating large ingots and blooms for forgings. The blooming-mill contains two large blooming trains and eight Siemens heating-furnaces. The rail mill has six trains and ten heating-furnaces. The mill plant also comprises a wire-rod mill, making 80,000 pounds each turn. A ventilating fan supplies fresh air to the mills through pipes located overhead and having outlets near the heating-furnaces. One hundred thousand cubic feet of fresh air per minute is distributed throughout the mills. The mill has in addition to its boilers over the heating-furnaces a brick and iron building, located near the rail mill, 205 feet long and 45 feet wide, containing 24 tubular boilers, aggregating about 2000 horsepower.

The Gautier Steel Department, situated in another part of the town, consists of a brick building 200 x 500 feet, where the wire is annealed, drawn and finished; a brick warehouse 373 x 43 feet; many shops, offices, &c.; the barb-wire mill, 50 x 256 feet, where the Cambria link barb wire is made, and the main merchant mill, 725 x 250 feet. These mills produce wire, shafting, springs, plow-share, rake and harrow teeth and other kinds of agricult-

ural-implement steel. In 1887 they produced 50,000 tons of this material, which was marketed mainly in the Western States. Grouped with the principal mills are the foundries, pattern and other shops, drafting offices, time offices, &c., all structures being of firm and substantial character. The company operate about 85 miles of railroad tracks, employing in this service 24 locomotives, and they own 1500 cars. In the fall of 1886 natural gas was introduced in the works.

### OTHER ENTERPRISES UNDERTAKEN.

Anxious to secure employment for the daughters and widows of the employees of the company who were willing to work, the management erected a woolen mill which now employs about 300 persons. Amusements were not neglected, and the people of Johnstown are indebted to the company for the erection of an opera-house, where dramatic entertainments are given.

The company own 700 houses, which are rented exclusively to employees. The handsome library erected by the company and presented to the town was stocked with nearly 7000 volumes. The Cambria Hospital is also under the control of the beneficial association of the works. The Cambria Club-house is a very neat pressed-brick building on the corner of Main and Federal streets. It was first opened in 1881, and is used exclusively for the entertainment of the guests of the company and such of their employees as can be accommodated. The store building is a four-story brick structure on Washington street, with three large store-rooms on the first floor, the remainder of the building being used for various forms of merchandise. Including the surrounding boroughs, all of which are built up solidly to Johnstown proper, the population is about 30,000. The Cambria Iron Company employ, in Johnstown, about 7500 people, which would certainly indicate a population of not less than 20,000 depending upon the company for a livelihood. A large proportion of the population of Johnstown are citizens of foreign birth or their immediate descendants. Those of German, Irish, Welsh and English birth or extraction predominate, with a few Swedes and Frenchmen. As a rule the working people and their families are well dressed and orderly; in this they are above the average. Most of the older workmen of the company, owing largely to their liberal policy, own their houses, and many of them have houses for rent.

### THE PARTIAL DESTRUCTION OF THE WORKS BY FLOOD.

Having passed through financial reverses, overcome losses by fire and reached a most important position in the industrial world, the company have now encountered the severest check to their prosperity in the damage wrought by the flood of May 31. The latest telegraphic dispatches state that the Gautier Steel Department has been completely wiped out of existence and that the Cambria Works proper have been very seriously damaged. The extent of the damage will not be known for some time, but a very large outlay of capital will undoubtedly be required to put these works in running condition, while the Gautier Department will have to be wholly rebuilt. The company announce that operations will be resumed as quickly as possible. They are fortunate in having assets largely beyond their investments at Johnstown. The greatest loss which they suffer is really in the loss of officers and men who have devoted their lives to the prosperity of the company.

The Buffinton steel works, at Burlington, Iowa, were destroyed by fire on the 29th ult. Loss, \$50,000; insurance, \$27,000. The works employed about 100 men.

### Bits of Engine-Room Experience.\*

About the middle of the year 1888 I had charge of a Buckeye engine, in which a mysterious pounding noise one day appeared. It proved upon examination to be in the cylinder, and was caused by the packing rings striking against a shoulder which had been worn at each end of the bore. How this occurred will be quite clear from an inspection of Fig. 1, which

Fig. 1.—Longitudinal Section of Cylinder.

represents a longitudinal section of the cylinder of an 18 x 36 inch Buckeye engine. The shoulder is represented at AA, and it was formed in this wise: The piston-packing was of the type shown in Fig. 2, where A represents a cross section of the cylinder and B the piston. The two piston-packing rings were cut to

Fig. 2.—Piston Packing.

break joints, and occupied a groove  $\frac{1}{4}$ -inch wide in the center of the piston, as shown at C. It will be seen at once that these rings do not travel the entire length of the bore, but stop in this case  $1\frac{1}{2}$  inches short at each end, as shown by the dotted line D.

From the center E upward this shoulder was worn quite sharp, while from E downward the shoulder was less marked, for the reason that the piston wore the bottom of the cylinder, as shown by the dotted line extending from E downward. An exaggerated case is shown by the dotted lines in the cross section of cylinder, A. The Buckeye Company, I am glad to learn, have abandoned this style of packing, and now use spring rings similar to those that I put in place of the kind removed. These rings were  $\frac{1}{4}$ -inch square, and traveled over each end of the bore  $\frac{1}{4}$  inch, as shown by the dotted lines FF. To put this packing in the shoulder shown at AA had to be removed. It was a comparatively easy matter to file off the shoulder at the back end when the head was removed; but to file off a belt of cast iron  $1\frac{1}{4}$  inches wide,  $\frac{3}{4}$  inch thick and 56.70 inches long in the crank end of an 18 x 36 inch cylinder is not such an easy job. This engine had to run every night, starting at 4.30 p.m.

\* Paper read by Lewis F. Lyne, of New York City, at the Erie meeting of the American Society of Mechanical Engineers.

and stopping at 6.30 a.m.; so it will be understood that the cylinder did not have time to cool sufficiently to make the interior a very desirable place to work in. The way we did it was this: A rod, B, of  $\frac{1}{4}$ -inch round iron was provided with an eye turned on one end, to slip over the offset file-handle C, generally used by machinists for filing flat surfaces. This rod was left sufficiently long to reach outside the cylinder, as shown, so that a workman

standing close to the end of the cylinder, at D, could work the 14-inch bastard file which was used on this occasion.

I used what is known as a safe-edge file, on account of its having a broad end, thus giving more surface for cutting. I had an old rubber spring which was cut in two; then with a tenpenny nail one half of this spring was fastened to the end of a broomstick, as shown at E. The broomstick was sawed of a proper length, so that when placed across the cylinder inside a sufficient pressure could be thrown upon the end of the file. We were now ready for business, so a sperm candle was placed in a  $\frac{3}{4}$ -inch hexagonal nut, and after being lighted was placed close to the head of the cylinder. A rubber hose was attached to a common bellows, and supplied fresh air through the stuffing-box. In just two and a half hours from the time of commencement the shoulder at this end of the cylinder was removed.

While I am on this subject I cannot refrain from condemning all forms of piston-

cylinders so that shoulders could be worn at the ends. I mean this to apply to pumps of all descriptions and air compressors, as well as to steam-engines; for I have met and remedied this same difficulty time and again in overhauling various kinds of machinery. I remember on one occasion, where the cross-head gibs on a certain steam-engine were adjusted when the piston stood at half stroke, there was a shoulder worn on each end of the guides, so that when the engine started the cross-head was split open when it reached the shoulders. So it will be seen that this principle applies not only to cylinders, but to guides as well. In short, where there is reciprocating motion great care should be taken to have the gibs or slides wipe over to prevent the formation of shoulders. To be sure, such instances are becoming more rare on account of the better diffusion of practical knowledge through our technical schools; but there are hundreds of steam-engines and pumps where these shoulders should be taken off and recesses cut in their places.

### VALVE-STEMS.

A common mistake is made in turning valve-stems of a uniform diameter throughout, so that, after they have been in use a year or so, one has to either throw away the stem and get a new one or resort to some such wrinkle as I am about to describe. The valve-stem, as it wears, assumes the form shown in Fig. 4, so that it is entirely out of the question to keep it tight, except at each end of the stroke, where it jams so tightly that one is in danger of tearing some of the valve-motion apart. I once knew a locomotive rock-arm to be sprung  $\frac{1}{8}$  inch out of its original shape by screwing the packing too tight on a badly worn valve-stem. A valve-stem of the kind first described became badly worn upon an engine under my direction, and its shape very much resembled Fig. 4; so I put it in a lathe and trued it up, letting the cut run about 2 inches each end beyond the point where stem would travel when in use. The job was to get a gland and junk-ring on that stem so that they would fit. This is how it was done: A brass bushing was sawed through longitudinally, and the joint filed to a fit. I then with soft-solder sweated them together, using the slightest quantity of solder. I then bored this bushing to fit the stem, and turned it to easily fit the

Figs. 3 and 4.—Valve Stems.

packings that do not wipe over the entire ends of the bore, to avoid the slightest possibility of wearing a shoulder. I remember an instance that happened on a tugboat in 1882, where a 20-inch cylinder was split the entire length because the piston-ring swedged against a shoulder worn at the end of the bore. The engineer had been taking up the main-rod brasses the day before, and in so doing the rod was lengthened so that the packing-rings, which were of the old-fashioned spring type, being stuck fast, split the cylinder as described. If the rings travel over the end into the counterbore there is no possibility of such an accident. I never could ascertain why any engineer could design

original junk-ring, which had been previously bored out and recessed, as shown in Fig. 4.

When finished the bushing was warmed to melt the solder, when it fell apart. I then slipped the ring H over the valve-stem I, and placed the two parts of the bushing G in place. It will of course be understood that when in the stuffing-box the packing will prevent this bushing from moving, so that for all practical purposes it is as good as if it were all solid. The ring J which fits in the bottom of the stuffing-box is made in the same manner as that of G, except when put on the stem a drop of solder is used to join it; but when once inside the stuffing-box it does

not matter whether it is in two pieces or one.

The practice of making the threads on the ends of piston-rods of equal diameter with the rest of the rod ought to be condemned for several reasons. The principal one is that the rod cannot be trued up and used without resorting to a split gland bushing; and when metallic packing is used it is necessary to remove that packing whenever the piston-rod is taken out of the cylinder. The reason is that the threads on the end of the piston-rod would tear it all to pieces in drawing it back through the stuffing-box. If the thread were of a smaller diameter than the body of the rod, as it should always be, then there would be no necessity of disturbing the packing, and the rod could be trued and replaced, requiring only a plain bushing for gland and for junk-ring.

#### RENEWING ENGINE BED.

The above engine, when first set up, rested on a bed of sulphur, which after a time began to disintegrate and work out. Mr. Lyne's method of remedying this evil was simple and effective: "Four pieces of flat iron,  $\frac{1}{4}$  x 4 inches, were cut off. These we reduced in thickness so as to just fill the space between the top of the cap-stones and the cylinder feet. We

forming the dam preventing the metal from running out at the sides. No one who has seen it doubts that this cylinder is fixed forever."

#### Automatic Injector.

The automatic injector of which we herewith present an engraving has few working parts and is extremely simple in operation. Steam enters through the jet S, passes into the chamber G through the jet L, causing the auxiliary check R to slide along the tube C; the steam, lifting the valve V, passes out freely through the overflow E, drawing the air out of the chamber T, in which a vacuum is created that lifts the water from a lower level. As soon as the water reaches the chamber T the steam is condensed and a velocity imparted to the water, which passes on into the chamber G, and as the velocity increases passes through the tube C and spills through the openings F F, forcing the auxiliary check R back on the tube C. When it reaches the projections q q the vacuum carries it on by the same to its original position, as shown in the drawing. As soon as the water attains sufficient velocity to overcome the boiler pressure it passes on through the tube D, thereby

THE METROPOLITAN AUTOMATIC INJECTOR.

dug out the sulphur by the side of each anchor bolt, of which there were four, two in each foot; we slacked the nuts of the foundation bolts, then put in the liners, one for each bolt, and screwed them fast. The sulphur was then removed from one foot at a time, and the space thoroughly scraped out. We then took two strips of lath and wrapped sufficient paper around each of them to fill the space between the stone and foot, thus dividing the space into three equal parts. This was done because it would take more metal to fill the space than could have been conveniently handled. We placed strips of laths edgewise all around the foot and backed them with fire-clay. An opening was left at each of the four corners—two for risers and two diagonal corners for pouring metal, leaving a head of about 2 inches, to better insure a solid casting. Some powdered resin was thrown into the gates to absorb the moisture and prevent the casting from blowing. Having previously melted in an iron pot a mixture composed of nine parts of lead, two of antimony and one of bismuth (commonly known as expansion metal), we poured from two ladles, and in about ten minutes had the satisfaction of finding that our cylinder was as securely held as if it had been originally bedded on the solid stone. We poured the outer spaces of each foot first, then removed the two strips of lath and poured the middle space, the two outside castings

causing a vacuum in the chamber G, which closes the valve V. When the machine is working there is a direct communication between the secondary spill F F and primary overflow through the ports u u on the auxiliary check R, which enables the injector to work very hot water. In starting the injector the passage between the primary and secondary overflows is automatically closed for an instant, then automatically opened when the injector is working. The steam-supply pipe and the suction-pipe are provided each with a valve to regulate the flow of steam and water respectively. A valve is also placed on the delivery-pipe. It will be seen that while the parts are few and easy of access the injector is automatic and reliable in its action. This injector is the invention of John Desmond, and is manufactured for Jenkins Brothers, of New York, Boston, Chicago and Philadelphia.

#### Proposed New Steamship Line.

Western men are interesting themselves in a proposed steamship line from Tampa Bay to Aspinwall, designed to promote direct trade between Southern points and the West at the expense of New York. A memorial, signed by members of the St. Louis Merchant's Exchange, cites the fact that it has been shown that many millions of dollars can be saved to the people of the Western, Middle and Southern States on goods from Cuba, Central America,

South America and Mexico that now come by the way of New York and the Atlantic seaboard, passing out of the Gulf of Mexico and the Caribbean Sea through the dangerous reefs of Florida and by Cape Hatteras to reach New York, entailing an extra insurance of 24 per cent., and a loss on vessels of \$10,000,000 yearly, saying nothing of the \$1,500,000 loss per year on perishable goods by long shipment. It has also been shown that \$265,000,000 worth of commerce passes and repasses yearly to the Eastern seaboard over this dangerous route, and that out of this amount \$165,000,000 worth is consumed, handled and manufactured west of and including the State of Ohio. Attention is then called to the advantages of Tampa Bay as a harbor, and to the fact that by making use of it all this heavy loss and increased cost of insurance can be saved to the consumer, and at the same time a large volume of business can be given to the Southern and Western roads in carrying these goods direct to St. Louis, Chicago and Cincinnati, the neutral inland markets of the country. Congress is asked for \$1,000,000 in aid of the scheme.

#### A New Sound Steamer.

The Providence and Stonington Line have added another handsome steamer to their already large fleet. The new boat has been christened the Connecticut. She was built at the yard of Robert Palmer & Sons, at Noank, Conn., and is in every way a fine piece of marine architecture. In many material respects she differs from all other steamers plying on Long Island Sound. Her principal dimensions are: Length over all, 357 feet; length on 11-foot load-line, 345 feet; beam outside of hull planking, 48 feet; extreme width over guards, 87 feet; depth of hull, 17 feet 8 inches; extreme depth forward, 26 feet; extreme depth aft, 20 feet; extreme height from bottom of keel to top of pilot-house, 60 feet. The bow lines are 171 feet long, about half her length, then a short parallel body, then the stern lines, which are sharper than ever seen in other boats of this class. By this arrangement the center of displacement is so far forward that all freight may be stowed forward of the main deck saloon. The engines are about 40 per cent. lighter than the ordinary beam engines of same power, and were built by the Wm. Cramp & Sons Ship and Engine Building Company, of Philadelphia, Pa. The engines are of the type known as double expansion, compound, inclined, direct-acting, surface condensing oscillators, with cylinders 56 inches and 104 inches diameter and 11 feet stroke of pistons. She also has feathering paddles, two air-pumps, four feed-pumps and two bilge-pumps, worked by independent compound engine, and an independent surface condenser fitted to work with all pumps, dynamos and donkey-engines. Steam is supplied by six boilers, 12 feet 6 inches diameter, 20 feet 8 inches long, set fore-and-aft in two nests of the boilers each, having athwartship fire-rooms at extreme ends. The boilers are of steel, built to carry 120 pounds of steam, and have two smoke-pipes placed fore-and-aft, 8 feet 6 inches outside diameter. When working full power, with engines making 30 revolutions per minute, this machinery is expected to develop nearly 6000 horse-power. To do this the vessel will be fitted with two blowers, each having a capacity of 40,000 cubic feet of air per minute, which will be used for forcing fires. The total weight of this machinery, including water in boilers, will be about 1000 tons. The vessel is expected to make 20 miles an hour when working full power.

### An Important Railroad Decision.

The decision of the Executive Board of the Interstate Commerce Railway Association, on the request of the Alton and Burlington railroad companies for a reduction of the lumber rate from Chicago to the Missouri River, was made public on the 28th ult. by Chairman Walker. The decision is an extremely voluminous one, and refuses the request for the reduced rate. The summing up is as follows:

"We do not feel justified in authorizing the Chicago and Alton and Chicago, Burlington and Quincy companies to make the proposed reduction to 10 cents per 100 pounds. Such a step would greatly disturb the lumber rates of all the lines and would almost inevitably result in great loss, even to some which are not involved directly in the controversy. It would probably be met by reductions on the part of the Southern lines which could not be confidentially affirmed to be altogether unjust. It would no doubt for a time afford increased tonnage to the roads which are seeking it, but the tonnage without profits is of no value except for advertising and statistical purposes, and to inflict direct losses upon the income of associated lines for the purpose merely of making an exhibit of enlarged tonnage when no net revenue above expenses is in sight would be consistent neither with the principles of this association nor with ordinary consideration for the rights of others.

"The proposed 10-cent rate would practically be a war rate, and only justifiable as such. It is the part of wisdom to count the cost before taking the sword. A conflict is proposed which may entail losses upon the various contestants amounting to millions of dollars. The Executive Board regards the proposed 10-cent rate as one which is not justified by existing circumstances, which would be of no practical or substantial advantage to the roads which ask it, which would invite immediate reductions by the Southern roads and thus would neutralize itself and which would work great injury to other lines in this association. The finding, therefore, is that the rate cannot properly be authorized."

The decision, as a whole, is probably the most important ever delivered concerning Western roads. The whole question is thoroughly gone into, both sides being fully stated. As representing the effect of Interstate Commerce Commission training on Chairman Walker, the following paragraph is significant:

"No common carrier can be justified in engaging in a general rate war to punish an adversary or to redress a wrong. In so doing it not only sacrifices the immediate income of its own stockholders and the interests of all for whom its administration is directly conducted, but also inflicts great injury upon the public at large, which finds its business plans and enterprises thrown into confusion, the prices of the commodities unsettled and eventually in one way or another is called upon to pay the bill. The employment of retaliatory methods is no longer admissible. The country is aroused to the wrongs that they involve, both to railway owners and to shippers. If the farmers cannot stop them it is obvious that the State must interfere."

It now remains to be seen whether the companies interested will abide by this decision or not. If they do, it will be a decided guarantee in favor of harmonious action in the future.

Professor Friend was the mechanical expert in constructing machinery for the alleged bogus electric sugar process and possessed all the secrets. How to maintain this secrecy in giving out contracts for the job was a source of much embarrassment. W. H. Cotterell, ex-president of the company, in his testimony be-

fore Recorder Smyth, said: "The professor hit upon a novel plan to impress the company with the secrecy which was to be maintained in the manufacture of the machinery. For this purpose he wrote an affidavit, which he had photographed, and which he said that every workman employed to make the secret machinery would have to swear to. This affidavit was very lengthy and bound the workman never to reveal to any one, not even his employer or his wife, the character of the work he was engaged at, or the person for whom it was done, or the object of it. A copy of one of these remarkable affidavits was shown the jury. Friend further told the company that this secret machinery, to avoid any possibility of its nature being discovered, was made in pieces in various parts of the country, and the parts were all shipped to him. Of course their manufacture was expensive, and this occasioned his constant demands for money."

### The Verrugas Viaduct Destroyed.

Writing under date of March 28 from Lima a correspondent says:

"Since the termination of the war with Chili no such misfortune has happened to Peru as the recent and unexpected destruction of the Verrugas Viaduct, on the Moya Railway, at a point 40 miles from Lima, and connecting the coast with the vastly wealthy interior. On Saturday afternoon last a water cloud suspended over one of the lofty mountains covering the bridge broke, and an immense column of water was precipitated on the hill, carrying with it in its downward course huge boulders and granite rocks, which were hurled against the center column of the viaduct, destroying it completely, and causing the remainder of the structure to fall, owing to the surrender of the base. The ruin was complete, and the whole work of destruction did not occupy ten minutes. The Verrugas Viaduct was built at Baltimore in 1874, at a cost of \$500,000, and put in position the same year. It measured 575 feet in length and was 260 feet in height, making it the highest structure of the kind known save one since erected in the United States. Its lines were graceful, and engineers and scientific men from all parts of the world came to admire and acknowledge it as an engineering triumph. To talk now of repairing it is out of the question; the Government is penniless, and the contractor cannot be called upon to incur the expense, any more than a man occupying a house destroyed by fire, independent of his will, could be. How the resources for rebuilding—nearly \$1,000,000—are to be found is a problem not yet solved. Not only the material work of interruption is to be deplored, but the markets of Lima and Callao will be deprived of their customary supplies, and the cost of all the necessities of life, now so exaggerated, will rise to a fabulous price. The enormous amount of ore formerly carried over the road must now seek the antiquated method of mule-back, so increasing the measure of freight as to render it practically valueless. The great establishment of Messrs. Bockers & Johnston, recently erected to consolidate base ores at a large expenditure, is rendered comparatively useless, and the great furnishing houses at Lima are left without their customary buyers. The interior will be deprived of all its supplies, and mining enterprise, so progressive in this section, is for the time being fairly ruined. What is of equal consequence is the effect the disaster will have on the Donoughmore contract. The hopes of the bondholders were mainly centered on this line, which promised to be lucrative in earnings, and the sudden collapse of an indispensable adjunct will lead them probably to retire their proposal. No other means of com-

munication save that dilatory and costly one of mule and llama back exists with the interior, and even this to a small extent, owing to the withdrawal of such traffic by the facilities of the railway. The event is really regarded as a national calamity, and well may it be so."

Under date of April 4 the same correspondent writes: "Among the new theories started regarding the destruction of the Verrugas Viaduct is that it was suddenly overpowered by a lightning flash, and this is sustained by the sulphurous odor attached to all parts of the debris. Engineers are still busily engaged in their investigation, and the first reports of damages have resulted to be extremely exaggerated. Mr. Grace has signified his intention of furnishing the money required for the rebuilding of the structure, but it will require nearly a year before it can be completed. Meantime the vast mining interests in the interior are severely suffering, the ores being rendered stationary, and the articles of food brought down formerly to Lima have increased threefold in their prices. The market for goods from the coast is also ruined, and the evils resulting from the disaster are becoming greater every day."

### Wire Nails vs. Cut Nails.

The *Wheeling Intelligencer* talks very plainly to the manufacturers of the Nail City, as follows:

The reason of the growing popularity of the wire nail has not been a secret. On the contrary, everybody has known that the explanation consisted largely in the fact that those who made them gave the consumers of nails from one-third to one-half more nails to the pound. Was this fact not something of great importance to cut-nail manufacturers? Should it not have been recognized ere this? The fact that it has not been recognized would seem to indicate to the public one of two things, either that cut nails cannot compete in this respect with wire nails, or else that the makers of them find it more profitable to go on selling the old-fashioned heavy nails. That they have not found it profitable to do so needs no proof at our hands. The declining price for nail stocks tells the story of itself. If, then, the cut nail could have been kept more popular with the public than it is to-day, but has not been so kept, it is plain that those who have been in charge of the vast interest embraced in their production are justly responsible to their stockholders for the present state of affairs.

The question arises as to what point the losing business of the past five years is going to be carried before stockholders will come to the front and take charge of their interests. Will it be when the stock of the majority of the mills quotes at 50 cents on the dollar? Some of them are nearing that point now. Or will a halt be called at the instance of those who have so much at stake and who recognize a necessity for two essential changes—viz.: first, to check the overproduction of a nail that does not meet the competition of the wire nail, and, next, to make a nail that promises to meet that competition with at least a greater degree of success than the present article?

The Chicago, Burlington and Quincy Railroad and competing line from Chicago have announced a new classification on iron, steel and rails from Chicago to St. Paul and Minneapolis. Commencing with Saturday, the 1st inst., these articles took sixth and fifth class rates on carloads and less. The rates now are, for car lots, 11 cents, less than car lots, 12½ cents, a reduction of 3 cents on the first and 4½ cents on the last named.

**Hoisting-Engine.**

The Tefft paper friction hoisting-engine, of which an engraving is here presented, is a new machine made by the Moore Mfg. and Foundry Company, of Milwaukee, Wis., and especially adapted for coal and ore hoisting, pile-driving, mining, &c. The form of the engine and the method of gearing and mounting the machine are plainly shown in the cut. By a simple movement of the friction-lever the speed can be regulated and the load raised steadily and uniformly at any desired speed, from nothing up to the limit at which the machine may be running. By the use of the brake-lever and the mechanism it controls the load can be held at any point. The engines are made with double  $8\frac{1}{2} \times 10$  or  $6\frac{1}{2} \times 10$  inch cylinders, set to quarter-stroke, with rocker-valves and straight-line frames. The

and the Mississippi River, except St. Paul and Minneapolis.

The new rail and lake rates to St. Paul and Minneapolis will be 17 and 21 $\frac{1}{2}$  cents, a reduction of about 5 cents on the all-rail rate. The inside history of this big iron and steel cut is quite interesting. The immediate cause of the present reduction was the cut made a few days ago by the Nypano from Youngstown to Chicago, and of course the other lines had to follow suit. The Nypano reduced the rate on manufactured articles of iron and steel from Youngstown to Chicago from 13 and 15 cents to 10 and 13 cents. Heavy pressure had been brought to bear on the Nypano and Lake Shore roads for some time by the Mahoning and Shenango iron manufacturers for a reduction of rates. The Nypano is not in the Central Traffic Association, but usually acts with that organization. About a month ago the val-

**Our Shipping Interests.**—Hon. Nelson Dingley, of Maine, the recognized leader of shipping legislation in Congress for several years past, has written an article for one of our popular reviews disclosing the policy that will be strongly urged for acceptance during the coming session. The measures to which Mr. Dingley gives his unreserved approval may be outlined as follows: The Government should begin by encouraging the enlargement of old ship-yards and the establishment of new ones on the Atlantic, Pacific and Gulf coasts and on the great lakes. The Government should pay a liberal construction bounty to encourage the building of iron and steel steamships for the foreign trade, on the theory that they may be available for naval service in case of war. The Government should pay liberal mail subsidies for faster and more frequent trips of existing lines, and the establishment of

THE TEFFT PAPER FRICTION HOISTING-ENGINE.

drums, without the engines, can be operated by belt or rope or by placing the pinion directly on a line shaft.

**Cut In Western Freight Rates.**

One of the biggest cuts in west-bound rates on articles of iron and steel manufacture in the history of railroads is reported to have been made by freight agents at Pittsburgh on the 1st inst. Only once before, about eight years ago, when the iron rate to Chicago for a few days was 12 $\frac{1}{2}$  cents, were the rates ever as low as they will be on June 8, when this latest cut will go into effect.

The present rates on iron and steel articles from Pittsburgh to Chicago are 17 $\frac{1}{2}$  and 15 cents in less than car and carloads respectively. The new rates will be 14 and 11 cents. The rates to East St. Louis will be 17 and 13 $\frac{1}{2}$  cents, 16 and 13 cents to Milwaukee, 24 $\frac{1}{2}$  and 19 $\frac{1}{2}$  to the Mississippi River points, Burlington, Rock Island and Davenport; 10 and 8 cents to Buffalo, &c. The cut applies west-bound to all the points between the Pittsburgh territory

and the Mississippi River, except St. Paul and Minneapolis. The new rail and lake rates to St. Paul and Minneapolis will be 17 and 21 $\frac{1}{2}$  cents, a reduction of about 5 cents on the all-rail rate. The inside history of this big iron and steel cut is quite interesting. The immediate cause of the present reduction was the cut made a few days ago by the Nypano from Youngstown to Chicago, and of course the other lines had to follow suit. The Nypano reduced the rate on manufactured articles of iron and steel from Youngstown to Chicago from 13 and 15 cents to 10 and 13 cents. Heavy pressure had been brought to bear on the Nypano and Lake Shore roads for some time by the Mahoning and Shenango iron manufacturers for a reduction of rates. The Nypano is not in the Central Traffic Association, but usually acts with that organization. About a month ago the val-

ley roads in the Central Traffic Association recommended to that body that a reduction be made, but the other lines refused and the matter was dropped. Afterward the Nypano, acting on its own responsibility, made the cut, which has become general.

The railroad men will not admit that the appeals and vigorous protests of Mr. Carnegie had anything to do with bringing about the reduction. They attribute the glory to the Mahoning and Shenango valley iron men, who induced the Nypano to make the cut.

This cut was wholly unanticipated in many quarters, the most prominent railroad men of the West having until very recently insisted that no reduction of rates would be made.

Another reduction in freight rates from Pittsburgh to El Paso, Texas, was made on the 1st inst. The reduction amounts to from 8 to 15 per cent., and the new figures are as follows: First class, \$2.23; second, \$1.96; third, \$1.73; fourth, \$1.53; fifth, \$1.25; class A, \$1.33; B, \$1.20; C, \$1.02; D, 80 cents; E, 70 cents per 100 pounds.

new lines specially to Central and South America and the East. The Government should adopt the French bounty system and establish a scale of navigation bounties, to be paid through a series of years to vessels engaged in the foreign trade, these bounties being large enough to cover the computed difference in running expenses between American vessels and the foreign vessels with which they must compete.

Operations will begin within the next ten days on a new Pittsburgh natural gas line that will be to some extent a competitor of the Philadelphia lines. It is to be built by the Oliver Iron and Steel Company and the Republic Iron Works. It will extend from Belle Vernon, a distance of 22 miles, and is to be a 16-inch main. The contract for the wrought-iron pipe has been let to the National Tube Works and will cost about \$12,000 a mile. The cost of laying it will be \$5000 a mile, making the total cost of constructing the line about \$500,000. The territory it taps is one of the richest in Western Pennsylvania and the builders of the line own large leases.

## THE WEEK.

Dispatches from Oklahoma report the finding of rich iron mines a short distance from Guthrie. A shaft will be sunk at once and a thorough examination of the deposit made.

A New Zealand letter says the present year is a phenomenal one, both in respect to Australia's famine and New Zealand's plenty. A recently published official statement shows that the yield of wheat to the acre in New South Wales this year is  $15\frac{1}{2}$  bushels; that of New Zealand is nearly 30 bushels. The total yield of New South Wales is about 1,500,000 bushels, a deficiency of some 3,750,000 bushels on the average of the last 27 years. As the requirements of the colony are over 8,000,000 bushels, and as Victoria, South Australia and Queensland cannot more than supply their own needs—and probably not that—the immense deficit of New South Wales must be made up by New Zealand. This the colony can easily do.

The Navy Department has determined to equip each of our naval vessels with a complete diving apparatus, thus profiting from experience in the Samoa hurricane.

Philadelphia harbor will be improved at a cost of \$200,000, already appropriated by the State.

Plans have been filed in the Building Bureau for the Farmers' Loan and Trust Company's new building. It will be an eight-story limestone-front office building, on the northeast corner of William and Beaver streets, this city. It will have a frontage of 92 feet and a depth of 70 feet. The roof will be fire-proof and of brick, and the structure will cost \$425,000.

English operators are making an effort to recover control of the distribution of China teas, which has been gradually slipping away from them for a number of years.

In the action brought by R. L. Montgomery against the steamship Port Adelaide, for damages in being required to bring the teas with which the steamship was loaded from a Brooklyn instead of a New York pier, where the Port Adelaide should have discharged, Judge Browne, in the United States District Court for New York, on Friday, decided that where a vessel departs from the usual custom in discharging her cargo the owners must be compensated for the additional cost of cartage.

Secretary Windom has rejected the site for new Appraisers' stores in New York selected by Secretary Fairchild, and is now considering the desirability of other sites. The appropriation available is \$800,000.

Architectural plans for the new World building on file in this city contemplate the erection of a structure 13 stories high, the materials to be brick, stone and terracotta. The ground dimensions are 115 x 136 feet, and the cost will be \$1,000,000. From the street level to the roof will be 188 feet.

A new steel cross-tail has been received at the Brooklyn Navy Yard for the steel cruiser Atlanta. On the return of the cruiser from her recent cruise in the West Indies it was found that the cross-tail in place was severely ruptured, there being no less than five cracks, one of which was fully 5 inches in length.

Tons and tons of honey are produced in California, and the export trade in this article is constantly extending. The California Fruit Grower says that from the 50,000 or 60,000 stands or hives in California for the year 1888 there was mar-

keted of extracted honey 3,000,000 pounds and of comb honey 500,000 pounds, or a total of 3,500,000 pounds for the season. The shipments to Europe have increased. They amounted to nearly 1,000,000 pounds of last year's crop. The greater portion of these shipments went direct to England; the balance to Germany.

The British steamship Hawkhurst, with a general cargo, steamed 2300 miles during 11 days on a voyage from London to Rio, with a fire raging in the hold and the decks red-hot.

Notice has been given by the Post-office Department that the rate of postage applicable in Canada to letters addressed for delivery in Canada or the United States has been reduced to 3 cents for each ounce or fraction of an ounce.

The flour-mill syndicate talked about for some time past, to embrace the principal mills in Minneapolis, is pronounced impracticable.

A memorandum of the industrial conditions of England has been prepared for the London Board of Trade from the reports of numerous trade societies, and the inference is drawn, comparing one with another, that the tide of trade is nearing high-water mark. The proportions of men on out-of-work benefit are yet somewhat higher than in the best of times, but this may to some extent be accounted for not only by improved methods of production, but by the very large amount of extra time being worked by the men employed, which naturally tends to restrict the demand for workmen. Those societies which have reported show a total membership of 192,973, many of them having increased in strength considerably during the past year. Of this total 3798 are out of work, as against 4000 for the same societies last month, a decrease of 202 only, all of which is due to the building trades. Last month the proportion per cent. of unemployed was 2.17, now it is 2, so that the change is of the slightest. The iron and coal trades continue to be well employed, and are remarkably free from serious disputes.

The Cleveland Plaindealer says: "The railroad companies are reaching out for the iron business by lowering freight rates to meet competition among manufacturers, but as yet Cleveland has received little benefit from the reduction. The New York, Pennsylvania and Ohio Railroad have posted a tariff on manufactured-iron articles and pig-iron from points in the Mahoning and Shenango valleys, which will be a reduction of 20 per cent. on the present rates. The new rates will go into effect May 30, and will affect west-bound business. The rates will hold good until August 31, after which the tariff now in effect will be reinstated."

To abate the rabbit nuisance in New Zealand a ferret-breeding establishment is maintained on one of the estates which will let loose 800 ferrets; 400,000 skins a year were sent to market from the station, and although the rabbits are now pretty well under control, over \$3000 a year is still expended in their destruction.

As the elevated tracks of the Pennsylvania road in Jersey City push their way toward the depot many inquiries are made as to how the work can be completed while more than 200 passenger trains and dozens of freight trains are run daily over the same ground. There will be three rows of iron columns to support the girders along which the four elevated tracks are to run. One of these rows of columns will be between the present surface tracks and the other two rows on the outside. The inside row and one of the outside rows for probably the whole length will first be built, and the superstructure will be completed with two tracks above. This

will permit the use of these two elevated tracks and the one directly beneath them, so that the third row of columns and the superstructure of the second half can be erected without interruption from travel over the second surface track.

It is stated by a prominent brewer that 11 of the 72 breweries in New York and vicinity have fallen into the hands of an English syndicate, who have a capital of \$7,000,000 and will issue bonds in London. In one instance a brewery that was paying 5 per cent. on an invested capital of \$500,000 was bought for \$600,000, and the syndicate propose to bond it for \$800,000 and guarantee 15 per cent. on this amount. A number of American brewers have consolidated their interests in opposition.

A serious explosion took place last week at the New Jersey Extraction Works, Elizabethport, in which one man was fatally and three others severely injured. The disaster was caused by the bursting of a new furnace filled with molten copper. Owing to its being a holiday only a few men were employed around the furnace. Usually there are 20 men kept working about the furnace drawing off the melted copper. The furnace was blown to pieces and the fragments were scattered in every direction. The furnace was constructed at the foundry of Samuel L. Moore's Sons and was recently built. The damage to the company by the explosion is estimated at \$6000.

King Kalakaua, of the Sandwich Islands, will visit the Paris Exposition if he can borrow the \$10,000 for necessary expenses.

Ex-Minister McLane, in his farewell letter to President Carnot, of France, referred to the immense region of the great West—a region which is tending to become more and more the center of population and industrial, commercial and intellectual activity of the United States; a region which French explorers helped to open to civilization, and that not many years ago.

Mr. Ryan, the new Minister to Mexico, was honored with a banquet on his arrival at the capital.

New Decatur, Ala., was the scene of a grand industrial celebration last week, which continued two days. Visitors were taken in steamboats to the Government works at Mussel Shoals, on which nearly \$5,000,000 have been expended, with the object of opening navigation from Knoxville, Tenn., by way of Chattanooga and Decatur to the Ohio and Mississippi rivers, thus benefiting the immense iron, coal, timber and agricultural interests of 56,000 square miles of territory, embracing the Tennessee Valley and its tributaries.

Charles Preston, secretary of the Haytian Legation, claims to have received cablegrams that Legitime still holds Port au Prince, but the weight of evidence goes to show that Hyppolite, of the Northern party, is the victor, and New York merchants are expecting more active trade, especially in coffee, of which it is said large quantities are awaiting shipment. It is stated in Washington that the demand of the United States respecting the maintenance of a coaling station in Hayti will be conceded without dispute. Hence no necessity for appointing a commission. Admiral Gherardi, just returned from Port au Prince, confirms the reported successes of Hyppolite, the rebel chief.

New South Wales has renewed the contract with the Oceanic Steamship Company for one year to carry the Australian mails which the Canadian line of steamships was seeking to obtain.

Secretary Noble has approved the plan of operations for continuing the irrigation

survey of arid lands proposed by Major J. W. Powell, director of the Geological Survey.

A large force of expert bridge-builders started from this city for Johnstown.

The building of the Jersey approach to the big bridge of the Baltimore and Ohio Railroad over the Kills is progressing rapidly. It will be completed by August 1. The approach begins at Roselle, and when finished will be six miles long.

The British Government has ordered a fleet of three vessels to Behring Sea pending the question of jurisdiction of the United States respecting the Alaska seal fisheries.

Fires in cotton cargoes from the United States are more frequent, despite the precautionary measures adopted by the boards of trade and other organizations. The narrow escape of the *Rugia* and a case of spontaneous combustion on the *Servia* at Liverpool are the latest examples. The difficulty is attributed to negligence in loading.

Chief Engineer Walter Katte, of the New York Central, says Italian railroad laborers haven't driven out Americans by working for less, because wages are higher than they were several years ago. The Italians get about \$1.20 to \$1.30 a day for ordinary work.

The graduating class at Cooper Union this year is larger than ever before. The number of students attending the different branches of the school is 3521, of which 3127 are men in the night school. The prizes from Wilson G. Hunt comprise one of \$15 in gold for mechanical drawing to Albert D. Mead.

The proposed enlargement of the State House in Boston will cost \$2,500,000.

Berlin cable dispatches announce that the Samoan treaty has been agreed to and the text forwarded to Washington for confirmation. It is claimed that the United States' view of the case has been very generally adopted, and our commissioners are more than satisfied with the result.

The Southern development of coal lands is having the effect to diminish materially the river trade below Pittsburgh, and it is intimated that the Southern market may be lost entirely.

Samuel D. Cock, owner of a large foundry in Callao, died in that port on March 24. All the leading papers of Lima and Callao paid feeling tributes on the occasion of the decease of this gentleman, who was one of the oldest members of the British community in Peru.

Salamanca, the new Captain-General of Cuba, has been enthusiastically received.

It is stated that the Omaha Railroad Company have completed an arrangement with the Oregon Railway and Navigation Company to connect the two lines, making a new transcontinental route.

The estimate for expenses of the New York Fire Department for next year is \$1,089,000, including \$270,250 for new buildings and equipments.

The statement that a dozen steel steamers for the lakes are to be built soon is discredited by the Pennsylvania Railroad Company, who were said to be one of the parties interested. A large addition to the lake fleets would not be warranted by the present state of business. A Buffalo paper says the same mammoth steel steamer line makes its appearance once a year and then drops as suddenly as if struck with a club.

The Legislature of Texas has passed a law making it a criminal offense for the freight agents of lines doing business in that State to meet for the purpose of mak-

ing rates. The law makes such an act conspiracy, and imposes a term in the penitentiary of ten years upon conviction. It also prescribes that rates may be lowered, but in no case may they be advanced. If competing roads should, in a rate war, reduce freight rates to a ruinous minimum, that minimum must be thereafter observed, and any attempt to advance rates by agreement will make the agents amenable to punishment under the conspiracy law.

Applications for 26 town sites in Oklahoma are on record.

The new iron rates on the Pittsburgh and Lake Erie Railroad go into effect June 17. They will apply on stuff from Wampum, Youngstown and other valley stations to the points in the vicinity of Scottdale. The new rates are as follows: On muck, scrap iron, billets, blooms and skelp iron 24,000 pounds minimum carloads, \$1.30 per gross ton; pig-iron, \$1.15; cinder and scale, \$1.10.

The tank system of making window glass, which has been so successful in Belgium, is being tried in Pittsburgh with good results. The tank used there by the T. Campbell Company is said to be the largest in the world, measuring 120 feet in length and 20 feet in width. It has a capacity of 760 tons of molten glass. Forty-eight men; blowers and gatherers, are at work at the same time and the weekly production of the tank is expected to be 6912 50-foot boxes of glass. The glass is declared to be without a blemish.

#### Fraudulent Bills of Lading.

The United States Supreme Court has just rendered a decision of much interest to the commercial world on fraudulent bills of lading.

Easton, the agent of the Texas and Pacific Railway Company at Sherman station, gave to Joseph Lahnstein a regularly drawn and signed bill of lading for 200 bales of cotton. Lahnstein indorsed the bill, drew a draft for \$8000 on Friedlander & Co., of New Orleans, and sent the two to that firm, who paid the draft.

It was subsequently learned that no cotton had been delivered to the road, that the bill of lading was fraudulent and that Easton and Lahnstein had acted in collusion. Friedlander & Co. sued the railroad company. They claimed that as the bill of lading was in regular form and issued by the company's agent, the company were liable.

The Supreme Court decides that the company were not liable. Here is what Chief Justice Fuller says:

"The company not only did not authorize Easton to sign fictitious bills of lading, but they did not assume authority themselves to issue such documents, except upon the delivery of the merchandise. Easton was not the company's agent in the transaction, for there was nothing upon which the agency could act. Railroad companies are not dealers in bills of exchange, nor in bills of lading; they are carriers only, and held to rigid responsibility as such.

"Easton, disregarding the object for which he was employed and not intending by his act to execute it, but wholly for a purpose of his own and of Lahnstein, became *particeps criminis* with the latter in the commission of the fraud upon Friedlander & Co., and it would be going too far to hold the company under such circumstances estopped from denying that they had clothed this agent with apparent authority to do an act so utterly outside the scope of his employment and of their own business. The defendant cannot be held on contract in the absence of goods, shipment and shipper; nor is the action maintainable on the ground of tort."

## MANUFACTURING.

### Iron and Steel.

Work on the new furnace of the Carrie Furnace Company, at Rankin, Pa., is being prosecuted vigorously, and it may possibly be ready for blast during the present month. It is being fitted up with Massicks & Crooke's hot-blast stoves, of which McClure & Schuler, of Pittsburgh, are the sole agents in this country. The furnace when completed will have a capacity of about 200 tons per day.

Warwick Furnace, at Pottstown, Pa., was successfully blown out on May 28, after a blast of 180 weeks, during which the furnace produced 107,600 tons.

A preliminary meeting of the manufacturers of steel shafts was held at the Hotel Anderson, Pittsburgh, last week, for the purpose of forming an association for mutual protection. Only three manufacturers were present, but matters pertaining to the trade were discussed. Another meeting will be held at an early date, when a large attendance is expected.

Charlotte Furnace, at Rochester, N. Y., made its largest output for one month in May, when an average product of 56 tons a day was attained of No. 1 and No. 2 foundry. The furnace is now making over 60 tons a day, mostly of No. 1.

Work on the new rod mill now in course of erection by the New Castle Steel Company, at New Castle, Pa., is progressing in a satisfactory manner, and it is expected to be ready for operation not later than September next. The plant will have a capacity of about 150 tons of rods per day, 100 tons of which will be used by the New Castle Wire Nail Company, of that place, while the balance will be sold in the open market. Employment will be given to about 100 men.

Walton Furnace, at Max Meadows, Va., the property of the Lobdell Car Wheel Company, of Wilmington, Del., has just been blown in.

Mt. Laurel Furnace, Clymer Iron Company, Temple, Pa., was banked on the 16th ult., in order to make necessary repairs.

For the week ending on Saturday, the 25th ult., Neshannock Furnace of the Crawford Iron and Steel Company, at New Castle, Pa., turned out 1411 gross tons of pig-iron. This is the largest production for the same length of time in the history of the furnace.

Gaylord Furnace, at Detroit, is out for general repairs.

We are informed that the report that the Moorehead-McCleane Company, of Pittsburgh, had notified their employees of a 10 per cent. reduction in wages is without foundation. The firm will wait until the Amalgamated Association presents its scale for the coming year before declaring their intentions.

Joanna Furnace, in Berks County, Pa., has started up after over two years' idleness. The furnace has undergone extensive repairs, enlarging its capacity, with new engines and boilers, making it one of the finest charcoal furnaces in the State.

After a successful run of nearly four years, No. 11 furnace of the Thomas Iron Company, at Saucon, Pa., will blow out the present week to make repairs.

Carnegie, Phipps & Company, Limited, of Pittsburgh, have extended the limit of time for the signing of the agreement at their Homestead Steel Works until the 10th inst. The original intention of the firm was to give their employees until 12 o'clock noon, June 1, to sign the new

sliding scale. If any of them did not do so by that time, their positions would be declared vacant.

The Glendon Iron Company, at Easton, Pa., are pushing forward repairs on stack No. 3. Their No. 2 stack, which has been in blast some time, is now out of service. This leaves but one furnace in blast.

The charcoal furnace of the Jefferson Furnace Company, at Oak Hill, Ohio, has been lighted.

Topton Furnace, of the Topton Furnace Company, at Topton, Pa., is undergoing extensive repairs at present, and will be ready for blast in a short time. At present the owners of the furnace are undecided whether to put it in blast when repairs are completed or allow it to remain idle until there is an improvement in the iron business.

The stack of the Vigo Iron Company, of Terre Haute, Ind., was blown out on May 22, and will probably be idle until fall. The stack will be raised 12 feet, and otherwise improved.

The Columbia Rolling Mill Company, of Jersey City, N. J., have bought a portion of their mill machinery, covering about 100 tons, to be delivered before June 15, and hope to have the balance, including boilers, engines, &c., in place before July 15.

The fact that the Valley Iron Works, of Coatesville, Pa., have resumed operations in full for the first time in three years, and that the Brandywine Iron Works and the Viaduct Mills, both of the same place, are now running in full force, would seem to indicate that the plate-iron industry of Eastern Pennsylvania is in a flourishing condition.

A contract for an important addition to their plate mills has just been given by Huston & Sons, of Coatesville, Pa. The new mill will be erected south of their present works, and will be made entirely of iron and fitted up with the most improved modern machinery. Several sets of rolls, 10 feet long and 36 inches in diameter, will be put in, and a large steam crane will be used for conveying the piles to and from the furnace. It is hoped to have the new plant in operation by January of next year.

Respecting the iron-works at Johnstown the Philadelphia Press of Wednesday says: "The news in reference to the situation of the Cambria Iron Company's affairs in Johnstown is much more favorable. It is said the company's furnace stacks were not even chilled, the gas and water-works are intact, and the Baltimore and Ohio tracks at Johnstown, which the company built, are not much damaged. The company have 1000 men at work clearing up the debris at one portion of the works, and will start up as soon as possible. The loss of the company has of course been very large, but it is not as heavy by any means as at first supposed."

#### Machinery.

The Atherton Machine Company, of Lowell, Mass., are employing an extra large force of men, and are turning out large orders for machinery to go to all parts of the United States.

Work has been commenced on new machines for the Clinton Wire Cloth Company, of Clinton, Mass., the increase in capacity being necessary to meet the demand for the "silver finish" brand of poultry netting made by this concern.

The various offices in the Westinghouse Building, at Pittsburgh, are kept cool by electricity. Nickolo Tesla, the inventor of the alternating current motor, has completed an adaptation of his motor to a fan, or to the revolving shaft of fans, for the production of cool air. The motors range

from  $\frac{1}{2}$  to  $\frac{1}{4}$  horse-power and are of the simplest construction, consisting only of a shaft revolving in an iron cylinder. There is no delicate machinery connected with the motor. After it has been attached to the electric current usually operating door-bells or lamps in private residences it will run forever, requiring only an occasional oiling of the bearings. The rapid rotation of the fan connected with the revolving shaft produces a current of cool air in the room.

The Laidlaw & Dunn Company, of Cincinnati, have received the contract for the entire pumping outfit to supply the United States barracks at Newport, Ky. This outfit is located at the new reservoirs of the Covington water-works. This concern is doing a large business in its standard Duplex pumps.

The Berlin Iron Bridge Company, of East Berlin, Conn., have closed a contract to build for the Franklin Moore Company, of Winsted, Conn., a new iron bridge, 40 x 100 feet, to be used as a forge shop. The building will be entirely of iron, without any wood-work about it, in order to insure absolute safety against fire. The same company are building for the Anaconda Smelting Works, of Anaconda, Montana, an iron building 325 feet wide by 600 feet long. This building is also entirely of iron, iron trusses covered with corrugated iron, and replaces the entire plant of the company which was lately destroyed by fire.

The Energy Mfg. Company, 1115 South Fifteenth street, Philadelphia, have within the last couple of months made shipments of their rope hoisting-machines, center-grinders, &c., to the following places: Australia, Alabama, Arkansas, California, Colorado, Connecticut, Dakota, Delaware, District of Columbia, Illinois, Indiana, Iowa, Maine, Massachusetts, Minnesota, Nebraska, New Jersey, New York, North Carolina, Ohio, Oregon, Pennsylvania, Rhode Island, Tennessee, Texas, Vermont and Virginia. This list of localities to which shipments have been made gives an excellent view of the very wide scope of the trade enjoyed by this company.

The Westinghouse Electric Light Company, of Pittsburgh, have just secured a large contract in Sterling, Ill., for the erection of a plant of 750 arc lights. The whole costs \$15,000.

The Putnam Machine Company, of Fitchburg, Mass., have just presented an illustrated catalogue, which gives in brief the history of the Putnam Company, followed by handsome engravings showing the many lines of tools manufactured by them. These include lathes of all kinds, gear-cutting machines, slabbing or milling machines, drills, die, bolt and nut-tapping machines, planers, car-wheel borers, slotting and paring machines, reamers, taps, dies, drills, &c. The catalogue not only presents a perspective view of the many machines made, but in some instances also presents such sectional drawings as may be necessary in order that the reader may fully understand the construction and operation of the machine. A complete description is also given of the well-known Putnam automatic cut-off steam-engine.

The Jeffrey Mfg. Company, of Columbus, Ohio, report a steady demand for their elevating and conveying machinery. They are running their works full time, and the prospects for business in their line are good.

From John Adt & Son, of New Haven, Conn., we have received one of their new catalogues illustrating and describing their machinery for wire-workers and hardware manufacturers. This includes their wire straightening and cutting and

wire straightening machinery of various kinds and sizes, which are so well known. They also describe their automatic shear-point staple machines, elastic rotary-blow riveting-machines, butt-milling and butt-drilling machines, adjustable drilling and countersinking machines, and foot presses and double-head drilling and milling lathes. Some of these machines we have presented in former issues of *The Iron Age*.

Among the recent purchasers of the patent friction covering now being manufactured by the National Pulley Covering Company, of Baltimore, are the following: Owosso Tool Company, Owosso, Mich.; H. P. Duschler Company, Hamilton, Ohio; Merrimac Mfg. Company, Scranton, Pa.; Norfolk Knitting Mills, Norfolk, Va.; Coonell Mfg. Company, Ann Arbor, Mich.; Wardnell Needle Works, Lake Village, N. H.; R. C. Dunn & Bro., Goldsboro, Pa.; Lindsey Bros., Middletown, N. Y.; W. S. Conger, Litchfield, Mich. Their business in one week recently came from 15 widely-separated States.

From Nicholson & Waterman, of Providence, R. I., the well-known makers of a full line of nut machinery, we have received a valuable treatise on stay bolts, which opens with a description of the duty to be performed by a stay-bolt, and then considers the methods now practiced of securing the bolts. The pamphlet treats the subject solely in a practical way, points out the difficulties encountered, and suggests the remedy.

#### Miscellaneous.

The Berlin Iron Bridge Company, of East Berlin, Conn., have just issued a large catalogue in which they illustrate their line of work by means of engravings made directly from photographs of actual structures built by them. The views presented have been so selected as to convey a very clear idea of the types of iron railroad and highway bridges built by them; also their method of building cylinder piers with piles and concrete. Following this is an extended description, copiously illustrated from work actually done, of their various forms of iron roofs for factories, depots and other buildings in which the span is considerable. These cover cases varying in magnitude from the grand iron train sheds of the New York, New Haven and Hartford Railroad at New Haven down to platform coverings for depots. They also present a list of many large and well-known firms for whom they have erected iron buildings during the past few years. Following this are the various forms of angles, T-bars, channels, beams and girders; also iron doors and shutters. In the back part of the book is a long list of iron and highway bridges built by the Berlin Company, and also a large collection of testimonials which commend the durability, simplicity and strength of their bridges.

In a recent issue of the *North American Review* Prof. R. H. Thurston, of Cornell University, and an authority on the subject of steam-engines, expresses it as his opinion that this invention is capable of vast improvement, and that it has not yet begun to exhaust its inherent powers. On the basis of greater developments in the application of inventions to the steam-engine Professor Thurston predicts that the next generation will see it consuming 1 pound of fuel per hour for a single horse power; that ships of 20,000 tons will be driven at the rate of 40 miles per hour; that the American continent can be spanned by flying trains in two days and that transportation between the cities of the Atlantic and those of the Pacific coasts will be so cheap that the general average of living will be vastly improved upon what exists to-day.

## The Appalling Calamity at Johnstown.

The columns of the daily newspapers are filled with details of the terrible catastrophe which befell Johnstown, Pa., on the night of last Friday. What was then one of the most flourishing of the inland cities of Pennsylvania, with 80,000 people in its natural boundaries, is now a storm-swept waste, with a few ruined buildings and but a part of its former population of busy workers. Its industries have been almost annihilated, its people have been reduced from comfortable circumstances to abject want, and its future has been suddenly transformed from one of brightest possibilities to one of doubt and darkness. The records of a century show nothing on this continent at all approaching the Johnstown horror in loss of life. Its suddenness was also a peculiar element, adding terror to the occasion. One rush of the fatal flood, a short season of swirling waters and crashing buildings, and the destroyer had done his work. The various forms of pestilence which have at times devastated portions of the country have given their victims warning of their approach, and even such earthquakes as have visited us have been merciful in their death-dealing power as compared with this latest frightful example of the destructiveness of the forces of nature. The annihilation of at least one-fifth of the total population of the valley in a time which could be measured by minutes is an awful occurrence, passing our powers of comprehension.

It appears from the best accounts of the catastrophe at hand that there were three stages in the disaster. First came a flood in the two streams which unite at Johnstown, caused by a heavy rain of some two days' duration; the second was the breaking of a lumber boom on Stony Creek, which sent a large number of logs crashing through that part of the town overflowed by its waters, and the third, and the most calamitous of all, was the giving way of the dam at Conemaugh Lake, located ten miles above Johnstown on a branch of the Conemaugh River. When the lumber boom on Stony Creek was broken the enormous mass of logs, hurled down the stream and over the submerged district of the doomed city, tore away the houses as though they had been built of cards. While this work of destruction was still going on there came down the valley of the Conemaugh a towering mass of rushing water from the burst embankment at Conemaugh Lake, which swept with resistless force over the remaining houses and buried them under fathoms of water or carried them at once down the stream. Below the city is a stout stone bridge over the Conemaugh River, built quite recently by the Pennsylvania Railroad

Company. Against this the mass of *débris* became lodged; the waters were backed up and overflowed all the space where the streets of Johnstown had been. And then, as though horror was fated to be piled on horror, fire broke out in the *débris* and burned to death numbers of human beings who had been carried thither in their frame dwellings.

The great rain storm which was the immediate cause of this dreadful occurrence prevailed over a wide section of the country from New York to Virginia, washing out railroad bridges, sweeping away trestles, causing land-slides, breaking down telegraph wires and interrupting railroad travel and means of communication by wire for several days. Information from Johnstown which was at first received by the outside world was, therefore, meager, and the frightful calamity briefly narrated in the press dispatches was thought to be exaggerated. But, unlike almost every other disaster, the proportions of this one have grown larger with every hour bringing more complete details. Nothing has transpired to mitigate its unvarying tale of loss of life and the terrible experiences of the survivors except that occasionally some one at first reported dead proves to have been rescued.

Conemaugh Lake, which is above alluded to as having burst its bounds, was an artificial sheet of water held in place by a dam. It was about  $8\frac{1}{4}$  miles long, 1 mile wide, and in some places 100 feet deep, and is said to have been the largest artificial reservoir in the United States. It was not constructed for useful purposes, but for pleasure, and is the property of a corporation called the South Fork Fishing and Hunting Club, composed principally of residents of Pittsburgh. Its outlet was from 200 to 300 feet above the level of Johnstown. The citizens of that place were aware of the danger to which they were exposed by the possible bursting of the dam, but rested quietly within the shadow of trouble from that source, confiding in the examinations known to be made from time to time by capable engineers, who regularly reported it staunch and able to withstand any force short of a convulsion of nature. It is presumed that the dam was weakened by the excessive rainfall and strained by the unwonted accumulation of water in the lake, and that a sudden cloud-burst supplied the conditions favorable to its collapse, which was attended with such sorrowful results. Criticism, denunciation and fiery words of reproach are being freely used against the unwitting authors of the destruction of Johnstown, and it is possible that the responsibility of the members of the club may be tested by suits at law. But no reparation is now possible, from this or any other source, that will mitigate the sorrows of those who mourn their loved ones.

The measures of relief for the sufferers by the floods are on a scale corresponding with the extent of the disaster. New York City immediately responds with large sums. The New York Chamber of Commerce on Tuesday held a special meeting. Like movements were initiated by all the exchanges and other commercial bodies. The Connecticut Legislature appropriated \$25,000 for the flood sufferers, and the Massachusetts Legislature \$10,000. The Bethlehem (Pa.) Iron Com-

pany have directed the Johnstown authorities to draw upon the company for \$5000. Immense quantities of relief stores are being sent to Johnstown from Pittsburgh, Philadelphia and other points, transportation free. Latest advices from the scene of the disaster do not mitigate its horrors or its extent.

## Mercantile Opportunities in Japan.

Japan is now recognized as the leading nation of the Orient, although only 25 years have elapsed since she entered the field of modern progress. When the Tycoon was dethroned and the Tokugawa dynasty became extinct after a continuous reign of 800 years, there was scarcely a foreigner in the country outside of the treaty ports—the legation buildings at Yeddo being closed on account of the enforced withdrawal of the resident ministers. Christianity was prohibited by an edict posted everywhere on the public thoroughfares, and the entire population remained in a condition of Eden-like simplicity as regards raiment, and other domestic requirements such as call for the products of industry and ultimately create a market for articles of foreign manufacture. Today we find Japan the very foremost of Asiatic nations, whose commerce is expanding by "leaps and bounds," so that, as we are told on good authority, "instead of being only one-seventh of China's commerce, as it was ten years ago, it is already one-half, and will in all probability be equal to or greater than that commerce a few years hence." In all that constitutes national greatness—in her system of government, her naval and mercantile marine, railroads, telegraphs, water-works, shops and manufactories—Japan is advancing with amazing strides.

At the present juncture the question is pertinent whether the United States Government, or rather the mercantile representatives of that Government, are hastening with due alacrity to take advantage of the special privileges and prerogatives acquired under the treaty with Japan in February last. It will be remembered that at that time, after protracted but unavailing endeavors on the part of the great powers acting in unison to effect a treaty revision, Japan approached each of them separately. The negotiations of 1886-87 were effective only in convincing Japanese diplomats that to reconcile the conflicting interests and prejudices of seventeen powers was impossible, except at the price of abject humiliation. Thereupon it was determined, by a masterly stroke of policy, to remove the "stigma of international isolation," and almost simultaneously with the promulgation of a constitution on February 11, attended with an exuberance of national feeling rarely manifested on any occasion, Japan's overtures to the United States were promptly accepted, and as a consequence Americans will soon, before the end of 1889, be in the full enjoyment of freedom to trade, travel, reside or own property anywhere within the limits of the Empire, but on the condition of fully recognizing Japanese jurisdiction, as in any other independent nationality.

Meanwhile it is interesting to observe the attitude of the European Powers, to whom proposals similar in terms were like-

wise submitted. The London *Times*, admonished by its correspondent at Tokio, who presents the subject in much fullness, is inclined to reproach the imperial authorities for their indifference, lest through their inaction the position now occupied by England in Japan and the share she now enjoys in her foreign commerce be taken "by some other power, such as the United States, which is more sensible of the commercial substance. Either we must accept the terms offered to and accepted by the United States," says the editor, "or we must yield the command of the Japanese markets to our principal commercial rivals in Japan." The question again arises: Are merchants in the United States availing themselves of their opportunities? A communication from the Minister of Foreign Affairs or Department of State setting forth the present position of affairs and the advantages incidental to the situation would be well received.

#### American Ocean Steam Traffic.

The annual report of the Pacific Mail Steamship Company states that the new 5000-ton steel steamship contracted for in Glasgow will be built at a "saving of one-third in cost over the prices quoted by the ship-builders on this side of the Atlantic." She is, however, debarred from carrying the American flag, and likewise excluded from the American coastwise trade. Neither is she eligible for mail pay from the United States beyond sea postage. "But the policy so far displayed by our Government," says the report, "has not warranted the managers in supplying their needs in the United States at such a material difference in cost." The action of the Pacific Mail Company in placing this contract in Europe was not graciously received by builders in the United States. Nor is it likely that these builders will concede that they are handicapped to the extent of one-third, if due allowance is made for the superior materials and workmanship required under the American standard. The report intimates that under a more liberal policy—doubtless meaning more liberally in the matter of mail contracts, or a bounty system of some kind—it will be "an easy matter for the company to qualify therefor by providing additional American tonnage."

Incidental to this subject a report comes from Washington that President Harrison and members of the Cabinet will soon have a prolonged conference with the officers of the Brazil Mail Steamship Company, with reference to the alleged discrimination against the American ocean marine, under the present maritime laws of this country. H. K. Thurber, the president of the company, is understood to have prepared documents, at the request of the authorities in Washington, showing the hardships now experienced by American companies in the unequal struggle with the subsidized lines of Europe. In the case of the Pacific Mail Line the company, aside from ordinary disabilities, have suffered from the operations of the Chinese restriction act and from the suspension of work on the Panama Canal, as well as from the competition of the subsidized steamships of the Canadian Pacific Company plying between Vancouver and Asiatic ports.

American ship-builders are said to be much elated at the prospect of a conference with the new Administration, hoping that it will be the inauguration of a policy looking especially to the relief of the interests of the ocean carrying trade, and in behalf of which all measures thus far attempted, either by the National or State governments, seem to have been wholly ineffectual and nugatory.

#### The Buffalo Railroad Complaint.

The New York State Board of Railroad Commissioners have rendered a decision in the complaint of the city of Buffalo. This complaint was founded on the fact that local rates between Buffalo and New York were a little more than the proportion of the through rates between the same points. In these days of severe competition a little difference like this in question prevents Buffalo from buying at the West to sell again at the East, or *vice versa*. It was claimed that the city was entitled to such a local rate as would permit this, and without ordering it so, the State Commissioners think that the claim is just. The decision does not go beyond suggestions, because the matter runs into interstate complications, and the Interstate Commission, in the somewhat similar complaint made by Detroit, took ground exactly opposite. Detroit, it will be remembered, asked for such a system of tariffs to and from the sea-board as would enable it to secure a share of the grain and jobbing trades of the States further away. But it was held that no city "owned" any trade whatever, and none was entitled by natural right to any lower tariffs founded merely on the desire to control trade, especially if such a plan would result in actually higher prices to the consumer.

In the Buffalo case the New York board anticipate the possible effect of granting *pro rata* rates to that city, and bluntly say that it would be right even if it resulted in higher through rates between the far West and the sea-board. Such a thing, however, is out of the question. The canal and the lakes, to say nothing of many other commercial conditions, must always force minimum through rates upon the rail carriers. It is beyond the power of the railroad managers to put what rates they may wish upon breadstuffs or manufactures, and the New York board must know it. Another and strong objection to any such increase of rates is the increased cost to the consumer or to the manufacturer; and when we consider that this proposed increase is to be put upon traffic in order that the middle-men of a particular city may do a larger business, it seems a wrong to the public even to advocate it. If once the principle be granted, it is only a question of time when all intermediate cities will demand the same jobbing privileges, and it would be very difficult to say why one should have it and not another. The end of such a state of things would be the practical breaking up of long routes of transportation at cheap rates, for every through rate would necessarily be no lower than the sum of a number of high locals. Any other system like the present must injure the middle-men's trade at some point or points between.

Buffalo has manifest advantages as a jobbing center. A large lake traffic out

and in makes it a natural distributing point, and its enterprising citizens have not been slow to use their opportunities. Coal, ore, breadstuffs and many products and manufactures are there transferred from water to rail or water. The city does not need other advantages for its prosperity. In concluding their decision the board say, speaking of *pro rata* rates for Buffalo: "Otherwise the result will be that the centers of business and distribution will be pushed further and further West, to the detriment and eventual paralysis of Eastern cities—a result which certainly will not be calmly tolerated." This opens up a wide subject. Do the commissioners mean that Buffalo is entitled to such a system of freights as to give it power to stop sea-board traffic and distribution in the trans-Missouri States? Undoubtedly a city should have reasonable tariffs, but where to draw the line in our complicated mercantile system is a problem yet unsolved.

#### China's Trade in Metals, Petroleum, &c.

Mr. E. McKean, the secretary for statistics of the Chinese maritime custom-houses, has just published his returns for 1888, as compared with those of former calendar years. They are more complete, and consequently more valuable, than they have been heretofore, particularly with reference to metals, about which the world at large has hitherto been but ill-informed, especially as regards tin and lead, now given in detail. The figures are given in Haikuan taels of \$1.24 American.

The import into China through the treaty ports was as follows:

Taela.		Taela.	
1883.....	73,567,708	1886.....	87,479,328
1884.....	72,790,758	1887.....	94,324,518
1885.....	88,300,018	1888.....	106,561,372
Total.....234,528,478		Total.....287,765,518	
Increase.....53,237,039, or 23 per cent.			
Iron.		Tin.	
Piculs.		Piculs.	
1883.....	817,526	71,062	190,723
1884.....	843,532	51,447	108,104
1885.....	1,202,880	66,700	159,783
Totals.....2,863,938		189,179	
1886.....	1,063,371	50,323	215,997
1887.....	1,023,080	40,556	222,228
1888.....	1,298,408	77,225	220,797
Totals.....3,404,839		168,804	
Increase.....540,351, or 15%		Dec. 20,575, or 11%	
		Inc. 205,950, or 45%	

Reduced to tons of 2240 pounds (1 picul equaling 134 pounds) the import in 1888 was:

Tons.		Value.	
Taela.		Taela.	
Iron.....	77,000	2,185,288	
Tin.....	4,800	2,135,721	
Lead.....	13,670	1,006,271	
Total.....		5,327,278	
Other metals.....		1,560,845	
Total.....		6,887,123	

On the other hand, 15,000 piculs of tin were shipped through the ports of Pakhoi and Ichang in 1888, probably at the time when the French syndicate had raised prices to a point inducing re-exportation. The import of petroleum was as follows:

Gallons.		Stock at	
Gallons.		Shanghai	
		December 31.	
1885.....	14,000,000	1,250,000	
1886.....	23,038,101	10,508,000	
1887.....	12,015,135	5,500,000	
1888.....	16,613,060	5,000,000	

Since Russian refined has begun to compete with our petroleum in China there is a tendency to overstock the Chinese market, and henceforward this branch of the trade will be subject to extreme fluctuations in the supply and price.

The mills of British India are fast supplanting Manchester in the twist trade with China. Thus Shanghai in 1888 received 163,946 piculs of twist from British India and only 62,721 piculs from England. The general twist import into China developed as follows:

1878.	1880.	1882.	1884.	1886.	1888.
Piculs.	Piculs.	Piculs.	Piculs.	Piculs.	Piculs.
108,360	150,518	184,940	261,457	382,984	561,903

The amount of cotton piece goods imported into China in 1888 was 44,437,525 tael; in this trade the United States at times largely participates whenever the market out there chances not to be overstocked. Other imports in 1888 were: Fish, 2,637,132 taels; matches, 1,089,842; rice, 9,638,829. Match factories have been started on a large scale in China, the consumption of the article being enormous. The rice imported was 7,132,211 piculs; the famine, of course, stimulated the movement.

In 1888 China exported through the ports 92,401,067 taels' worth of products, against 85,860,208 taels in 1887. Her export of tea was as follows:

	1884.	1885.	1886.
	Piculs.	Piculs.	Piculs.
Black.....	1,564,451	1,618,408	1,654,058
Green.....	202,556	214,688	192,330
Brick.....	244,996	280,111	861,482
Totals.....	2,012,003	2,113,207	2,308,480
Taels.....	20,030,041	32,207,042	38,464,155

	1887.	1888.
	Piculs.	Piculs.
Black.....	1,629,880	1,542,209
Green.....	184,681	209,377
Brick.....	331,231	412,641
Totals.....	2,145,862	2,164,227
Taels.....	20,011,720	30,280,611

Russia receives the large amount of tea it imports from China overland via Kiachta. In the English market tea from British India rapidly supersedes Chinese, while of the tea consumed in the United States 50 per cent. is imported from China and the remainder from Japan.

China's silk export in 1885 was 20,001,175 taels; in 1886, 28,863,218; in 1887, 31,690,214; in 1888, 32,180,298. The export of Chinese straw mats declined from 150,942 piculs in 1887 to 79,938 in 1888. China exported in 1888 no less than 12,000 tons of paper, worth 1,650,298 taels. While China exported 60,000 tons of sugar, the import did not exceed 8680 tons; about 33 per cent. of the export went from Formosa to Japan.

American trade with China was as follows:

Calendar year.	Import into the United States.	Domestic export to China.
1888.....	\$17,557,841	\$3,196,055
1887.....	17,875,479	5,315,115

While our import from China is as a general thing steady, the domestic export, which is largely cotton goods and petroleum, naturally fluctuates widely where competition is so great.

A letter from Chattanooga extolling the advantages of that city as an industrial center says: "In less than a quarter of a century there has arisen, almost phoenix-like, a beautiful city, in the enjoyment of commercial power. Thirteen railroads radiate to all parts of the country; over 200 manufacturing establishments bring money into her coffers; a well-ordered street railway system, dummy lines and electric cars give local transportation facilities, while gas and electric lights, water-works, grand churches, good hotels, and everything that goes to make up a magnificent city are among the actual advantages which she enjoys. You could

find nowhere better appointed nor handsomer homes. There are besides a steel-rail mill, blast furnaces, wrought-iron pipe works, planing mills, iron and mantel concerns, an edge-tool factory, machine works, tack, nail and spike mills, a great forge, capacious brass and copper foundry, extensive tanneries, various wood-working establishments, a brick-yard turning out fine pressed brick, a stained and plain glass works, car and wheel shops, agricultural works, barbed-wire mills, carriage and wagon factories, and many more. All these are doing a good business."

### Great Destruction of Bridges.

The destruction of bridges, lumber, dams and other property by floods within the last few days, notably in Pennsylvania and New York States, but extending south through Maryland and Virginia, will make a lamentable aggregate. The Pennsylvania Railroad alone have lost more than 20 bridges, many of them large and costly. A Harrisburg railroad official estimates the loss of the company at \$3,000,000. On the Pittsburgh division the bridges between Altoona and Johnstown are gone, also the Mineral Point bridge and the Conemaugh bridge, the bridges at Linden and Montgomery on the Erie division, and three spans of the bridge at Williamsport. The Philadelphia and Reading lose the bridges at Milton and Sunbury. On the West Pennsylvania division the bridges at Blairsville, East Tunnel and East Leechburg are gone. The destruction of property at Hanover, Pa., is enormous. The railroad bridge at Mengis Mills was swept away. The Long Bridge at Washington is badly wrecked. To repair the damage the Pennsylvania Railroad purchased 4,000,000 feet of heavy timber at the large lumber yards along the line, Wilmington and Baltimore lumber yards furnishing about 1,000,000 feet more. The Pennsylvania Canal at and above Columbia is greatly damaged and all the rolling-mills are submerged. In Virginia the floods were disastrous. The trestle bridge of the Norfolk and Western Railroad and that of the Richmond and Petersburg Railroad Company across the Appomattox River at Petersburg were washed away; also Campbell's Bridge, and a new and costly iron bridge on the Petersburg and Weldon Railroad. The Chesapeake and Ohio Canal is damaged to the extent of perhaps \$1,000,000 and virtually destroyed. Losses in the Cumberland Valley are estimated at \$200,000. Eight bridges between Senaheim, Pa., and Gunpowder Falls, Md., along the Western Maryland Railroad, have been carried away. In New York State the losses are heavy. The losses at Elmira are put down at \$500,000. The Erie Railroad shops at Hornellsville were flooded and abandoned. The New York, Lake Erie and Western's new iron bridge across the Genesee at Belmont was swept away. The monster iron tanks of the National Transit Company on the flats at Olean suffered severely. The destruction of the Delaware, Lackawanna and Western bridge at Waverly will suspend all through Western traffic for several days. The losses of lumber at Williamsport and Lockhaven, Pa., on the Kanawha River and at other points are estimated at millions of dollars.

The contractors for the new cruiser Baltimore have notified the Navy Department that the preliminary trial of the ship will take place on June 15 in the Delaware River. In the official trial the ship is to show a speed of 19 knots upon an estimated horse-power of 10,500. The total cost of the hull and machinery, exclusive of her armament, was \$1,325,000, and most of this money has been paid over to the contractors.

## Washington News.

(From Our Regular Correspondent.)

WASHINGTON, D. C., June 4, 1889.

The Bureau of Ordnance officers are very well satisfied with the outlook for the fabrication of modern high-power and long-range guns. The Bethlehem Iron Company, under their contract with the Government, from their new plant are now prepared to furnish the largest forgings which will be required for the heaviest ordnance under present designs. The Government has already completed a number of 6-inch and is finishing the 10-inch guns. It is now proposed to order a supply of 12-inch caliber, after which the 16-inch guns, the largest designed by the Naval Ordnance Bureau, will be given a practical test in the way of manufacture. The Bethlehem Company are now turning out the largest steel forgings ever attempted in the United States.

The guns for the Charleston's batteries are on their way to San Francisco. It was stated at the Navy Department to-day that the facilities were now such that guns of the different calibers can be turned out as rapidly as they will be required by the vessels now under construction. Engineer-in-Chief Melville and his chief assistant, M. P. Towne, U. S. Navy, with the competent force under their direction in the Bureau of Steam Engineering of the Navy Department, have completed the designs for the engines of all the vessels under way and which exceed in power anything ever attempted in the United States. The engines for the 3000-ton cruisers are designed to develop 10,000 horse-power and to make a speed of 20 knots an hour. These engines have six boilers; one pair, 14 feet 4 inches, another pair, 13 feet 4 inches, in diameter, and all 20 feet 4 inches long, and two donkey boilers, 10 x 18½ feet. There are four cylinders, one for high, two for low pressure, and one intermediate, with piston-valves. There are brass condensers, each with centrifugal circulating pumps for condensing and also air pumps. Each system of boilers is supplied with separate feed pumps and other appliances, and can be worked separately. They will carry 160 pounds of steam. The officers have great confidence in these engines, which are now under construction. All the boilers and all practicable parts of the machinery are made of steel, the shafts being hollow. Each engine has auxiliary condensers, and can work separately and also operate the twin screws. The engines for the 2000-ton vessels are triple expansion, with 5400 horse-power. There are four boilers 18½ feet and a donkey boiler 9½ feet long, all of them being 12 feet in diameter.

There is unusual activity in all branches of the Navy Department preparing designs of the hulls, machinery and ordnance for the new vessels authorized by Congress. Chief Constructor Wilson, with a large corps of assistants, Engineer-in-Chief Melville, assisted by Chief Engineer Towne and Commodore Sicard, Chief of the Bureau of Ordnance, with experts in their respective branches, are pushing work with the utmost rapidity.

If Congress exhibits the liberality indicated by the Republican Senate a few years ago, the close of the present Administration will find the navy of the United States one of the fleetest and finest in the world.

The Philadelphia Record says engine No. 206 on the Bound Brook Railroad, built on the Wootton pattern, ran eight miles at the rate of 39 seconds per mile, or over 90 miles an hour.

### A Model Electrical Manufactory.

An article in the *Stevens Indicator* for April, by L. W. Serrell, Jr., thus describes the new factory of the C. & C. Electric Motor Company, at 841 Greenwich street, New York City, employing over 100 men and depending upon electric power alone as a prime mover:

The building is a thoroughly fire-proof structure, built entirely of iron and stone. The floors are made of granolithic cement, with a slight slope draining to the center of the side walls to sewer connections, and may be washed down with a hose, or flooded in case of fire, with water taken from a 15,000-gallon tank on the roof. This tank also supplies the water necessary to operate the elevator, and receives its supply from an artesian well under the building. The walls are provided with conduits built in them for the electric wires. The electric-power generating plant is in the basement, and the only possible means of distributing power around the building is through the wires which run out of the dynamo-room. As the structure of the building does not allow of the running of belts from floor to floor, dependence is had entirely upon electricity as a motive power. The power-generating plant consists of a 12 x 12 inch Ball engine, belted direct to a No. 20 Edison dynamo, of 50,000 watts capacity, compound wound for 220 volts; the engine also drives through a counter-shaft a constant-potential and constant-current dynamo used in testing. A central station switch-board is arranged beyond the dynamo, from the "bus" wires on which are tapped independent circuits to each floor. At present four motors are employed, two of  $8\frac{1}{2}$  horse-power, one of 2 horse-power and one of 1 horse-power; yet these small machines, fixed in out-of-the-way places, furnish power for 22 engine lathes, eight drill presses of various sizes, four milling-machines, two power presses, several iron planers, besides tapping-machines, grindstones, emery-wheels and a 60-inch boring-mill, making in all a total of about 45 machine tools.

Power tests made in the engine-room, when a full force of men is working in the shops, show a load of 22 horse-power on the engine and an electrical output of  $13\frac{1}{4}$  horse-power on the dynamo. This may seem incredible, but when we remember that every time a machine is shut down the motor is instantly relieved of that amount of work and takes just so much less current, and the dynamo supplying less current takes less power to drive it, we can more readily see how such figures are not so improbable, after all, especially in cases where the shafting load is light. In actual practice probably not over half the machines are doing actual work at the same time; thus one man may be setting his work in position while the man at the tool next to him may have his machine in operation doing work. Hence in a carefully-laid-out shop, with short lengths of shafting making a light friction load, there may be installed machines requiring, if all were worked at precisely the same instant, nearly double the amount of power represented by the motors installed. This is analogous to the case of an electric-light station where the number of lamps placed on a circuit would require, if all were burning at precisely the same instant, more than double the amount of current that the generator feeding the circuit is capable of supplying.

A decided advantage is gained in this system of factory construction over the usual method of transmitting all the power by belting and long lines of shafting by being able to run any small portion of the factory independent of all the rest. For instance, if the work is behind in one department and it is necessary to work over-

time, that particular department of the shop, having a motor of its own, can be run without running any of the machinery or shafting in any other part of the building; and thus a great saving of fuel can be effected over the old method, where it would be necessary to run all the shafting throughout the entire building.

The building is wired for 220 lights, connected two in series, and each floor is provided with a separate switch-board, to which the terminals of the various light-circuits are brought. The circuits are so arranged that the darker portions of the shop may be lighted independently of the other portions. The building is heated with the exhaust steam from the engine, which exhausts into a 6-inch pipe that runs through the upper part of a large horizontal drum used as a feed-water heater, and thence up to the roof, where it exhausts into the air when not used for heating. The upper end of the exhaust-pipe is provided with a check-valve which opens when the back-pressure reaches a certain amount. Valves are provided in this main pipe at each floor, through which the steam may be turned into the heating-pipes. The latter are arranged in a manner similar to the "multiple arc" system of electric lighting. A 4-inch pipe extends along each side of the building and connects through the valve to the main exhaust; elbows are provided every 7 feet apart, from which run 8-inch pipes across the building, connecting the two 4-inch pipes together. The steam that condenses in these pipes returns to the feed-water heater through a smaller pipe, which connects to a spiral tube submerged in the water in the drums. With this arrangement the back pressure on the engine never exceeds 4 pounds. If for any reason the back pressure should exceed this amount the valve on the roof opens and relieves it. The C. & C. electric motors are built with interchangeable parts throughout, all parts being finished to standard gauges and drilled in standard jigs, while pedestals and caps are milled with standard cutters, thus insuring an interchangeability of parts that could be realized in no other way. From the practical standpoint the success of the plant has been unqualified. From the time steam was first turned on the engine until the present not a single stop for repairs has been necessary, and frequently the shops are run 15 or 16 hours a day.

A staff correspondent of the *Philadelphia Press* telegraphs as follows from Johnstown: "Powell Stackhouse, vice-president of the Cambria Iron Company, was here inspecting the ruined shops of the corporation. He said that the works would be rebuilt at once. The total loss to the company will be, it is thought, not more than \$5,000,000. It was established beyond doubt to-day that two prominent Philadelphians, connected with the Cambria Iron Company, lost their lives. One is Charles Butler, assistant treasurer, whose body was found; the other is Harry Clay Adams, University of Pennsylvania, and a member of the class of 1887, who was elected engineer to assist Mr. Joseph Morgan, the chief engineer. The first attempt was made on Monday to enter the Cambria Iron Works. A gang of 800 men was put to work, and they are removing the debris around the mill. At almost every step dead bodies are being unearthed."

A report is current that the Hudson River tunnel, which was originally intended to be an avenue for railroad freight trains, is to be used to carry water to this city for the syndicate who anticipate grabbing up the Passaic water-shed and making contracts with this city and Brooklyn.

### PERSONAL.

Arthur Holland, who has been connected for many years with Naylor & Co., of New York, Philadelphia and Pittsburgh, and who has of late held their power of attorney, was admitted as a member of the firm on the 1st inst.

William Hainsworth, for some years superintendent of the Pittsburgh Steel Casting Company and president of the Hainsworth Steel Company, also of Pittsburgh, has recently resigned both of these positions and sold his interests in the two firms. Mr. Hainsworth, it will be remembered, was the builder of the cast Bessemer-steel gun for the Government, but which failed to stand the test of the Government officials. Mr. Hainsworth's plans for the future are as yet undecided.

The Massachusetts Institute of Technology, of Boston, Francis A. Walker president, last week sent out about 70 graduates, among whom in mechanical engineering were the following: G. M. Basford, A. B. Bellows, W. G. Bixby, Z. W. Bliss, C. N. Borden, L. W. Bridges, H. H. Craigin, C. H. Cromwell, A. L. Davis, N. Durfee, E. V. French, F. W. Hobbs, E. S. Hutchins, L. E. Johnson, L. H. Kunhardt, W. W. Lewis, H. Loring, Jr.; F. E. Sanborn, W. G. Snow, R. Sweetland, W. W. Underhill, A. L. Williston, V. Windett and W. G. Winchett. Willard Goldthwaite Bixby read an abstract of his thesis work on the experimental determination of the strength of cast-iron gears. He was followed by Frederick William Bradley, of the department of electrical engineering, who described an experimental study of a Weston dynamo machine. Nathan Durfee, of the mechanical engineering department, read an abstract on a Wright compound engine at the Troy cotton and woolen manufactory at Fall River, Mass., and James Porter Gilbert, of the chemical course, told of the action of nitric acid on the bromanols. William Elton Mott, civil engineer, read an abstract which related to experiments on rubber models of riveted joints.

The President has appointed Charles L. Knapp, of New York, to be Consul-General of the United States at Montreal.

William H. Wallace, of New York, the well-known iron and steel merchant, sailed for Europe yesterday on the *Gallia* for the purpose of making an extended visit abroad. He was accompanied by his wife, two daughters and his son, Hon. William C. Wallace, member of Congress from New York City.

Capt. C. B. Sears, of the Engineer Corps, has been detailed by Secretary Proctor to report to Governor Beaver for engineering duty at Johnstown. He will superintend the construction of the pontoon bridges across the Conemaugh.

Public Works Commissioner Thos. F. Gilroy dismissed 80 supernumeraries in his department, a saving to the city of \$53,596 per annum.

John Frost died 8d inst. in Brooklyn, aged 70. His father erected the first iron-works in Brooklyn at Water and Jay street. For 11 years Mr. Frost was foreman of the Novelty Iron Works in New York, and for the last 30 years he had been foreman in Campbell & Thayer's Linseed-Oil Works.

W. H. Anderson & Son, Detroit, Mich., have removed from 38 Clinton street to more commodious quarters at 14 and 16 Macomb street, where they will continue the manufacture of stone, marble and granite workers' tools and supplies.

# TRADE REPORT.

## Chicago.

Office of *The Iron Age*, 59 Dearborn street,  
CHICAGO, June 3, 1889.

**Pig-Iron.**—Orders aggregating thousands of tons were placed during the past week, yet, in all probability, the number of buyers was not larger than in any one of the weeks of the two months previous. Local manufacturers of Agricultural Implements have been feeling the market for some time by insinuating that they would be inclined to buy their next season's supply if it could be had at satisfactory prices. Their offers were always about \$1 per ton below the market price. Dealers were not seeking orders covering ten months' delivery at so great a concession. Lately they have been talking higher prices in a tone of belief, and it is likely that buyer and seller came to terms by meeting each other half way. The placing of orders by these large consumers usually establishes the bottom figures on local Irons and calls into the market others who have been waiting their action. Notwithstanding the fact that it is at least 30 days in advance of customary time when the makers of Farming Implements buy it would not be surprising if the majority of them placed their orders this month. Many makers of Charcoal Iron have notified their agents that they would rather go out of blast than sell at less than what they were now getting, and some are not disposed to accept contracts covering a year's supply. Makers of Local Coke Irons are also firm in their views, but situated so favorably that they can afford to contest any price that may be named to customers of this market. Outside furnaces are making a strong fight to hold their trade and the railroads over which they ship are inclined to assist them by making a reduction in freight rates. Whether rates can be made low enough to be of any benefit remains to be seen. Through this conflict lower figures may result on small lots and carload trade in the near future. On a market fairly active and prospects good we make the following cash quotations, f.o.b. Chicago: Lake Superior Charcoal, \$18.50; Local Coke, No. 1, \$16; No. 2, \$15; No. 3, \$14; Chicago and Bay View Scotch, \$16.50; American Scotch (Blackband), No. 1, \$18 @ \$18.50; Southern Coke, No. 1 Foundry, \$15.75; No. 2 Foundry and No. 1 Soft, \$15; No. 3 Foundry, \$14.50; No. 2 Soft, \$14; Gray Forge, \$13 @ \$13.50; Tennessee Charcoal, No. 1, \$19; No. 2, \$18; Alabama Car-Wheel, \$25.

**Bar-Iron.**—There were more than the usual number of good-sized orders circulating among the trade last week. Prices were asked on three or four orders, car specifications, several implement specifications, and on stock orders by dealers. Rumor has it that some of these were placed at rates which figure close to \$1.50, f.o.b. Chicago. Should this be true it would be an inside price, as manufacturers are asking \$1.45 for Common and \$1.60 for Single Refined at mill. Many manufacturers who are tired of unprofitable prices and striving to keep their mills employed on small trade refuse to quote on large and long-time contracts, thus giving the impression that the market is improving more force than a close investigation will justify. The market is certainly so very unsettled that it cannot be gauged by any of the recent transactions. This condition will probably continue through the month of June, or until the labor scale for next year is positively settled. From store jobbers are quoting from \$1.75 to \$1.95, according to quality, on small lots, which are in fair demand.

**Structural Iron.**—Prospects for better trade are slowly improving. Nearly every week adds a little increase to the volume of business, but prices are cut as close as ever. The high waters of the past week damaged many railroad bridges, and manufacturers are already counting on this as a source from which they will obtain orders for material immediately. The demand from country towns for building shapes is very fair. Being largely from standard sizes from stock secures to the seller a better profit than when he must bid against competition for an order. Mill lots f.o.b. Chicago are still quoted as follows: Angles, 2.12¢ @ 2.15¢; Universal Plates, 2.15¢ @ 2.20¢; Sheared Plates, 2.20¢; Tees, 2.55¢; Beams and Channels, 2.90¢. From stocks small lots are quoted at 2.25¢ @ 2.30¢ for Angles, 2.65¢ @ 2.70¢ for Tees and 3.40¢ for Beams.

**Plates, Tubes, &c.**—Trade was not very brisk in Iron or Steel Plates last week. Consumers were taking only for present requirements in small lots, but the firmness displayed by mills in accepting orders made this a desirable condition of the market. Light-gauge Iron Plates are particularly firm, and to avoid taking further orders some mills have advanced their figures 5¢ per hundred above the market price or withdrawn entirely. Boiler Tubes are firm at the following quotations and another meeting of the manufacturers will be held this week with a view of making an advance in prices. We quote as follows from store: Nos. 10 to 14 Iron Sheets, 2.60¢ @ 2.70¢; Nos. 10 to 14 Steel Sheets, 2.75¢ @ 3¢; Tank Iron, 2.40¢ @ 2.50¢; Tank Steel, 2.50¢ @ 2.60¢; Shell Iron or Steel, 3¢; Flange Iron, 4¢; Flange Steel, 3.50¢; Fire-Box Steel, 4.75¢ @ 5.50¢; Ulster Iron, 3.75¢; Boiler Rivets, 3.75¢ @ 4.25¢; Boiler Tubes, 57½¢ off for 1½-inch and less and 62½¢ off for 2-inch and larger.

**Sheet-Iron.**—The condition of the market continues to be very favorable to the seller. Consumers are making strenuous efforts to obtain supplies that were ordered some time back. Manufacturers appear to be utterly unable to keep up with the present demand, and still decline to accept orders for anything except lots of less than 100 tons, which are gauged in price according to quality and the mills' ability to furnish. Quotations on No. 27 range from 2.85¢ to 2.90¢ at mill. Store quotations on No. 27 are pretty firm at 3.10¢ @ 3.20¢, according to the quality of the Iron.

**Galvanized Iron.**—Trade was quite light in this branch of business. The demand was confined to small lots, and no important orders in sight. Stocks in the hands of dealers and agents are in good supply in all sizes. Jobbers continue the quotation of 65¢ off on Juniata and 65¢ and 5¢ off on Charcoal.

**Steel Rails.**—Negotiations for large blocks that were started several weeks ago are still open. The aggregate orders for May, it is said, will not exceed 15,000 tons. Small orders are coming in, but in such an irregular way that there is no certainty yet that the Illinois Steel Company will start up another of their mills this month. They continue to quote \$29 @ \$30 on the general run of orders. At this writing it cannot be determined what effect the misfortune of the Cambria Iron Company will have upon the market, if any.

**Merchant-Steel.**—The buyers who are looking for material to cover their next season's requirements were more numerous last week, and probably some orders were placed, either one of which would fill up some of the smaller manufacturers for the entire year. With the exception of the trade which comes from Harvesting-Machine manufacturers business has been chiefly for small lots of the better

grade of Steel. Soft Bessemer Steels are quoted at 1.80¢ rates at mill. Store prices on other grades are as follows: Mixed Machinery Steel, 2.10¢ @ 2.20¢; Tool Steel, 7.75¢ @ 8¢; Specials, 12¢ @ 25¢; Crucible Spring Steel, 3.50¢ @ 3.60¢; Open-Hearth Spring, 2.50¢; Open-Hearth Machinery, 2.75¢ @ 3¢; Bessemer Machinery, 2.30¢ @ 2.40¢; Sheet-Steel, 7¢ @ 10¢; Tire Steel, 2.20¢ @ 2.25¢.

**Track Supplies.**—Indications are that there will be a better business in this line very soon. There are more inquiries for Fish-Plates, Bolts, Spikes, &c., than there have been for several months past, but the whole does not aggregate anything very large in immediate business. In small lots Steel Fish-Plates are quoted at 1.90¢; Iron Fish-Plates, 1.70¢ @ 1.75¢; Bolts with Square Nuts, 2.50¢; Bolts with Hexagon Nuts, 2.65¢; Spikes, 1.90¢ @ 2¢.

**Old Rails and Wheels.**—There is quite an active demand for Old Iron Rails. Several lots, aggregating 500 to 1000 tons, changed hands at prices equivalent to \$19.50 @ \$20. Chicago stocks are light and demand increasing from Ohio and Eastern mills. There is very little doing in Old Steel Rails. Short lengths are quoted at \$15 @ \$16 and long lengths at \$17.50 @ \$19. There is no demand for Old Car-Wheels. Nominal price would be about \$16. Stocks are abundant and buyers wanted.

**Scrap.**—The accumulation of stock continues to be a feature of the market. Consumers are making a little more inquiry, but not buying in any quantity. Dealers claim that they cannot afford to shade prices any further, and it is doubtful whether any reduction they might make would be an inducement to purchasers. The majority of transactions for the week were in cheaper grades of material. Dealers quote to consumers per ton of 2000 lb as follows: No. 1 Wrought, \$17.50; Fish-Plates, \$18; Axles, \$22; Horseshoes, \$17; No. 1 Mill, \$13; Cast Machinery, \$11; Stove Plate, \$9; Cast Borings, \$8; Wrought Turnings, \$10.50; Axle Turnings, \$12; Mixed Steel, \$10.50 @ \$11; Coil Steel, \$13.50; Leaf Steel, \$15.

**General Hardware.**—Trade continues very active on Shelf Goods, Roofing Plates, Tools, Building and House-Furnishing Materials. Copper Sheathing and Copper Bottoms have been reduced 5¢ per 100. Shot have been advanced 15¢, and are now sold at \$1.10 per bag. Paper shells have been advanced from 33½¢ to 20¢ discount on sizes 4 to 12 inclusive on all grades except first quality. Standard Wringers are selling at a reduced price, on account of competition with new makes. The price on Axes is about 50¢ per dozen less than during this period last year. Sales during the past winter were very light.

**Nails.**—As predicted last week, the Nail market has gone to pieces, and large blocks are being thrown upon the market almost regardless of cost. The dissolution of the Western Association has engendered a reckless spirit which from a superficial aspect indicates that some of the manufacturers are going to sell out their stocks and quit the business or force some of their competitors to do so. Manufacturers' prices cover a wide range, and there is no telling what the bottom is. Jobbers are not inclined to name a price on carloads that they would be governed by under all circumstances, but from the general trade orders would be accepted at \$1.85 rates and small lots at \$1.90 rates, regular terms. Wire Nails have been advanced about 10¢ per keg on an average by manufacturers making 60d the base. This reduces the price on the small sizes and advances it on the larger sizes. Jobbers quote \$2.30 in carloads and \$2.35 in small lots.

**Barb-Wire.**—There is no change from the conditions reported last week. The

demand continues good for small lots, and mills are still working on orders. On Painted Wire from store 2.75¢ is quoted, and on Galvanized, 3.35¢. No concessions for carloads.

**Pig-Lead.**—The market has been quiet but firm. Sales of some 400 tons are reported at figures ranging from 3.75¢ to 3.80¢.

## Philadelphia.

Office of *The Iron Age*, 220 South Fourth St., PHILADELPHIA, Pa., June 4, 1889.

The disaster at Johnstown has absorbed the attention of the trade during the past two or three days, and as yet everything is unsettled, so that it is almost impossible for manufacturers to know where they stand. Apart from the great loss at the Cambria Iron Company's Works, there is the interruption to transportation and the uncertainty in regard to the supply of Coke, Soft Coal, &c. Then there is a possibility that smaller mills along the Susquehanna and at other points may be disabled for some time, so that it is impossible to form any definite idea of the immediate capacity for production, as mills not directly affected by the floods may be seriously embarrassed by the difficulty in obtaining supplies of various kinds. In the meantime those who are in a position to accept orders ask from  $\frac{1}{2}$ ¢ to  $\frac{1}{4}$ ¢ advance on Plates and Angles, and in fact more money is asked for nearly all kinds of Finished Iron. Until this terrible calamity occurred the entire market was beginning to show strength and activity, and it may be that the extraordinary turn of events may give an impetus toward a general advance. This article has to deal with things from a business stand-point, so that it will omit all other references. In doing so, it may be said that the trade are a little undecided as to the immediate course of the market. The impression is that it will cause an immediate stiffening in all kinds of Finished Iron and Steel, but it may not affect Pig-Iron. Finished Iron and Steel will be wanted immediately and in large quantities, while there will be a serious falling off in production. The Cambria Iron Company are not only out of the market, but the orders which that company had on their books will have to be placed elsewhere. Many smaller mills have doubtless been crippled so that they will not be in a position to do much until after mid-summer, while those that are able to run find their fuel supply in a most precarious position. These considerations naturally cause sellers to hesitate in naming quotations, as there is a possibility of an advance being started along the entire line. As regards Pig-Iron, the position is somewhat different. If the mills cannot run they will not need much Pig-Iron, but if the curtailment of the fuel supply affects the mills it must also to some extent affect the furnaces, so that the chances are that Pig-Iron will not accumulate to any extent; neither will prices be materially affected in either direction. Up to this time (Tuesday, p.m.) quite a number of the Philadelphia representatives of mills and furnaces have not yet been able to communicate with their principals, so that it is impossible to know what condition they are in; hence, so far as they are concerned, all business is in abeyance.

**Pig-Iron.**—As already stated, the market is unsettled, and prices feverish and irregular. There is a great deal of inquiry for Iron, but whether due to actual requirements or whether they are "feelers" can hardly be determined at present. The disposition among holders is to quote firmly at last week's quotations, and in no case to accept very large orders or to make concessions. This, however, may be only temporary, and perhaps preliminary to an advance, although that, of course, is mere

conjecture. As a matter of fact it is impossible to form any definite opinion in the present unsettled state of the market, although the general impression is that it will ultimately develop into higher prices. In the meantime it is difficult to place orders at the inside quotations, so that \$17 @ \$18, delivered, about covers the market for No. 1 Foundry, \$16 @ \$16.50 for No. 2 and \$14.75 @ \$15 for Gray Forge. Southern Irons are held firmly at \$15.50 @ \$16 for No. 2, and \$16.50 @ \$17 for No. 1, delivered in consumers' yards, with only moderate offerings at those figures.

**Blooms.**—The feeling in Steel Blooms is very firm, as quite a number of orders placed with the Cambria will have to be duplicated elsewhere. At the moment it is difficult to get firm quotations on large lots, but in a general way holders ask an advance on last week's prices, which were as follows: \$28 @ \$28.50, at mill, for Nail Slabs; \$30 @ \$31 for Tank Slabs; \$32.50 @ \$33.50 for Shell Slabs; \$36 @ \$37 for Flange, and \$38 @ \$40 for Fire-Box; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite, \$41 @ \$42.50; Scrap Blooms, \$32 @ \$33 "Bloom" ton of 2464 lb.

**Muck Bars.**—There is more inquiry, but very few Bars are offered. Sales were made last week at \$27, delivered, but it would be difficult to get anything to-day less than \$27.50.

**Bar-Iron.**—In the absence of actual sales it is difficult to quote exact prices, although there is no doubt that they would be from  $\frac{1}{2}$ ¢ to  $\frac{1}{4}$ ¢ higher than they were a week ago. Manufacturers hardly know what figures to name on large lots, although their regular customers could probably secure moderate supplies at from \$1.75 to \$1.85 for best Refined Bars. There is a great deal of inquiry from consumers, but to what extent Bars may be actually required remains to be seen.

**Plate and Tank Material.**—Inquiries are numerous, and requirements will doubtless be very large during the next three or four months. Mills are already full of work, and are not quoting on anything additional, unless at advances of from \$1 to \$2 per ton or more. We repeat last week's quotations, although, as we have said, they are doubtless below what would be accepted to-day—viz., 1.90¢ @ 2¢ for Ordinary Plates and Tank Plates; 2¢ @ 2.1¢ for Universal Plates; Shell, 2.3¢ @ 2.4¢; Fire-Box, 3.5¢ @ 3.7¢; Steel Plates, Tank and Ship Plate, 2.2¢ @ 2.25¢; Shell, 2.5¢; Flange, 2½¢ @ 3¢; Fire-Box, 3½¢ @ 4¢.

**Structural Material.**—There is a great deal of inquiry to-day, and a large amount of business will undoubtedly be placed as soon as terms can be arranged. The mills are already pretty well employed, and the sudden demand likely to be thrown upon them will be likely to lead to a decided stiffening in prices. Quotations under present conditions are liable to be somewhat irregular, but to-day's figures are about as follows: Bridge Plate, 2.05¢ @ 2.10¢; Angles, 1.95¢ @ 2¢; Tees, 2.4¢ @ 2.6¢; Beams and Channels, 2.8¢ for Iron or Steel.

**Sheet-Iron.**—The demand keeps up very satisfactorily, and while there is no change to note in prices, everything is held at last week's figures, viz.:

Best Refined, Nos. 14 to 20.....	3¢
Best Refined, Nos. 21 to 24.....	3.20¢
Best Refined, Nos. 25 to 26.....	3.40¢
Best Refined, No. 27.....	3.50¢
Best Refined, No. 28.....	3.60¢
Common, $\frac{1}{4}$ ¢ less than the above.	
Best Soft Steel, Nos. 14 to 20.....	3½¢
Best Soft Steel, Nos. 21 to 24.....	3½¢
Best Soft Steel, Nos. 25 to 26.....	3½¢
Best Soft Steel, No. 27.....	4¢
Best Bloom Sheets, $\frac{1}{4}$ ¢ extra over the above prices.	
Best Bloom, Galvanized, discount.....	.65 %
Common, discount.....	.67½ %

**Steel Rails.**—It is stated that a number of options have been accepted within the past few days, and that manufacturers are now asking advances of more or less importance. In this market \$28, at mill, is said to be a firm quotation, and under present conditions it is extremely doubtful if that figure could be shaded. The feeling in Rails and Steel of all kinds shows increasing firmness along the entire line.

**Old Rails.**—There is no apparent change in this department, although so far as known there has been no business whatever during the week. Buyers could be found at \$22.50 to \$23, delivered, but they are held for \$23 and upward.

**Scrap-Iron.**—Holders ask outside prices, and although transaction have been somewhat limited, the feeling is very firm at \$20 @ \$21 for cargo lots; \$21 @ \$21.50 for carload lots, delivered, or for choice, \$22; No. 2 do., \$14 @ \$15; Turnings, \$14 @ \$15; Old Steel Rails, \$18 @ \$19; Cast Scrap, \$15 @ \$16; do. Borings, \$9 @ \$10; Old Fish-Plates, \$23 @ \$24; Old Car-Wheels, nominal, \$17 @ \$18, Philadelphia.

**Wrought-Iron Pipe.**—The demand is very active and prices strong, with an upward tendency, although as yet discounts remain as before, viz.: Butt-Welded Black, 52½ %; Lap-Welded Black, 65 %; Butt-Welded Galvanized, 45 %; Lap-Welded Galvanized, 52½ %; Boiler Tubes, 60 %.

**Nails.**—In sympathy with the rest of the market, the feeling is feverish and unsettled. It is difficult to quote prices to-day, but a general advance from the recent low figures appears to be pending.

## Cincinnati.

Office of *The Iron Age*, Fourth and Main Sts., CINCINNATI, June 3, 1889.

**Pig-Iron.**—Neither buyers nor sellers of Pig-Iron in the local market have changed attitudes during the past week. The depression noted for several weeks has given place to a despondent tone in some quarters, while in other instances interested parties have simply deferred hope of improvement. Sellers attach much importance to the fact that four furnaces have blown out in the South, either because they could not or would not submit to the low prices current, but buyers are not slow to oppose the fact that three other furnaces in the same district have resumed operations during the week, so that there is little strength to be gained from the changes. But while prices have continued low, the volume of business has increased some. The very lowest prices which have been named have been either for small amounts or for near delivery, producers refusing to sell for long delivery at prices now current. Agricultural works have been especially anxious to place orders for round amounts for 8 to 12 months. There has also been some talk of Pipe works placing large contracts. Among the sales during the week were 1200 tons No. 3 Southern Foundry Coke Iron at \$13; 1000 tons Mottled at \$11.75, cash; 2500 tons of mixed grades Foundry Iron, of which 1000 tons were of Softeners, on basis of quotations; 1000 tons Gray Forge at \$12.75, and a few 100-ton lots at \$12.50. In addition sales of 2500 and 1000 tons were reported on Saturday. There has also been a better inquiry for Car-Wheel Iron. Most of the demand was experienced late in the week, so that the market closes under more favorable auspices than the facts recited early in the week would lead one to suppose. The fact is, with prices below the productive point, but little risk can be run by those in need of Iron for some little

time. The following are the approximate prices current here at the close for cash, f.o.b.:

#### Foundry.

Southern Coke, No. 1 (new classification).....	\$14.00 @ \$14.50
Southern Coke, No. 2 (new classification).....	13.50 @ 14.00
Southern Coke, No. 3 (new classification).....	13.00 @ 13.50
Ohio Soft Stone Coal, No. 1.....	15.50 @ 16.00
Ohio Soft Stone Coal, No. 2.....	14.50 @ 15.25
Mahoning and Shenango Valley.....	16.00 @ 16.50
Hanging Rock Charcoal, No. 1.....	20.00 @ 22.00
Hanging Rock Charcoal, No. 2.....	19.00 @ 21.00
Tennessee and Alabama Charcoal, No. 1.....	17.50 @ 18.00
Tennessee and Alabama Charcoal, No. 2.....	16.50 @ 17.00

#### Forge.

Strong Neutral Coke.....	12.75 @ 13.00
Mottled Neutral Coke.....	11.75 @ 12.00
Gray Forge.....	12.50 @ 12.75

#### Car-Wheel and Malleable Irons.

Southern Car-Wheel.....	20.00 @ 24.00
Hanging Rock, Cold Blast.....	22.00 @ 25.00
Lake Superior Car-Wheel and Malleable.....	20.00 @ 21.00

**Manufactured Iron.**—An easy tone has prevailed, but in a few instances both mills and foundries have secured better orders, which is encouraging.

**Nails.**—The demand has been only moderate and the market easy, without further change in prices. Steel Nails, 12d and 40d, sell at \$1.80 @ \$1.90  $\frac{3}{4}$  keg, with 10¢ rebate in carload lots at the mills, and Steel Wire Nails at \$2.40 @ \$2.50  $\frac{3}{4}$  keg.

**Old Material.**—There have been moderate offerings of Old Rails, but little demand, at \$20, spot. Old Wheels have been in light demand, but small sales are reported at \$16, cash.

## St. Louis.

OFFICE OF *The Iron Age*, 214 N. Sixth st.,  
St. Louis, June 3, 1889.

**Pig-Iron.**—A better feeling prevails in this department. Inquiries for some good round lots have been received during the past week, and indications point to an increased demand at an early period. Everyone seems to think that bottom has been reached, and while prices may remain stationary for some time, they confidently expect any change will be for the better, and base their anticipations on the fact that a number of furnaces have blown out and those that are in blast are well filled with orders, while consumption is steadily on the increase. There are a few furnaces, however, that seem disposed to quote some very low prices, and until they have entered enough orders to keep them running it is useless to expect any advance in prices. On the other hand, there are those that express confidence in the future and refuse to meet these low quotations. For ordinary-sized lots we quote as follows for cash, f.o.b. St. Louis:

Southern Coke, No. 1 Foundry, \$15.25 @ \$15.75
Southern Coke, No. 2 Foundry, 14.75 @ 15.25
Southern Coke, No. 3 Foundry, 14.25 @ 14.50
Gray Forge..... 13.25 @ 13.75
Ohio Softeners..... 17.00 @ 19.00
Lake Superior Charcoal..... 19.75 @ 21.50

#### Missouri.

Charcoal Foundry, No. 1.....	16.00 @ 16.50
Charcoal Foundry, No. 2.....	15.00 @ 15.50

#### Tennessee.

Charcoal Foundry, No. 1.....	17.00 @ 18.00
Charcoal Foundry, No. 2.....	16.50 @ 17.00

Connellsville Coke, f.o.b. East St. Louis, \$4.55; St. Louis, \$4.70.

**Bar-Iron.**—Business is confined mostly to small orders, on which the mills are kept fairly well employed. The demand for iron for railroad work is on the increase, and the country merchants are purchasers of some fair-sized lots. Prices remain as last quoted, as follows: Small lots from store, \$1.80; Carload lots from \$1.60 to \$1.70, according to circumstances.

**Barb-Wire.**—Mills are fairly well employed and the demand seems in a fair way to keep up during the summer months.

The demand from the South and Southwest has been especially large, and mills have been running full time and have had no opportunity to accumulate any stock. Prices remain unchanged, but are quoted with considerable firmness as follows: From \$2.80 to \$2.85 for Painted and from \$3.40 to \$3.45 for Galvanized; carload lots from \$2.70 to \$2.75 for Painted and \$3.30 to \$3.35 for Galvanized, f.o.b. St. Louis.

## Cleveland.

CLEVELAND, June 3, 1889.

**Iron Ore.**—The amount of Ore now sold is estimated at 3,750,000 tons. Considerable Gogebic Ore at \$5  $\frac{3}{4}$  ton is being placed, and round lots of Minnesota Ore at \$5.75 are in demand. The market has not been particularly active during the week just closed, but furnace men at Pittsburgh and in the Mahoning and Shenango Valleys are beginning to buy quite liberally, and orders aggregating 500,000 tons may be expected from these districts within the next few days. A determined effort has been made to force up Lake freights, but the last charters reported were at the figures prevailing since the opening of navigation. It is possible that the Escanaba rate may be forced to \$1, but efforts in that direction will be vigorously resisted. Non-Bessemer Ores at \$3 60 @ \$4 are again selling quite freely, and the sale of 5000 tons of a special high grade of Bessemer Ore, containing less than 0.02 % of phosphorous, at \$6.25, f.o.b. vessels Cleveland, is reported. The receipts of Ore at Cleveland during May were 213,275 tons, and the shipments from the local docks to the furnaces were 90,092 tons.

**Pig-Iron.**—The faith of the furnace men in the early improvement of the market is exemplified by their liberal purchases of Ore at about the same prices paid last year, when their own products were quoted much higher than at present. The amount of Ore already sold is far in advance of the record up to a corresponding time last year. There has been a steady demand for iron during the past week, but the sales were confined to small amounts. Dealers believe, however, that the aggregate amount sold is in excess of the record for any preceding week in May. The following are market prices to-day:

Nos. 1 to 6 Lake Superior Charcoal.....	\$20.00 @ \$20.50
No. 1 Strong Foundry, Bessemer quality, $\frac{3}{4}$ ton.....	18.50 @ 17.00
No. 1 Strong Foundry, $\frac{3}{4}$ ton.....	18.00 @ 17.00
No. 2 Strong Foundry, $\frac{3}{4}$ ton.....	15.00 @ 16.00
No. 1 American Scotch, $\frac{3}{4}$ ton.....	16.50 @ 17.00
No. 2 American Scotch, $\frac{3}{4}$ ton.....	15.50 @ 16.50
No. 1 Soft Silvery, $\frac{3}{4}$ ton.....	17.00 @ 18.00
Mahoning and Shenango Valley Neutral Mill Irons, $\frac{3}{4}$ ton.....	14.00 @ 15.00
Mahoning and Shenango Valley Red Short Mills, $\frac{3}{4}$ ton.....	14.50 @ 15.50

**Manufactured Iron.**—The market is not active, but there is a demand for Common Bar at 1.60¢. Combination shapes are freely inquired for, but Steels are dull.

**Old Rails.**—A few sales of Old American Rails at \$21 are reported. Old Wheels are plenty but are not in great demand.

## Detroit.

WILLIAM F. JARVIS & Co., under date of June 3, 1889, report as follows: There is very little change in the situation here since our last report. While the buying is mostly confined to carloads and 50-ton lots, a few larger sales have been booked and inquiries for several thousand tons have been received, but as the prices buyers are offering are in most cases considerably lower than sellers will accept these inquiries may not result in immediate sales. As soon as buyers become convinced that prices have reached bottom there will be an active demand, and prices will at once become firmer and go higher. The number of Lake Superior Charcoal furnaces

that are out of blast will soon reduce any surplus there may be of this class of iron. Out of five furnaces in Detroit or in the near vicinity, with a total weekly capacity of about 1400 tons, three are out of blast and the two in blast have a weekly output of only about 400 tons, and there are several others in the State also idle. We report a quiet market, with prices as follows:

Lake Superior Charcoal, all numbers.....	\$19.50 @ \$20.00
Lake Superior Coke, all ore.....	18.00 @ 19.00
Lake Superior Coke, cinder mixed.....	17.75 @ 18.25
Standard Ohio Black Band.....	18.00 @ 19.00
Southern No. 1.....	17.00 @ 17.50
Southern Gray Forge.....	15.00 @ 15.50
Southern Silvery.....	16.00 @ 16.50
Jackson County (Ohio) Silvery.....	18.00 @ 18.75
Old Wheels.....	18.50 @ 19.00

## Louisville.

LOUISVILLE, KY., June 3, 1889.

**Pig-Iron.**—There has been some change in prices during the last week, and some sales have been made for deliveries running through the year. Buyers in territory adjoining this district have also made purchases for their wants, extending through the season; and the indications are that where sales can be effected at present prices buyers are disposed to take hold and purchase for the next seven months' delivery. There is a scarcity of Bright and Silver Gray Iron where buyers desire immediate shipment. Of the new Southern furnaces which have gone in blast, Lady Ensley and Trussville are meeting with much favor. The Irons of both are strong and well graded. Lady Ensley is made of all-brown Hematite Ore and Pocahontas Coke. We quote as follows:

Southern Coke, No. 1 Foundry, new classification.....	\$14.25 @ \$14.75
Southern Coke, No. 2 Foundry, new classification.....	13.75 @ 14.25
Southern Coke, No. 3 Foundry, new classification.....	13.00 @ 13.50
Gray Forge.....	12.50 @ 13.00
White and Mottled, different grades.....	12.00 @ 12.50
Silver Gray, different grades.....	12.50 @ 13.50
Southern Charcoal, No. 1 Foundry.....	16.00 @ 16.50
" " No. 1 Mill.....	14.50 @ 15.00
Southern Car-Wheel, standard brands.....	21.75 @ 22.75
Southern Car-Wheel, other brands.....	18.00 @ 19.50
Hanging Rock Coke, No. 1 Foundry.....	15.50 @ 16.00
Hanging Rock Charcoal, No. 1 Foundry.....	19.50 @ 21.00
Hanging Rock, Cold Blast.....	20.75 @ 22.75

## Chattanooga.

Office of *The Iron Age*, Carter and 9th Sts.,  
CHATTANOOGA, June 3, 1889.

**Pig-Iron.**—The market is still in a waiting mood, and nearly everybody appears to think that improvement in prices will soon begin to appear. There is demand enough now, and judging from inquiries, which are more numerous than they were a month or so ago, better prices are not far off. The feelings of our Pig-Iron producers are much more hopeful than they have been in some time, and the impression seems to have gone forth that there is going to be a decided change for the better very soon. There seems to be just now a combination of circumstances that has induced such a feeling, besides the slight improvement that has already manifested itself. There has been during the past week much more inquiry than formerly, and there is a decided tendency manifested by buyers to make large contracts to extend all through the year, but without an exception producers are not listening to any such propositions, but are content to sell for deliveries only in the near future, and from now until the close of the present year there will be fewer long-time-delivery contracts made probably than at any time in the past. Notwithstanding the apparent depression in the Pig-Iron-producing business, the question of erecting new plants appears to be as active as ever. The subject of the manufacture of Basic Steel appears rather to have given an impetus to the

Iron question South, and the feeling is quite animated. The interest that is being taken in the Iron-making business South was never as much manifested as it is at the present time, and the question of Pig-Iron of the past and present is not so much talked of or thought of as the Pig-Iron of the future, and what it is going to be.

## New York.

Office of *The Iron Age*, 66 and 68 Duane street.  
New York, June 5, 1889.

The floods which have devastated a large part of Pennsylvania, extending into New York on the north and Maryland and Virginia on the south, seriously interrupted business during the past week. Railroad bridges were washed out by the score, embankments and trestles were destroyed, and for several days important industrial centers in Pennsylvania were wholly deprived of all communication with the surrounding country. Among the railroads the Pennsylvania system was the chief sufferer, the main line and some of the most important branches having been seriously damaged. The loss of life has been appalling, but in addition to that many large industrial establishments have been so nearly destroyed that for some time the dependent population will be without the means of earning a livelihood. The pecuniary loss attendant upon these most extraordinary floods for the time of the year will aggregate many millions of dollars. The only ray of comfort to be taken out of this calamitous condition of affairs is the necessarily heavy demand for materials which will be required to repair damages to railroads and other interests, making the Iron trade a prominent beneficiary.

**Pig-Iron.**—A great many inquiries are in the market and some heavy sales of Southern Iron are reported. The representatives of Southern furnaces state that their principals generally are notifying them to exercise caution in quoting for future delivery. Large consumers in the West have purchased so freely of late that in view of the decreasing output of Iron a reasonable hope is entertained of better prices in the near future. Some go so far as to say that the consumers who have steadily refused to make contracts for their future requirements will shortly find that they have waited too long for the market to touch bottom and that they have lost their opportunity to buy cheap. The low sale of Southern Iron at Cleveland reported in the daily press was not worth making a sensation over. The prices given was not an unusual one in the West and does not indicate further demoralization. Northern furnacesmen are also in better heart, as their customers are calling for prompt shipments on contracts, and the quantity of Iron moving is very large as compared with the output. Northern Iron is quoted at \$16.50 @ \$17.50 for No. 1; \$15.50 @ \$16 for No. 2; \$14.50 @ \$15.25 for Gray Forge, all at tidewater. Southern Iron is quoted at \$16 @ \$16.50 for No. 1; \$15.50 for No. 2 Foundry and No. 1 Soft; \$14.75 @ \$15 for No. 3 Foundry and No. 2 Soft; \$14.25 for Gray Forge, all delivered at New York.

**Scotch Pig.**—Nothing is doing in this line of any special consequence. Quotations continue as follows: Dalmellington, \$19.50; Summerlee, \$21.50; Coltness, \$21.75.

**Spiegeleisen.**—A temporary demand was experienced during the past week, but consumers generally are so well supplied that not much business is looked for at present. Importers quote 20 % at \$28; 80 % Ferro is in more regular demand, but in very small lots, at \$57 @ \$58.

**Bar-Iron.**—Only small orders have been taken at old rates—namely: Common, 1.6¢ @ 1.65¢; Medium, 1.7¢; Refined, 1.75¢ @ 1.9¢, for carload lots on dock.

**Structural Iron and Steel.**—Prices are firm in this class of material, and the decline seems to have been checked. Business is very good and promises to be still heavier. Quotations for delivery on dock are as follows: Sheared Plates, 1.95¢ @ 2.1¢; Universal Mill Plates, 2.1¢ @ 2.15¢; Angles, 2¢ @ 2.1¢; Tees, 2.4¢ @ 2.6¢; Beams and Channels, 2.8¢.

**Plates.**—The market is strong, with a large demand. Locomotive builders are receiving more orders, and are purchasing quite freely. While no advance has been made as yet, the condition of trade has improved very materially, and manufacturers are not disposed to load up too heavily at present prices. Dock deliveries are quoted as follows: Iron Tank, 1.95¢ @ 2.1¢; Shell, 2½¢ @ 2.5¢; Steel Tank, 2.2¢ @ 2.8¢; Shell, 2.4¢ @ 2.5¢; Flange, 2.65¢ @ 2.75¢; Fire-box, 3.25¢ @ 4¢.

**Merchant-Steel.**—A fair volume of business is in progress, but only small lots are moving. Prices are still badly demoralized. Good brands of Tool Steel, in large lots, are quoted at 7¢ @ 7½¢; specials, 12½¢ @ 20¢; Crucible Spring, 8½¢ @ 4¢; good Open-Hearth Machinery, 2.30¢ @ 2.5¢; common ditto, 2¢ @ 2.25¢; Open-Hearth Spring, 2½¢ @ 2.5¢; Sheet, 6½¢, 8½¢ and 10½¢.

**Steel Rails.**—The sales made in the past week aggregate about 25,000 tons. A number of round lots are being negotiated, and inquiries have grown a little more frequent, buyers doubtless anticipating an advance in price in consequence of the improved condition of the mills. The manufacturers are helping along this feeling by quoting \$27 at mill and insisting that they intend to make it their bottom rate. The disaster which has overtaken the Cambria works is not without its effect also. That mill is not only out of the race for an indefinite time, but it will probably be obliged to distribute its orders among the other Rail companies.

**Track Supplies.**—Large orders are coming up in the wake of the heavy Rail contracts recently made, but thus far it is not known that any of them have been placed. Quotations for Fish-Plates continue at 1.80¢ @ 1.90¢; Track Bolts, Square Nuts, 2.70¢ @ 2.75¢; Hexagon Nuts, 2.80¢ for Common Iron and 3¢ for Refined; Spikes, 1.90¢ @ 2¢.

**Old Material.**—A better feeling is reported with regard to Old Rails and Scrap, in consequence of the growing inquiry. Consumers bid \$22 for Old Rails, but holders are not willing to sell at that figure. For No. 1 Wrought Scrap \$20 is bid, but \$21 is asked. Other Old Material continues dull at about \$13.50 @ \$14 for Turnings, delivered; \$15 @ \$16 for Cast Scrap, and \$9.50 @ \$10 for Cast Borings.

**Wire-Rods.**—A little inquiry for prompt lots is reported, due probably to the cutting off of the Cambria supply. Foreign Rods are very high, owing to the German labor troubles, which still continue, and most makers abroad are unwilling to quote. Prices are now ranging at about \$42.50, New York.

**Blooms and Billets.**—No business is doing in foreign. An inquiry for Basic Billets elicited a quotation of \$33.50, export, which was too far above competing domestic Billets to lead to a sale.

Messrs. Naylor & Co., 99 John street, New York, have issued the following circular letter, under date of June 1: "Referring to the annexed circular of the Tennessee Coal, Iron and Railroad Company, we are now ready to receive orders for

Pig-Iron manufactured by that company, and shall be glad to be favored with your inquiries at our offices in New York, Philadelphia and Pittsburgh." The circular of the company, which is dated at Nashville, Tenn., June 1, is as follows: "We have arranged with Messrs. Naylor & Co., New York, to sell the Pig-Iron manufactured by this company in New England, Pennsylvania, New Jersey, Delaware, Maryland, Virginia and the cities of Wheeling, W. Va.; Louisville, Ky.; Jeffersonville, Fort Wayne and Lafayette, Ind.; and Chicago, Hegewisch and Pullman, Ill.; and we shall be glad if you will address all inquiries after this date to them or their houses in Philadelphia and Pittsburgh. All sale contracts will be signed by Messrs. Naylor & Co. in the name of the company, as its agents. All payments are to be made direct to Messrs. Naylor & Co., who will give receipt for them in the company's name."

## Financial.

For the time being all thoughts are absorbed by the catastrophe in Pennsylvania, the number of whose dead Governor Beaver computes at something like 10,000, while the property loss is between \$25,000,000 and \$40,000,000. Maryland losses, according to some estimates, \$5,000,000, and several millions more must be added for property destroyed in New York and Virginia. To a large extent these figures represent the destruction of bridges, factories and lumber. A cheering feature is the enthusiasm everywhere shown in extending relief to the sufferers, all the mercantile exchanges in New York being among the contributors, besides corporations, bankers and individuals. The Reading Company send \$25,000, and Philadelphia promises \$500,000 by Saturday night. Half of the Reading's 40 collieries were flooded, but will be restored within a week. The suspension of mining in all the anthracite region is interrupted by damage to breakers and other colliery machinery, and transportation in the mining regions will be seriously embarrassed for several days.

An event of the week was the sale at auction by jobbers of \$3,500,000 worth of flannels at an advance of 5 % on prices over those of last year, though not commensurate with the increased cost of wool. The effect was to strengthen confidence in values. Alex. McKay, general freight agent of the Michigan Central, and five of his subordinates were indicted by the United States Grand Jury, at Chicago, on Saturday, for violation of the Interstate Commerce law in giving a shipper a rebate on grain rates. It is the most important action since the passage of the Interstate law, showing that the commission has stopped advising and is now inflicting penalties.

The Stock Exchange markets were considerably affected by advices from Pennsylvania. The stock of the Cambria Iron Company, which has been badly stricken by the calamity, is strongly held. On Monday in Philadelphia more of this stock was offered, showing the stockholders not to be much disturbed, but in New York it dropped from 250 to 50. The Cambria Company, with \$4,000,000 capital, the *Press* says, "have assets valued at figures approximating \$12,000,000. The Johnstown plant, while valuable, was comparatively only a small part, and the losses, estimated at \$2,000,000 to \$2,500,000, even with the loss of traffic and business until work is resumed, can be deducted and still leave a most valuable property." In Wall street the market was weak and irregular under the pressure of realizing sales. The silencing of the stock tickers by order of the Governing Committee, it is hoped, will be effective in stopping the

"bucket-shop" business. Government bonds were steady. Sales of \$5000 coupon 4s were reported at the board at 129½. The Treasury accepted \$80,000 4½s at 106½. Quotations as follows:

U. S. 4½s, 1891, registered.....	106½
U. S. 4½s, 1891, coupon.....	107½
U. S. 4s, 1907, registered.....	128
U. S. 4s, 1907, coupon.....	129
U. S. currency 6s.....	119

On Tuesday stocks were generally strong. The announcement was made that the Southern Pacific had not left the Transcontinental Association, and would continue to work in harmony with the other roads, but in competition with the Canadian Pacific. The coalers were not much affected by the news from Pennsylvania. Although the number of collieries drowned out is large, particularly in the Mahanoy and Centralia regions, it is likely that the mines whose operations are not seriously impaired by the flood will be worked so as to make up for the stoppage of production by others. It was reported that \$750,000 more in gold had been ordered for Wednesday's steamer, and that shipments to the extent of \$5,000,000 to \$10,000,000 during June are not improbable.

General trade is hardly satisfactory, although the Clearing-House returns from 39 cities show an increase of 22.8% in the volume of transactions, indicating considerable activity. New York gained 35.6%, Boston 12%, St. Louis 19.3%.

In breadstuffs there is a heavy feeling, with easy figures for some grades. Holders of wheat are less eager to sell. Corn is firmer on reports of damaging rains in the West. Exports of wheat for the week from the United States comprised 350,000 bushels and of corn 1,570,000 bushels. Coffee is dull. Cotton is steady at ½¢ advance for spot on fair demand. Provisions are in demand for export at steady prices. Sugars are advanced ½¢ all round, and business is fairly active. Teas are firm. Tobacco steady. In ocean freights there is increased urgency in the demand for tonnage, in good part for petroleum, lumber, timber and grain.

The weekly bank statement of Saturday showed a decrease of nearly \$500,000 in surplus, but the gold shipped on that day was not reflected. Loans were contracted \$714,900, specie decreased \$1,792,500, legal tenders were up \$1,422,100. Time loans are 2½% for 60 @ 90 days, 3 for four months and 4 @ 4½ for the remainder of the year, but lenders are indisposed to make contracts maturing after October. The supply of commercial paper is limited. Rates are 3 @ 3½% for 60 @ 90 day indorsed bills and 4 @ 5½% for longer dates. Of the June interest and dividend disbursements the railroads pay out about \$24,000,000, and the General Government \$1,670,000 as interest on the 4½%. The semi-annual disbursements payable in Boston in June amount to \$5,534,764, as compared with \$4,890,410 last year.

Sterling exchange is firm, with posted rates at \$4.88 @ \$4.90. Gold to the amount of \$3,896,704 went to Europe on Saturday, chiefly to the Continent, the Paris and Berlin rates enabling exports to be profitably made. According to the Custom-House reports the exports of specie from this port during the week were \$4,107,653, making a total since January 1 of \$31,775,000, as compared with \$17,096,000 for the same time last year. The imports were \$257,000.

The imports of merchandise at this port during the week were valued at \$10,029,700, of which \$2,171,000 represents dry goods. Since January 1 the total valuation is \$216,306,000, against \$204,881,000 for the corresponding period last year and \$200,200,000 in 1887.

The Signal Service weather crop bulletin reports that low temperature, local frosts and excess of rain operated unfavorably

upon the crops in the States north of the Ohio River. The recent heavy rains, however, were beneficial in relieving the drought in the cotton States, and also improved the agricultural outlook in Kentucky, Tennessee, Arkansas and Texas. Harvest prospects are believed to be better than a year ago.

The new iron rate between Youngstown and Chicago, which goes into effect June 8, 15¢, is the lowest in eight years. At a meeting of the freight agents of all railroads of Detroit and Toledo, held at Toledo on Tuesday, rates were fixed at a figure that will allow the Eastern iron mills to compete with the Chicago reduction. The principal rates fixed were: Youngstown to Chicago, 9¢ in carload lots; Toledo to Chicago, 7¢; Cleveland to Chicago, 8¢; Toledo to Indianapolis or *vice versa*, 7¢; Toledo and Cleveland, 5¢. Nothing definite has been accomplished thus far in the attempted adjustment of the Oregon Railway joint lease and other matters affecting Pacific Coast connections. An important change in freight rates has been announced to take effect on June 10 between New York and New Orleans.

## Metal Market.

**Copper.**—Spot Copper improved for the week in the London market from £41. 2/6 last Wednesday to £41. 12/6 yesterday, and futures from £41 to £41. 5/, with sales of 1800 tons all told. Statistics showed an improvement on the 1st inst., the visible supply in England and France having decreased from May 1 some 7000 tons, the deliveries in these countries aggregating 13,900 tons for May, which shows a good revival of consumptive inquiry. The London *Economist* of May 25 prints a very sensible editorial on the general Copper situation, winding up with the following paragraph: "As a matter of fact we fail to see how any good can be effected by a combination of producers. We believe that the Copper market had better be left free to seek its own natural level. If this be done, those who at present hold large stocks of Copper may find it expedient or may be forced to realize; but that would be a decided gain, for then the metal would the more quickly pass into consumption under the stimulus of low prices. After such a liquidation the position would be comparatively healthy and Copper producers, after a short period of difficulty, would reap a permanent advantage." The Boston and Montana mine made the largest product in its history in May, getting out 2,520,100 lb of Fine Copper and 88,000 ounces of Silver. The whole figured at a gross value of \$325,000, and all expenses at not over \$200,000. The total product thus far in the fiscal year (11 months) is 21,630,553 lb of Copper and 116,782 ounces of Silver, against 7,000,000 lb of Copper and no Silver at the same time last year. There has been no change in our own market, the nominal quotation for Lake Ingot being 12½¢ @ 12½¢, and 11¢ @ 11½¢ for casting brands, while at 12¢ the regular customers of the mining companies continue being supplied by them. June sold at 12.10¢. The Mansfield Copper Company, of Eisleben, Germany, produced in 1888 13,579 tons Fine, being 356 tons in excess of 1887.

**Tin.**—Has followed a downward course once more in London, giving way from £92 last Wednesday to £91 with spot yesterday, and futures from £92. 17/ to £91. 15/. This decline was all the less expected, since the visible supply in Europe and America on June 1 showed a decrease of 1140 tons when compared with that of May 1. London sales for the week, 600 tons. Our own market followed suit all the more readily, as the comparatively light consumptive demand is confronted by a superabundance of available Tin of-

fering. June was sold down to 20.40¢, August from 20.55¢ down to 20.45¢, the latter and spot being obtainable at 20.35¢ last night. Our market to-day closes dull and uninteresting at nominally 20½¢ on the spot. **Tin-Plates.**—There has been no particular change since our last report, the moderate demand being met by dealers slightly under importers' price. We do not alter our quotations. On the other side there is a difference of about 3d per box between makers and buyers; should the former yield quite a large business would doubtless be done. We quote large lines, ordinary brands, per box: Siemens-Martin Steel, Charcoal finish, \$4.75 @ \$5.50; Coke finish, \$4.55 @ \$4.65; Terns, \$4.12 @ \$4.30; Coke Tins, \$4.25 @ \$4.35, and Wasters \$4.12½ @ \$4.15.

**Lead.**—Sales for the week in the open market sum up to 400 tons at 3.92½¢ to 3.97½¢, the closing figure being 4¢, and as much as 4.10¢ asked. St. Louis has been strong, advancing to 3.85¢ @ 3.90¢.

**Spelter.**—The demand being good and the supply to meet it barely sufficient, Common Domestic Spelter has further improved, and is now held at 5¢, a sale having been made yesterday at 4.90¢. Silesian is unchanged, 5½¢. High-priced Ores, Coal and higher wages in Germany lend strength to the position out there.

**Antimony.**—The notable advance in London has caused an improvement here to 13½¢ for Hallett and 14½¢ @ 14½¢ Cookson, at which a moderate consumptive demand is being supplied.

## New York Metal Exchange.

The following sales are reported:

FRIDAY, May 31.

32 tons Lead, August.....	3.9¢
16 tons Tin, September.....	3.95¢

MONDAY, June 3.

10 tons Tin, June.....	20.40¢
25 tons Tin, August.....	20.55¢
25 tons Tin, August (2d half).....	20.45¢
16 tons Lead, August.....	3.95¢
50 tons Lead, spot.....	3.95¢
50 tons Lead, spot.....	3.95½¢

## Coal Market.

The New York market for Anthracite is dull and quiet, few sales being reported at the advanced schedule which took effect on Saturday. The future is largely dependent on the extent of damage from the disastrous floods, respecting which there are numerous telegrams, with little definite information. At Shamokin all the collieries were forced to suspend and, many were drowned out. All the collieries in the Mahanoy Valley and at Centralia are drowned out to an extent that will incapacitate them for work at least two weeks. One account says that only 20 of the 40 collieries of the Reading Company are in operation. At Hazleton the work of getting out Coal is stopped. Some of the collieries are completely drowned. Lattimer No. 3 and Mt. Pleasant No. 1, belonging to A. Pardee & Co., are said to be in the worst condition. At Carmel, where 6000 hands are employed, work in two large mines is indefinitely suspended, nearly all the pumps being under water. At Ashland not a single colliery in a list of nearly a score but is drowned out and much of the machinery is submerged. Gigantic pumps make no headway against the water. In the Pine Grove regions the collieries are filled with water. Every mule at Brookside Colliery, the largest of the Philadelphia and Reading Coal and Iron Company collieries, was hoisted. No coal trains are able to reach the collieries. The announcement is made that the Chesapeake and Ohio Canal had been irreparably damaged and will be abandoned. This means that its Coal business from the Cumberland region will now be divided

among the railroads leading to tidewater. A dispatch from Corning, in this State, referring to the floods, says the Fall Brook Coal Company lose heavily—that “\$1,000,000 will not cover the loss.” Added to other embarrassments in the mining regions, transportation is interrupted, so that at least a week must elapse before the Coal trade can be restored to anything like normal conditions. Meanwhile supplies at tidewater are sufficient for the emergency. The reported production for the week is 608,552 tons, a decrease of 100,000 tons compared with the previous week, but an increase of 64,000 tons compared with the same week last year. Since January 1 the total is 12,129,813 tons, a decrease of 1,393,000 tons compared with 1888. Quotations, Free Burning, f.o.b.: Broken, \$3.85; Egg, and Chestnut, \$4; Stove, \$4.80.

The Bituminous Coal trade is somewhat improved, but there is no radical change. Supplies will be diminished by the floods, but no scarcity is apprehended. The Cumberland Coal shipments aggregate 56,000 tons, Tyrone and Clearfield 48,000. The scarcity of vessels continues.

The Philadelphia *Inquirer* says: “The new Lehigh and Wilkesbarre Coal Company's mine at South Wilkesbarre will be started up on June 8. It is expected to be one of the largest producers in the region.”

Coxe Bros. & Co. are putting down a large colliery in the Schuylkill region, near Green Mountain.

The Pennsylvania Railroad Company announced a reduction in tolls on Buckwheat Coal and Culm to New York Harbor of 10¢ a ton, which will go into effect on June 21. The total reduction on these sizes is now 50¢ below domestic sizes.

Walter S. Ottinger, of the Cambria Works, says that “John Fulton, general manager of the Cambria Iron Works, who is drowned, was one of the best men that ever lived. As an engineer he was superb, and as a Christian no man was purer or better. He could handle men as well as any other man in Pennsylvania.” Charles T. Butler, assistant cashier, and John S. Buchanan, superintendent of the warehouses, are also among the victims.

Machinery that is intended to revolutionize the present mode of propelling boats is now being built for a boat of about 300 tons register that lies at the foot of Twentieth street, Brooklyn. The inventor, Dr. Jackson, says he is spending \$10,000 a week in perfecting his ideas. Much secrecy is maintained, but it is said that the force to be used is hydraulic. The Worthington Pump Company are building a steam pump for the boat, but they have been delayed, it is said, by finding that ordinary metals are not strong enough to resist the pressure that will be exerted. They, however, have decided to try cast steel. It is alleged that the builders expect to realize a speed of 30 miles an hour with ordinary vessels.

## British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]

LONDON, WEDNESDAY, June 5, 1889.

Merchant-Bar Copper, while fluctuating somewhat irregularly in price, has ruled quite strong. Early in the week an advance was caused by reports that an agreement had been arrived at in Paris. This was followed by some reaction due to realizations, but subsequently prompt sold up to £41. 10/, and the market closes strong. The fact that only a moderate quantity out of the large stocks on hand is offered tends to sustain values, particularly for named brands. Large purchases of forwards are said to have been made privately. There is a report that the recent interviews between mining delegates were unpleasant, resulting in the refusal of some companies to enter a fresh combination. The sale is reported of 200 tons Montana Matte, terms private. Among other important transactions the past fortnight 600 tons Yellow Metal and 1000 tons India Sheets are reported.

The demand for Tin has improved, but prices have ruled irregular in the face of that fact and the decrease in visible supply. Sales of prompts have been made at as low as £91. At the Dutch sales 24,200 slabs Banca and 1000 Billiton sold at an average of £92. 15/ in Holland.

Tin-Plate has been in rather better demand the past week and heavy shipments to the States are reported. Prices are, however, no better. Two new mills are being added to the Vernon works.

Pig-Iron warrants have been firmer, and the “bears” are manifesting uneasiness. It is stated that large orders have been placed in the hands of brokers to purchase should prices further decline. High prices for Coke have increased the cost of production and will cause Cleveland furnaces to be damped unless rates advance. The masters are determined not to produce at a loss. One Tees firm has stopped deliveries of Bilbao Ores. Maker's brands of Scotch, while 6d to 1/6 lower than last week, have met with freer sale, as has also Middlesborough at about 6d decline. Hematites are strong and more active also.

The effect of the Staffordshire combination is watched with considerable interest in Wales, where a similar organization may be formed. Welsh Bars are 2/6 up this week, but other Manufactured Iron is unchanged.

Steel of all descriptions continues strong, and prices generally are higher, including 2/6 advance on Rails and Blooms and 10/ rise on Wire Rods. Makers ask £6. 10/ upward for the latter.

High prices have been paid for Old Material during the week, and Rails are said to be scarce at the present time.

Scotch Pig.—There has been a more active business, but at irregular and rather lower prices.

No. 1 Coltness, f.o.b. Glasgow	54/6
No. 1 Summerlee, “	55/
No. 1 Gartsherrie, “	51/8
No. 1 Langloan, “	53/6
No. 1 Carnbroe, “	46/
No. 1 Shotts, “ at Leith	52/6
No. 1 Glegarnock, “ Ardrossan	51/6
No. 1 Dalmeilington, “	45/
No. 1 Eglinton, “	43/

Steamer freights, Glasgow to New York, 2/6; Liverpool to New York, 10/.

Cleveland Pig.—At a further reduction in prices there has been a larger trade and the market is firmer. No. 3 Middlesborough, G.M.B., quoted 88, prompt.

Bessemer Pig.—Trade has been quite brisk and the market is decidedly firmer. West Coast brands, mixed numbers, 49/6, f.o.b. shipping point.

Spiegeleisen.—For this material there continues to be a firm and fairly active market. English 20 % quoted 82/6, f.o.b. at N. W. England shipping point.

Steel Rails.—The market strong at 2/6 advance, and the demand fairly active. Heavy sections quoted at £4. 15/, and light sections £5 @ £5. 2/6, f.o.b. at N. W. England shipping point.

Steel Blooms.—Makers ask 2/6 advance, but sales are not large. We quote £4. 5/ for 7 x 7, f.o.b. at N. W. England shipping point.

Steel Billets.—There has been a good business at slightly under previous nominal prices. Bessemer, 2½ x 2½ inch, £4. 5/, f.o.b. at N. W. England shipping point.

Steel Slabs.—The market for these continues quiet but steady. Bessemer, £4. 2/6, f.o.b. at N. W. England shipping point.

Old Rails.—Demand only fair, but prices firm, owing to light stocks. Tees quoted at £3. 5/ @ £3. 7/6, and Double Heads, £3. 12/6 @ £3. 15/, c.i.f., New York.

Scrap-Iron.—A fair demand and prices steady. Heavy Wrought quoted at £2. 2/6 @ £2. 5/, f.o.b.

Crop Ends.—Business moderate and prices unchanged. Bessemer quoted £2. 10/ @ £2. 12/6, f.o.b.

Tin-Plate.—The market has been rather more active, but prices show little change. We quote, f.o.b. Liverpool:

1C Charcoal, Allaway grade	15/3 @ 15/6
1C Bessemer Steel, Coke finish	12/6 @ 12/8
1C Siemens “	14/ @ 14/6
1C Coke, B. V. grade	13/ @ 13/6
Charcoal Terne, Dean grade	12/ @ 12/3

Manufactured Iron.—In this line there continues to be a fairly active trade at firm prices. We quote, f.o.b. Liverpool:

Staff. Marked Bars	£ s. d. @ £ s. d.
“ Common	6 0 0 @ 6 0 0
Staff. Bl'k Sheet, singles	7 12 6 @ 7 15 0
Welsh Bars (f.o.b. Wales)	5 5 0 @ 5 7 6

Copper.—The market fairly active and stronger, particularly for named brands. To-day's prices for Bars were £41. 10/, spot; £41. 5/, three months' futures. Best Selected, £47.

Tin.—A fair business done but at irregular and lower prices. Straits quoted to-day at £91, spot, and £91. 10/ for three months' futures.

Lead.—The market barely steady and rather slow. Quoted £12. 6/ for Soft Spanish.

Spelter.—There is less doing but prices remain firm. Quoted at £18 for ordinary Silesian.

## Foreign Markets.

### GERMANY.

HAMBURG, May 25, 1889.—Iron.—The Rhenish-Westphalian Iron market displays great firmness. The gigantic coal miners' strike

took a good many iron works by surprise, their stock of coal being light, and several had to stop work in consequence for the moment. The effect on iron has if anything been a stiffening one. Some more blast-furnaces may be blown out, and this is all the more to be regretted, as both production and consumption of Pig-Iron has of late been very brisk. Stocks of the latter are reduced to 50,000 tons, showing that the larger production of the last few months has been absorbed. The largest reduction of stock has been in Forge Pig, but Foundry Pig has also been somewhat reduced; Thomas and Bessemer less so. All rolling-mill products and railroad material remain unaltered. The quotation for Wire-Rods is 110 @ 120 marks  $\frac{1}{2}$  ton, and that of Steel Rails 120 @ 125 marks.—*Borsenhalle*.

#### BRAZIL.

PARA, May 28, 1889.—*India Rubber*.—Two steamers with together 200 tons of Rubber on board have just left for the United States, having absorbed all the available supply on the spot May 31. The total receipts in May at this port were 620 tons Fine and 680 tons Ordinary.—*Per cable direct*.

#### CHILI.

VALPARAISO, March 29, 1889.—*Copper*.—The news per cable of the collapse of the syndicate and of the decline to £35 in consequence thereof has put a stop to dealings for export here. At a similar figure Copper production would not leave a margin in this country. *Coal*.—Copious arrivals from Australia have caused a drop to 25/, while Newcastle on the spot is worth 34/6 and floats thereof are firmer. *Exchange*.—There has been quite a decline, to 26 $\frac{1}{2}$ d, 90 days' sight on London.—*Weber & Co.*

#### EAST INDIES.

SINGAPORE, April 23, 1889.—*Tin*.—Our last report was dated 9th inst. Only a moderate business has been done in the majority of our staples, and there are no signs of any increase in the near future. Financial difficulties in France have had a depressing effect on this metal, and the fortnight's business totals only 160 tons at prices ranging from \$35.80 to \$36.35  $\frac{1}{2}$  picul. Stocks are not large, and we hear of nothing that justifies any change in the estimated production for the year. The closing price is \$35.60  $\frac{1}{2}$  picul with buyers. During the first quarter there were shipped from the Straits Settlements to the United States 31,523 piculs of Tin, against 10,014 tons during the corresponding period of 1888; 23,954 in 1887; 15,471 in 1886; 8406 in 1885, and 15,724 in 1884. Since then the steamer Prometheus took hence for New York 3785 piculs and the Ganges 3788. *Gum Copal*.—Continues firm, partly because there is a fair demand for good quality, but chiefly because prices are not yet at the level that will induce a large holder to make contracts. There have been no arrivals to speak of. *Gum Damar*.—Nothing has been done beyond a few small sales of low quality. Palembang has changed hands for Continental requirements. Very little of this article now comes to Singapore. *Tonnage*.—Rates are weaker and we look for some future decline shortly. Room offers freely for next month's shipment, but for this month's loading 37/6 for dead-weight is the best practicable so far. *New York via Cape*.—No change. News is just at hand of the loss of the Norway. *For Boston* the Obed Baxter has sailed. *Exchange*.—Is steady at 3/1 $\frac{1}{2}$  for six months' sight credit drafts.—*Giffman, Wood & Co.*

MANILA, May 27, 1889.—*Hemp*.—There are buyers at \$14.50  $\frac{1}{2}$  picul, against \$8.37 $\frac{1}{2}$  same date last year, equaling  $\frac{1}{2}$  ton, cost and freight, £46.10/, against £28.5/6. Since last cable there were no clearances for the United States, against 6000 bales last year; since January 1, 109,000 bales, against 76,000; there remain loading for the United States, 23,000, against 15,000; cleared for England since January 1, 107,000 bales, against 184,000; loading for ditto, 14,000, against 8000; cleared for all other ports, 18,000, against 34,000; receipts at all ports since last cable, 6000, against 22,000; ditto since January 1, 251,000 bales, against 249,000 in 1888 and 188,000 in 1887. *Freight*.—\$7.50, against \$5.50. *Exchange*.—Six months' sight, 3/5, against 3/5.—*Ker & Co., per cable direct to their agent in New York, Mr. Charles Nordhaus, 89 Water street.*

#### RUSSIA.

ST. PETERSBURG, May 23, 1889.—*Petroleum*.—The Government has at length taken a favorable view of the pipe line which a private company propose to lay for Naphtha conveyance between the Caspian and Black Seas. The cost of it is estimated at 30,000,000 rubles, and the Government has been petitioned by the company to guarantee 3% per annum interest on a bond issue to be made of 14,000,000 rubles,

but the Finance Minister is opposed to this guarantee, but even without the latter the line will be laid.—*Journal de St. Petersburg.*

#### Teal's Portable Hoist.

The Committee on Science and the Arts of the Franklin Institute, Philadelphia, submitted a report on May 1 relative to Teal's portable hoist, from which we take the following extracts:

There are several well-known differential hoists in the market, but they all differ widely from Teal's invention. In all other hoists known to us, the overhauling or lowering of the hook is a mere reversing of the hoisting action and requires the same time as to lift a load, there being in them no provision for applying power to any other part of the hoist than that by means of the hand-chain by which the lifting is done.

The Teal hoist, on the contrary, has a slow and powerful motion to lift its load by means of the hand-chain and a quick movement for overhauling the chain and lowering the hook for a second lift by a pull directly upon the lift-chain. Supposing the convenient velocity in pulling the two chains to be the same, then in the 1000-pound hoist examined by us the hook can be overhauled five times faster by a pull upon one side of the lift-chain, or six and seven-tenths faster by pulling on the other side, than it can be by the hand-chain. This increases the capacity and usefulness of the hoist, and is therefore a valuable improvement.

The extent of this improvement is shown in a table which gives the velocity ratio and overhauling speed of several well-known hoists, with the ratio of increase in the Teal hoist. The general arrangement and workmanship of the hoist is good. The journals are made self-oiling by having a chamber filled with fibrous packing combined with each journal, and while we think some parts of the malleable-iron framing could be with advantage increased in weight and strength, we regard it as, upon the whole, an excellent hoist, with such novelty and advantage as fully entitle it to receive an award from the committee. The results of the tests made by the committee are given in such a manner as to enable a comparison to be easily made with those obtained by the committee appointed by the judges of group No. 136 of the Novelties Exhibition of 1885 on portable hand-hoists. In view of the very high efficiency of the hoist, showing a considerable increase over the best one then tested, and in view of the increase of capacity and speed in overhauling, the committee recommend the award of the John Scott legacy premium and medal to Chas. A. Teal for his invention.

#### Selling Galvanized Iron by Weight.

A week ago, says *The Metal Worker*, we indulged in a little editorial musing in the Roofing and Cornice Department concerning the practice of designing galvanized iron by gauge and the many objections there are to this system of describing sheets. We pointed out that sheet-copper is sold according to weight per square foot, and that, therefore, the roofer or cornice-maker who employs the latter material knows exactly what amount of surface a certain number of pounds of copper will cover, while if it were galvanized iron that was used for the purpose the amount could not be accurately determined. The weight of galvanized sheet per square foot has no fixed relation to the gauge under which it is sold, the reason being that the commercial gauge marks themselves are only a roughly approximate designation of thickness. The evil arising from the present indefinite system of marking is not confined to

mere annoyance, but often amounts to an actual financial loss on a contract, due to mistakes in estimating the quantity of material needed. The suggested remedy was very simple, and consisted in adopting the practice of selling galvanized iron by weight, the same as sheet-copper. We did not expect to see our advice followed immediately, for hitherto we have had to wait a long time before any effort was made toward changes that we had suggested. In the present instance, however, we have been agreeably disappointed, for, as will be seen by this week's advertisement of a prominent metal-house, any one in need of galvanized iron is enabled to buy sheets that are guaranteed not to exceed a given weight per square foot. Under this system the manufacturer has only to determine the superficial area of his work and to decide upon the thickness of the iron he wishes to use (which is given both in wire gauge and decimals of an inch), when by means of the table furnished by the dealer he can readily calculate the number of pounds of galvanized sheet-iron required. We are well satisfied that this innovation will commend itself to the trade, and, furthermore, we believe that the practice will in time be followed by other supply-houses and rolling-mills until selling galvanized sheets by weight becomes the common system.

#### Joints in Cast-Iron Pipe.

The attention given not long ago to the testing of soil-pipes brought to notice the methods employed for making joints between sections of cast-iron pipe. The two joints in most common use are the calked lead and rust joints, the former being the popular one in plumbing-work. When the pipe, from any cause, is subject to considerable variations of temperature the lead joint is liable to become leaky through the unequal expansion and contraction of the two metals. Never mind how tight the ring of lead is driven into the hub, the irresistible force of heat will in time loosen it and break the hermetic seal. This objection is overcome by packing the joint with iron filings wetted with water or some corrosive liquid that by its rusting action expands the filling and makes a close and permanent joint. The reasons that the latter method is not more often followed are the difficulty of properly preparing the cementing material and the fact that pipes so joined cannot be separated without breaking. The rust joint is permanent in the last degree, so permanent, indeed, that a sledge-hammer is the readiest instrument with which to effect its disarticulation. It seems strange that the inventive genius of the age has not better solved the problem of cast-iron-pipe joints, and that people are still confined in their choice between what may be tersely described as an imperfect method and an impracticable method. So long as the cast-iron pipes are made in their present form the joints will have to be filled with a cementing material of some sort. A filling of possible usefulness for this purpose is referred to by one of our foreign exchanges in describing a new method of making a joint between rough surfaces of cast-iron. The cement is simply mineral asbestos mixed with white lead to the consistency of a stiff putty, and has been successfully employed for closing cracks in cast-iron gas retorts. This compound, besides making a tight and permanent joint, will, it is said, resist any amount of heat, and is unaffected by steam or water. Let it be understood that we do not recommend plumbers to use this asbestos cement without trial, but simply tell them what is told us, and they in turn may do what they please with the information.

## Hardware.

Trade continues in fair to moderate volume, and is perhaps about as good as can be expected at this season. Business through the country is in general prosperous, and a hopeful tone pervades the trade in regard to fall business. Prices are not strong, but there are few changes.

### Cut Nails.

The consumption of Nails is quite heavy, and the leading houses are doing a good business. The curtailment of production referred to last week has been carried still further since then by the forced suspension of operations at factories in Central Pennsylvania which have been flooded by the great rise in the Susquehanna River. Buyers here who have been getting their supply from that section are somewhat anxious and are seeking to cover their immediate requirements from other sources. Advantage has not been taken of this circumstance to raise prices, but it seems altogether likely that if the Central Pennsylvania supply should be cut off for any length of time prices will go up naturally. The Oxford Nail factory is again running but only temporarily, and will shut down as soon as its stock of Plate is consumed and will then await developments. Iron Nails are still quoted at \$1.80 to \$1.90, according to quantity.

### Export Trade.

The condition of the export trade remains about the same as last month; good orders continue to arrive from the Argentine Republic and the last mail from the Australian Colonies was a shade better than those received in April and May. Latest advices from Melbourne state that orders will be held back as much as possible until freight rates are more favorable. At the present time, however, rates are firm, and there seems to be considerable doubt as to the weakness promised. Freighters are in a peculiar situation; vessels they must have, and they are obliged to charge their customers high rates and run the chance of driving away business or reduce rates lower than charter and lose money. At present rates freight is scarce, for Melbourne and Sydney particularly, and heavy shipments of lumber and oil to fill vessels are the results. This means loss to freighters at present state of market in the colonies. Melbourne has 100,000 cases of oil on hand; Sydney, say, 90,000, not taking into account heavy shipments to arrive. The lumber market in Melbourne is reported as fair, while Sydney is dull. A great deal of interest is being taken by the American manufacturers in the export business, and new lines are rapidly being introduced into the Argentine and Australian colonies. The American manufacturer cannot be accused of non-activity or lack of enterprise in seeking foreign markets; he has had remarkable patience and has passed through trials and tribulations without number. In order to get his goods introduced a lot of money has been invested in catalogues, export journals with little or no circulation in markets where his goods could be sold, in contributions to pay expenses of travelers to foreign markets, and in consignments for which no return has ever been made, and in other fruitless ways.

### Wire Nails.

We give below the new Wire Nail card, June 1, 1899, in the form in which it has been adopted by the manufacturers. It will be observed that it covers the Standard Nails and also the Shelf goods. In accordance with the outline of the plan, as referred to in our last issue, it will be observed that the object sought to be accom-

plished by the manufacturers in this new arrangement, which is so important a departure from former methods, is to have a system by which Nails of any regular size or kind may be sold at a single base price. The card has accordingly been so arranged as to cover by its advances the increased cost of the different goods, so that it will apply to any and all goods described in it. Another object in adopting this scheme has been to reduce the assortment of the goods regularly sold under the miscellaneous list, a selection having been made of such gauges as in the judgment of the manufacturers were the most desirable for the trade in general. This is expected to result to the advantage of the manufacturer in diminishing the number of sizes to be manufactured and carried in stock, while the selection made is considered as suitable for the merchant and tending to discourage the carrying of several gauges of Nails of the same kind and length. Nails not described in the card are to be sold at special net prices. The manner in which the card is proportioned to the cost of the goods is intended to remove the temptation to cut on certain goods, the extras on which much exceeded the increase in their cost. It will thus be seen that the extras on some of the leading sizes, which were unreasonably low, have been increased, while on the smaller sizes, which were held at unnecessarily high prices, they have been very materially reduced. The following is the new card:

### WIRE-NAIL CARD.

WIRE NAILS [IN KEGS] JUNE 1, 1899.

60d Common, Base.....

Common Fence, Shingle, Flooring and Common Brads.		Lining Nails.	
60d..... base.		Extras.

All Barbed Nails 25 cents advance over smooth.

All special Nails at special prices.

The objects of the manufacturers in adopting the above card are clearly explained in the following circular, which has been issued by the Cincinnati Wire Company, Cincinnati, Ohio:

The advantage of this list to the dealer over the old method of quoting will be appreciated at a glance. It does away with a great many gauges for which there was little or no sale; it also does away with the miscellaneous list.

It covers all standard stock sizes. Any length or gauge of Nail not on this list will be regarded a special Nail to be made to order at a special net price.

Under this list all Nails of every description in any size package will be quoted on the one base price of 6d common. Each length and gauge of Nail is put under its proper head, so that in ordering it will not be necessary to state any gauge, but simply to state the kind of Nail and length or penny.

Each size in this list is rated according to its relative cost above the base size, and there will therefore be no cutting of classification.

The HP Nail Company, Cleveland, Ohio, send out the new card with this explanatory circular:

At a meeting held in Cleveland, Ohio, May 23, to take into consideration the changing of

the Wire-Nail price list, 90 per cent. of the Wire-Nail capacity of this country was represented, and voted unanimously to adopt the new list, as presented, to go into effect June 1, 1889. Great care has been taken in making this change. The aim of this new price-list is to sell each Nail (as near as possible) on a basis of its cost. The former base Nails have been advanced, and the high advance Nails have been reduced. The miscellaneous list (which was subject to discount) has been abolished. All Nails on this new price-list are sold from the same base price, with advances added. Special Nails not found in this list will be subject to special prices. We feel satisfied that this change will be as satisfactory to the buyer as to the manufacturers. There are no good reasons why you should have any more sizes of Wire Nails to carry than Cut Nails.

As showing the value of Nails under the new as compared with the old card, we have received the following figures, which relate to an actual retail assortment of the standard goods on hand at the time of the change. The base price is put in both cases at \$2.75. It will be seen that there is with this assortment, which is not entirely symmetrical, very little difference in the aggregate value under the new and the old cards:

No. kegs.	Nails.	Old card.	New card.
1	2d fine.....	\$6.25	\$5.25
7	3d fine.....	40.25	33.25
5	2d fine.....	27.50	23.75
2	3d .....	9.50	8.50
13	4d .....	48.75	47.45
6	5d .....	22.50	21.90
45	6d .....	155.25	153.00
4	7d .....	13.80	13.60
66	8d .....	204.60	214.50
5	9d .....	15.50	16.25
27	10d .....	78.30	85.05
3	12d .....	8.25	9.30
3	16d .....	8.25	9.30
5	20d .....	13.75	15.25
2	30d .....	5.50	5.90
2	40d .....	5.50	5.90
2	50d .....	6.20	5.70
2	60d .....	6.20	5.50
200	.....	\$675.85	\$679.85

We are not informed that any action was taken by the manufacturers in regard to the base price, as in the present condition of the market it would not probably be feasible to secure entire agreement upon this point. We understand, however, that the purpose of the manufacturers is that the base price which has for some time been ruling be adhered to.

#### Miscellaneous Prices.

In sympathy with the Copper market the prices of Plumbers' and Steam and Gas Fitters' Brass-Work are slightly lower, and are not characterized by entire uniformity.

Agricultural Wrenches are held firmly at the lately slightly advanced prices, and are quoted regularly at discount 80 per cent.

The Lead manufacturers held a meeting in this city last Friday and made a small advance on Sheet and Pipe Lead, the new quotations being, Sheet, 6½¢, and Pipe, 6¢. The condition of the Lead market was the cause of this change, and it is not unlikely that Shot will soon follow.

The Hazard Powder Company, 97 Randolph street, Chicago, Ill., issue a circular relating to Shot-Gun Cartridges loaded to their order with Hazard Powder, and send also a price-list. A discount of 40 and 10 per cent. is quoted, with extra discounts for quantities named.

In his advertisement on page 118, C. E. Hudson, Leominster, Mass., calls attention to his line of Apple-Parers for the coming season. The name of his Hudson '88 has been changed to the Daisy. The following revised quotations on Apple-Parers, which, it will be observed, are lower than prevailed last year, are made by him:

Little Star, per dozen.....	\$4.25
Rocking Table, per dozen.....	5.50

#### Relief for the Sufferers.

The Hardware Board of Trade, 4 and 6 Warren street, New York, are receiving subscriptions for the relief of the sufferers by the disaster in Johnstown and vicinity. Those reported to the hour of going to press are as follows:

New York Belting and Packing Co.....	\$500.00
Wallace & Sons.....	100.00
Thomas Kenworthy.....	100.00
Wiebusch & Hilger.....	50.00
Schoverling, Daly & Gales.....	50.00
Alfred Field & Co.....	50.00
Henry B. Newhall Co.....	50.00
Maltby, Henley & Co.....	50.00
Hermann Boker & Co.....	50.00
Topping & Fox.....	50.00
F. & W. Clatworthy.....	25.00
McCoy & Sanders.....	25.00
A. B. & W. T. Westervelt.....	10.00
O. Lindemann & Co.....	10.00
Bayles Bros.....	10.00
William Bishop.....	5.00

This list, it is hoped, will be largely increased, but it should be borne in mind that many Hardware houses have contributed to the same object, which makes so strong an appeal to the sympathy and liberality of all, through other channels.

#### Trade Topics.

With reference to the position of Los Angeles, Cal., and the feeling of opposition on the part of its merchants to Pacific Coast agencies with headquarters at San Francisco, a matter to which we alluded in a recent issue, we have the following from a well-known Hardware house of that city, and our correspondents refer also, it will be observed, to Los Angeles as a business center:

The time has been when exclusive agencies were the rule in many lines and located at San Francisco, notably Farm Implements and Tools. We have occasionally, when asking for prices from Eastern manufacturers, been courteously referred to "our exclusive agent" at San Francisco. We have uniformly replied that the markets of San Francisco and Los Angeles are as distinctly two markets as are the markets of Portland, Me., and Charleston, S. C., and that we should pay no percentage to coast exclusive agencies. The real-estate boom having departed from this city and section, we have now settled down to legitimate business. Our city and country can boast of steady advances in population, reasonable activity in building and improving, and the outlook is good. We have a rich country, and we think there can be no question as to the probability of a successful future for our trade.

The fraternity of commercial travelers who are endeavoring to induce the railroad companies to adopt an interchangeable 5000-mile ticket at 2 cents per mile, are hoping that their efforts will be attended with success, especially as they are aided by the co-operation of merchants and manufacturers in some leading cities. The principal difficulty in the way is the apprehension of the railroad companies that the tickets would fall into the hands of scalpers, and thus be diverted from their intended exclusive use by the travelers to whom they are issued. If assurances could be given to the railroad companies that this would not be the case there would be little doubt but the tickets would be promptly and cheerfully furnished.

In reply to the inquiry which appeared in our last issue from an Alabama Hardware man as to the proper place on boxes to mark cost and selling price—front, side or bottom—we have the following succinct and pointed advice from a prominent New England merchant:

Do not mark the cost or selling price on the box. In buying stock select a line and stick to it. Put the boxes the maker puts the goods into on the shelves. Sample nothing unless it is under glass. Buy Root's lists and use them. To say more is to waste your time and space.

Merchants are often annoyed by having business in their town given to outside parties, and where the outsider is in a position to supply the goods or do the work better or on more advantageous terms there

is of course no good reason for complaint, but sometimes the home merchant is compelled to see the contract given to outside parties without any such justification. This matter is referred to by a correspondent in the West, who alludes to it in this way:

I had a conversation with a steam-fitter about keeping trade in his own town. He stated that on public work preference always seemed to be given to outsiders, and mentioned one job on which he was required to give bonds to twice the amount of the job, and to agree to accept a small cash payment on the completion of the work and the balance in six months. The job was awarded to a man from an adjoining city, who received cash on completion of the job at the same figures.

This was probably an exceptional case, as local pride and the public spirit of each town are usually on the side of its own merchants, and we happened to have advice by the same mail in regard to a job in the same vicinity as that referred to, in which the merchant who resided in the adjoining town was informed that unless his figures were very much below those of their local concern the contract would be kept at home, as they desired to avoid sending the money out of town.

#### Items.

A catalogue showing remarkable care and skill in its compilation has just been issued by Horton, Gilmore, McWilliams & Co., Chicago, Ill., and in it there are a number of features which are new and commendable. It opens with a title-page which is reproduced in the advertisement of the house on page 87, after which is a page devoted to what they call "Our Pick-up Department," which contains the mottoes "Quick Delivery," "Complete Shipments," "No Substitution," "Bottom Prices," and gives illustrations to emphasize their readiness to pick up for their customers any outside goods which can be found in the city and their facilities for doing the same, with the suggestive intimation that everything can be found in the Chicago market that is worth having. The volume is given a formal introduction in a letter to the trade in *fac-simile* of the handwriting of James M. Horton, the president. This catalogue derives special interest from the fact that it is the first which has ever been issued by the house, and illustrates the energy and enterprise of its present management. It is a volume of 1190 pages and represents an exceedingly complete line of Hardware and related goods. It opens with Mechanics' Tools and passes on to Agricultural Tools, including Steel Goods, Rakes, Shovels, Post-Hole Diggers, &c. Builders' Hardware, covering a large variety of staple and special goods, next follows, after which the department devoted to Cutlery is reached, which opens with illustrations of the Revolving Show-Cases which are given to customers who purchase the company's goods when a line of Table Cutlery, miscellaneous Knives, Pocket Cutlery, Sheep Shears, &c., is shown. The department devoted to Revolvers, Guns, Ammunition, &c., follows, with the related goods in the way of Fishing-Tackle, Bicycles, Velocipedes, &c. Tin Ware, Pieced, Stamped and Japanned, is represented in suitable variety and with very satisfactory cuts. Many other goods in this department are shown, and also Tinsmiths' Tools, Machines and Supplies, Refrigerators and many miscellaneous articles. Near the end of the volume are such staple goods as Tacks, Nails, Screws, Bolts, Horseshoes, Metals, &c., and it closes with Spectacles, Clocks, an interesting variety of such oxidized silver goods as Shoe-Horns, Bonbonieres, Pins, Match Safes, Vinaigrettes, Book-Marks, Glove-Buttoners, Button-Hooks, Letter-Openers, Paper-Knives, &c. The volume is well printed, conveniently arranged and fully illustrated. It will be sent to cus-

tomers with the first goods ordered, and is not, we are advised, for sale.

L. W. Ferdinand & Co., Boston, Mass., have issued a convenient illustrated catalogue of 180 pages, in which prominent place is given to the manufactures of the Shelton Brass Hardware Company, for whom they are agents. The list thus represents an extensive line of Heavy and Ship Chandlery Hardware, Tackle Blocks, Cordage, &c., and will be found convenient and serviceable as giving a desirable assortment of these goods. Several specialties are illustrated which are of interest.

T. Seloff & Co., Detroit, Mich., successors to McCutcheon & Hanford, dealers in Hardware, Stoves, Hot-Air Furnaces, &c., 57 Grand River avenue, have recently purchased a fine brick building at 787 Grand River avenue, and have about completed its equipment. This firm are, we are advised, the Detroit agents for Sayre, Owens & Co., manufacturers of the Union, Oneida and Tubular Hot-Air Furnaces, Utica, N. Y.

In connection with the formal notice of the disposal of the stock of goods and goodwill of the business of Caruth & Byrnes Hardware Company to the Simmons Hardware Company, St. Louis, Mo., a more personal announcement is made by David W. Caruth, president of the former company. It is in the following graceful and appropriate terms:

MY DEAR FRIENDS: Owing to physical infirmities, increasing with years, I have found it necessary for me to be relieved as far as possible from the cares of active business. This has induced me, and through me the Caruth & Byrnes Hardware Company, of which I am president, to go out of active business. To accomplish this end with satisfaction to ourselves and with due regard to the welfare and interests of our many patrons and friends, we have this day transferred our stock of goods to the Simmons Hardware Company, of St. Louis, which concern has thus become our successors. I personally desire to express to you all my warmest friendship, and at the same time to thank you cordially not only for your liberal patronage, but especially for the very friendly business and personal favors extended to us in the past. I shall be most happy to meet any of you at any time (for I shall remain in St. Louis). Our office will be with Simmons Hardware Company, at which place I shall make my headquarters to adjust and settle up the old business of our company and where I shall be glad to welcome you.

In the description given in our issue May 28 of the Sash Lock and Ventilator manufactured by Jenkins & Timby, Oswego, N. Y., and 102 Chambers street, New York, the cut illustrating it was inadvertently placed upside down, thus rendering less clear and satisfactory the description and perhaps puzzling those who did not give careful attention to it. Our readers will please note the correction, and it may be worth their while to look again at the description, that they may get a clear idea of the construction and merit of the Sash Lock and Ventilator. They will be able to do this very readily by reference to the advertisement in this issue on page 93, in which a very clear illustration of the article is given. The manufacture of this article is attended to by I. G. Jenkins, Oswego, N. Y., while its sale is attended to by T. F. Timby, 102 Chambers street, New York.

James E. Colby, a traveling salesman for the wholesale Hardware firm of Markley, Alling & Co., has disappeared, and the members of the firm apprehend that he has been foully dealt with. His territory was through Iowa. When last heard of he was at Neola, May 11. His employers have made liberal use of the telegraph wires, but nothing can be learned of him. He is not known to have had any enemies, and is well liked by the men on the road. Mr. Colby is about 27 years old and wears a heavy dark mustache. He is a native of Toronto, Ont. Members

of the firm think he engaged a team to drive to a point in the country and was "held up" by highwaymen. While out of Chicago Mr. Colby made Des Moines his headquarters.

Hibbard, Spencer, Bartlett & Co., Chicago, Ill., issue a price-list of Fire-Works, in which many illustrations are given showing the display secured by the different articles, and thus of special interest as including many novelties, as well as staple Fire-Works. A number of assortments of Fire-Works, in cases, are also given, with the value of the goods at retail prices and their list-price, which is subject to discount. A number of Pistols and related goods are also included in the catalogue.

E. C. Meacham Arms Company, St. Louis, Mo., issued under date May 24 another of their price-currents representing their unusually complete assortment of Arms, Ammunition, &c. Their discount sheet is attached.

Morley Bros., East Saginaw, Mich., issue a circular calling attention to the Letter Opener, of which we recently gave a description, and which they are putting on the market. The advantages of this device and the manner in which it does its work are alluded to.

The Niagara Stamping and Tool Company, Buffalo, N. Y., issue a large sheet illustrating a varied line of goods in which supplies for canning factories are given a prominent place, and the completeness of their assortment of these goods is emphasized. It will be of interest to many in the trade as relating to Machines and articles which are not often found in catalogues.

Wells Bros. & Co., Greenfield, Mass., issue a neat catalogue devoted exclusively to Stratton Bros' Improved Spirit Levels, of which they are now the sole manufacturers.

J. H. Martin & Co., 143 Water street, St. Johns, N. F., issue a sporting catalogue relating to Fishing Tackle, Cricket Goods, Guns, Ammunition, &c., in which an interesting assortment of goods in these lines is represented, with prices. They also call attention to the fact that their principal business is Shelf and Heavy Hardware and general House-Furnishing Goods, full lines of which are kept in stock.

James E. Halsey, who is widely known to Hardware men from his long connection with the trade, especially in the South, will represent the Electric Cutlery Company, 91 Chambers street, New York, in the Southern States, selling their Electric Razors and Cutlery, Lamont and Electric Razor-Strops, &c.

Butts & Ordway, 145 Pearl street, Boston, Mass., announce that they have added to their stock a line of Builders' Hardware, and allude to the favorable terms on which they are offering the goods.

#### Exports.

PER BARK HARRIET S. JACKSON, MAY 18, 1889, FOR EAST LONDON, SOUTH AFRICA.

By W. H. Crossman & Bro.—6 dozen Hatchets, 20 crates Stoves, 8 cases Carriage Hardware, 68 packages Carriage-Ware, 300 dozen Hatchets, 5 dozen Hatchets, 5 dozen Axes, 120 dozen Brooms, 3 dozen Churns, 3 dozen Clocks, 15 dozen Traps, 50 dozen Handles, 7000 pounds Nails, 10 Lawn Sprinklers, 94 packages Stoves, 18 Scales, 5750 pounds Sash Weights, 155 pounds Sash Cord, 6 dozen Hatchets, 30 dozen Brooms, 1820 pounds Sash Weights, 2 dozen Sash Cord, 5 dozen Wash-Boards, 3 dozen Tables, 10 dozen Traps, 1 dozen Clocks, 52 cases Stoves, 504 Flows, 608 Flows.

By Mailler & Quereau.—1 case Guns.

y R. W. Forbes & Son.—8 packages Hardware, 174 dozen Axe and Pick Handles, 1 gross Blacking, 600 pounds Axle Grease, 2 gross Shade Rollers, 2 dozen Store Trucks, 24 sets Axes, 1 case Horse Hoes, 3 cases Churns, 12 boxes Scales, 35 dozen Axes, 6 dozen Axes, 8 dozen Fork Handles.

By Arkell & Douglas.—54 cases Edge Tools, 16 cases Edge Tools, 12 cases Handles, 36 dozen Shade Rollers, 6 dozen Traps, 1 dozen Wringers, 8 cases Axle Grease, 6 cases Spokes, 17 bundles Fellos, 14 bundles Wash-Boards, 3 cases Axes, 12 boxes Clothes-Pins, 4 crates Rolling-Pins, 22 cases Hardware, 9 cases Edge Tools, 7 cases Handles, 4 racks Churns, 12 dozen Wash-Boards, 1 case Brooms, 2 cases Perambulators, 14 cases Meat-Cutters, 2 cases Toys, 15 cases Hardware, 18 cases Edge Tools, 12 dozen Forks, 6 boxes Clocks, 4 cases Hardware.

By H. W. Peabody & Co.—9 cases Hardware, 3 dozen Wash-Boards, 12 cases Hardware, 4 packages Dairy Implements, 2 gross Brooms, 11 cases Edge Tools, 20 dozen Brooms, 23 cases Hardware, 11 cases Fire-Arms, 24 dozen Wash-Boards, 1 case Toys, 24 dozen Shade Rollers, 1 case Pumps, 2 dozen Churns, 192 dozen Handles, 6 cases Axes, 33 packages Carriage-Ware, 1 case Agricultural Implements, 1 case Scales, 1 case Carriages, 32 packages Hardware, 1 case Skates, 1 case Dairy Implements, 2 packages Whips, 7 packages Agricultural Implements, 2 cases Harness, 190 dozen Blacking, 3 Refrigerators, 8 cases Fire-Arms, 5 cases Clocks, 409 pounds Bolts, 300 pounds Fuse, 50 feet Hose, 1 case Blocks, 3 cases Bolts, 11 cases Hardware, 1000 Handles, 6 cases Fire-Arms, 2 cases Wringers, 2 cases Clocks, 2 cases Perambulators, 1 case Wringers, 1 case Pumps, 9 cases Hardware, 4 cases Fire-Arms, 24 dozen Handles, 3 dozen Churns, 1 case Freezers, 6750 pounds Twine, 1 case Emery Goods, 36 dozen Handles.

PER BARK MATHEW BAIRD, MAY 24, 1889, FOR PORT NATAL, SOUTH AFRICA.

By R. W. Forbes & Son.—7 cases School Slates, 22 packages Scrapers.

By H. W. Peabody & Co.—100 dozen Handles and Brooms, 1 case Stamped-Ware, 8 cases Hardware, 79 packages Agricultural Implements, 12 dozen Wash-Boards.

By Corner Bros. & Co.—110 dozen Tools, 80 cases Hardware.

By W. H. Crossman & Bro.—120 dozen Brooms, 20 dozen Wash-Boards, 5 dozen Axes, 60 dozen Pick-Axes, 16 dozen Axes, 192 dozen Handles, 1 case Hardware, 15 dozen Curry-Combs, 1/2 dozen Churns, 1 dozen Shellers, 1 dozen Store Trucks, 3 Refrigerators.

PER BRIG NETTIE, MAY 24, 1889, FOR AUCKLAND, NEW ZEALAND.

By Arkell & Douglas.—2 crates Handles, 2 cases Hardware, 1 case Saws, 1/2 dozen Mangles, 2 cases Nails, 1 case Wringers, 11,200 pounds Barb Wire, 5 cases Edge Tools, 3 dozen Ox Bows, 170 pounds Bolts and Nuts, 60 boxes Horse Nails, 2 cases Hammers, 28 cases Handles, 4 dozen Springs, 6 cases Hardware, 10 dozen Handles, 3 cases Edge Tools, 3 cases Saws, 2 cases Hammers, 2 cases Wringers, 8 cases Traps, 500 Broom Handles, 6 dozen Rakes, 1 1/2 dozen Churns, 2 cases Bench Screws, 3 cases Shade Rollers, 1 case Nails.

By H. W. Peabody & Co.—10 cases Hardware 5 cases Agricultural Implements, 14 packages Hardware, 13 cases Stone, 400 feet Belting, 13 packages Churns, 4 cases Fire-Arms, 1 case Castings, 52 packages Hardware, 2 cases Castings, 3 cases Pumps, 170 dozen Handles, 16 packages Agricultural Implements, 20 packages Lawn Mowers, 21 packages Churns, 1000 feet Rubber Hose, 950 pounds Nails, 3 crates Sewing-Machines, 1 package Indicators, 5 tons Barb Wire, 20 packages Agricultural Machinery, 1 case Hardware.

By F. B. Wheeler & Co.—3 1/2 dozen Wringers, 18 dozen Axes, 6 gross Axle Grease, 6 dozen Axes, 1 dozen Axes, 24 dozen Handles, 1/2 gross Axle Grease, 2 dozen Axes, 24 dozen Handles, 1 case Clocks.

By A. S. Lascelles & Co.—2240 pounds Barb Wire, 1 box Wagons, 4 boxes Lawn Mowers, 10 dozen Rakes, 4 crates Wagons, 1 box Cutlery, 1 crate Churns, 2 cases Plated-Ware, 1 dozen Oil Cans, 1 1/2 gross Clocks.

By Welsh & Lea.—12 cases Handles, 5 cases Iron Bolts, 1 case Carpet Sweepers, 3 cases Saws, 9 cases Hardware.

By Morris, Strouse & Co.—20 1/2 gross Fruit Jars.

By Geo. W. Silcox.—25 packages Sewing-Machines.

By H. B. Moore.—400 pounds Refrigerators.

By R. W. Forbes & Son.—36 dozen Axes.

By Mailler & Quereau.—14 packages Reapers, 3 packages Cultivators, 10 cases Scales, 29 cases Handles, 2850 pounds Axes, 60 kegs Nails, 4 cases Wheels.

By Coombs, Crosby & Eddy.—6 Pumps, 78 dozen Wood Handles, 4 dozen Bench Screws, 2 dozen Wringers, 9 Pumps, 6 dozen Rakes, 6 Lawn Mowers, 5½ dozen Tin-Ware, 22 dozen Axes, 4 dozen Grindstone Fixtures, 123 dozen Hardware, 17 Tools, 8 dozen Hammers, 4 dozen Bird-Cages, 11 Meat Choppers, 96 dozen Tacks, 2 dozen Axes, 6¼ gross House-Furnishing Goods, 1 dozen Hay Knives, 1 gross Whetstones, 2 dozen Wrenches, 2½ dozen Churns.

By R. W. Forbes & Son.—45 packages Blacking, 44 packages Sewing-Machines, 69 packages Blacking, 12 boxes Hardware, 2 packages Hardware, 1 box Plated-Ware, 1 case Plated-Ware, 1 case Lamp-Ware, 10 packages Churns, 36 packages Fruit-Jars, 2 cases Hardware, 1 gross Fly-Traps, 30 dozen Rakes, 20 dozen Snaths, 18 dozen Wrenches, 2 dozen Washers, 1 case Grinding Mills, 1 case Shade Fixtures, 1 case Rubber Goods, 17 packages Hardware, 5 packages Planters, 13 packages Agricultural Implements, 20 boxes Lawn Mowers, 30 dozen Spade-Handles, 4 cases Wringers, 100 dozen Axe-Handles.

By W. H. Crossman & Bro.—36 dozen Axes, 11,200 pounds Barb Wire, 37 gross Fruit-Jars, 6 dozen Hatchets, 50 Toy Pistols, 5 packages Plated-Ware, 25 cases Skates, 32 gross Fruit-Jars, 2 dozen Wringers, 30 dozen Wash-Boards, 30 boxes Clothes-Pins, 1 case Ox-Bows, 600 feet Rubber, 1 case Lamp Goods, 1200 pounds Horse-Nails, ¼ dozen Hay-Knives, 3 cases and 46 bundles Carriage-Ware, ½ dozen Lawn Mowers, 3 dozen Axes, 8 dozen Hatchets, 10 dozen Axes, 2 dozen Dashers, 3 dozen Traps, 1 dozen Wringers, 12 dozen Egg-Beaters, 2 cases Hardware, 3 cases Hardware.

#### FOR NELSON.

By Arkell & Douglas.—3600 Cartridges.

By H. W. Peabody & Co.—44,800 pounds Barb Wire, 240 dozen Handles.

By R. W. Forbes & Son.—8 packages Hardware, 2 packages Hardware, 2 crates Butter-Workers, 60,000 Caps, 1 case Miter Boxes, 1 box Pumps, 9 packages Stoves, 1 package Rubber Springs, 9 Emery Wheels, 1 case Lampware, 2 gross Shade-Rollers, 11,250 pounds Barb-Wire, 180 dozen Axe-Handles, 40 dozen Wash-Boards.

By McLean Bros. & Rigg.—500 Handles, ¼ dozen Augers, 1 gross Axle-Grease, 8 dozen Axes, 1 gross Shade-Rollers, 8 gross Lead-Pencils, 1 dozen Bird-Cages, 1 dozen Wringers, 10 dozen Wringers, 4 gross Cotton Lines, 3 dozen Mallets, 2 dozen Cast-Iron Sinks, 4 dozen Lanterns, 1 dozen Dashers, 1½ dozen Churns, 336 pounds Tacks, 9000 Cartridges, 12 dozen Handles, 1 case Castings, 9 gross Fruit-Jars, 2 Drills, 3 cases Assorted Hardware, 12 dozen Wash-Boards, 3 dozen Mop-Sticks, 4 packages Lamp Goods, 8 Lawn-Mowers, 1 case Hardware, 3 cases Hardware, 6 dozen Mattocks, 3 cases Hardware, 12 cases Hardware, 10 Butter-Workers, 48 dozen Handles, 6 dozen Wash-Boards, 22 Stoves, 12 gross Clothes-Pins, 3 packages Stove Fittings.

PER BARK OLE SMITH PLONG, MAY 25, 1889, FOR PORT ELIZABETH, SOUTH AFRICA.

By Coombs, Crosby & Eddy.—24 Plows, 24 pounds Sash-Cord, 6 Plows, 36 Plowshares, 34 dozen Edge Tools, 1152 pounds Sash-Weights, 20 dozen Axes, 40 dozen Hatchets, 3 cases Plows, 60 Ladders, 2 cases Carriages, 9 Carriages, 3 cases Harness, 4 cases House-Furnishing Goods, 40 dozen Edge Tools, 5 cases Bird-Cages.

By Corner Bros. & Co.—97 cases Hardware.

By R. W. Forbes & Son.—6 dozen Axes, 40 dozen Pick-Handles.

By H. W. Peabody & Co.—16,000 pounds Nails, 6 bundles Carriage-Ware, 3 cases Hardware, 2 cases Pumps, 204 dozen Handles, 10 kegs Nails.

By J. Norton & Sons.—11 packages Power Threshers.

#### Outside Lines.

From advices received it is evident that the Hardware business in England is in an unsettled condition and unsatisfactory in some respects, especially as regards the encroachment by merchants in other lines upon Hardware territory. Complaints are frequently made that the business of regular iron-mongers is seriously interfered with by the co-operative stores, dry goods merchants and others, and the question is coming up as to what shall be done to correct this condition of things. The *Ironmonger*, of London, is agitating the question, and under the head of "Opportunities of the Trade" refers to the matter in this way, asking, it will be observed, a free expression of opinion on the subject:

It is held in many quarters that there are excellent opportunities for iron-mongers to embark in other industries, which they could

carry on as aids to and feeders of their iron-mongery branches. It is urged, indeed, that as the drapers have invaded the domain of the iron-mongers and as the "general dealers" also cut several classes of iron-mongery, therefore iron-mongers ought to "go in" for other branches. Some of the new departures suggested are:

Jewelry,  
Fancy Goods,  
Furniture,  
Cycles,  
Basket-Ware,  
Sewing-Machines,  
Clocks and Bronzes,  
Oils and Colors, &c.,  
Drapery,

Guns, Pistols, Rifles, &c.  
Paper-Hanging and Decorating,  
Engineering Work,  
Grocery,  
Gas and Water Fittings,  
Glass and China,  
Stationery and Books,

and so on. Some of these branches, we are well aware, are already carried on by many iron-mongers. Cycles, Oils and Colors, Guns, Rifles, &c., Plumbing and Gas-fitting, and a certain amount of engineering work already find places in the establishments of some iron-mongers; but the other trades indicated above, with many more which might be named, are generally considered to be "out of the way" of iron-mongers. There may or may not be good reasons why they should remain untouched by the trade, and in order to elicit the views of our readers we invite them to discuss the matter fully in our columns. They may say what they like in their letters, but it will serve to direct the correspondence into useful channels if we formulate the following series of questions:

1. What is the most profitable "outside" branch of trade in which an iron-monger can engage?

2. What experience, if any, have you yourself had of carrying on any branch of business other than iron-mongery proper? Answer this question as fully as possible if you are in a position to answer it at all.

3. State your arguments clearly for and against an iron-monger embarking in any branch outside his own trade.

4. If an iron-monger does start an outside branch, what, in your opinion, are the leading principles by which he should be guided?

It is hoped that this discussion may be interesting and profitable to the trade at large. There is certainly plenty of good material for it in existence.

There is, fortunately, in this country a much better condition of things prevailing, and Hardware merchants are permitted to carry on their business with much less interference from outside lines. There is, however, to be observed a certain tendency toward the breaking down of the lines which have separated the different kinds of trade, and there is some reason to apprehend that there will be in the struggle for business an increasing disposition to do this.

#### Arrangement of Stores.

From P. C. Benn, with Willis D. Thompson, Concord, N. H., we have a description of the Belting case shown in the illustration, Fig. 346. It is divided, as indicated, into compartments for the reception of the different sizes of Belting, the compartments being ½ to 1 inch larger than the width of the Belting for which

Fig. 346.—Belting Case.

they are designed, a feature which permits the easy insertion of the rolls. Iron rods are run through the middle of these sections of the case for the purpose of holding the rolls of Belting in the places provided for them while any required length is being cut off. It will thus be seen that by simply drawing out the rod any roll can be put in or withdrawn without disturbing the other sizes. The top of the case can be utilized as a counter. Mr. Benn remarks that this case has been in use for the past 15 years, alluding to it as placed

at the rear end of the store, the floor being marked off every 5 or 10 feet to facilitate measuring. The utility of this arrangement will be recognized by the trade.

This rack, Fig. 847, is in use by Hibbard, Spencer, Bartlett & Co., of Chicago, for the purpose of displaying samples of Stove Boards in their house-furnishing department. It is constructed mainly of 2½-inch strips, 1 inch thick, and is put together with screws, so that it can be

Fig. 847.—Wire-Cloth Rack.

taken down at the close of the season and packed away in small space. The Stove Boards stand on a ledge on the bottom and central strips, there being room for two tiers on each side of the rack. The cross pieces are close enough together to hold the smallest sizes of Boards as well as the large ones.

The accompanying illustration, Fig. 848, is a representation of a new and compact Wire-Cloth rack in use in the Chicago sales-room of the Gilbert & Bennett Mfg.

Fig. 848.—Stove-Board Rack.

Company, 148 Lake street. It is intended to hold 63 rolls, embracing a full assortment of widths and colors, up to 3 feet. It stands on the floor and extends to the height of 6 feet 1 inch. It is constructed of white pine, the horizontal pieces being inch boards and the uprights ¾-inch boards. The pigeon-holes are 7 inches square in the clear, which has been found to be about the right size to accommodate Wire Cloth. Above each roll is painted the width and color, as, for instance, "24, drab." A salesman is thus able to lay his hand at once on a desired roll, without pulling a number of them out to see which is the right one. The rack is open front and back, so that it can be used from either point of approach.

The Samoan difficulties are believed to have been definitely settled. The protocol drawn up by the conference at Berlin will be signed next Saturday.

**Non-Friction Band-Saw Guide.**

The three accompanying engravings show clearly the construction and application of a non-friction band-saw guide manufactured solely by Cross & Speirs, of Waterbury, Conn. The guide consists of a holder, in the top portion of which is fitted a sleeve, adjustable to and from the saw and held by a set-screw, and in which turns the shank of the wheel which forms a bearing for the back edge of the saw. In setting the guide, the back of the saw is made to bear a little harder on the upper edge of the disk, leaving a slight opening on the lower edge. The pressure of the work against the saw then makes its back bear securely against the disk. As the movement of the saw revolves the disk or

frivolous pretext. St. Nicholas Mole, which rumor says France seeks to acquire by treaty, is capable of being strongly defended and commands the channel between Hayti and Cuba. Most of the commerce of the Caribbean Sea from the United States goes through Crooked Island passage and past Nicholas Mole. As a naval depot the situation is fine.

**A Hardware Drummer.**

Not long ago a drummer for a hardware house started out. He was a giant in strength. He had two strong grips or hand-bags made, and in each he put up iron samples weighing about 185 pounds. He would alight from a train with his two

fellow would take hold of them with a smile and a firm grip, only to go down on the platform in defeat with a thump. Then he would rise, look at the grip, gaze at Smith awhile, then leave, muttering something about voodooism. Smith would then throw them into a wagon and go up to a hotel.

At the door he would call a bell-boy, and as he pushed his way through the crowd he would hand them to the poor, overworked boy, and the crowd would be astonished to see him go down with those grips, the fall making a noise that sounded like a freight-train wreck and shook the house. Smith would pick them up himself, and remark to the landlord that it was a shame to overwork his help in any such manner, and he would then walk

*Wright's Non-Friction Band-Saw Guide.*

wheel friction is done away with, and there is practically no wear at all. The wearing parts of the guide are made from hardened tool steel, and if kept properly oiled will last as long as the saw. The parts are so arranged that they can be adjusted easily to any width or thickness of saw, while the guide can be readily attached without injury to the machine. For resawing or heavy work it is preferable to have two guides, one above and one below the table, but for ordinary work one upper guide is sufficient, as it is so set as to take all the pressure. Testimonials received by the manufacturers indicate that the use of these guides has resulted in a great saving in saws, as the temper is preserved and the back edge is prevented from checking.

There are two much-coveted West India harbors, the Bay of Samana, in San Domingo, and St. Nicholas Mole, at Gonaves, in Hayti. The former at one time was ceded to an American company, but the so-called concession was revoked on a

innocent-looking grips, and the hotel porter would make a rush for him.

"Right this way for the Hardcase House. Carry the grips up to the hotel, boss?"

"Yes," Smith would say—his name was Smith. He would then hand the two grips to that porter, and let go as soon as he saw the unsuspecting victim had hold of them. There would be a wild flourish of feet, a loud crash, and the porter would go down as if he had been shot.

"What are you throwing my grips around in that manner for?" Smith would yell, as if mad.

The porter would jump up, thinking he had stumbled, apologize, and make a grab at the grips. Then he would pull away until his suspender-straps would break, and would say: "B-b-boss, what are these things? I can't lift 'em."

Smith would take hold of them lightly, gently lift them up and say: "Oh, well, if you don't want to carry them I'll go to the other hotel."

Then, calling the other porter, he would give them to him. Of course, the other

toward the register, and the landlord would then rush up to him and say:

"Why, them boys are lazy. Here, give me your grips, sir," and he would take them.

Of course Smith's remarks attracted all eyes, and as the landlord got a good hold of the handles Smith would let go suddenly. The spectators would be astonished to see the landlord's back suddenly hump itself like a cat on a back fence, his eyes bulge out like marbles on a mud wall, and then see him fall full length between those grips with a crash that brought people out across the way. He would get up slowly, rub his back, walk around the grips, and then go and swear, as Smith would take them up and put them on the counter.

Then the fun would begin. The clerk grabbed one of them to set it off the counter and it wouldn't move. He looked astonished, and then spit on his hands and tried to lift it, as his face turned red and knots swelled upon his forehead. But that grip wouldn't move. Then all the crowd would try their hand, and finally

all swear it was some trick. Smith would lift it off gently and ask them what ailed them. This would make the crowd feel his arms, and they found out he had muscles like rocks for hardness. Then it dawned on them that Smith had heavy grips for a sell, and they were correct.

#### An Unbreakable Wood Handle.

The annexed cuts show very clearly the construction of the Lunkenheimer wood handle, which is claimed to be unbreakable. The handle is bound by a seamless brass ring, B, about  $\frac{1}{4}$  inch wide, imbedded in the under side of the handle and there held and concealed by the lower plate of

Lunkenheimer Wood Handle.

the handle, thus making it impossible for the handle to be pulled apart or split. The manufacturers of this handle, the advantages of which are self-evident, have prepared special machinery in order to turn it out in large quantities. It is made by the Lunkenheimer Brass Mfg. Company, of Cincinnati, Ohio.

#### Hatchway Hoisting-Machine.

We show herewith a simple and cheap hoisting-machine made in two sizes of 500 and 1000 pounds capacity by the Energy

Hatchway Hoisting-Machine.

Mfg. Company, of 1115 South Fifteenth street, Philadelphia. The hand-rope wheel-shaft is made any length, so that the hand rope is at one side of the hatchway, which is left clear for the load. This hoist is fitted with a double-acting brake, one sus-

taining the load at any point when hoisting, the other being used when lowering to control the speed. The load-rope does not wind around a drum, so the machine can be made much lighter than the old rope-wheel and drum; at the same time it

#### Anti-Friction Elevator-Door Hanger.

The construction of this door-hanger is extremely simple. It consists practically of but two parts, a frame, by means of which it is attached to the door, and a

Anti-Friction Elevator-Door Hanger.

does the work with greater ease and rapidity. The manufacturers of this hoist state that they have a great number in use doing all kinds of work.

#### Enright's Cleat Former.

P. B. Calvert & Co., of 68 North Second street, Philadelphia, Pa., are offering the trade a convenient machine known as Enright's cleat former, a general view of which is afforded by the accompanying illustration. This machine is made of cast-iron, and weighs only about 5 pounds. It is so constructed that two cleats may

be formed at one operation, two holes being punched in each cleat, or one cleat may be formed without holes. A steel spring on the front of the leaf releases the cleat after it has been punched. At the right of the cut is shown a cleat already formed, the size being  $1\frac{1}{4}$  inches. A careful inspection of the engraving which we present will enable those in the trade to readily understand the operation of this device.

Enright's Cleat Former, Built by P. B. Calvert & Co., Philadelphia.

be formed at one operation, two holes being punched in each cleat, or one cleat may be formed without holes. A steel spring on the front of the leaf releases the cleat after it has been punched. At the right of the cut is shown a cleat already formed, the size being  $1\frac{1}{4}$  inches. A careful inspection of the engraving which we present will enable those in the trade to readily understand the operation of this device.

The Warwick Iron Company's furnace, at Pottstown, Pa., was blown out on the 28th ult. for a period of four or five months for repairs. This furnace has been in constant operation since December 15, 1885, with an output of 108,000 tons of iron. Some new improvements will also be added to the works.

The Treasury Department has decided that certain imported barbed wire to which patent of domestic manufacture has been applied is not entitled to drawback under the law upon exportation.

That part of the apparatus which meets the eye is a sound-receiver made up of two narrow compartments, which are separated from each other by a partition. The receiver is capable of being rotated by the listener, who sits below, and the sounds reach his ear through separate tubes, each connected with one of the compartments. It is only when the receiver is pointed directly at the source of sound that the vibrations enter both ears. If an obstacle lies in the course of a vessel there is a reflex wave of sound obtained by echo.

The indifferent success of an English locomotive recently on trial in this country will be followed by a trial in England of a locomotive built in the United States. It is stated that the Pennsylvania Railroad has decided to send one of its best engines, perhaps "Long-legged No. 10." It will make its first appearance on the London and Northwestern Railroad. As the English railroads are much straighter than those in this country, railroad men are much interested to see what an American locomotive can do on a bee-line track.

**For Horseback-Riders and Bicyclists.**

This device, which is put on the market by Wendell M. Smith, Rochester, N. Y., and George T. Carter, Pittsburgh, Pa., is intended, as shown in the accompanying illustration, to hold the trousers down when riding a horse or bicycle, and is referred to as having advantages over the

*For Horseback-Riders and Bicyclists.*

old method of straps and buckles, especially in the fact that it is complete in itself and can be attached or detached in an instant. As shown in the cut, the outside is made of wire coiled as in a spring with the ends bent into the form of hooks, so as to clasp the sole of the shoe firmly. A small leather band with a common metal clip on one end passes through the inside of the wire coil and is made fast to its outer end. For bicycle-riders the outside coil is exactly the same, but instead of the little leather strap a fine coil-spring is used, as shown also in the illustration. This is referred to as allowing the trousers legs to give when pedaling, and also prevents them from flapping against the wheels. As the metal clip is also likely to interfere with the wheel, attachment is made on the inside of the trousers leg by means of the spiral hook shown in the cut. When in use the device is concealed from the view of passers-by, does not change the ordinary appearance of the trousers, and when not in use can be carried in one's pocket. It is referred to as simple, durable, inexpensive and as having been thoroughly tested.

**Former for Dipper Handles.**

While factory-made dipper handles may be used to a certain extent, there are many shops where such articles are formed on

*Former for Dipper Handle.—Fig. 1.  
General View.*

the candle mold stake as of yore. The usual method of forming handles is by making bends near the edges by placing the tin on the stake and bending over by

means of the hand, then finishing the edge with the mallet. If a person had a hand whose width was equal to the length of a dipper handle this operation could be very quickly performed, but as the tin-

*Fig. 2.—Shape of Handle After Coming from Former.*

ner's hands are not the required width two or more movements are necessary to turn over each edge. A former as shown in Fig. 1 can be made from Russia iron that is very convenient for making the first bend when forming tubes similar to dipper handles. By holding the former in the left hand and slipping the edges of two or more handles in the bend A, then forming, and by treating the other edges in a similar manner, the handles are formed as shown in Fig. 2. The edges are then finished by means of the mallet, and the forming completed in the usual manner.

**A New Kind of Soil-Pipe.**

The Sanitary Soil Pipe Company, 100 West Sixth street, St. Paul, Minn., manufacture and sell Gleich Krause Company's patent soil-pipe, which is illustrated in the cut herewith presented. The main peculiarity of this pipe is the ribbed or serrated exterior surface, the principal advantages of which are that it permits a very tight joint to be made with the hub, and also allows the pipe to be broken readily at any point when in a stack or hanging in

*A New Kind of Soil-Pipe.*

the air. The sectional view through the hub shows the joint to be triple-wedge shaped, as the manufacturers describe it, and forming, they claim, a perfect protection against leaking, expansion, contraction or settling. As noted above, the principal advantage of the form, however, is to prevent splitting or cracking when the pipe is cut, the grooves being spaced  $\frac{1}{4}$  inch. The pipe is said to have an attractive outside appearance, so that it is not necessary to cover it. What is of special interest at a time when particular attention is being given to the testing of soil-pipes is the statement of the manufacturers that this pipe has been repeatedly tested 500 pounds hydraulic pressure without any leak whatsoever. It is also pointed out that considerable saving of material is effected, because the pipe can be cut without splitting or breaking.

The brass ferrule shown in the illustration is for connecting lead waste and vent pipes with the soil-pipe. The manufacturers also allude to their trap covers, which are so constructed as to make a perfect air-tight joint.

**Broilers for Gasoline Stoves.**

Harkins & Willis, of Ann Arbor, Mich., have placed upon the market what they are pleased to term Jim's Meat Broiler, designed for use in connection with gas or gasoline stoves. It is of simple construction and is designed to perform its work without drip or smoke and to require very little attention while in use. From an inspection of the cut presented here-

*Broiler for Gasoline Stoves.*

with it will be seen that the broiler consists of a metal surface perforated with holes, which are so punched as to keep the meat up from the iron plate. The holes are three-cornered, and the flange or burr on each side of the hole tends to keep the meat partially suspended while the heat circulates beneath and closes the pores. This action tends to retain the flavor and juices of the meat, while the peculiar formation of the apertures in the iron plate prevents all dripping. The center is slightly raised, causing the juices to run into the groove or swedge around the edge of the broiler. The arrangement is such that the manufacturers claim there is comparatively little smoke in operation, and that after broiling has been done the device is easily cleaned. It is claimed to be very rapid in operation and to give very satisfactory results.

E. L. Baker, United States Consul at Buenos Ayres, in a report to the Department of State, says that the cattle industry of the Argentine Republic is in such a languishing condition that a law has been passed offering a guarantee of 5 per cent. for ten years on the capital employed in the business of exporting fresh or preserved beef. The report says it is understood that several establishments are preparing to take advantage of the guarantee provided by the Government and are going into business on a large scale, with special steamers fitted up for the traffic and warehouses in England and France. Consul Baker is of the opinion that Argentine beef can never compete seriously with United States shippers unless improved methods are adopted in its preparation for market.

The harness manufacturers of this city and vicinity have organized to prevent the selling of goods by wholesale harness houses at retail prices.

### Building Heavy Boilers on the Pacific.

The screw steamship *Australia*, of the Oceanic Steamship Company, of which J. D. Spreckels Bros. are the managing owners, says the *San Francisco Mining and Scientific Press*, has for the past two months been laid up for the purpose of converting her old machinery, which was on the compound principle, and using steam of 75 pounds pressure, into the modern system of triple expansion, using steam at 160 pounds above atmospheric pressure. The contract for the conversion was intrusted to the Risdon Iron and Locomotive Works, and is now rapidly approaching completion.

The boilers of the *Australia* are two in number, 14 feet 4 inches mean diameter, 16 feet 4½ inches long. Each boiler is fitted with six of Fox's corrugating furnaces 3 feet 4 inches mean diameter, 17-32 thick, having one fire-box common to each pair of through furnaces. The furnace fronts are flanged outward, thereby affording the means (which is highly essential) of hydraulic riveting. The back end of the furnace is flanged upward to take the tube-sheet (the latter is 29-32 thick), so that in the event of a furnace crown collapsing no difficulty arises in replacing the furnace, seeing that the furnace mouth is larger in diameter than the outside corrugation, and cutting at the back ends affords attachment for new furnace.

With the exception of tubes and braces, the boilers are constructed entirely of steel manufactured under the Siemens-Martin process. The shell plating, which is 1½ inches thick, having tensile strength of 62,720 pounds, is built up of three courses, having two plates in each course. The longitudinal seams are fitted with butt straps inside and out and are treble-riveted, with the exception of end courses, which are double-riveted; the circular seams are also treble-riveted. With the exception of the forward end circumferential seam, the whole of the riveting on shell and ends is hydraulic riveting. The machine used for this purpose was built in San Francisco, and exerts a pressure upon the rivet of 150 tons to the square inch. Where practicable, the riveting of the fire-boxes is also hydraulic. The fire-box plating is composed of ½-inch plates, excepting bottom, which is ¾, and is single-riveted to tube-sheets. The plates forming the tops and sides of each fire-box are in one piece, so that only two plates form the outside of the box. The roof is efficiently supported by crossbars having braces screwed through the plate with nuts and washers inside. The sides are supported with braces screwed through the shell and also to each other. Each brace is protected with iron ferrules, in conformity with the United States Government requirements.

The flat part of the ends in the steam space are supported with wrought-iron braces 2½ inches in diameter, having plate-washers 10 inches in diameter outside, with nuts inside and outside. The tubes are 3½ inches external diameter, No. 8 thick; the number in each boiler, 616. Every alternate tube vertically and fourth horizontally is fitted as a stay screwed through the front and back tube-plates and beaded over at both ends, this plan having proved more efficient than that of fitting nuts, which are liable to burn away. These tubes are ¾ inch thick, and together with the plain tubes were expended by roller mandril. The whole of the plating is calked inside and out on the approved principle. The boilers have been constructed to conform to United States, Lloyds' Registry and British Board of Trade requirements for a working pressure of 160 pounds above the atmosphere. With this pressure it is estimated, with the

ample grate and heating surfaces provided, that the *Australia*, in ordinary work and with coal of average quality, will develop 2300 indicated horse-power, and this upon a coal consumption of 39½ tons per diem. The previous horse-power of the ship was 1800, with a consumption of 50 tons per diem. With the new machinery the ship is estimated to attain 13½ knots per hour. The heating surfaces are as follows:

Tubes.....	6814.2
Furnaces.....	482.5
Fire-boxes.....	516.4
Tube-plates.....	283.1

Total in two boilers.....	7896.2
Total fire-grate area in two boilers.....	234 sq. ft.
Ratio of heating surface to grate area.....	33.7:1

Each boiler is fitted with Cockburn's spring-loaded safety-valves—three to a set—and are 4½ inches diameter. All the valves can be eased from stoke-hold platform, and can be turned round while under steam. Main stop-valves, with brass internal steam-pipes, are provided on both boilers, 7 inches diameter, shutting off steam from engines and from each other. Surface, bottom, blow-off and drain cocks are also fitted together with a double set of water-gauges and test-cocks, having cocks at extremities of pipes on boilers. The main and donkey feeds enter at the after end of the boilers, and are so fitted that either valve can be overhauled while under steam. Internal pipes carrying the feed away from the furnaces over the tubes are also fitted. There is connection with non-return-valves on both boilers providing steam of reduced pressure into winch range.

As too much care cannot be exercised in raising steam in these high-pressure boilers, in order to reduce the possibility of leakage at bottoms to a minimum Clarke's patent circulators, with steam connection from winch boilers, are supplied. Steam jets for blowing tubes at sea or in port are fitted. The fire-doors are constructed on Martin's principle, and to the firemen are a great boon. They are perfectly balanced and open upward, so that a touch with the firing shovel is all that is required to open or close them, while in cleaning or slicing a fire they can be opened to the required height, and so prevent the intense heat from attacking the fireman, as is the case with the common swing-back door, which is a decided nuisance in a heavy sea. Ash-pit dampers and pricker-bars are fitted as usual. The fire-bars are of the ordinary type, in two lengths, supported on the ordinary dead-plate in front and on Tucker's patent bridge walls at back end. The smoke-stack is also fitted with a damper worked from stoke-hold platform. All the steam and feed pipes are of hammered copper, having spigoted flanges on the locomotive principle, and the flanges of steam-pipes are brazed and further secured with rivets. The boilers with their mountings in place have been subjected by hydrostatic test to a pressure of 320 pounds to the square inch (twice the working pressure) before leaving the works, and no evidence of weakness was discernible. The whole work proved to be perfectly staunch and water-tight.

**Rapid Transportation for Letters, &c.**—A large number of business men and scientists gathered at Boston last week to inspect and witness the performance of the pneumatic tube invented by John T. Williams, who was present to explain his new system of rapid transportation. Mr. Williams' plan is to erect a single-track elevated structure which is to carry a small car for the transportation of small packages and letters, the motive-power being electricity. It is urged that this system would greatly facilitate the mail service, and that by its use mails could be forwarded every five minutes between such

points as New York and Boston, the journey in this case being something less than two hours. Even the small shuttle-like carriage used to illustrate the system in Boston, some 4 feet long and weighing 56½ pounds, could carry 1000 letters, which, dispatched every five minutes, would accomplish the present daily work between the New York and Boston post-offices. The power proposed is an Edison incandescent circuit of 110 volts. There is ½ horse-power propelling the carriage at the start, and in such a distance as that from New York to Boston it is estimated that sufficient power could be furnished by five or six stations placed at equal intermediate distances. There appears to be no limit to the speed attained by this system, and the field for the invention is apparently unbounded.

The Pullman Palace-Car Company have again sued the Wagner Palace-Car Company, W. S. Webb, the president, and the Lake Shore and Michigan Southern Railway Company, this time to restrain the railroad company from using the vestibule itself as a completed structure. George M. Pullman has secured letters patent on the structure, the application having been for two years before the patent examiners. The vestibule was in actual use in May, 1887. A suit involving the face-plates was recently decided in favor of the Pullman Company, and if successful in this suit the company will have a complete monopoly of vestibule connections for railway cars.

# CURRENT HARDWARE PRICES.

JUNE 5, 1889.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers' prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers, at the figures named.

# CURRENT METAL PRICES.

JUNE 5, 1889.

The following quotations are for small lots. Wholesale prices, at which large lots only can be bought, are given elsewhere in our weekly market reports.

IRON AND STEEL.	
Bar Iron from Store.	
Common Iron:	
3/4 to 2 in. round and square.	\$ 1.90 @ ..
1 to 6 in. x 1/2 to 1 in.	\$ 2.00 @ 2.10
Refined Iron:	
3/4 to 2 in. round and square.	\$ 2.20 @ 2.30
1 to 4 in. x 1/2 to 1 in.	\$ 2.30 @ 2.40
4 1/2 to 6 in. x 1/2 to 1 in.	\$ 2.40 @ 2.50
1 to 6 in. x 1/2 and 5-16	\$ 2.50 @ 2.60
Rods—3/4 and 1-1/2 round and sq.	\$ 2.10 @ 2.20
Bands—1 to 6 x 8-16 to No. 12.	\$ 2.20 @ 2.30
"Burden Best" Iron, base price.	\$ 3.00 @ ..
Burden's "H. B. & S." Iron, base price.	\$ 3.80 @ ..
"Ulster"	\$ 3.00 @ ..
Norway Rods	4.00 @ 5.00

Merchant Steel from Store.	
Open-Hearth and Bessemer Machinery,	
Toe Calk, Tire and Sleigh Shoe, base price in small lots.	2 1/2
Best Cast Steel, base price in small lots.	5
Best Cast Steel Machinery, base price in small lots.	5 1/2

Sheet Iron from Store.	
Common American.	R. G. Cleaned.
10 to 16.	\$ 2.75 @ 2.80
17 to 20.	\$ 2.85 @ 3.00
21 to 24.	\$ 3.00 @ 3.10
25 and 26.	\$ 3.20 @ 3.30
27.	\$ 3.35 @ 3.45
28.	\$ 3.50 @ 3.60
Galv'd, 14 to 20.	\$ 4.50 @ 4.60
Galv'd, 21 to 24.	\$ 4.75 @ 4.85
Galv'd, 25 to 26.	\$ 5.25 @ 5.35
Galv'd, 27.	\$ 5.45 @ 5.55
Galv'd, 28.	\$ 5.60 @ 5.70
Patent Planished.	\$ 10 1/2 @ 10 3/4
Russia.	\$ 10 1/2 @ 10 3/4
American Cold Rolled B. B.	\$ 5 1/2 @ 5 3/4

English Steel from Store.	
Best Cast.	\$ 15 @ 16
Extra Cast.	\$ 16 1/2 @ 17
Swaged, Cast.	\$ 16 @ 17
Best Double Shear.	\$ 15 @ 16
Blister, 1st quality.	\$ 12 @ 13
German Steel, Best.	\$ 10 @ 11
2d quality.	\$ 9 @ 10
3d quality.	\$ 8 @ 9
Sheet Cast Steel, 1st quality.	\$ 15 @ 16
2d quality.	\$ 14 @ 15
3d quality.	\$ 13 @ 14

METALS.	
Tin.	
Banca, Pigs.	\$ 23 @ 24
Straits, Pigs.	\$ 22 @ 23
English, Pigs.	\$ 23 1/2 @ 24
Straits in Bars.	\$ 24 @ 25

# THE IRON AGE

THURSDAY, JUNE 13, 1889.

## Power Traveling Crane.

The power traveling crane of which we herewith present engravings of the principal parts consists of two strong plate-girders securely connected at the ends and across the top, thus securing the necessary lateral strength required for high speeds of travel. It is carried at each end upon two large wheels with heavy steel tires and double flanges, and is moved and kept

driven by a square shaft parallel to the runway, which shaft is carried in improved drop-hangers supporting it in a securely locked capped bearing of ample length. The cap over the bearing is provided with oil and grease cups, insuring lubrication and protection from dirt. Power is transmitted through spur-gearing and improved friction-clutches of large size and ample power. Few bevel-wheels are used and no worm-wheels. All the movements of the

feet per minute, or one-half its capacity at 40 feet per minute. The load is raised and lowered by power and is at all times automatically sustained, no hand or foot brake being required. The machinery is all easily accessible, and full provision is made for easy lubrication. Brass oil-cups are furnished where needed. Power is transmitted to the trolley by square shafts in the bridge, which shafts are also carried in improved drop-hangers holding

*The Main Operating Gear.*

## THE SELLERS POWER TRAVELING CRANE.

square by means of spur-wheels engaging into cast-iron racks on each side of the runway. This feature of driving both sides of the bridge positively the makers of this crane found to be essential for safe and certain action at the high speeds of traverse used. The trolleys are carried entirely within the bridge, thus economizing height and enabling the greatest lift to be obtained with the greatest clearance under the bridge. The load on the trolley is sustained by four strands of chain so arranged as to lift always in a vertical line, with no tendency to deviate sideways—a very important feature for many purposes, as in a foundry for setting cores, drawing patterns, &c., and machine-erecting shops for assembling work, &c. The crane is

bridge with two trolleys are controlled by only eight levers, one for traversing the bridge, one to change the speed or entirely disconnect the machinery in the bridge from the main driving-shaft, which may run continuously; and three for the trolleys, one to change speeds, one to traverse and one to hoist and lower. In a bridge with only one trolley the same movements are controlled by five levers. These levers are conveniently operated from a hanging cage or platform, giving the operator full view of the entire space covered by the crane. Crane with 5-ton or larger trolleys will lift its maximum capacity at 10 feet per minute, or one-quarter its capacity at 40 feet per minute. Crane with 2½-ton trolley will lift its maximum capacity at 20

the shafts above and below and having long capped bearings to insure against wear. The crane has fast and slow gearing, giving the following maximum speeds, but variable at the will of the operator from maximum to zero :

Bridge travel, fast gear...200 feet per minute.  
Bridge travel, slow gear...100 feet per minute.  
Trolley travel, fast gear...100 feet per minute.  
Trolley travel, slow gear... 50 feet per minute.

An important feature is the fact that the change from fast to slow or slow to fast speeds requires no change in the speed of the main driving-shaft, but is accomplished in the crane itself by simply shifting a lever; consequently it is possible to use more than one crane on the same runway, each one entirely independent of the

other, and can be used slow or fast, at whatever speed the service may demand, without in any way interfering with or affecting the action or speed of the other crane or cranes that may be driven from the same shaft. Briefly stated, the prominent superior features of this crane, which is manufactured by Wm. Sellers & Co., Incorporated, of Philadelphia, Pa., are:

High speeds of traverse and hoist under perfect control and variable to the slowest speed that can possibly be required. Load automatically sustained at all times, thus avoiding absolutely the great danger and anxiety which are inseparable from the use of those cranes which require the operator to apply the brake. All movements are accomplished by very few levers. Capped and locked tumbler bearings thoroughly lubricated. All machinery easily accessible. Load raised or lowered always in a vertical line. Character of bridge giving great lateral strength and permitting maximum height of hoist and clearance under the bridge. Complete independence of each crane when two or more cranes are used on the same runway and driven from the same shaft.

#### Cupolas for Remelting Cast-Iron.

At a late convention of the Institution of Engineers Mr. Charles Hornung, of Middlesborough, England, read a paper upon the subject of cupolas adapted for remelting iron which is of sufficient interest to command the attention of many of our readers, and we therefore reprint it herewith:

During recent years many improvements have been made and patented with the object of reducing the cost of remelting iron in foundry cupolas, and have met with various degrees of success. The lining has been more carefully shaped according to the requirements of the furnace. In some cases hot blast has been used, and the waste gases have been carried away by flues for the purpose of heating either boilers or the metal to be charged into the furnace. The object of this paper is to give a short sketch of a few of these improvements, together with some of the results obtained. Originally cupolas were square, round, or oval in section, and provided with a single tuyere only, the lining being composed of a refractory sand rammed up around a metal core to the desired shape. But this lining was found to wear away very rapidly and required frequent repairs; hence it came about that the sand was gradually replaced by firebrick. The height of these cupolas was usually only about 6 feet, and the consumption of fuel reached as much as 10 cwt. per ton of metal melted. The capacity of these cupolas was found inadequate for all but the lightest work; so, in order to collect a larger quantity of iron in the crucible, or lower part of the furnace, five or six tuyeres were placed on either side of the cupola, one above the other, about 10 inches apart, and connected outside by vertical pipes, only one tuyere being used at a time. When the blast was turned on all the tuyere holes excepting the lowest one were closed; then as the melted metal in the crucible rose up to the level of this bottom tuyere it was stopped up and the next above it opened, and so on in rotation until the top tuyere was open and those beneath it all stopped up, after which the metal was tapped out in the ordinary way.

At one time cupolas were simply cylindrical in shape, the inside diameter of the lining being the same from top to bottom; but about the year 1860 Mr. Ireland patented a cupola, the lining of which was made smaller in diameter at the tuyeres. The superiority of the working of this furnace over those generally in use at that time was due to the more careful system of charging adopted and to the better proportioning of the internal shape. The

method of working as described by Ireland was as follows: After lighting up and heating the cupola by means of a small fire kindled in the usual way 7 cwt. of coke were charged, and on the top of this 1 ton of pig-iron, broken up into pieces about 10 inches long, next 2 cwt. of coke and 1 ton of iron, the subsequent charges being about 1½ cwt. of coke and 1 ton of pig-iron, ac-

said they ought to be. Owing to the gradual narrowing toward the tuyeres of the internal diameter of the Ireland furnace the charges obtained a regular descent, and owing to the combustion being concentrated in a smaller space for the same amount of coke burnt, the temperature immediately in front of the tuyeres was much higher than in the ordinary cupola

*Perspective View of Hoisting Gear.*

*Transverse Section through Trolley.*

according to the quantity of metal required. The cupola contained, when full up to charging level, about 6 tons of pig-iron and 15 cwt., or 12½ per cent., of coke. Undoubtedly Ireland effected very great improvement in the working of cupolas, and he deserves recognition for having been the first to give properly directed consideration to this important branch of the iron trade; but I have not been able to find that the results obtained in the actual working of his cupolas were quite as favorable in respect of coke consumption as he

with parallel sides. In order to allow of collecting and keeping a good supply of melted metal Ireland increased the diameter of the lower portion of his cupola, generally termed the crucible or well. The tuyeres were placed in two horizontal rows, 16 tuyeres of about 3 inches in diameter in the upper and four tuyeres of 8 inches in diameter in the lower row. This does not seem to have effected much economy, but only to have increased the melting zone.

The Stewart cupola, commonly known as Stewart's rapid cupola, is provided with

three rows of tuyeres close together, which produce an effect exactly similar to that just described. Further, the melting zone being increased, the metal has to pass through a greater space, where it is subjected to the oxidizing influences of the incoming blast. To some extent this oxidization of the molten metal is prevented by raising the hearth of the furnace up to within a few inches of the tuyeres, and having, in place of the well or crucible for the melted metal, a separate receiver connected to the cupola by means of a brick-lined spout from its hearth

become clogged up with slag, and has to be cleaned out entirely every night, which is a great inconvenience in the case of working right through for two or three days with the same furnace. Otherwise the metal obtained is good and clean.

Heaton patented a cupola worked by means of the draft caused only by the height of the chimney and the ascensive power of hot air, instead of forced blast; but this method was slow and entirely unsuited for intermittent working.

Woodward's cupola was worked by means of an induced current created by a

of an engine and fan, but it is doubtful if the actual results were as good as those given in some accounts; at all events, this system of working seems never to have come into general use. Then, again, the distribution of oxygen was irregular, and, consequently, the combustion was incomplete; the tuyeres were also too small.

Some of these difficulties appear to have been quite recently overcome in the Herbertz cupola, which, in the place of tuyeres, is provided with an annular opening so constructed that it can be varied in height as required according to the work-

Longitudinal Section of Power Traveling Crane.

Transverse Section.

level. This receiver is entirely lined out and roofed with fire-brick, and is provided with the necessary tapping and slagging holes. Leading off from the roof of the receiver to about the center of the charge in the cupola is a pipe, lined with fire-clay to about 2 inches diameter. This pipe carries away the heated gases from off the surface of the molten metal, and delivers them into the center of the descending charge, which is thereby partially heated before arriving at the melting zone. Owing to the depth from the hearth level being so very much smaller than in other cupolas, the coke for lighting up is considerably reduced. The difficulty of Stewart's arrangement, however, seems to be in the receiver itself. This is apt to

steam jet blowing up the chimney. There were two rows of rectangular tuyeres, or rather holes, for the admission of the air, usually eight in the upper and four in the lower range. The jet was a simple contracted nozzle, fixed in the center at the bottom of the chimney, about 4 feet above the charging level. The steam jet for creating the draft was said not to be greater than would be required for driving an engine and fan. Woodward claimed that the coke consumption in one of his cupolas for ordinary work was about 10 per cent. of the metal charged, including lighting up. The charge was introduced by means of a hopper at the side of the furnace. The first cost of such a cupola and plant was much reduced, owing to the absence

ing of the furnace. Steam consumption is given as about 808 pounds per hour, with a jet  $\frac{1}{4}$  inch in diameter, and a comparison of this with a cupola of similar dimensions worked with forced blast from a 8 horse-power Root blower, needing to drive it about 198 pounds of steam per hour, shows there is no economy obtained by means of the jet. Consumption of coke in two experiments mentioned in the German periodical *Stahl und Eisen*, in June, 1886, was 5 per cent. and 10.2 per cent. for melting only, and 9.9 per cent. and 12.7 per cent. total, including lighting up, or, taking the mean, equaled over 2 cwt. of coke per ton of metal melted. The use of the annular opening or slit effects a more even distribution of air inside of the cupola than is possible in Woodward's system; but the above-mentioned result does not show a very marked saving in fuel, and this I attribute to the low pressure at which the air enters, namely,  $2\frac{1}{2}$  to 3 inches water-column, instead of 10 to 20 inches, as in the case of an ordinary cupola with a Root blower. Also, the pressure being weak, the oxygen of the air drawn in does not readily penetrate the pores of the coke, and therefore is apt to cause only a superficial combustion. Analyses of the gases at the top of a Herbertz cupola in the experiments above referred to show carbonic acid 10.7 per cent. to 11.5 per cent., carbonic oxide 0 per cent. to 8.4 per cent., and oxygen 6.7 per cent. to 8.2 per cent., or an average of 7.5 per cent. of oxygen. This 7.5 per cent. of oxygen is in excess of that required for combustion, and robs the furnace of considerably more heat than would escape at the top of the charge of 2.55 per cent. to 11.73 per cent. of carbonic oxide. The

excess of oxygen in an ordinary cupola causes extensive decarburization of the metal, but in the Herbertz system its action is not so injurious, owing to the melting zone being smaller, and the iron being consequently exposed to the action of the gases for a shorter time.

Krigar's cupola, with a receiver and induced current, was arranged so that the air, instead of passing up the shaft of the cupola, entered at two or three different levels below the top of the charge, and was drawn downward toward the melting zone by means of a steam jet placed in a chimney on the roof of the receiver. The gases helped to keep up the heat of the metal collected in the receiver, but the charge arrived at the melting zone almost cold after the passage through it of the cold air. The consumption of coke averaged about 13 per cent. as compared with the melted metal. The waste of iron was reduced by this system, because the molten metal was not subjected to any oxidizing atmosphere of ascending air. I cannot discover that this system has been tried in England; if it has, it has not met with much favor. In districts where the price of good coke is high foundrymen have sought to overcome this disadvantage by melting the iron with gas obtained from a gas producer, and so to use an inferior fuel without interfering with the quality of the castings. Dufrené patented an arrangement of a gas producer connected direct to an ordinary cupola. The air for the combustion of the producer gas circulated round the sides of the producer, and so became heated previous to uniting with the gas inside the cupola. The gas was admitted at the top of the crucible portion of the furnace, about the height at which the tuyeres are usually placed; just above this gas port was a grating, composed of refractory material, on which the pig-iron to be melted was placed.

An arrangement of Siemens regenerators working in connection with a cupola was brought out in 1884 by Mr. Bramall, of Sheffield. Each of the regenerators was alternately heated by means of the waste gases from the cupola, previous to the introduction of the producer gas. This appears, however, to be based on a wrong system, for, in order to heat the regenerators, the waste gases must be at a relatively high temperature, which would only be the case when the cupola was working badly. Another cupola working on a similar system was brought out by Henry Krigar, of Hanover. It consisted of two distinct shafts and a receiver. The pig-iron and scrap were charged into the shaft most remote from the receiver, which shaft was left open at the top, the fuel being charged into the second shaft, which was closed at the top. Blast, admitted into the stack of fuel only, passed through the lower portion of the coke and ascended the shaft containing the pig-iron; by this means the melted metal came in contact with the coke previous to passing into the receiver. The working of this furnace has not been attended with any success that I can hear of. At one time the utilization of waste heat at the top of the charge was considered to be one of the most important points in the economical working of a cupola. This was effected in various ways. First, the blast was passed through a series of pipes placed in the chimney of the cupola, but this arrangement was costly compared with the results obtained. Then the waste heat was made to traverse a chamber in which the iron and coke were stacked previous to being charged into the furnace; but very little, if any, economy was derived. At Woolwich a cupola was erected having a blast box extending over its entire height from the tapping hole to the charging level; the blast entered at the top and was raised in temperature by the heat radiating from the walls of the furnace. Attempts have also been made

to utilize the waste heat for raising the steam necessary for driving the fans, &c. But none of these ideas have proved successful, owing to the irregular and intermittent working of foundry cupolas.

In the different systems already mentioned, with the exception of Ireland's, this fundamental fact seems to have been entirely disregarded, namely, that carbonic acid coming in contact with red-hot fuel combines with a certain quantity of carbon to form carbonic oxide, thereby robbing the coke of some of its carbon; the complete conversion of the coke into carbonic acid seems to have been only a secondary consideration. In an ordinary cupola, with one row of tuyeres—usually placed about 2 feet 6 inches above the metal in the crucible, the carbonic oxide formed by the combustion of the coke in front of the tuyeres comes in contact, just above, with a layer of incandescent fuel, and a considerable portion is converted into carbonic oxide, which, having no oxygen to combine with, rises to the surface of the charge, and, meeting with the oxygen of the atmosphere, burns, if hot enough, with its characteristic blue flame, or if too cold to ignite passes away invisibly. According to the experiments of Favre and Silbermann, the calorific power of 1 pound of carbon burning to carbonic acid is about 14,040 heat units, while that of carbon burning to carbonic oxide is only 4450, or 9590 heat units less; therefore, unless this carbonic oxide can be burnt so that the heat of its combustion can be utilized in raising the temperature of the descending charge a serious waste of fuel must, of necessity, take place. As the formation of carbonic oxide cannot be prevented, obviously the requirement is a sufficient quantity of air to burn the gas above the point of its formation. M. Voisin was one of the first to direct his attention to this point, and later Ireland brought out his cupola, which has been previously mentioned. Voisin employed two rows of tuyeres, the upper row being placed at the level at which the formation of carbonic oxide was greatest, this level being ascertained by taking the temperature at different heights. Undoubtedly he was on the right road, and deserves all the credit due to a pioneer; but his efforts met with only partial success, and this from a very simple reason, viz., that the combustion of the carbonic oxide at once ignited the hot coke, and, in fact, caused an upper zone of fusion, above which the original process was repeated by the absorption by the carbonic acid of an equivalent of carbon from the glowing fuel, and the consequent reduction to carbonic oxide and loss of heat.

Since then several scientists have made attempts to more completely utilize the waste gas, but they have invariably stumbled at the crucial point, which was to burn the gas without attacking the solid fuel. This difficulty would, however, at last appear to have been overcome, and that in a small town in Hungary, where the engineers, Arthur Greiner and Thuisco Erpf, went on quietly experimenting until they hit on the plan of arranging a number of small blast inlets over an extended upper zone of the body of the cupola, through which, by careful manipulation of the blast, they managed to convert practically the whole of the carbonic oxide into carbonic acid below the surface of the charge. In the words of M. A. Gouvy, in a paper read before the Société des Ingénieurs Civils, Paris, in May last year: "This system is such a decided advance on all previously known methods of cupola-working, and in the direction of true economy, that it may be well to devote rather more time to its consideration." Greiner and Erpf's cupola was described and illustrated in *Iron* of July 29, 1887. The analyses made by Messrs. Pattinson and Stead show that this invention effects in a very complete manner the

utilization of the carbonic oxide. The samples were taken from the waste gases just above the charge, near the inside lining, of two cupolas at the works of the Anderston Foundry Company. One of the cupolas was of the ordinary first-class foundry pattern; the other was a similar cupola altered to Greiner and Erpf's system.

	Ordinary cupola. Per cent.	Greiner and Erpf's cupola. Per cent.
Nitrogen.....	75.5	79.92
Carbonic oxide.....	11.5	1.25
Carbonic acid.....	12.5	18.75
Hydrogen.....	0.5	0.08
Total.....	100	100

Messrs. Pattinson and Stead, in a note on these analyses, say: "The results show that the heat developed in the cupola, where the gas produced at the main tuyere is burnt by air injected above, is about 80 per cent. greater than is developed in the ordinary cupola. For many reasons the practical saving of coke in large cupolas will not reach that point, but the results prove beyond doubt that the system is a correct one, and must result in considerable economy of fuel."

From these analyses we find that in the ordinary cupola 9488.2 heat units are developed per pound of carbon. Taking the melting-point of cast iron as 2780° F., its specific heat as 0.13 and 40° F. as the average temperature of a pig of metal, coke containing 89 per cent. carbon, we get

$$2780 - 40 = \frac{2740 \times 0.13 \times 22.40}{9488.2 \times 0.89} = 95 \text{ pounds,}$$

the amount of coke required to melt 1 ton of cast-iron. To this must be added the following:

Melting slag and burning limestone..	} 2.87 lb.
Carbon burning to CO.....	
20 lb. slag per ton of metal.....	} 9.9 lb.
Carried off by waste gases at temperature 770° F.....	
6 per cent. for radiation.....	5.7 lb.

Total coke per ton of metal melted 113.47 lb.

In a similar manner from the analysis of the waste gas from Greiner and Erpf's cupola we find 13,465 heat units developed per pound of carbon, and using the same calculations we get:

$$2780 - 40 = \frac{2740 \times 0.13 \times 22.40}{13465 \times 0.89} = 66.6 \text{ lb. coke.}$$

Adding the following:

Melting slag and burning limestone..	} 1.9 lb.
Carbon burning to CO.....	
20 lb. slag per ton of metal.....	} 9.9 lb.
Carried off by waste gas at 770° F.....	
6 per cent. for radiation.....	4.0 lb.

Total coke per ton of metal melted. 82.4 lb.

Or a reduction in coke consumption of about 27 per cent. as compared with the ordinary cupola.

Some of the results obtained in the Greiner and Erpf cupola are indeed remarkable. At a foundry in Magdeburg it is stated that the consumption of coke, exclusive of the bed coke, has been brought down to 3.2 per cent., or 72 pounds of coke per ton of iron melted. I confess that this seems to me inconceivable, but at several of the German works they claim now to be working with 4 per cent. and  $\frac{1}{4}$  per cent. of coke—i. e., 90 and 100 pounds per ton, and I have ascertained that from 100 to 130 pounds is now the regular consumption in several cupolas to which this system of utilizing the combustible gases has been applied in this country. In conclusion, I will again use the words employed by M. Gouvy in his paper before mentioned. He says: "The consideration of the different methods employed for melting iron in the cupola leads me to the conviction that the best results, as regards the cost of production, have been obtained with the apparatus in which

the complete combustion of the carbonic acid has been chiefly considered. The use of hot air, the utilization of the gases from the top of the furnace, the replacing of the blast under pressure by a natural or induced current, the injection at the tuyeres of a foreign matter such as pulverized coal, &c., do not appear to have given any actual economy."

#### Exhaust Tumbling Barrel.

The engraving here presented shows a new form of tumbling barrel designed for their own use by the Stover Mfg. Company, of Freeport, Ill. After having thoroughly tested the working qualities of the barrel the makers decided to place it upon the market. At one end of the egg-shaped barrel is an exhaust-pipe connected to the hollow journal; at the opposite end is a tight and loose pulley. The barrel is provided with a sectional lining of hard iron, which can be easily replaced when worn out. A current of air is forced through the barrel by an exhaust fan, which re-

THE STOVER EXHAUST TUMBLING BARREL.

moves the dust and carries it out through pipes arranged for the purpose. The makers claim that it does more and better work, takes up less room and fewer barrels are required for a given amount of work than any other on the market.

#### The Experimental Stage of High-Speed Cruisers.

A Washington correspondent of the *New York Times* says:

Letters from the naval officers in charge of the trial of the new steel cruiser *Charleston*, at San Francisco, show that she is having exactly the same trouble that her prototype, the *Naniwa-Kan*, had during her many trials, and it could all have been avoided had the Navy Department or the contractors been given the benefit of the experience of that vessel. The building of modern high-speed cruisers is still in the experimental stage, and when the Armstrongs sold Secretary Whitney the plans and specifications of the *Naniwa-Kan*, either by accident or design they failed to communicate to him the result of their experience in her 23 trials, as, in fact, they carefully avoided telling him that the vessel had made 22 failures before her final success.

The result was, then, that when the *Charleston* put to sea and attempted to run her engines under false draft her guide-shoes and motion-bars quickly heated and she had to be stopped. Everything had worked smoothly under natural draft with no signs of heat; but as soon as an attempt was made to force her these parts heated, though all the rest of the engines ran as before. The adjustments were all right, but it was found that the steel guide-shoes would heat whenever an attempt was made to run at high speed. The vessel was taken back to San Francisco for the purpose of replacing the guide-shoes with white metal, and just about this time one of the naval officers ran across an account of the experience of the *Naniwa-Kan*, which, had it been known before, would have saved all the trouble. It was found in a paper read before the Northeast Coast Institute of Engineers and Ship-builders by Mr. F. C. Marshall, the designer of the *Naniwa-Kan*'s engines, in which he says:

In the case of the horizontal engines of the type shown in plate III (the *Naniwa-*

*Kan*), in the first instance they had considerable trouble with the guide-shoes and motion-bars, but that arose, they found, from the fact that they had adopted the same principle and material for the guide-shoes of motion-bars, which are of steel, as they did when the bars were of cast-iron, as was the common practice in ordinary merchant vessels. They found that the bars heated when worked above a certain velocity. The oil burned off and the application of water rendered the abraded surfaces so hard that no tool could be made to cut them, and they had great difficulty with them. The guide-bar shoes were subsequently fitted with white metal and with special arrangements for supplying oil, and the result was that they had not the least difficulty even with a working velocity of 850 feet per minute.

There is a considerable scarcity of coke in the East, caused by the inability of the railroads to make shipments to that point. The operators at the coke works state that this will be remedied in a few days, and coke will be sent East by a roundabout way over the Allegheny Valley Railroad. Some of the works in the Connellsville region have been closed down until this arrangement can be made, while others, in

preference to closing their works, have been shipping coke to the West and stocking that market. When arrangements are completed for sending coke East, shipments to the West will be stopped for a few days, and all the coke produced will be sent to the Eastern market until the supply equals the demand. There will be no advance in prices on account of the temporary scarcity.

#### Enormous Ore Shipments.

From the *Marquette (Mich.) Mining Journal* of the 1st inst. we take the following:

The shipments of iron ore from the mines of Lake Superior for the month of May by water have undoubtedly slightly exceeded 1,200,000 tons. Our shipping report shows that on the 29th a total of 1,166,867 tons had gone forward by lake from the mines of the four great ranges, and the shipments for the last three days of the month have certainly carried the aggregate for May beyond the figure named. For the corresponding period last year the quantity of ore shipped by lake from the same ports was 374,348 tons, the gain over 1888 being 791,938 tons, or at the rate of over 200 per cent. This is a marvelous showing, and would give augury of a tremendous season's output if there were any likelihood of the May rate of shipments being maintained from now on to the close of navigation; but, of course, that is quite impossible, for even if the mines could furnish the ore the market could not take such a quantity. The shipments for the week ended Wednesday amounted to 242,664 tons, this being the largest week's work on record. Of this total 46,655 tons went from Marquette, 103,984 from Escanaba, 1945 from St. Ignace, 52,846 from Ashland and 37,234 from Two Harbors. The shipments from Marquette were appreciably affected by the strike on the ore docks here that began on Monday and has since continued, as a large fleet of vessels was held here for a couple of days in the early part of the week, and the destination of others that were bound for this port was changed as soon as it became known that the railroad company were having trouble with the force of men employed on the ore docks, else the total for the week would have reached even a larger figure than the footing shown in our statement of shipments.

The American engineers were hospitably received on their arrival in Liverpool. They reached the Mersey on the 5th inst. in two detachments, the first being the members of the American Society of Civil Engineers and party, who came by the City of New York, and the second representative members and their friends of the Mechanical and Mining Engineers, who arrived by the City of Richmond. A general reception committee, embracing most of the prominent men in Liverpool, was formed, and with them were combined a distinguished deputation from the Institution of Civil Engineers and other technical societies of Great Britain and Ireland, and representatives of the Liverpool Engineering Society, to welcome the Americans on their arrival in England. An interesting feature was an excursion to Laird Brothers' Birkenhead Iron Works and to the Mersey Tunnel Railway, followed by an official reception by the Mayor of Liverpool in the Town Hall.

Advertisements issued by the Navy Department call for proposals for furnishing about 428 tons of steel protective deck-plates, 40 pounds per square foot, for the armored cruiser *Maine*. The deliveries are to be completed within 60 days after the contract is made, and proposals will be received up to July 8.

### New Electric Plant at Salem, Mass.

The Salem (Mass.) Electric Light Company, finding their present station entirely inadequate to the needs of their rapidly increasing business, are now erecting a new one designed by the Thomson-Houston Electric Company. The new station will be a model of its kind, and in its construction are combined many new features and improvements in central station work. Owing to the shape of the lot of land owned by the company it was deemed expedient to erect two buildings. The boiler-house, therefore, has been made independent of the building containing the engines and dynamos. The engine and dynamo house is two stories high, the first story, where the engines are situated, being 14 feet, and the second, where the electrical apparatus is placed, being 12 feet. This building is built of brick throughout and is 102 feet long and 56 feet wide. The boiler-house is 92 feet long, 54 feet 4 inches wide and 23 feet high. The chimney is 130 feet high, 6 feet inside diameter, and 13 feet square at the base. The foundations are rubble stone placed on piling capped with concrete; 798 spruce piles were used under the main building and 52 oak piles under the chimney.

The steam plant, which is compound condensing, consists of one 350 horse-power double tandem compound engine, made by McIntosh & Seymour, and one 150 horse-power high-pressure Fitchburg, now in use at the present station. The boilers were made by the Cunningham Iron Works, and are three in number, 6 feet in diameter, 17 feet long, and 125 horse-power capacity each. The auxiliary steam apparatus consists of one 1200 horse-power surface condenser, a Knowles air and circulating pump, and a feed-water heater situated in the smoke-flue.

The station is built to allow the addition of 1000 horse-power, and there is room for 9 additional boilers and another line of shafting. The station has a capacity of 42 dynamos. At present there will be 14 in use, 11 of which will be arc and 2 alternating current machines, and 1 will be a generator for railway work. On the second floor are the store and testing rooms and superintendent's office. A coal-shed will be built in the rear of the boiler-house, which will have a capacity of 1500 tons, and a track constructed for bringing coal from the shed to the boilers.

The company inform us that no pains will be spared to make this station complete even to the smallest detail, so that it will be one of the finest electric light and power stations in the New England States.

Sergeant Stewart, in charge of the Signal Service Bureau, says that the fall of water on the Conemaugh shed at Johnstown up to the time of the flood was probably  $2\frac{1}{2}$  inches. He believes it was much heavier in the mountains. The country drained by the Little Conemaugh and Stony Creek covers an area of about 100 square miles. The bureau, figuring on this basis and  $2\frac{1}{2}$  inches of rainfall, find that 464,640,000 cubic feet of water was precipitated toward Johnstown in its last hours. This is independent of the great volume of water in the lake, which was not less than 250,000,000 cubic feet. It appears that the actual rainfall on the Conemaugh water-shed registered on Friday up to the time of the catastrophe was about  $2\frac{1}{4}$  inches. Colonel T. P. Roberts, a leading engineer, estimates that the lake drained 25 square miles, and gives some interesting data on the probable amount of water it contained, arriving at the conclusion that the total flood of

water was 890,000,000 cubic feet, based on a rainfall of about 8 inches over the entire area.

### The Stratton Steam Separator.

The advantage to be derived from the employment of dry steam is well known and appreciated by engineers. The apparatus of which we herewith present engravings is designed to separate the particles of water carried over by the steam from the boiler and to deliver dry steam

clearly shown in the sectional view, from which also an idea may be obtained of the course taken by the steam in its passage through the separator. Depending centrally from the top of the separator is a cylindrical pipe which ends about at the middle of the shell. This pipe forms a continuation of the outlet-pipe. The steam enters at the top of one side of this pipe and in its downward journey follows a spiral course around the pipe. Naturally, the particles of water carried by the steam, being the heavier, are thrown by centrif-

THE STRATTON SEPARATOR.—VIEW SHOWING THE CONNECTIONS.

to the engine. The perspective view on this page shows the method of connecting the separator. The top of the separator is placed in the steam-supply pipe as near the engine as may be convenient. From the bottom of the separator extends a pipe leading to the sewer. A short distance from the separator this pipe is tapped to form a connection with a steam-trap having a suitable outlet. The water taken from the steam which is passing to the engine collects in the bottom of the separator, from which it is automatically drawn by the action of the trap. If from any cause the trap should refuse to work the water may be drawn off by closing the valve in the pipe leading to the trap and then opening the valve in the main pipe. The construction of the separator is

ugal force against the sides of the shell, down which they trickle and collect at the bottom. The lower half of the shell is widened in order to prevent those particles which are still held in suspension by the steam from being carried out with it. The dry steam then passes upward through the cylinder and on to the engine. A glass gauge indicates the quantity of water collected and tells when it should be drawn. For small sizes the separator is made in a single casting, as shown in both the perspective view and the section. The other view represents a large-size separator, in which the top is of cast-iron and the shell of riveted steel plates. This separator embodies the latest improvements made by the Stratton Separator Company, of 32 Cortlandt street, New York City.

### The Vermillion Range Mines.

We have interviewed John Birkinbine, of Philadelphia, with regard to the reported danger of a craze in Vermillion range mining stocks. Mr. Birkinbine is well informed concerning matters in the Minnesota iron-ore district and speaks from personal knowledge obtained through frequent visits to that section. He says:

I have just returned from Duluth and can only say that if, as *The Iron Age* says, there is "danger of a mining-stock craze" in the Vermillion range of Minnesota "similar to the disastrous Gogebic speculation which prevailed some two years since," there are few local indications of it. There are, of course, boomers

ported in demand now at 75 per cent. of its par value, will frown down and expose in their own interest any boom which would react upon their own investments. The conditions in the Vermillion range are vastly different from those on the Gogebic range in 1886, and the story of the Gogebic is too fresh for repetition. Several attempts to get up big deals on the Vermillion range have failed, and it is probable that the developments in the future will be on a moderate scale and the money invested will be employed for judicious development.

That there is excellent ore in Minnesota along the iron range is beyond doubt, and there are undoubtedly large deposits as yet undiscovered or unde-

### Apprentices in German Machine-Shops.

In the report of Commercial Agent Smith, at Mayence, the system of education in German machine-works is dwelt on as follows: In the machine-shops and such works apprentices are generally taken either for a particular kind of work, such as smith, planer, turner, &c., or are trained principally for this work, and then in the last year of the apprenticeship introduced to machine-building and intrusted with work in all divisions of the factory. The apprentices are generally placed under the supervision of a head workman, foreman or boss. In the well-known Marienhütte, at Kolzenau, they are usually put in charge of a particular workman. The agreement is in writing, and the apprentices must all attend a trade school run by the works. At the Wilhelmshütte, in the same district (Breslau-Liegritz), the apprenticeship is for four years, by written indentures.

The apprentices receive neither board, lodging nor clothing, but are paid such wages as the managers of the works think just. Each week 12 cents are withheld from the wages as security against the departure of the apprentice, and if he leaves the works before the apprenticeship expires he forfeits what has been thus deducted from his wages and \$12 in addition; but if he serves out the apprenticeship what has been weekly withheld from him is paid to him in a lump sum, with interest. The workmen all keep an eye on the apprentices, both within and without the workshops, and they are instructed in all the branches of work of the company, passing gradually from one grade of work to another.

Special attention is given to the training of apprentices in the Deutzer Gas-Motor Factory, where 10 to 15 apprentices a year are taken. The length of apprenticeship is four years, and the instruction is given by the bosses and elder foremen. To the aptest of the apprentices opportunity is given to learn all the branches of work carried on in the establishment. In the evening the apprentices have to attend an industrial school connected with the factory.

The training of the apprentices in the railway repair shops is said to be admirable, and they are given a much more general training than occurs in many private establishments, in which they generally get a more or less one-sided training. At the large shops of the State railways not more than eight or ten apprentices are taken a year as a rule. They must not be less than 14 years old and not more than 16, though in exceptional cases they may be up to 18 years old, and the sons of the ordinary railway employees and permanent workmen are taken in preference to others. During the apprenticeship, which is four years in length, they live with their families or in good families of the place of work. They are paid small wages, but not up to the lowest wages earned by a journeyman in their line of work, and of these wages a tenth is withheld until the conclusion of the apprenticeship. Grave misconduct on the part of an apprentice shuts him out from future employment in any of the workshops of the State.

The new steel screw steamer *Lumen*, built specially for carrying petroleum in bulk, by W. G. Armstrong, Mitchell & Co., of Newcastle, takes a cargo from Bayonne, N. J., to Rotterdam. Her dimensions are as follows: Length, 304 feet; breadth of beam, 37 feet 9 inches; depth, 27 feet 9 inches; her carrying capacity is estimated at 3500 tons. The engines are of the triple-expansion type. The *Lumen* on her trial trip attained a mean speed of 10½ knots per hour.

Sectional View of Separator.

Separator for 12-Inch Pipe.

and speculators on the *qui vive* to take advantage of any opportunity for starting such a craze, but the chances of success are small. The properties are held by numerous owners, and in many cases there are disputed titles, which will act as barriers to any wild schemes being developed. The Chicago and Minnesota Ore Company, lately the Minnesota Exploration Company, have a corps of men constantly engaged in explorations, and it is hardly to be expected that a company with \$2,000,000 capital which is now producing from its Chandler Mine 1000 tons of ore per day and whose stock now commands 60 per cent. of its par value will stand idly by and see good properties pass into irresponsible hands.

The Minnesota Iron Company are producing from their town mines 2000 tons of ore per day, and carrying it and the ore from the Chandler Mine over their railroad, and those who control the \$14,000,000 capital of this company, which is re-

veloped. These deposits will be the means of bringing handsome returns to those who invest judiciously in them. There are also many properties whose development will cause disappointment to the owners, but only actual work will demonstrate one or the other. There will also be efforts made in certain localities to float companies on small bases, but there appears to-day little reason to believe that this will reach a craze in the Vermillion range.

One basis for the rumor of a mining-stock craze may be the fact that in order to control more than 5000 acres (the limit allowed by the State), the parties interested in the Chicago and Minnesota Ore Company have organized seven or eight different companies, and few outsiders know anything concerning these corporations; hence they are each counted as separate organizations *de facto*, while they are really merely formed so as to legalize a large land ownership.

### The American Tinned Plate Association.

A special meeting of the American Tinned Plate Association was held in their office, in the Lewis Block, Pittsburgh, on the afternoon of the 4th inst. This was the first meeting held by the association for over two years. The object of the meeting was to receive the resignation of the secretary, John Jarrett, who has been appointed consul to Birmingham, England. The meeting was well attended, but the members from the East could not be present owing to the bad condition of the railroads. They sent telegrams and letters, which were read, announcing the cause of their absence. President W. H. Lewis was in the chair. After an informal talk on the condition of the iron and steel trade, the following resolutions were unanimously adopted:

*Whereas*, Our worthy secretary, Mr. John Jarrett, has been appointed consul to Birmingham, England, by the President of the United States; therefore

*Resolved*, That we, the Tinned Plate Association, accept his resignation with feelings of sincere regret; and

*Resolved*, That we bear testimony to the loyal enthusiasm with which he has so zealously guarded the interests of American industries, and his upright career through all the various gradations from an iron-worker to his present eminently honorable position of consul.

It was resolved to continue the association and to retain the present office in the Lewis Block. M. C. Cronmeyer, of the United States Iron and Tin Plate Company, Limited, was elected to succeed Mr. Jarrett as secretary, and will be assisted by Charles Gilpin, of the M. Dewees Wood Company, of McKeesport, Pa., one of the vice-presidents of the association.

### Canadian Tariff Changes in the Direction of Free Materials.

The Treasury Department has received the full text of the changes in the Canadian tariff law recently promulgated by orders in council. The changes seem to be designed to encourage Canadian manufacturers by making free to them the materials used in their products. In the metal schedule the following articles are made free, subject to the conditions in each case stated:

Wire of iron or steel, Nos. 13 and 14 gauge, flattened and corrugated, used in connection with a machine known as the wire-grip machine for the manufacture of boots and shoes and leather belting, to be used for those purposes only in their own factories.

Plow plates, mold-boards and land sides.

Wire of iron or steel, galvanized or tinned or coppered, or not, of No. 16 gauge or smaller, when imported by manufacturers of wire-cloth, wire-work, brushes, pianos and plated-ware, to be used for these purposes only in their own factories.

Steel of No. 12 gauge and thinner, but not thinner than No. 30 gauge, when imported by manufacturers of wire-cloth, wire-work, brushes, pianos and plated-ware, to be used for these purposes only in their own factories.

Steel of No. 12 gauge and thinner, but not thinner than No. 30 gauge, when imported by manufacturers of buckles, clasps and ice-creepers, to be used for these purposes only in their own factories.

The Reading Trust Company, assignees of the Reading Iron Works, have decided to sell the entire plant, furnaces, rolling, pipe, tube and sheet mills, forges, foundries, &c., and numbers of tracts of land in Reading on July 1. This, it is believed, will result in an early resumption of the works

### Knife-Grinding Machine.

The machine here illustrated is a late production of the Diamond Machine Company, whose main office is at Boston, Mass., and Western office at Chicago, Ill. It is designed to grind knives or any other work up to 30 inches in length. It has automatic power feed, both lateral and longitudinal, obtained by a new device. The angle-iron on which the platen or table to which the knife or work to be

in the small detail cut, Fig. 2. By loosening the yoke-screw the workman is able to swivel the angle-iron to any desired position or pitch to the wheel. This feature will commend itself to the user of the machine. Long engine-lathe boxes are provided, which can be readily replaced when worn. Extreme care has been taken to exclude emery dust from the bearings. The water-hood is so arranged that all water is distributed directly on the wheel in front of the work to be ground, thus

Fig. 1.

Fig. 2.

Fig. 3.

### THE DIAMOND KNIFE-GRINDING MACHINE.

ground is clamped can be reversed so that the workman can grind to or from the edge as he wishes; also directly across the edge, or square face, if desired. The platen or table is exceptionally wide and furnished with extra width of ways to traverse upon. It is also provided with small hand-wheels at one end, to bring the work to be ground to the wheel on a parallel line, then to retain its parallel lines. There is an automatic driver for feeding the emery-wheel forward to the work as it is ground away. It can also be operated by hand movement when desired. The center of the angle of knife-bar is inclosed by a split yoke, as shown

preventing drawing the temper. The inside hood leads all water and spray directly back to the upper tank; is provided with a syphon, Fig. 3, for which a patent was recently granted the Diamond Company. This device avoids taking any of the emery and the sediment that comes from the wheel and the work to the lower tank. The pump that takes the water from this tank to the wheel is made of brass, and so designed that it will not clog up from prolonged use. The machine weighs complete, as shown, for 30-inch knife-grinding, 11,000 pounds, using wheels 22 x 1½. It is also made in five other sizes, taking work up to 100 inches.

## THE WEEK.

Authentic advices received from the West state that the Cincinnati and all the Chicago lead companies have joined the National Lead Trust Company.

A unique exhibition is to be opened at Fort Worth, Texas, on the 20th inst. An extraordinary building is to be constructed of wheat, corn, cotton, sea-coast shells and other Texan products. This will groan under the name of Karporama. It will have Moorish windows, mansard domes, Chinese pagoda towers, a Roman porch, a tower with Norman Gothic battlements and a surmounting dome. The big dome will be covered entirely with wheat, and the towers will be made each of a product—one of corn, another of cotton, one of wheat, one of shells of the ocean, and so on. Hence its name, Karporama, from the Greek, meaning a view of the fruits of the earth.

The substitution of metal ties for wooden ones in railways for agricultural purposes is the subject of a report from the Agricultural Department, prepared by Engineer Trotman. The Department was induced to look into the subject in view of the large destruction of the forests of this country for railway-ties. The conclusion is drawn that metal ties are able in point of efficiency to compete with wooden ties, and that their use is extending, but that in point of economy, considering the first cost and durability, the result depends upon the material, the state of the metal market and upon local circumstances.

The contract for the zigzag tunnel, 1600 feet long, to be built in Delaware County, N. Y., for the New York, Ontario and Western Railroad, has been awarded to Ward & Lary. Estimated cost, \$600,000.

The proposed salt combination, in which several of the largest New York dealers are interested, will probably be organized in the fall. The idea is to introduce improved machinery, and by doing business on economic principles reducing the cost of manufacture, but without materially influencing the prices to consumers. As a part of the scheme Englishmen are appraising the salt works at Syracuse.

The spinners in Clark's thread mill, in Newark, accepted a reduction of  $7\frac{1}{2}$  per cent. in wages and returned to work.

No action is likely to be taken at Washington with reference to the proposed duty on Canadian railroad cars, but some new and stringent regulations may be prepared to prevent the retention of Canadian cars in this country for domestic traffic.

The entire business portion of Seattle, on Puget Sound, was destroyed by fire 6th inst., entailing a loss estimated at \$6,000,000 or \$8,000,000. The burned district comprises 64 acres, or 31 blocks. The fine water-front, including all the wharves and docks, the coal-bunkers, the railroad tracks and gas-works, were completely burned. The Arlington and Commercial hotels, the coal-bunkers of the Oregon Improvement Company, the docks of the Oregon Railway and Navigation Company, the tracks of the Puget Sound Shore Railroad and the Columbia and Puget Sound Railroad, the big new warehouse of the Seattle Transfer Company, the Mechanics' Mill, the Branch Iron Commission store, wholesale warehouses along the water-front and Stetson & Post's sawmill are included in the general destruction. The heaviest losers are H. L. Yesler, ex-Governor Watson, C. Squire, J. M. Coleman, the Oregon Improvement Company, A. A. Denny, the Seattle Transfer Company, the Oregon Railway and Navigation Company, the banks, Bailey & Gatzert, Schwabacher Brothers

& Co., Toklas, Singerman & Co., the Safe Deposit Company, the Puget Sound Shore Railroad, the Columbia and Puget Sound Railroad, Judge Thomas Burke, Dexter Horton, E. Sanderson, George F. Frye, Stetson & Post, the Commercial Mill Company, the Mechanics' Mill Company, the Seattle Ship-building and Dry-Dock Company, the Terry estate, Hillory Butler, Isaac Cohn, J. S. Bailey, Captain Starr, L. S. J. Hunt, Angus McIntosh, the Gordon Hardware Company, the Seattle Hardware Company, Moran Brothers, Sutcliffe Baxter, J. F. McNatt, A. P. Hotaling, W. S. Ladd, John Collins (owner of the Occidental Hotel, valued at \$400,000), John Leary, William Shoudy, Harrington & Smith, J. A. Hatfield, E. Lobe, Levy & Co., and Canadian Pacific docks.

All the grain elevators in St. Louis, with one exception, have been consolidated under a single management. There are 11 of them, valued at \$4,000,000.

All the brick-layers in Cleveland have laid down their trowels, and the contractors decided to import workmen from other neighborhoods to take the vacant places.

Work on the great Merchants' Bridge, at St. Louis, is being pushed with vigor. The fourth caisson will be finished in a few days.

Two Russian men-of-war recently visited Corea, and report says the admiral, introduced by the Russian minister, had a protracted conference with the King, the object of which was the acquisition of an island in Fusan harbor as a coaling station. Judge Denny, lately recognized as the King's adviser, has always combated strenuously any attempts of other powers to obtain territorial rights in any part of the kingdom.

Among the labor bills passed at the recent session of the New York Legislature which have become laws under the approval of Governor Hill are the bill regulating the wages of laborers on public works at the uniform rate of \$2 per day, the bill for the better protection of skilled labor by the registration of union trade-marks, and the bill providing that all corporations shall pay wages in cash.

Jos. B. Francis, of Lowell, Mass., an engineer of experience, takes the broad ground that no earthen dam can be made even reasonably safe. On the other hand, Engineer Fteley, of this city, is far from condemning earth-work reservoirs. The dam at the Boyd Corners reservoir of the Croton Aqueduct he pronounces safe.

The iron tower at Hell Gate yields neither to jack-screws nor dynamite, and is now being separated into the original parts, one piece at a time.

In taking the manufacturing statistics of the new census the Census Bureau will follow the general plan of the census of 1880. Special agents in the cities will cover only those industries which are not covered by experts. The work will not begin until June 1, 1890.

The engine-house of the Salisbury Mine, at Ishpeming, Mich., owned by the Iron Cliffs Company, was burned last week. Loss on machinery and building \$50,000.

New York merchants in the Haytian trade are well satisfied with the reported success of Hyppolite, representative of the Northern faction, and a gradual recovery of trade with that country is predicted. The contest is spoken of as a battle of the people to secure constitutional government, and the right has prevailed. A fair coffee crop is expected, but not equal to that of former years. The logwood in store has been almost exhausted and no more has been cut. Haytian paper money

is now not worth in New York 40 cents on the dollar. Both Legitime and Hyppolite have issued large quantities of this scrip. It is said they will unload paper on the market, while any silver they get they will bury for future use. Dread of the yellow fever will for the present operate as a serious drawback, particularly in engaging seamen for steamships.

The Japanese and Mexican ministers have exchanged ratifications of the new treaty between their respective Governments. Mexico, therefore, is the first power to enjoy exclusive privileges in Japan, from which all foreigners hitherto have been debarred. The State Department at Washington has under advisement the steps that may be necessary to give effect to a treaty, similar in terms, drafted by representatives of Japan and the United States, but which has never been consummated.

Chief Arthur, of the Brotherhood of Locomotive Engineers, declares that no strike shall ever again have his sanction, as he is "opposed to strikes on principle."

Governor Hill has signed the Yates-Fassett Prison bill, to amend Title I of Chapter II of Part IV of the Revised Statutes, relating to State prisons and for other purposes connected therewith. One hundred men will be put to work in the foundry at Sing Sing as soon as possible, finishing stoves.

The Chesapeake and Ohio Canal, damaged by the floods, will probably be sold under foreclosure. The State of Maryland holds an interest equal to \$20,000,000, and is the largest creditor.

The Atlantic Transport Company, running between English ports and Philadelphia, have contracted for three new steel steamships 370 feet long, 44 feet beam, 30 $\frac{1}{2}$  feet depth of hold; registered tonnage, 6000. They will be built at Harland & Wolf's yard, Belfast, Ireland, and will be named the Michigan, Massachusetts and Mississippi, and will be finished in about two years.

On McCormick's Island, near Harrisburg, Pa., 15 acres are covered with logs to a height of 10 feet. The salvage laws as to logs are much complicated, and many lawsuits will follow as the floods subside.

Judge Bickerton, of the Supreme Court of the Hawaiian Kingdom, who is now in this country, says the present population of the islands is about 80,000, of whom about 25,000 or 30,000 are in Honolulu. The Americans predominate. The recent revolution, really one on paper only, has shorn the king of the almost unlimited power he possessed in levying taxes and general jurisdiction, and the country is now governed by a representative body. He describes the general feeling of the people as being in favor of annexation to the United States, and although the people are not unanimous in that respect now, he predicts annexation as the political future.

The New York Dock Department has approved of a plan for extensive improvements on the water front at the foot of Thirty-seventh and Thirty-eighth streets, North River, by the Pennsylvania Railroad Company, subject to supervision by engineers of the board. Several warehouses are in contemplation, and the entire expenditure may reach \$2,000,000.

A long, low craft, steadily moving along and throwing out from each quarter huge spouts of water, attracted attention on the East River during the past week. This vessel was the pneumatic propulsion craft Eureka, invented and owned by Mr. John Lecoy, of Brooklyn, N. Y. The fastest speed attained at any time could not have been over 5 knots

an hour, but that was enough to demonstrate the correctness of the principle under which Mr. Lecoy is working. The Eureka's motive-power comes from a series of explosions, the force of which is directed through two apertures, situated one in each quarter. The effect of the explosion when operated at the stern of the vessel is to drive the vessel ahead. To obtain a backward movement the force of the explosion is directed into two funnels, the apertures of which open one on each side of the vessel forward. The explosion results from the combustion of petroleum and air, the ignition coming from electric sparks.

The fastest day's run on record on a Transatlantic voyage—515 miles—was made by the City of Paris on her last trip over. The entire run, however, did not break the former record.

To give an idea of the rapidity with which the hulls of iron vessels become foul, the Ranger, at the Brooklyn Navy Yard, at her last docking had attached to her bottom as much as 12 tons of marine growth, and this, too, after she had been for some time in the fresh waters of the Sacramento River, in which a portion of the growth had perished. The Atlanta originally had a coating of anti-corrosive paint next to her plating, and an outside coat supposed to be proof against the attacks of barnacles. At the examination of her hull a few days ago it was found that the barnacles had eaten their way through the anti-corrosive paint and had firmly attached themselves to the ship's bottom. The frequent dockings of the Atlanta and the Boston have demonstrated the costliness of keeping steel bottoms in anything like a fit condition for satisfactory speed performances, and there is talk of sheathing them with an alloy of copper.

The coroner's jury in Westmoreland County, Pa., also that at Nineveh, find that the South Fork Hunting and Fishing Club are responsible for the loss of life by the recent disaster, because of negligence in repairing the dam. Much of the old part is standing intact, while adjacent parts of the new work are wholly carried off. There was no central wall of puddle or masonry either in the new or old dam. It has been the invariable practice of engineers for 30 or 40 years to use one or the other in building high dams of earth.

The great hotel at Rockaway is now in course of demolition. The only money ever made out of the gigantic speculation will be made by those who bought the old materials, paying therefor only \$29,000, a sum beggarly in comparison with the large amounts loaned by Morton, Bliss & Co. and other bankers for its construction. The purchaser says the plumbing materials alone would almost realize this sum for him. There are hundreds of tons of lead pipe, over 700 stationary marble-top wash-stands and 200 full-sized bathtubs lined with the heaviest zinc. Everything about the great building is of the best quality, and the \$1,500,000 expended in its construction is accounted for in the character of the work, nearly all of which is as good as when it was put in ten years ago. Altogether there are some 6,000,000 feet of lumber in the house—sufficient to build a town of 600 first-class cottages. Besides, there are some 5000 doors, 1200 windows—the glazing of which cost \$9000—28½ miles of iron gas and water pipes, 300 large radiators, and enough other odds and ends to furnish a city.

Silk culture in California is likely to be abandoned, notwithstanding very good success in growing cocoons. The Governor says California cannot compete with China or Japan in that industry. If so, can any other State?

## MANUFACTURING.

### Iron and Steel.

The plant of the Western Nail Company, at Belleville, Ill., has been sold under foreclosure proceedings to Charles A. McNair, secretary of the Missouri Furnace Company and trustee for a portion of the stockholders, for \$40,000. The plant in question was at one time a highly-valued property. The nail mill proper was built some seven or eight years ago at a cost of about \$100,000, though the capital of the company did not then exceed \$50,000; but later it was increased to \$200,000. Some three years ago a costly steel plant was erected in connection with the mill, but since then the depression of the nail market and the strikes of the nailers have prevented its running, so that very little has been realized from the heavy investments made. Last year the mill was operated a few months by the St. Clair Nail Company, and arrangements are now progressing looking to the reopening of the plant. The property is situated near the Louisville and Nashville depot, in the northeastern part of Belleville, and embraces a 9-acre tract on which it is situated. The mortgages on the concern amount to \$100,000, and the bonds are held by the following parties: Belleville Savings Bank, \$30,000; First National Bank, Belleville, \$20,000; Missouri Furnace Company, St. Louis, \$25,000; Continental Bank, St. Louis, \$10,000; Brier Hill Iron and Coal Company, \$9000; Sligo Furnace Company, St. Louis, \$8000; D. Gilchrist, \$2000; Joseph Penn, \$1000. The owners have 15 months in which to redeem the property.

The facilities enjoyed by Carnegie Brothers & Co., Limited, proprietors of the Edgar Thomson Steel Works, at Braddock, Pa., by which they are enabled to turn out steel rails in large quantities on short notice, were shown last week. On Tuesday, the 4th inst., the firm received an order for 1000 tons of steel rails from the Pennsylvania Railroad Company to repair and replace tracks of the company that had been washed out for a number of miles by the flood at Johnstown. The order had to be commenced on raw material and the rolls had also to be changed. Notwithstanding this, the larger portion of the order was rolled, loaded and shipped within 24 hours. In 36 hours the entire order was completed and shipped to its destination. When it is taken into consideration that changes in rolls had to be made and the entire order filled from raw material, the work was remarkable, and it is believed that it is the quickest turn-out of steel rails on record.

The Phoenix Iron Works, of Cleveland, Ohio, have been engaged since the first of the year on a large order for cranes and machinery for the Anniston Pipe Works, at Anniston, Ala. The order includes about 25 cranes ranging in capacity from 5 to 30 tons each, and will aggregate near \$100,000. This, in addition to numerous other orders accepted and under way, has necessitated double time. These works have lately shipped a 5-ton traveling crane to the Volk & Murdock Iron Works, Charleston, S. C., and a 10-ton pivot crane to the American Bridge and Iron Company, Roanoke, Va.

The Laurel Coal and Iron-Company have been organized at Wheeling, W. Va., and application has been made for a charter. The following-named persons have been elected as directors: N. B. Scott, W. F. Stifel, J. F. Paull, S. K. Wallace, P. B. Dobbins, J. C. W. Brockunier, Joseph Speidel, E. Buckman and A. L. Rice. The board was organized by the election of S. K. Wallace, president, and P. B. Dobbins, secretary. The holdings of the company

comprise several thousand acres of valuable timber, iron ore and coal lands located in Logan County, W. Va. It is said that there are six veins of coal on the land aggregating 31 feet in thickness, and one of the veins a superior coking coal.

The Cleveland Rolling Mill Company, of Cleveland, Ohio, are filling large orders for forged work on the new Government vessels now building on the Eastern coast.

The Variety Iron Company, of Cleveland, Ohio, have been awarded the contract for the iron part of the new Island Bridge at Athol, Mass.

It is reported that the greater part of the Crescent Nail Works, owned and operated by the Standard Nail and Iron Company, at Standard, Pa., was washed away by the recent flood. The plant was a small one and contained but 18 nail machines.

The building department of the Shiffler Bridge Works of J. W. Walker, at Pittsburgh, is extremely busy at present. Work now under contract includes an iron casting-house for the Paducah Iron Company, of Paducah, Ky.; also an iron roof for an engine-house for the Ashland Iron and Steel Company, at Ashland, Wis.; also two iron buildings at the Black Diamond Steel Works of Park, Bro. & Co., Limited, at Pittsburgh. The bridge department of the same establishment is very busy on a large amount of iron railroad bridge work, and is running night and day to fill its orders.

Norristown Furnace, at Norristown, Pa., operated under lease by Isaac McHose & Son, chilled recently and is now undergoing repairs. It will not be ready for blast for some weeks yet.

A shaft for a new Bessemer engine was recently poured at the works of the Pennsylvania Steel Company, at Steelton, Pa., which weighed 45,000 pounds. The mold was 25 feet long and 29 inches in diameter. The casting was a perfect success. No. 2 blast-furnace of the above company, which has been idle for some time undergoing repairs, has again resumed blast. All the stacks of the firm, five in number, are now in successful operation.

Cofrode & Saylor, bridge builders, of Pottstown, Pa., have received the contract for the erection of the bridge across the Schuylkill River at City avenue, Philadelphia. The structure is to be an iron rectangular truss deck bridge, and will be 606 feet in length and wide enough for two carriages to pass, with foot-walks on either side. There will be five spans, two 114 feet long, one 170 feet and two 153 feet long.

The Jenifer Charcoal Furnace of the Clifton Iron Company, of Jenifer, Ala., was sold on the 18th ult. to the Jenifer Iron Company, of the same place.

The stack of the Chattanooga (Tenn.) Iron Company, which is only 12½ x 60 feet, produced during the month of May 2015 tons of iron, distributed as follows:

	Tons.
No. 1 foundry.....	487
No. 2 foundry.....	825
No. 3 foundry.....	554
Gray forge.....	5
No. 1 soft.....	118
No. 2 soft.....	26

It will be seen from the above that by far the larger part of the yield was of foundry iron.

The Aetna Machine Company, of Warren, Ohio, have received an order from the Youngstown Bridge Company, of Youngstown, Ohio, for an engine to drive the machinery in the bridge-works now building at Haselton, Ohio.

**Machinery.**

The electric coal-mining machines manufactured by the Jeffrey Mfg. Company, of Columbus, Ohio, have proved a complete success, and are now in operation in the mines of the Shawnee and Iron Point Coal Company, Shawnee, Ohio.

Wheelock Engine Company, now located on Union street, Worcester, Mass., will soon begin the erection of a new shop at South Worcester. The new plant will be built of brick and consist of one building, 150 x 90 feet, which will be filled with new and improved machinery for engine-building, and be the means of doubling the present capacity of the concern. The company expect to be in their new quarters in September next.

The Canton Mfg. Company, of Canton, Ohio, have just shipped one of their well-drilling machines to South America, and are finishing up another for shipment to a Southern Ohio point.

The Gordon Steam Pump Company, of Hamilton, Ohio, have been awarded the contract for the pumps to be used at the new water-works now building at Punxsutawney, Pa. The order was secured through the Pittsburgh agency.

The Westinghouse Electric Company, of Pittsburgh, have received an order from Oklahoma for a plant of 750 incandescent and 35 arc lights for the town of Guthrie. This plant will be the first of its kind in the Indian Territory.

The Thomson-Houston Electric Company have recently closed the following contracts for electrical street-car propulsion: Fulton County Street Railway Company, Atlanta, Ga., 8 miles, 8 cars; Attleboro, North Attleboro and Wrentham Street Railway Company, Attleboro, Mass., 6 miles, 5 cars; Americus Street Railway Company, Americus, Ga., 4 cars; Auburn Street Railway Company, Auburn, N. Y., 3 cars. The Thomson-Houston Electric Company have 50 railways under contract and in operation.

The Niles Tool Works, of Hamilton, Ohio, and the Morgan Engineering Company, of Alliance, Ohio, have established a branch office in Pittsburgh, Pa., for the sale of their products at No. 309 Penn Building, similar to those in New York, Philadelphia and Chicago. Robert A. Bole, for many years connected with the glass-manufacturing firm of W. H. Hamilton & Co., of Pittsburgh, will have charge of the combined interests of both companies. The Gordon Steam Pump Company, also of Hamilton, Ohio, have established an office at the same place, in connection with the two houses above named, in charge of John Hare, a practical engineer of long experience in the pump business and for seven years the representative of Epping, Carpenter & Co., of Pittsburgh. All communications addressed as above regarding machine tools, steam hammers, cranes and pumping machinery will receive prompt attention.

Trimble & Lutz, dealers in machinery supplies at Wheeling, W. Va., have recently secured a contract for fitting up a large building at that place with steam-heating apparatus. The order calls for 292 steam radiators, and was received in the face of some very strong competition from the largest cities in the country.

The Westinghouse Machine Company, of Pittsburgh, are fitting up a new machine-shop for large work on the east side of Twenty-fifth street and Liberty avenue in that city. A very large new planer, by Wm. Sellers & Co., is already erected and in operation, and a large new cylinder-boring machine, by the Pond Machine Tool Company, is now in process of construction.

Other large tools will be added. The new shop is rendered necessary by the company's heavy run of orders for large compound engines. During the month of May this company received orders for 66 engines, aggregating 3375 horse-power.

An extensive order received from Ashland Mine, in the Gogebic range, has just been filled by the Webster, Camp & Lane Machine Company, of Akron, Ohio. The order called for three hoisting-drums, each 10 feet in diameter, with a capacity of 1500 feet of cable and weighing over 100 tons; an automatic engine of 300 horse-power, a complete plant of boilers, with stacks and fixtures; also skids, sheaves and wire rope, all of which are to be used in connection with the hoisting machinery. The same order also included three hoisting-drums, each 10 feet in diameter, 1500 feet of cable and a 300 horse-power automatic engine for the Germania Mine. The firm has also recently turned out two engines for the Union Strawberry Company, at Anderson, Ind. The engines are each 300 horse-power, with cylinders 26 x 48 inches in size, and both propel an enormous belt-wheel 20 feet in diameter, weighing 25 tons. This wheel is made in two parts, which are bolted together, making a belt surface of 6 feet in width. The trade of this company is daily increasing, as the firm are building up a large custom in the mining districts all over the country.

The Diamond Machine Company, of Providence, R. I., manufacturers of grinding and polishing machinery, are just opening a new store and machinery repository at 35 and 37 South Canal street, Chicago, which will also be their Western office. They take pride in referring to this store as being one of the largest and best in its line in Chicago. They propose to keep a full stock of their own machinery, as well as other machinery of a varied character. All Western orders will be filled from the Chicago repository and office.

Rankin & Fritch Foundry and Machine Company, St. Louis, are building two large brick machines, with a capacity of 25,000 brick per day each, for the Kennedy Brick Mfg. Company.

Shultz Belting Company, St. Louis, Mo., are building a two-story addition to their works, to be used as a belt-room. An increasing business compelled them to make this move.

From the Thomson-Houston Electric Company, of Boston, Mass., we have received a neatly-illustrated pamphlet which describes their electric railway system in all its principal features and gives many of the principal lines constructed by them. The rapidly-growing adoption of the electric motor, especially for the propelling of cars, makes this pamphlet of value to all those towns in which the subject of electric railways is being discussed.

W. P. Davis, manufacturer of machine tools, whose office is at Rochester, N. Y., and works at North Bloomfield, in the same State, reports that his works are very busy, running overtime at present. He is bringing out a heavy large spinning lathe, 26-inch swing, an unusual lathe as regards size and stiffness, made for the Star Headlight Company, of Rochester; also a 30-inch special surface grinding machine to grind strips from 3 to 6 inches wide and 30 inches long. He believes this is a machine much needed on the market, as it will be built at a nominal price. He has not had quite as large a sale on key-seating machines for the past two months as previously, but the sale of his standard 20-inch drill seems to be steadily increasing. He has had some very large orders for them, principally from the trade, though some of the large

manufacturers order direct. Since establishing his sales-room and office in Rochester he has taken the agency of one of the largest engine and boiler concerns in the United States, and has already sold several steam plants.

**Hardware.**

Freeman Wire Company, St. Louis, Mo., are running full, the bulk of their orders being for office and store railings, cemetery and lawn fencing and elevator inclosures.

Collins-Gibbons Mfg. Company, St. Louis, Mo., report a large demand for their small-size wire-cutters. They have also recently filled a number of orders for their large-size automatic wire straightening and cutting machines.

**Miscellaneous.**

On Friday, the 7th inst., a charter was issued to the Monongahela Natural Gas Company, of Pittsburgh, capital \$1,000,000. The stockholders are David B. Oliver, H. W. Oliver, George F. Oliver, John Phillips and Horace Crosby, of Allegheny County, and E. C. Converse, of New York. The Bellevue district is to supply the gas.

Howell Wheel Company, Covington, Ky., have recently ordered \$2500 worth of new machinery, which when ready will be placed in their present plant, increasing their capacity to 400 wheels per day. A new addition is also being built to their works, 50 x 100 feet. The company have made several important improvements in the construction of their wheel, the demand for which has been far in excess of their productive capacity.

Wm. R. Thomas, superintendent of the Crane Iron Company, at Catasauqua, Pa., has been awarded a patent for an ore separator or concentrator. The invention has been pronounced a success.

Work on the new railroad bridge across the St. Lawrence River, at Quebec, will soon be commenced. The great depth of the St. Lawrence at that point has hitherto been an almost insurmountable obstacle to building a bridge there. This will, however, be overcome, as the present scheme provides for a cantilever bridge which will cost very nearly \$10,000,000. The width of the river from shore to shore is 24,000 feet. The two main piers will be built of granite, 500 feet from each shore, in about 40 feet of water. The cantilever bridge itself will be 1442 feet long and 408 feet above high-water mark. The total length of the bridge, including the approaches, will be 34,000 feet. When this bridge is finished the Canadian Pacific will have an uninterrupted line from the Atlantic to the Pacific Ocean through Canadian territory over the Intercolonial Railway to Halifax and St. John.

A line of electric street cars on an entirely new system is soon to go into operation in Pittsburgh. The idea is to propel each car independently without a cable, without a slot rail or any overhead wires, or even a central station and power-house. The vehicle is a combination car, of which the one part is occupied by the passengers and the other by the motive-power. The latter consists as the prime mover of a gas engine, tanks filled with condensed gas and a dynamo. The electric motor, however, will be placed under the second part. The tanks are filled with a sufficient amount of condensed gas to keep the engine supplied for 15 or 18 hours. The little gas engine in the front part of the car is connected with the dynamo and the dynamo with the motor. Each car will be fitted up in the same manner and run independently. All that is required is a filling of the tank in the morning before the cars start out, and then they will run for the whole day without interruption.

## Negro Labor in Southern Iron-Works.

A recent reference to negro labor in Southern iron-works which was published in these columns has attracted so much attention that additional information which has reached us on the same subject will doubtless be interesting. We are assured that it is the experience of Southern iron manufacturers that the negro is entirely available for performing all classes of work in rolling-mills as well as foundries. This class of labor has so long been employed in iron-ore and coal mining and at blast-furnaces that it is taken for granted that every one is familiar with the facts in that direction. More skill being required in rolling-mills and foundries, however, it was not generally regarded as a matter of course that negro labor would be entirely satisfactory there. But this seems to be the case. Those who are familiar with the condition of Southern iron-works before the war will probably recall in this connection the excellent force of negro workmen who operated the rolling-mill of Woods, Yeatman & Co., in Tennessee. A later instance of such labor brought forcibly to the attention of white workingmen was the substitution of negro puddlers from Richmond, Va., in the works of Park, Bro. & Co., at Pittsburgh, some years since, when their men struck. Wherever the negro has had a chance to acquire the necessary skill he has shown himself capable.

It is further remarked that negroes are anxious to get work in establishments of this character. Such an inclination is not to be wondered at, as it has been the experience of Northern manufacturers that a larger supply of labor than could be utilized was often available from the neighboring agricultural population. Better pay and regular hours of work are the strong inducements. It is not surprising that Southern manufacturers claim that negro workmen are more easily controlled than the workmen engaged in the same class of work in Northern mills and foundries. It is characteristic of the race to be more amenable to regulations established by those who assume authority over them, and they will probably for a long time be free from the influence which trade unions exert. Moreover, the prejudice existing among white workingmen against receiving negroes into their societies will operate for a long time as a barrier to effective work in the line of labor agitation and organization in that direction.

The claim is made by those who have studied this matter that the negroes drink less and are much steadier than the white men who generally work in rolling-mills and foundries. This will be disputed and

indignantly resented by white workingmen. Those who make the assertion have probably generalized upon insufficient data. Rolling-mill and foundry workmen suffer by the indiscretions of some of their number, but long years of personal observation of the habits of both these classes of toilers have convinced us that they are not generally addicted to the use of ardent spirits. Yet this is often alleged against them as a peculiar characteristic, inseparably connected with the manufacture or manipulation of iron. The many have to bear the odium of the bad habits of the few. It is not possible that in this respect negro workmen would prove themselves better than white men.

The assertion is made by Southern employers that a rolling-mill or a foundry can be run with negro labor on 60 per cent. of what it would cost to do the same work with white labor. This is probably true with some qualification. There are localities in the South in which white workingmen from the North have found it impossible to perform the full tasks to which they had been accustomed in their old locations. At the same rate of wages paid in the North, therefore, the cost of making iron would be increased on account of the smaller output. Negroes, being accustomed to the climate, could probably work harder than their white competitors, and thus decrease the cost. How much further this cost would be decreased in rolling-mills by the lower rates of wages paid to negroes has not been made plain, as the rates, if published, have not come under our observation. With regard to foundries, we have the assurance of D. M. Thomas, secretary of the National Association of Stove Manufacturers, that in a recent trip through the South he ascertained conclusively that labor costs have been very much reduced by the employment of negro hands in the stove-works.

A Southern correspondent who writes us on this subject adds that "nothing like mobism or interference with laborers at work is tolerated, but all men, both white and black, are protected." We are glad to have this assurance, which comes on good authority. He evidently alludes to the frequent occurrences during strikes in the North when mobs interpose to prevent those willing and anxious to work from securing employment in the establishment under ban. This condition of affairs is certainly very creditable to the South, but it may be doubted whether it can be perpetuated after great manufacturing communities are built up and thousands of workingmen are found where hundreds or probably only scores are employed to-day.

Probably no such outpouring of voluntary contributions for charitable purposes has been seen in this country since the Chicago fire in 1871 as that evoked by the late Johnstown catastrophe. The aggregate amount received from all sources for this purpose has considerably exceeded \$2,000,000 and may probably reach \$3,000,000. The calamity was so great in its proportions as to touch all hearts. Cities have vied with each other to see which could raise the largest amount, while corporations and individuals have responded most nobly to the call for relief from the suddenly distressed people of that terribly

stricken city. The iron and steel and hardware interests have been prominently liberal in their contributions, recognizing a special claim on them through the long identification of Johnstown with the iron and steel trades.

## Retaliation vs. Reciprocity.

With so much of acrimonious discussion growing out of the fisheries dispute, the seizure of vessels and other measures of reprisal on either side, it is not strange that false impressions are gradually disseminated, all tending to mutual alienation rather than to any friendly outreaching in the direction of reciprocity, such as was formerly recognized in treaty relations between the United States and the Dominion. The ministerial organ of the Ottawa Government, the *Montreal Gazette*, comes forward with some spirit in reply to an alleged ill-founded attack by Joseph Nimmo, entitled "A Canadian Scheme of Aggression upon American Commerce," the substance of which is that the Canadian Pacific Railroad was built expressly to antagonize interests in the United States, with the ultimate aim of establishing upon this continent a strong government based upon monarchical principles. The *Gazette* pleads guilty as to the main charges in the indictment. The editor admits that "the Canadian Pacific was built to unite the four disconnected blocks of inhabited territory constituting the Dominion. Its chief aim, in connection with other legislation, was to cause these four sections of the Dominion to trade among themselves. It was their desire to suppress the growth in Canada of a sentiment favorable to annexation to the United States. They meant to have a line of military communication between the different parts of the Dominion. Their present, as their late, premier aims to build up on this continent a strong government based upon monarchical principles, in close union with that of Great Britain." While conceding these points, it is broadly intimated that these matters particularly concern the people of the Dominion, and no others. Nor is there anything in the recital, in the opinion of the editor, that constitutes a grievance against Canada, or that warrants the "initiation of hostile legislation by the United States or of discriminatory regulations by its Government." The special reference here is doubtless to the proposition to bond Canadian cars crossing the boundary, respecting which it may be remarked that no measures of this character are likely to be enforced; certainly not without further action on the part of Congress. It is manifest that there would be two parties in such a contest, and that the vantage-ground would not be altogether on one side.

The ministerial organ endeavors to give this consideration due weight. We quote: "In Manitoba the Northern Pacific has entered the territory of Canada, has received public aid for so doing, and has begun a process of extension through the chief traffic-producing districts of the Canadian Northwest in direct competition with Canadian roads, and, it is now stated, contemplates building a line from Winnipeg to the Pacific Coast, to intensify the competition. In Eastern Canada, too, there are instances of United States railroads pushing their way into the Domin-

ion's territory. The Central Vermont for years operated lines of railroad in the Eastern townships. A Maine company now control the Passumpsic road and draw to New England traffic that would otherwise naturally come to Montreal. In Ontario the Vanderbilts own a railroad between the Detroit and Niagara frontiers, to carry United States freight across Canada to United States seaports—a Western duplicate of the Canadian Pacific's main line, which is to carry Canadian traffic across United States territory to Canadian ocean points. On the New Brunswick frontier United States roads cross the boundary line and return to their own territory as convenience of construction dictates, and are accorded all necessary facilities by the Canadian Government as a matter of course."

Ordinary fairness requires that the questions at issue should sometimes be contemplated from the Canadian point of view, before the public mind becomes unconsciously perverted, lest it happen that alleged grievances prove to be more fictitious than real and friendly relations become rudely shocked with no adequate cause. Especially is it needful to guard against the intrigues and perversions of men identified with rival projects who may hope to profit by excluding Canadian competition. The latest nightmare engendered by a heated public sentiment is that which grows out of the question of jurisdiction in Behring Sea, attended with the mustering of naval forces within the disputed area, rather than a resort to diplomacy. In a review of the situation it becomes obvious that constant agitation of irritating questions between nations, as between individuals, is consummate folly, and more heinous in proportion to the magnitude of the interests involved. Moreover, the old maxim *audi alteram partem* holds good always.

#### The First Year of Emancipation in Brazil.

While Dom Pedro II was sick in Europe the Princess-Regent, by decree of May 18 last year, liberated all the slaves in Brazil. There were a good many misgivings in and out of Brazil about the immediate result of this sudden partial disorganization of labor, but fortunately the apprehensions then entertained were not realized. The majority of new freedmen continued work on the plantations, lazily, it is true, and to some extent negligently, so that the coffee, for example, was in the main not picked carefully enough. Still, the crop being superabundant in 1888 and prices high, yielded planters a brilliant return. This year the crop is quite short, and there is again much fault found with the quality, the lessened yield arising from bad weather during blossoming, but prices have remained high and the planters have little cause for complaint. The two crops taken together amounted to 11,000,000 bags. The sugar crop of 1888 showed a deficiency of 90,000 tons as compared with 1887, but the latter year had witnessed an unusually large production (350,000 tons), and since then prices have risen 50 per cent., so that even the sugar planters have been doing well. India rubber has for a couple of months past also been steadily rising, while since 1878, when the crop

amounted to 7598 tons, its yield has doubled. In other words, the three leading products which Brazil exports have been and are still bringing such handsome prices in the world's markets that, in spite of some short-comings that may be traced back to partially disorganized labor during the twelvemonth following emancipation, the planters have so far not felt very seriously the loss of their slaves from a financial point of view. The fact is that the banks, which during slavery times had been in the habit of advancing money to planters on their growing crops and on mortgages on their estates, including the slaves, have been a great deal more affected by the liberation of the latter than the planters, and so are many dealers. A correspondent of one of our daily papers expresses himself on this subject as follows:

The planters, realizing that under existing circumstances, without the necessary slave labor (to say nothing of the pecuniary loss already sustained), they could not hope to meet their obligations, and they had in many cases received more money upon the mortgages than they could now realize by the sale of the plantations, allowed the mortgagee to foreclose and buy in. The direct result of this was that the banks were in danger of becoming short of money, and were loaded up with property which, for the time at least, would be nearly worthless, and as a further sequence to the foregoing, the planters are making use of the loss of their property as an excuse for non-payment of the merchants' claims upon them, and this last class are in their turn the sufferers; commerce, as a direct result, is beginning to feel the strain, and the present year will undoubtedly show a decided falling off in both exports and imports. The mere fact that Brazil is not at this moment in actual rebellion, but is, on the contrary, submitting to this sudden sweeping away of property, and submitting to the inconvenience and suffering entailed, speaks volumes for the patience and good sense of the people. The Government, realizing the condition of the planters and the great importance of rendering them all the assistance in its power, proposed, among other plans for this purpose, the establishment of a special class of banking institutions, which were to have, among other powers granted them, that of being allowed to issue a prescribed amount of their paper over and above their regular capital, which was to be guaranteed and secured by real estate mortgaged to the bank issuing the paper. Some scheme involving Government aid is, beyond doubt, necessary if this most important industry of Brazil (coffee-planting) is to recover and again assume its former position among the exports of the country, and to this end the Government will doubtless bend all its energies.

Yet while it may be a matter of comparative ease to relieve the monetary strain superinduced by the act of emancipation, it is a vastly more difficult matter to provide the necessary physical aid the coffee-planter requires, unless the tide of immigration now setting toward the country solves the problem and a higher class of laborers takes the place of the former slaves. If this, happily for Brazil, should prove to be the case, the planters of the southern portion will sooner recover from the deadlock caused by the emancipation act, and avail themselves of this new aid to cultivation, than the middle and northern sections of the country. Santos, the chief port of this section, will more than ever be the main shipping port for coffee, and Rio de Janeiro take a step back as a place of export for this article.

Brazil received a large immigration last year from Southern Europe, the bulk of it coming from Italy, some 120,000 landing at Rio and Santos, and this year probably a similar number will be added to the population. The planters of the chief coffee districts took immediate steps in that direction last summer, and the Govern-

ment subsequently did the same. Chinese coolies are not wanted, but Pernambuco and Bahia may eventually procure coolies from British India for the sugar estates, although the central sugar-house system of production, with improved processes of manufacture and portable plantation railways, will enable the planters to get along with less manual help than the old methods, as Cuba and Louisiana have both abundantly proved.

The planters, however, are clamoring for indemnity for the loss of their slaves, and the banks and dealers in the interior politically support them in their demands, and something will have to be done. Parliament opened on May 4, and the complete denial of compensation to the planters on the part of the John Alpedo cabinet of liberals has thrown the old conservatives into opposition and induced a host of planters to adopt republicanism. A cabinet crisis was thus produced, and the matter submitted to Dom Pedro II, who, on June 8, as per cable, has ordered Senhor Celso to form a new liberal cabinet, whose task will be to bring about a reasonable compromise, and compensate the planters by an issue of new Government bonds. As at no other time have Brazilian finances been in as flourishing condition as at present, nor the credit of the Government in London so high, there will be no difficulty in getting this threatening agitation out of the way.

Our people take a greater interest just now in all that concerns the countries south of us than at any previous time, and will be glad to see the Brazilians overcome the difficulties with which they are contending without serious civil disturbances. The trade we are doing with Brazil has reached huge proportions, and our domestic export thither promises well now that the consumptive capabilities of that country are rapidly on the increase. It compared last year with that of 1887 as follows:

Calendar year.	Imports from Brazil.	Exports to Brazil.
1888.....	\$55,259,228	\$8,100,538
1887.....	56,377,719	7,108,845

The decrease in imports from Brazil thus shown is immaterial as compared with the increase in our exports thither, which amounted to \$1,056,678, or 16 per cent. of the total exports in that direction in 1887.

#### A Coloring of the Steam Jet.

Some valuable notes are contributed to "Wiedemann's Annalen" by Von Helmholtz on the phenomena of the steam jet. He noticed that a jet of steam escaping from a hole of 1 or 2 millimeters diameter, lighted obliquely and observed upon a black background, is invisible at the lower extremity, and presents toward the top the well-known whitish appearance. (We may say in parentheses that a series of illustrations given in the work on steam issued by the Babcock & Wilcox Company, of this city, contains several illustrations which clearly show this feature of the steam jet.) He discovered that this aspect could be modified in many ways. The jet takes an azure blue when an electrified point is brought near the steam, and the color varies according to the power of the electrical machine to purple, red, yellow, green, &c., these tints being intimately connected with the dimensions of the liquid drops, and hence

it follows that the electrical point has the power of provoking condensation of the supersaturated vapor which is found at the lower part of the jet. The same result is obtained by bringing near to the steam jet a platinum wire made incandescent by the electric current, or silver, iron, copper or brass wires simply made red-hot in a flame, or even glass heated below the red, or an organic matter, wood, paper, &c., in a state of slow combustion. The products of any flame whatever, with the exception of the flame of pure alcohol, directed upon the jet of steam by the aid of a chimney or by simply blowing produce a very energetic effect. The same modification is also caused when traces of certain chemical substances are introduced into the jet. It is known that solid dust particles provoke the condensation of super-saturated vapors, but their presence cannot be invoked here to explain the preceding facts. Helmholtz believes that it may be attributed to a molecular concussion, the effect of which may be compared to that of mechanical concussion upon superheated or super-saturated liquids. A flame, for example, is the scene of closely approximated and extremely varied movements, and the chemical atoms which are incessantly passing in it from one combination to another are found in every kind of unstable condition. These movements and changeful states of combustion leave their traces in the products of combustion at a certain distance from the flame properly so called, and determine the observed phenomena. The luminous effect produced at the extremity of an electrified point and the presence of ozone in its vicinity show that this point is the cause of concussions comparable to those provoked by active combustion, and the analogy between the two phenomena is found again in the fact that they both furnish means for making electricity pass through gas. Regarding incandescent bodies, they can act either through the emission of solid particles from their surfaces or by the chemical concussions which they communicate to the surrounding gases.

### The Sparrow's Point Furnaces.

A letter to the *Steelton Reporter* from Sparrow's Point, Md., contains the following information concerning the new furnaces of the Pennsylvania Steel Company at that place:

Furnace A could easily be ready to be touched off within a week, but it will hardly have the fires lighted before September 1. The delay is caused by the incomplete state of some arrangements which affect its operation. Furnace B could be completed within a month, but considerably more time will be taken to put it in readiness for its appointed work. The large engine for Furnace A was tested recently at both high and low pressure, and the result was satisfactory in every way. The engines for Furnaces B and C will be tested within a week, and it is expected that all four of the engines will be ready for action within one month. The boilers and pumps are all in position and ready to begin their long term of service. The tunnel, which forms part of the conduit through which cooling water will be brought from the river to the plant, has been completed a good while; the dredger is engaged on the last piece of work, and in about one month this part of the work will be completed. The large stock-house is completed, except the roof, which is not all put on as yet. The casting-houses for Furnaces C and D are about half com-

pleted. The columns for Furnace C are up, and workmen have begun building up the furnace shell. The four large hot-air ovens for Furnace C are finished and are ready for the work they are intended for. Two of the four ovens for Furnace D are also finished, and the remaining two are about half-way up. The draft stack, 245 feet high, for Furnaces C and D is within a few feet of completion. It is a counterpart of the one already erected for Furnaces A and B. The trestle-work in the stock-house of Furnaces A and B is completed, and the tracks have been laid on it all the way. A scale siding of over a mile in length has been built along the Baltimore and Sparrow's Point Railroad, and a large scale-house has been erected.

### The Blast-Furnaces on June 1.

The production of pig-iron shrinks from month to month, but the falling off is not so great as would be supposed. Our reports show that the output is still very heavy, when the condition of the trade is taken into consideration. At the same time a distinctly hopeful feeling characterizes the communications we have received from the furnace men. Many of them report diminishing stocks and increasing inquiries. Others state that they are refusing to quote on business offered them, which would cover a large part of the next twelve months. The condition of all the furnaces in the country on June 1, as compared with May 1, was as follows:

	Total stacks.	In blast.	Capacity per week.	Out of blast.	Capacity per week.
June 1. 545	286	187,119	239	73,856	
May 1. 545	286	144,843	249	64,762	

The condition of the anthracite furnaces in the several geographical divisions was as follows on the 1st of the current month:

### Anthracite Furnaces June 1.

Location of furnaces.	Total number of stacks.	Number in blast.	Capacity per week.	Number out of blast.	Capacity per week.
New York.....	28	11	3,697	12	3,841
New Jersey.....	14	4	1,897	10	8,604
Spiegel.....	3	3	218	0	0
Pennsylvania:					
Lehigh Valley....	46	23	8,280	23	8,288
Spiegel.....	1	1	75	0	0
Schuylkill Valley..	32	15	5,522	17	4,631
U. S. Susquehanna Valley.....	17	10	3,484	7	998
Lebanon Valley....	16	14	7,173	2	608
L. Susquehanna Valley.....	21	10	4,020	11	2,788
Totals.....	173	91	34,386	82	24,728

For a year past our records show the following:

	Furnaces in blast.	Capacity per week.
June 1.....	91	34,386
May 1.....	95	35,315
April 1.....	102	37,977
March 1.....	103	37,987
February 1.....	107	39,187
January 1, 1889.....	107	39,728
December 1, 1888.....	99	34,879
November 1.....	95	38,645
October 1.....	95	38,728
September 1.....	92	38,541
August 1.....	96	38,897
July 1.....	92	32,478
June 1.....	99	32,418

It will be observed from this table that the capacity of the anthracite furnaces in blast is still in excess of that of a year since. The changes which have occurred within the past month are unimportant. The New York furnaces maintain their former status. In New Jersey the Warren Furnace was blown out. In the Lehigh Valley one Glendon stack was blown out and one Thomas stack was blown in. One of the Saucon furnaces of the Thomas Iron Company is now out for repairs after a very successful run of nearly four years. In the Schuylkill Valley the Warwick has been blown out for repairs, after having

made a very satisfactory blast in every respect. Mount Laurel has been banked. One of the Montour furnaces has been blown in on the Upper Susquehanna, and one of the Colebrook stacks at Lebanon. In these two districts an increased production will result.

The coke furnaces exhibit the heaviest decline in production, as was naturally to be expected. The reduction in output amounts to about 6000 tons per week. The following table shows the condition of the coke furnaces on the 1st of the present month.

### Coke Furnaces June 1.

Location of furnaces.	Total number of stacks.	Number in blast.	Capacity per week.	Number out of blast.	Capacity per week.

Spiegel.....	1	1	483	0	0
Wisconsin.....	4	2	1,000	2	850
Missouri.....	6	2	1,094	4	2,318
Colorado.....	2	0	0	2	940
The South:					
Virginia.....	12	9	4,187	3	1,180
Kentucky.....	4	3	887	1	230
Alabama.....	26	21	13,278	5	3,262
Tennessee.....	11	9	4,382	2	790
Georgia.....	2	1	501	1	310
Totals.....	216	135	91,771	81	40,374

As compared with previous months the furnaces in blast show the following record:

	Furnaces in blast.	Capacity per week.
June 1.....	135	91,771
May 1.....	147	98,399
April 1.....	151	100,060
March 1.....	150	100,737
February 1.....	150	98,513
January 1, 1889.....	157	108,736
December 1, 1888.....	151	101,748
November 1.....	146	94,696
October 1.....	137	85,461
September 1.....	133	81,082
August 1.....	122	74,855
July 1.....	21	69,543

The most important changes made in connection with the coke furnaces relate to those of the Conemaugh Valley. The furnaces of the Cambria Iron Company, at Johnstown, are banked at present owing to the recent disastrous flood, which prevents them from receiving their supply of coke. These furnaces suffered no damage, but will be at work shortly. Other coke furnaces in various parts of the country have also had their production curtailed by the interruption of railroad communication in Central Pennsylvania, which cut off their coke supply.

The first day of the present month found three idle blast-furnaces in Allegheny County out of a total of 20 stacks, a larger number than have been idle at one time for some months. These three idle stacks are Furnace A, of Carnegie Bros. & Co., Limited; Lucy No. 1, of the same firm, and No. 1 stack of Shoenberger & Co. The first-named stack was blown out on May 11 for repairs, and will probably be ready for blast during the present month. The Lucy stack was blown out on May 7 for relining and general repairs. It has had a long and very successful blast, and will be blown in again as soon as possible. Shoenberger stack No. 1 was banked on May 25 for repairs and will be ready for blast about the 15th inst. As will be noticed, we have increased the number of stacks credited to Allegheny County from 19 to

20. This has been made necessary by the fact that the new stack of Laughlins & Co., which has been in process of erection for some months, has been completed and put in blast. This firm have now three stacks in operation, two of which have a capacity of about 225 tons per day each, while the third has a capacity of 75 tons per day, making a total productive capacity for this firm of over 500 tons per day. The new stack of the Carrie Furnace Company is rapidly approaching completion, and in all probability will be blown in early in the next month. When this takes place the blast-furnaces of Allegheny County will have a capacity for producing about 1,200,000 gross tons of pig-iron per year, or about one-sixth of the whole amount made last year in the entire country. At present the Carrie Furnace Company have one stack in blast, which is making about 125 tons per day. Clinton Furnace, which is being operated by a syndicate of creditors of Graff, Bennett & Co., is producing from 45 to 50 tons per day. This is one of the oldest active coke furnaces in Pennsylvania, having been erected in 1859. Carnegie Bros. & Co., Limited, have seven stacks at Braddock, six of which are in blast, five of them on Bessemer and the other one on spiegel. Edith Furnace, operated by the Edith Furnace Company, in Allegheny City, is in successful blast, and is turning out about 3500 tons per month. The two stacks of the Isabella Furnace Company at Etna are turning out more iron than ever before in their history. The two Shoenberger stacks are comparatively small, and make about 5250 tons per month. The new Soho Furnace, of the Moorhead-McCleane Company, which was blown in on November 15 of last year, has been making an excellent record for a new furnace. For the month of May just closed it produced 5860 gross tons of pig-iron. From present indications the output of pig-iron in Allegheny County for the present year will be the largest in its history.

Among the coke furnaces in other districts but little worthy of note has occurred. Bellefonte, in Center County, Pa., has blown out, as also has Vernon, in the Shenango Valley. Kemble was banked on the 14th. In Maryland Catoclin has ceased production for the present. In Virginia the rebuilt Longdale has been blown in and the large Victoria is expected to be in operation by the 25th inst. In Ohio the Zanesville, Grafton, Akron and Winona are out, while the Franklin and Fannie have been blown in. Vigo, in Indiana, is being rebuilt. All four of the Ensley furnaces in Alabama are now in operation, and the Williamson Furnace has also been put in blast.

The condition of the charcoal furnaces of the country was as follows at the beginning of the month:

Charcoal Furnaces June 1.

Location of furnaces.	Total number of stacks.	Number in blast.	Capacity per week.	Number out of blast.	Capacity per week.
New England.....	14	7	580	7	580
New York.....	10	3	412	7	520
Pennsylvania.....	23	3	210	20	849
Maryland.....	8	4	400	4	165
Virginia.....	28	4	250	19	696
West Virginia.....	3	0	0	3	165
Ohio.....	13	7	334	6	291
Kentucky.....	2	1	120	1	100
North Carolina.....	2	1	70	1	70
Tennessee.....	8	4	1,131	4	500
Georgia.....	2	0	0	2	114
Alabama.....	9	9	1,798	0	0
Michigan.....	25	9	3,061	16	3,930
Missouri.....	3	2	596	1	213
Wisconsin.....	7	3	1,411	4	491
Texas.....	1	1	173	0	0
California.....	1	0	0	1	120
Washington.....	1	1	175	0	0
Oregon.....	1	1	181	0	0
Totals.....	156	80	10,962	96	8,754

As will be seen by the following table, the charcoal iron production has changed very slightly for some time:

	Furnaces in blast.	Capacity per week.
June 1.....	60	10,962
May 1.....	54	10,629
April 1.....	53	10,173
March 1.....	55	11,031
Feb. 1.....	62	11,219
Jan. 1.....	67	11,946
Dec. 1.....	71	12,286
Nov. 1.....	73	12,724
Oct. 1.....	71	11,619
Sept. 1.....	67	11,243

The Muirkirk Furnace, in Maryland, has been blown in, also Walton, in Virginia, and Jefferson, in Ohio. In Michigan the Detroit and Newberry are both out, while one of the Fayette stacks has been blown in; the second Eureka stack is out. The Minneapolis Furnace, in Wisconsin, is doing good work. Although rated as a 60-ton furnace, in 6 days and 18 hours in the last week of May 570 tons were made, the output for the 30th being 88 gross tons and for the 31st 94½ tons, on an average of 84½ bushels of charcoal. In Missouri the Sligo Furnace has again been started.

## CORRESPONDENCE.

### The Silver Question.

To the Editor:—Replying to an article on the silver question in your issue of May 23, 1889, I wish to say that the bullion product of the United States is principally confined to the States and Territories west of the Missouri River. Wells, Fargo & Co.'s report for the year 1888 shows aggregate products as follows: Gold, \$29,987,702; silver, \$53,152,747. These two metals are closely associated together, very little gold being found without a proportion of silver and very little silver without a proportion of gold, and it is not the intention of the people of this nation to favor the gold miner more than the silver miner. They are as closely associated together as the two metals, therefore, it is the intention of the silver kings like Senator Stewart, of Nevada, to degrade gold, but to elevate silver and place it in the rank where it belongs, adopting the bimetallic law, permitting each and every one to pay at will in gold or silver. Then dealers in money will give up searching for the metal which is hard to find and seek for that which is plentiful, to have it coined if each person is everywhere free to coin gold and silver alike, as it is mined, at the standard of 25.8 grains of gold to the dollar and 412.5 grains of silver to the dollar. This fixity of the relative value between the two metals can be obtained without infringing on the liberty of the individual, because the legally granted option to pay in gold or silver does not preclude stipulations being made in contract for exclusive payments to be made in either metal, if Congress would allow the public to get silver dollars coined in the Federal mints (which they have been taxed to build), or in other words, if the United States would return to the bimetallic régime founded by Alexander Hamilton (the first Secretary of the Treasury). He proposed that no preference should be given to either gold or silver. The founders of the Constitution of this Republic did not intend that one section or one class of producers should meet with more favor than another; therefore, we believe that the silver producer is unjustly treated by the wealth consumers under the provisions of the Constitution.

The fraudulent trick is explained as follows: The Government, under the Bland act, purchased for the year 1888 \$24,000,000 worth of silver bullion to be coined. This amount, at an average of 93 cents per ounce, would purchase at coining value \$38,365,161 worth of bullion, thus making a profit off of the producer of \$9,365,161.

China purchased for the same period \$14,621,431 at coining value, but pays for it at 93 cents per ounce, thus paying only \$10,517,927 for it, and making a profit off of the producer of \$4,104,043. Deducting these amounts from the total product would leave \$5,166,155 coining value in unsold bullion to be used in the arts which is useful only to the wealth consumers, the wealth producers not being able to purchase it after standing the enormous discounts in favor of the consumers. This amount at 93 cents per ounce would be worth \$3,766,083, making a loss of \$1,450,073 to the producer. The trick exposed is as follows: Profit to the Government for stamping \$24,000,000 worth of bullion, \$9,365,161; loss to producers on China purchase, \$3,104,043; discounts on balance unsold, \$1,450,073; total discounts to silver producers, \$14,919,277 out of the \$53,152,747 mined in 1888. There are hundreds of troublesome mortgages and the like on this coast that \$14,919,277 annually would be no small sum toward paying off. Besides, there are now thousands of miners out of employment and hundreds of mines idle that the discount on silver would pay the expense of operation, but with both expense and discounts to pay they cannot operate. This also has a bad effect on the farmer, merchant and producers of all commodities. If the silver-bullion producer could exchange his bars of bullion at the mints for silver as the gold producer can the Treasury would not be filled to overflow. There would be no silver-barricade of \$323,000,000, as every silver-bullion producer would then be an agent to circulate silver, and there is not a miner, merchant or producer in the land that would refuse to accept payment in silver, and there would be thousands of homes made happy that are now in want. The political possibility is of importance, and unless some relief is had in the near future it may be summed up as follows: At the next national leap-year party held in Chicago the California delegation will not only be solid, but they will be joined by every bullion-producing State west of the Missouri River, and their battle-cry will be for President Hon. W. M. Stewart, of Nevada. Those leap-year party pledges are getting too common. This coast is as much of a unit on the silver question as it has been on the Chinese question, and with Senator Stewart for the national standard-bearer in 1892 this coast will feel that it has entered on a new era of prosperity. Yours respectfully,

E. T. HALE.

SAN FRANCISCO, CAL., June 3, 1889.

The first students in the Cleveland, Ohio, Manual Training School have finished their course and graduated. The annual report to the corporate members says two of the students who are also members of the high school determined to try the experiment of a post-graduate course, the work of which should be the construction of a 3 horse-power steam-engine by each pupil. The result of the experiment has been satisfactory in many ways, as it has shown that the pupils can apply what they learn, that they are interested in their work, and that they can work much more rapidly than would be supposed by judging from their former work, where some new difficulty had to be overcome at every step. Both of the engines will be running by the end of the term.

It is supposed that the steam-power now utilized is almost equivalent to the hand labor of the whole population of the world. Its actual amount is estimated at 46,000,000 horse-power. The United States heads the list with 7,500,000 and Great Britain comes next with 7,000,000. Among other nations Germany has 4,000,000, France 3,000,000 and Austria-Hungary 1,500,000.

## Mineral Productions of the United States.

Advance sheets of the report of David T. Day, Chief of the Division of Mining Statistics and Technology, U. S. Geological Survey, on the metal and mineral productions of the United States for the calendar year 1888, make a very remarkable showing. In the report for 1887 Professor Day said that nearly every mineral industry showed an increase over previous years, and that the tremendous aggregate estimated value of mineral products for the year, \$542,284,225, was the largest total ever reached by the mineral industries of any country. He attributed the immense production to exceptional conditions in important industries, and expressed the opinion that the aggregate shown for the year 1887 would not be equaled in 1888. The advance sheets of his report for 1888, however, show that this expectation was not confirmed, and that the total production for the year again showed a large increase, exceeding the aggregate for 1887 by nearly \$50,000,000. The comparison of totals for a series of years, according to the Geological Survey reports, is as follows:

### Aggregate Metal and Mineral Production of the United States.

1882.....	\$456,165,490	1886.....	\$465,327,888
1883.....	453,240,748	1887.....	542,284,225
1884.....	418,476,748	1888.....	591,650,961
1885.....	428,713,909		

The increase since 1884 is indeed remarkable, three successive years showing an increase over the year preceding by \$37,000,000, \$77,000,000 and \$50,000,000 respectively, and the production of 1888 exceeding that of 1884 by \$178,000,000.

The comparison of production of metals for 1888 and 1887 shows that the output of copper was increased by artificial stimulation nearly enough to offset the reduced value of the product of pig-iron, while gold production was unchanged, and silver, lead and zinc increased, making an excess of \$6,000,000 in the yield of metals compared with the previous year. The main item in the comparison of the two years is of course the immense coal product, exceeding in 1888 the production of 1887 by nearly \$30,000,000. Besides these great items, an increase is noted in the production of petroleum, natural gas, and a long list of minerals. The only item in which a material reduction in the value of the year's production is recorded is pig-iron, and in this the quantity produced was greater than in 1887. The details of the production of the more important minerals are as follows:

### METALS.

**Iron and Steel.**—The principal statistics for 1888 were: Domestic iron ore consumed about 12,060,000 long tons. This is an increase over 1887 of 760,000 tons. Imported iron ore consumed 587,470 long tons. Total iron ore consumed in 1888, about 12,650,000 long tons, or 150,000 tons more than in 1887. Pig-iron made in 1888, 6,489,738 long tons. This is an increase over 1887 of 72,590 tons. Steel of all kinds produced in 1888, 2,899,440 long tons. This is a decrease from 1887 of 489,681 tons. Limestone used as a flux in the manufacture of pig-iron in 1888, about 5,438,000 long tons.

**Gold and Silver.**—According to the Director of the Mint the gold product was 1,604,927 fine ounces, valued at \$33,175,000. This is about the same as in 1887, being an excess of only \$75,000. The silver product was 45,783,682 fine ounces, of the commercial value of about \$43,000,000 and of the coining value of \$59,195,000. This is an increase of 4,515,327 ounces over the product in 1887. In addition to the product of our own

mines some 10,000,000 ounces of silver were extracted in the United States from foreign ores and bullion.

**Copper.**—The total product, including the yield of imported ores, increased to 281,270,622 pounds, or 115,635 short tons, during 1888, which is 46,053,291 pounds more than the product of 1887. During the first quarter of 1889 the production was increasing at even a more rapid rate. The prices received by American producers averaged 15½ cents per pound for lake copper, 14½ for Arizona and 14 for other districts, making the total value \$33,833,954. Montana led in the production, making 97,897,968 pounds. Consumption was somewhat reduced by the high prices.

**Lead.**—The product increased to 180,555 short tons from 160,700 tons in 1887. The increase was due principally to the heavier receipts of lead in Mexican silver-lead ores from 15,000 tons in 1887 to over 27,000 in 1888. The average price in New York was 4.41 cents per pound. The production of white lead, chiefly from pig-lead, was 89,000 short tons, valued at \$10,680,000.

**Zinc.**—The erection of new works and the extension of old ones led to a further notable increase in the production of zinc in 1888. The additions to capacity were fairly uniformly distributed in the West, East and South. Production in 1888, 55,908 short tons; in 1887, 50,340 tons. The production of zinc white in 1888, directly from ores, was 20,000 short tons, worth \$1,600,000.

**Quicksilver.**—The product was 33,250 flasks (of 7½ pounds each) from California, a decline in that State of 510 flasks from 1887 in spite of a very satisfactory price, which averaged \$42.50 per flask, making the total value \$1,413,125. No new valuable deposits were discovered in 1888, and without them it is not probable that the yield of quicksilver will increase.

**Nickel.**—The industry remains unchanged except for indications of further developments at Lovelock in Nevada and Riddle, Oregon. The product includes 190,637 pounds of metallic nickel, valued at \$114,882 at 60 cents per pound, and 4545 pounds, worth \$1136, exported in ores and matte.

**Cobalt Oxide.**—The total product, including the contents of the exported ores and matte, was 12,266 pounds, worth \$18,441. In 1887 the total was 18,340 pounds, worth \$18,774, the lower rate of value in that year resulting from a larger proportion of exported nickel in matte and ore.

**Chromium.**—The product declined from 8000 tons in 1887 to 1500 tons in 1888. The average price in San Francisco remained \$15 per ton. Increased operations are probable in 1889.

**Manganese.**—The product of manganese and manganiferous iron ores in the United States in 1888 was 239,460 tons, valued at \$276,215. Of this amount some 25,500 tons would be classed as manganese ores; remainder as manganiferous iron ores. Of the manganiferous iron ores 11,462 tons averaging 11 per cent. of manganese and 189,574 tons averaging 4 per cent. of manganese were from the Colby Mine, Michigan. In addition to the above, some 60,000 tons of argenterous manganese ores, valued at \$10 a ton, chiefly for the silver contained in them, were produced in the Rocky Mountain region.

**Aluminium.**—The past year was more promising than ever before for the production of cheap aluminium. The production of metallic aluminium as an industry distinct from the production of alloys began toward the close of the year, and 500 pounds had been made up to December 31; the production of 3000 pounds since then indicates that the industry may continue. The exact amount of alloys produced by the Cowles process has not been furnished, but was not markedly different from the

product of 1887, when 18,000 pounds of aluminium contained in bronze and ferro aluminium were produced. The price for metallic aluminium declined to as low as \$4.50 per pound for less favored brands.

**Platinum.**—Including the platinum and iridium separated from gold by the assay offices and that saved in placer gold mining the product was about 500 ounces, valued at \$2000.

### FUELS.

**Coal.**—The total production of all kinds of commercial coal in 1888 was 142,037,735 short tons; increase over 1887, 18,022,480 tons. This may be divided into Pennsylvania anthracite, 43,922,897 short tons (increase, 4,416,642 short tons), or 39,216,872 long tons; all other coals, including bituminous, brown coal, lignite, small lots of anthracite produced in Colorado and Arkansas, and 4000 tons of graphitic coal mined in Rhode Island, amounted in the aggregate to 98,114,838 short tons; increase, 13,605,838 tons.

**Coke.**—The production of coke in the United States in 1888 was 8,527,560 tons. Pennsylvania produced by far the largest amount, the Connellsville region alone producing 4,855,553 tons; West Virginia, 528,583 tons; Alabama, 518,511 tons; Tennessee, 385,693 tons, and Virginia, 149,099 tons.

**Petroleum.**—The product of petroleum in the United States in 1888 was 27,846,018 barrels (of 42 gallons each), valued at about \$24,598,559. Of this amount Pennsylvania produced 16,491,088 barrels; Ohio, 10,010,868 barrels; West Virginia, 119,448 barrels; California, 704,619 barrels, and other States 20,000 barrels.

**Natural Gas.**—The amount of natural gas consumed is given in coal displacement—that is, the amount of coal displaced by the use of natural gas. It is estimated that the amount of coal displaced by natural gas in the United States in 1888 was 14,163,880 tons, valued at \$22,662,128. Of this amount 12,548,830 tons were displaced in Pennsylvania, 750,000 tons in Ohio and 660,000 tons in Indiana.

### STRUCTURAL MATERIALS.

**Building Stone.**—Direct returns from producers of the various kinds of building stone show that there was but a small gain in value over the figures of 1887. The value of the stone produced in 1888 was \$25,500,000, or \$500,000 more than in the preceding year.

**Brick and Tile.**—Value, \$48,213,000. This figure represents only a small gain over 1887. This is due to increase in the number of manufacturing plants.

**Lime.**—The production is estimated at 49,087,000 barrels. These figures are not largely in advance of those for 1887.

**Cement.**—The amount of cement produced in 1888 was less than for 1887, being 6,253,295 barrels for 1888.

### ABRASIVE MATERIALS.

**Grindstones.**—Ohio and Michigan furnish practically all the sandstone from which grindstones are made. The product in 1888 increased slightly, 41,000 long tons being produced, against 37,400 in 1887.

**Corundum.**—Production is limited to the old mines in North Carolina and Georgia; 589 short tons, valued at \$91,620, were produced in 1888, against 600 tons in 1887.

**Oil-stones and Whetstones.**—The production of novaculite from Arkansas increased slightly, making the total, including Labrador oil-stone, &c., 1,500,000 pounds, valued at \$18,000 in the rough state.

### MISCELLANEOUS.

**Salt.**—The industry shows only slight changes. In 1888 the production was 8,055,881 barrels of 280 pounds. In 1887 the product was 8,003,962 barrels. Kansas became a commercial source of salt in 1888, producing 155,000 barrels, with a prospect of still greater increase in 1889.

**Borax.**—The production was restricted to 7,589,000 pounds. In 1887 the product was 11,000,000 pounds.

**Soapstone.**—Production about 15,000 tons, worth \$50,000 before shipment.

**Asphaltum.**—The production of 1888 included 700 tons of gilsonite mined in Utah; 3100 tons of ordinary asphaltum, principally from California, and 50,000 tons of bituminous rock, quarried in California for pavements in competition with asphaltum.

**Flint.**—For potters' use the consumption was 16,250 long tons. Including that for sand-paper and for glass, the consumption was about 30,000 tons.

**Mica.**—Owing principally to the use of smaller sizes in stoves, the production of sheet-mica decreased from 70,500 pounds in 1887 to 48,000 in 1888. There is increased demand for mica waste.

**Mineral Paints.**—The product, including ocher, metallic paints and small amounts of umber and sienna, increased to 24,000 long tons.

**Graphite.**—The production of pure graphite was limited to Ticonderoga, N. Y., and is reported as unchanged. The total production of pure material was 400,000 pounds. Small amounts of less pure material for foundry facings, &c., were produced in North Carolina and at Cranston, R. I.

**Fluorepar.**—The production, limited to the neighborhood of Roseclaire, Ill., and Evansville, Ind., is reported at 6000 tons, an increase of 1000 tons over 1887.

With the reduction of copper production to the normal demand, Professor Day says, a decline in the aggregate for 1889 will not be inconsistent with the natural develop-

ment of our mineral resources. This is clearly true. The immense production of 1887 and 1888 has been due to exceptional conditions in several industries which have now been changed. The tremendous production of fuels has been in part due to these unusual conditions affecting metals; but with all due allowance for abnormal influences, the record of a series of years shows a steady growth apart from all artificial stimulants and exceptional conditions, and indicates the continuance of this gradual expansion in many important directions in response to the increasing demands of consumption and the country's growth and development of resources.

#### William L. Humason.

William L. Humason, who was widely known to the Hardware trade as president of the Humason & Beckley Mfg. Com-

pany, New Britain, Conn., was born in Simsbury, Conn., January 10, 1821. In his early life he engaged in teaching and represented Simsbury in the State Legislature one year, but in 1857 he moved to New Britain, from which place he was also sent as representative to the Legislature for two years. In 1853 he established the Humason & Beckley Mfg. Company, who in 1863 were incorporated under the laws of the State of Connecticut. Of this company he remained the president until his death, which occurred April 15, 1889. By the death of Mr. Humason a number of institutions in New Britain were deprived of the excellent counsel and assistance which from his ability and position he had always rendered them. He was a director of the New Britain National Bank and of the New Britain Institute, having been identified with them from the time of their establishment. He was also an efficient member of the town board of education. He was a vestryman in St. Mark's Episcopal Church, in which he had also held various offices, and of which he was a valued member. He was also a charter member of the New Britain and Saturday Night Clubs, by whom suitable resolutions were adopted, showing the estimation in which he was held. While a careful and successful business man, Mr. Humason's tastes were of a literary nature, and he never parted with his early love for literary culture and employment, and was a fine reader and public speaker and a poet of more than ordinary ability. Many of his shorter poems have been published, but his longer ones, which were written for special occasions and delivered by him, he would never consent to have given to the public, although strongly urged to do so by his friends. As a business man Mr. Humason was held in estimation as of unquestioned integrity. As a friend he was genial and sincere, and as a citizen his influence was always on the side of order and right, and

In the Sabines district, Mexico, a new iron region has recently been discovered, according to a report in the *Iron and Steel Bulletin*. It seems to be very favorably situated, being well watered and contiguous to an extensive coal basin, which is surrounded by a chain of mountains of volcanic origin. These contain deposits of specular and hematite iron ore of great purity, and have only 0.004 per cent. of phosphorus. In this respect the ores are equal to the best of the Lake Superior district.

# TRADE REPORT.

## Philadelphia.

Office of *The Iron Age*, 220 South Fourth St.,  
PHILADELPHIA, Pa., June 11, 1889.

**Pig-Iron.**—There has been a good deal of inquiry for Pig-Iron during the week, but the actual amount taken is not important. Buyers have had an idea that they could make their own prices, so that when sellers asked an advance it had a tendency to check the demand. But the requirements of consumers have forced some of them into the market at prices averaging from 25¢ to 50¢ per ton advance on last month's quotations. This, of course, does not refer to special brands, which were held at steady quotations when many others yielded 50¢ to \$1 per ton. Those who quoted \$14.50 for Gray Forge and \$16.50 for No. 1, for instance, are now firm at \$15 and \$17, with very little for sale at the new prices. As a matter of fact, the strongest feature in the market appears to be in the limited offerings. Regular customers are accommodated with moderate quantities, but there is no chance for parties who may desire to place orders for deliveries during the fall and winter months. From this it will be seen that there is a complete change in the character of the market. Instead of buyers dictating terms, sellers have full control, and govern themselves accordingly. There is no probability of any material advance in prices, but a gradual stiffening seems to be almost inevitable, as the movement includes every description of Iron and Steel. The usual asking prices for local brands are about \$15, delivered, for Gray Forge, \$16 @ \$16.50 for No. 2, and \$17 @ \$17.50 for No. 1. Very few would be willing to shade these prices, while some would either ask more money or not quote at all, as favorite brands are well sold up and command a premium of 50¢ to \$1 per ton. Southern Iron is held at slightly better prices, although \$14.50, \$15.50 and \$16.50, delivered in consumers' yards, would still be accepted for shipments within the next three months, but buyers appear somewhat indifferent unless for tried and approved brands. The average gain in prices during the week, however, is at least 25¢ per ton, and if Southern and Western markets do equally well it is a pretty sure thing that 25¢ more will be added before the close of another week. Everything depends on what the West may do, hence very conservative trading in the meantime.

**Blooms.**—The market is firm, and in most cases the extreme outside figures are demanded. Sales have not been specially heavy, as buyers have not made up their minds to pay the advance required by holders. The following quotations fairly represent the market, the inside figures being the bid prices: \$28 @ \$28.50, at mill, for Nail Slabs; \$30 @ \$31 for Tank Slabs; \$32.50 @ \$33.50 for Shell Slabs; \$36 @ \$37 for Flange, and \$38 @ \$40 for Fire Box; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite, \$41 @ \$42.50; Scrap Blooms, \$32 @ \$33 per "Bloom" ton of 2464 lb.

**Muck-Bars.**—Prices show a good deal of irregularity, some asking as high as \$29, delivered, while others would accept orders at \$28. Sales have been made at from \$27 to \$27.50, but \$27.50 @ \$28 would be nearer the market to-day, although the offerings are limited, and with a fair demand prices could easily advance.

**Bar-Iron.**—The movement in Bars has not been in proportion to that in other departments, although there is a gradual stiffening, especially in desirable qualities. Offerings from some of the Ohio mills have

unsettled the market a good deal; Bars claimed to be of first-class quality having been offered at 1.70¢, delivered, for 50-ton lots and upward. Buyers did not respond, however, as there was a suspicion that the Iron was made from Old Rails. In many cases 1.75¢ @ 1.77½¢ is bid for local brands of established character, but at 1.8¢ @ 1.85¢, which is the usual asking price for such qualities, buyers hesitate or take only such small lots as they must have to go on with. The feeling would be very strong but for the persistent efforts of these Western men to unload their Iron on Eastern markets. Under present conditions buyers don't know what course to take, hence the market is feverish and unsettled, but generally a trifle dearer. Skelp Iron is doing better, and further interest is likely to be manifested before long. Prices are now about 1.75¢ for Grooved and 1.95¢ @ 2¢ for Sheared.

**Plate and Tank Material.**—This department of the Finished Iron trade at the moment leads all others in activity and strength. The mills are now full of work for the next couple of months, and while there is always room for the usual day-to-day demand, it is extremely difficult to place orders unless at an advance of at least ½¢ over last week's prices. Large orders are still more difficult to place, as the feeling is more deeply rooted than ever that prices will show further appreciation as the season advances. From the number of inquiries on the market there is little doubt that a great deal of business will have to be placed in the near future. Prices about as follows: 1.95¢ @ 2¢ for Ordinary Plates and Tank Plates; 2¢ @ 2.1¢ for Universal Plates; Shell, 2.3¢ @ 2.4¢; Fire-Box, 3.5¢ @ 3.7¢; Steel Plates, Tank and Ship Plate, 2.2¢ @ 2.25¢; Shell, 2.5¢; Flange, 2½¢ @ 3¢; Fire-Box, 3½¢ @ 4¢.

**Structural Material.**—The demand during the week has been very heavy and mills have now about all the work they can handle during the next 60 or 90 days. The bridge builders are among the heaviest buyers, and as there is a vast amount of work to come on the market during the summer months, the feeling in regard to prices is very firm. For the present quotations are about as follows: Bridge Plate, 2.05¢ @ 2.10¢; Angles, 2¢; Tees, 2.5¢ @ 2.6¢; Beams and Channels, 2.8¢ for Iron or Steel.

**Sheet-Iron.**—Business is reported to be in a very satisfactory condition, the entire output being taken without any opportunity for manufacturers to work on stock. Inquiries are numerous, and prospects indicate an unusually large consumption. Prices firm and unchanged, as follows:

Best Refined, Nos. 14 to 20.....	34¢
Best Refined, Nos. 21 to 24.....	3.20¢
Best Refined, Nos. 25 to 26.....	3.40¢
Best Refined, No. 27.....	3.50¢
Best Refined No. 28.....	3.60¢
Common, ¼¢ less than the above.	
Best Soft Steel, Nos. 14 to 20.....	3½¢
Best Soft Steel, Nos. 21 to 24.....	3½¢
Best Soft Steel, Nos. 25 to 26.....	3½¢
Best Soft Steel, No. 27.....	4¢
Best Bloom Sheets, ¼¢ extra over the above prices.	
Best Bloom, Galvanized, discount.....	.65 ¢
Common, discount.....	.67½ ¢

**Steel Rails.**—The firmness noted last week has finally developed into a higher range of quotations. Sales in lots of 5000 tons and upward have been made at \$28 at mill, which is now considered an inside figure, although \$27.50 is quoted by those (it is said) not in a position to accept orders. There is no doubt that the market is in a sound, healthy condition, with a decided tendency toward firm if not higher prices.

**Old Rails.**—There is nothing doing in this market, so that prices are entirely nominal. A few lots have been taken in the interior at \$23, delivered at mills, but

the demand is slow and prices inclined to weaken. A 600-ton lot of old Steel Rails was taken at \$17, delivered at mill, and a lot of short pieces at \$1 less.

**Scrap-Iron.**—There is a very good demand, and desirable lots are promptly taken at full quoted rates, which are about as follows: \$20.50 @ \$21 for cargo lots; \$21 @ \$21.50 for carload lots, delivered, or for choice, \$22; No. 2 do., \$14 @ \$15; Turnings, \$14 @ \$15; Old Steel Rails, \$16.50 @ \$17.50; Cast Scrap, \$15 @ \$16; do. Borings, \$9 @ \$10; Old Fish-Plates, \$23 @ \$24; Old Car-Wheels, nominal, \$17 @ \$18, Philadelphia.

**Wrought-Iron Pipe.**—The demand is increasing, and, with some pressure for early deliveries of certain sizes, prices are very firm, although for the present discounts are unchanged, as follows: Butt-Welded Black, 52½ ¢; Lap-Welded Black, 65 ¢; Butt-Welded Galvanized, 45 ¢; Lap-Welded Galvanized, 52½ ¢; Boiler Tubes, 60 ¢.

**Nails.**—The market is gradually hardening, but as yet there is no quotable change in prices. Carload lots are available at from \$1.80 to 1.85, according to brand, and lots from store at \$1.90 @ \$2.

## Chicago.

Office of *The Iron Age*, 58 Dearborn street,  
CHICAGO, June 10, 1889.

The conditions of the Iron trade have undergone a very favorable change since the first of the month. Railroads have come into the market for Rails and Track Supplies in round quantities. It is reported that orders for 4500 cars were placed last week and that there are inquiries for 5000 more that have not yet been contracted for; all from lines in the South and West. The effect is already reflected on the Pig-Iron, Bar-Iron, Steel and kindred branches of merchandise. Crop prospects are very favorable to an unsurpassed yield, which means larger consumption of manufactured articles and increased freight traffic.

**Pig-Iron.**—A desire to buy Pig-Iron seems to have taken hold of all classes of consumers within the last ten days. A large consumer closed negotiations the early part of the week for about 5000 tons, which was a fair indication that he was satisfied the bottom had been reached. Other buyers in the same line of manufacture took the cue and went shopping for the best terms they could get. The increase in inquiries bolstered up the sellers—and they did not need much prodding—to such an extent that they are now predicting higher prices within the next two months. This may be brought about if the furnaces that are selling at prevailing figures are completely sold up and the field left to those who now decline to accept long-time orders. The tone of the market is stronger and under continued heavy buying the lowest prices may be abandoned. Charcoal Irons are in better demand than they have been any time in the last three months. Dealers in Ohio Irons are renewing their efforts to make sales since railroads reduced freights to \$1.80 per gross ton, taking effect on the 8th inst. Makers of foundry grades of Southern Iron are less inclined to press sales than they were several weeks ago. They claim to be sold up, but it is more likely that they cannot make the price low enough to sell the Iron without incurring a loss. Southern Mottled and Gray Forge Irons are offered quite freely, and sales of round lots have been made at very low figures. The reduction of 50¢ per ton on local Coke Irons is the result of competition on large orders recently placed. In this grade of Iron small buyers can do about as well as the big fellows. It would not require very heavy buying of Car-Wheel Irons to make them advance 25¢ a ton from the lowest

figures. Indications point to an early improvement in the demand for this grade. We quote as follows, cash, f.o.b. Chicago: Lake Superior Charcoal, \$18 @ \$18.50, all numbers; Local Coke, No. 1, \$15.50; No. 2, \$14.50; No. 3, \$13.50; Chicago and Bay View Scotch, \$15.50 @ \$16; American Scotch (Blackband), \$18; Southern Coke, No. 1 Foundry, \$15.50; No. 2 Foundry, \$14.75; No. 3 Foundry, \$14; No. 1 Soft, \$15; No. 2 Soft, \$14; Gray Forge and Mottled, \$13; Hanging Rock, No. 1, \$18.25; No. 2, \$16.25; Tennessee Charcoal, No. 1, \$18.75; No. 2, \$17.75; Alabama Car-Wheel, \$24 @ \$25.

**Bar-Iron.**—There was quite a good inquiry for Bars on car specifications and merchant trade. Freight rates to Chicago from Pittsburgh were reduced to 11¢ and from Youngstown to 9¢ @ 100 lb, and manufacturers made a corresponding reduction. In carload lots mill price on Common Iron, f.o.b. Chicago, is quoted at \$1.55 and Single Refined at \$1.70, half extras. Best Refined from store is quoted at \$1.80 @ \$1.85. The demand for the better grades is less active in consequence of the difference in price. The market for the cheaper grades is irregular and subject to quick changes. Some manufacturers anticipate a long shut-down in July and will not take orders for delivery beyond that date, while others do not and are grabbing up everything in the way of an order that they can get. On car specifications \$1.57½ flat is named.

**Structural Iron.**—During the week several large building projects developed. The demand for bridge material, immediate shipment, was quite active. Foundries are figuring very close on Cast-Iron work, and not always supplying the Beams at a profit. The demand for standard sizes from stock is increasing and also the delays in obtaining them. Quotations continue as follows, f.o.b. Chicago: Angles, 2.12¢ @ 2.15¢; Universal Plates, 2.15¢ @ 2.20¢; Sheared Plates, 2.20¢; Tees, 2.55¢; Beams and Channels, 2.90¢. From stock small lots are quoted at 2.25¢ @ 2.30¢ for Angles, 2.65¢ @ 2.70¢ for Tees and 3.40¢ for Beams.

**Plates, Tubes, &c.**—Business is reported fairly good in small lots from store both in Iron and Steel Plates. Jobbers' stock sheets show that they are prepared to let the mills take a rest in July if they want to without their being put to much inconvenience. There was no change made in the discount on Tubes last week. There continues to be a steady demand from the regular trade and a noticeable increase from railroads. We quote as follows from store: Nos. 10 to 14 Iron Sheets, 2.50¢ @ 2.60¢; Nos. 10 to 14 Steel Sheets, 2.75¢ @ 3¢; Tank Iron, 2.40¢ @ 2.50¢; Tank Steel, 2.50¢ @ 2.60¢; Shell Iron or Steel, 3¢; Flange Iron, 4¢; Flange Steel, 3.50¢; Fire-Box Steel, 4.75¢ @ 5.50¢; Ulster Iron, 3.75¢; Boiler Rivets, 3.75¢ @ 4.25¢; Boiler Tubes, 57½¢ off for 1½-inch and less and 62½¢ off for 2-inch and larger.

**Sheet-Iron.**—Jobbers are having quite an active demand for Black Sheets and it is doubtful whether a large order could be placed with manufacturers for delivery before the last half of July. Makers continue to quote 2.85¢ @ 2.90¢ on No. 27, subject to shut-down. Store prices range from 3.20¢ to 3.30¢ on No. 27, according to quality.

**Galvanized Iron.**—Mill agents report a very active trade. In comparing last week with the previous week it would seem that buyers withheld their orders the last week in the month and rushed them in as soon after the 1st as possible. Business is still confined to bundle lots, on which jobbers quote 65¢ off on Juniata and 65¢ and 5¢ off on Charcoal.

**Merchant-Steel.**—A good week's business was done on low-grade Steels. Orders from manufacturers were larger and more numerous. Quite a number of inquiries for Toe Calk, Machinery and Soft-Center Steels were received for immediate delivery from parties who have not been buying in this market. Tool Steels were also in better demand. Dealers are inclined to hold prices pretty firm on store shipments. Manufacturers are quoting 1.80¢ rates on Soft Bessemer Steels, but this price has been shaded on round lots and extended deliveries. We make the following quotations from store: Mixed Machinery Steel, 2.10¢ @ 2.20¢; Tool Steel, 7.75¢ @ 8.50¢; Specials, 12¢ @ 25¢; Crucible Spring Steel, 3.50¢ @ 3.60¢; Open-Hearth Spring, 2.50¢; Open-Hearth Machinery, 2.50¢ @ 3¢; Bessemer Machinery, 2.30¢ @ 2.40¢; Sheet-Steel, 7¢ @ 10¢; Tire Steel, 2.20¢ @ 2.25¢.

**Steel Rails.**—Since the first of the month there is a great change in the status of the Rail market. The Illinois Steel Company have booked orders enough to keep two and perhaps three of their mills in operation until late in the fall. The Joliet Mill was started up last week and the Union Mill will start to-day—Monday. It is said railroads have been withholding contracts for the purpose of getting them into the construction account for the last half of the year. Some companies are in great need of the Rails, and should have ordered them two months ago. Manufacturers continue to quote \$29 @ \$30 on small lots. New orders for immediate shipment would command the outside price.

**Track Supplies.**—Inquiries for Track Supplies have kept pace with the improved condition of the Steel-Rail market. A good many orders have been placed, but large buyers have not yet contracted for anything beyond immediate wants. Prices are a little irregular and if anything weaker on nearly all of the articles coming under this heading. Fish-Plates are quoted 1.70¢ @ 1.90¢, according to quantity and time of delivery; Bolts with Square Nuts, 2.50¢; Bolts with Hexagon Nuts, 2.60¢ @ 2.70¢; Spikes, 1.85¢ @ 1.90¢.

**Old Rails and Wheels.**—Since consumers have been looking around for lots of Old Rails holders are less inclined to sell at present prices. Stocks are scarce, and all transactions have been confined to small lots, which are quoted at \$19.75 @ \$20. Old Steel Rails, long lengths, are quoted at \$17 @ \$18 and short lengths at \$14 @ \$15. Old Car-Wheels were in very good demand. Car-Wheel makers have been getting a good many orders since the 1st of the month, and they are now trying to buy Old Wheels. They find that the holders are unwilling to sell just at the time they want them. Wheels that could have been bought at \$16 two weeks ago cannot be had at \$17 now. Buyers have offered \$16.50 freely during the week, but we hear of no transactions at that price. A number of inquiries are on the market for lots of 500 and 1000 tons, for which consumers would pay about \$17. If the demand proves to be as urgent as it appears to be Wheels are likely to sell at \$18 before the week closes.

**Scrap.**—While there have been a good many inquiries for low-grade Scrap and some improvement in the demand for better grades, transactions have not been very heavy. On a ton of 2000 lb dealers make the following quotations: No. 1 Wrought, \$17.50; Fish-Plates, \$18; Axles, \$21; Horseshoes, \$17; No. 1 Mill, \$13; Cast Machinery, \$11; Stove Plate, \$9; Cast Borings, \$8; Wrought Turnings, \$10; Coil Steel, \$13; Leaf Steel, \$14.50; Locomotive Tires, \$14.50; Track Scrap, \$16; Mixed Country Wrought, \$12.

**General Hardware.**—The demand for all classes of Hardware continues to be very good. There is an inclination on the part of manufacturers to stiffen prices. At a meeting of the manufacturers on the 6th inst. Mattocks, Grub Hoes, Clay, Ore, Tamping and Coal Picks were advanced about 10% and are now quoted by jobbers at 60% and 5% off. The advances made recently on other lines are being well maintained. Traveling men report to their respective jobbing houses that the feeling throughout the country is very encouraging. Dealers are inclined to anticipate their wants and jobbers are having all that they can do.

**Nails.**—Manufacturers succeeded in unloading probably 15,000 to 20,000 kegs of Nails in this market last week. It is well understood that in order to do this prices had reached a figure that was considered bottom. Jobbers for the time controlled the market and manufacturers accepted or rejected the prices named as seemed best in their judgment. While the demand for Nails in small lots is very active there are very few buyers who are willing to take carloads of exclusively Cut Nails. On orders for mixed cars of Cut and Wire Nails jobbers quote \$1.85 for Cut Nails and \$2.30 for Wire. In small lots Cut Nails are quoted at \$1.90, and Wire Nails at \$2.85. At a meeting of the local jobbers last week the new card on Wire Nails was adopted, but they make no change in their quotations. The card for small sizes was not adopted and jobbers continue to quote on the old list and discount. A meeting of the manufacturers of Cut Nails is called for the 12th inst. for the purpose of changing the card to 60d base and advancing the price to \$2.

**Barb-Wire.**—Manufacturers are running their mills to their full capacity and have no stocks on hand. The demand for small lots continues very good, and prices firm at 2.75¢ for Painted Wire and 3.35¢ for Galvanized. A circular has been sent out from St. Louis to the leading manufacturers of Barb-Wire in the country proposing a meeting at an early date for the purpose of conferring on the subject of forming an organization to control the Barb-Wire business. The scheme is to form a parent company, capitalized to an extent sufficient to purchase the plants of the principal manufacturers and have them all operated under a governing committee similar to the plan adopted by the Steel-Rail makers of this city. We understand the manufacturers of this section favor the holding of the meeting, but are not sufficiently acquainted with the details of the plan suggested to express their views on its feasibility.

**Pig-Lead.**—Prices during last week considerably stronger and sales active. About 500 tons changed hands at 3.80¢ @ 3.85¢, and the continued demand advanced the market to 3.90¢ asked. Buyers are offering 3.85¢, but sellers are not inclined to accept this figure at the close of the week.

## Chattanooga.

Office of *The Iron Age*, Carter and 9th Sts.,  
CHATTANOOGA, June 10, 1889.

**Pig-Iron.**—The past week has developed nothing that is particularly new, and the conditions of the market remain practically about as they were. While opinions differ as to how soon an advance will come, there are few who think an improvement will take place very soon. A more feverish disposition has manifested itself quite lately, and the market is being watched with much more interest than for some time past. It must be admitted that the existing conditions cannot long continue, and that a change of some kind cannot be far off. The de-

mand for our best grades of Foundry Irons from New York continues quite as active as ever, and recent sales were made at \$16.50 @ \$16.75, delivered, cash 30 days, less commission. The products of all of our Southern stacks are not bringing these prices, and some sales have been made at prices considerably shaded, but there has been and still is a full demand from the Eastern markets for certain brands of our Irons, and they are being taken at prices that range at the top of the market.

## Louisville.

LOUISVILLE, KY., June 10, 1889.

**Pig-Iron.**—There have been some large orders placed here during the last week, one for 3000 tons. Heavy buying has also taken place in the surrounding territory. Prices, however, have not advanced, and 2000 tons of Gray Forge were offered here yesterday at \$12, cash, showing no improvement. The heavy purchases should lead to a slight advance, but so far this has not been the case. There seems to be a large number of buyers feeling the market, and some large purchases have been made by those who did not wish to run the risk of an advance later on, so have purchased their supply for the season 30 days earlier than they have been in the habit of doing. Opinions vary in regard to any immediate improvement. One of the largest buyers here feels that in November Iron will be as low as it is to-day, and that to purchase for any great length of time would simply be to lose the interest on the investment. We quote as follows:

Southern Coke, No. 1 Foundry..	\$14.25 @ \$14.75
Southern Coke, No. 2 Foundry.	13.75 @ 14.25
Southern Coke, No. 3 Foundry.	13.00 @ 13.50
Gray Forge .....	12.50 @ 13.00
White and Mottled, different grades	12.00 @ 12.50
Silver Gray, different grades .....	12.50 @ 13.50
Southern Charcoal, No. 1 Foundry	16.00 @ 16.50
No. 1 Mill .....	14.50 @ 15.00
Southern Car-Wheel, standard brands .....	21.75 @ 22.75
Southern Car-Wheel, other brands	18.00 @ 19.50
Hanging Rock Coke, No. 1 Foundry .....	15.50 @ 16.00
Hanging Rock Charcoal, No. 1 Foundry .....	19.50 @ 21.00
Hanging Rock, Cold Blast .....	20.75 @ 22.75

## St. Louis.

OFFICE OF *The Iron Age*, 214 N. Sixth st., {  
St. Louis, June 10, 1889. }

**Pig-Iron.**—The market shows more activity than for two months past. Inquiries are plentiful and some good sales have been made, but prices were necessarily low. One lot of 1000 tons Southern Foundry Iron was taken at about \$14.75, delivered. There are negotiations now in progress for 2000 or 3000 tons of Gray Forge, which it is expected will be closed in a few days. While there is no material advance in prices, yet the situation is decidedly improved, and the general opinion of consumers is that bed-rock has been reached, and if they intend taking advantage of the low prices now ruling, now is the time. The furnaces have apparently come to the same conclusion, and are consequently quoting prices with more firmness and are not disposed to book orders for delivery later than July 1. Of course the improvement may only be temporary, but as buyers and sellers alike seem confident, it is quite probable a better market will be the result. For ordinary-sized lots we quote as follows for cash, f.o.b. St. Louis:

Southern Coke, No. 1 Foundry, \$15.25 @ \$15.75	
Southern Coke, No. 2 Foundry, 14.75 @ 15.25	
Southern Coke, No. 3 Foundry, 14.25 @ 14.50	
Gray Forge .....	13.25 @ 13.75
Ohio Softeners .....	17.00 @ 19.00
Lake Superior Charcoal .....	19.75 @ 21.50
<i>Missouri.</i>	
Charcoal Foundry, No. 1 .....	16.00 @ 16.50
Charcoal Foundry, No. 2 .....	15.00 @ 15.50
<i>Tennessee.</i>	
Charcoal Foundry, No. 1 .....	17.00 @ 18.00
Charcoal Foundry, No. 2 .....	16.50 @ 17.00

Connellsville Coke, f.o.b. East St. Louis, \$4.55; St. Louis, \$4.70.

**Bar-Iron.**—In sympathy with Pig-Iron this department shows increasing strength. Some fair-sized orders were placed during the past week, and inquiries received indicate an increasing activity. The mills are well employed and are likely to be so for some time. Small lots from store are quoted at \$1.80; carload lots, from \$1.60 to \$1.70, according to circumstances.

**Barb-Wire.**—Trade is moderately active and mills are working with full forces. Stocks of Wire are unusually light for this season of the year, the large spring trade having taxed the mills to their full capacity. Prices are quoted firm, with an advancing tendency. The plant of the American Wire Company was disposed of at auction on the 5th inst., H. L. Fox & Co., of this city, being the purchasers. Mills quote from \$2.80 to \$2.85 for Painted and from \$3.40 to \$3.45 for Galvanized; carload lots at from \$2.70 to \$2.75 for Painted and \$3.30 to \$3.35 for Galvanized, f.o.b. St. Louis.

## Cleveland.

CLEVELAND, June 10, 1889.

**Iron Ore.**—Sales of Ore during the past week have been confined to moderate amounts, although sufficient altogether to make a fair showing and to bring the aggregate transactions since the opening of the season close up to 4,000,000 tons. With this amount of Ore contracted for, furnacemen are not particularly solicitous regarding additional purchases, and are not attempting to force their demands. It seems to be the prevailing opinion that not less than 750,000 and probably 1,250,000 more tons of Ore will be sold this season than last, and there are several months still open in which to do the buying. The furnacemen having already bought liberally seem inclined to await developments in the Iron market before filling out their stocks. Considerable Ore is being sold from day to day, but the score or more of really large purchases calculated to practically terminate the season's business may not be made until the latter part of July. All attempts to increase transportation rates on the lake have thus far failed. Ore is coming down to Lake Erie ports at a tremendous rate and is being hurried forward to the furnaces almost as rapidly. About 1,250,000 tons have thus far been shipped from the Lake Superior district, against about 450,000 tons at a corresponding period last year. Fair grades of Gogebic Bessemer Ores have sold during the past week at \$5, Cleveland delivery, and considerable Non-Bessemer ore from \$3.60 to \$4. Minnesota Ore continues to command \$5.75 and Republic Ore is bringing the same figures, with Menominee Bessemer in fair demand at \$4.90 @ \$5.15.

**Pig-Iron.**—The market is evidently improving in activity, although prices are still weak and far from stationary. It is undisputable that a considerable quantity of Iron is being sold from week to week, but the amounts are generally small, and the prices paid mean little if any profit to the furnace men. Despite all the discouraging features the situation generally is improving. Buyers are placing orders more frequently and seem to fully realize that any further reduction in prices is out of the question. There are not wanting evidences of an increasing confidence in the market. With this improvement has come a slightly better demand, in which future needs are in a measure considered. The following are the present cash quotations:

Nos. 1 to 6 Lake Superior Charcoal .....	\$20.00 @ \$20.50
No. 1 Strong Foundry, Bessemer quality, # ton .....	16.00 @ 16.50

No. 1 Strong Foundry, # ton ..	15.50 @ 16.00
No. 2 Strong Foundry, # ton ..	15.00 @ 15.50
No. 1 American Scotch, # ton ..	16.00 @ 17.00
No. 2 American Scotch, # ton ..	15.00 @ 16.00
No. 1 Soft Silvery, # ton .....	16.50 @ 17.50
Mahoning and Shenango Valley Neutral Mill Irons, # ton .....	14.00 @ 14.50
Mahoning and Shenango Valley Red Short Mills, # ton .....	14.50 @ 15.00

**Scrap-Iron.**—The market lacks vitality. Old Axles are in some demand, but Old American Rails even at \$21 are selling sparingly. There are still plenty of Old Wheels to be had, but there are few purchasers.

**Manufactured Iron.**—Common Bar at 1.60¢ is in only fair demand. Sheets are scarce and buyers are purchasing sparingly.

**Nails.**—The market is still weak, though prices are no lower. Steel Wire Nails at \$2.30 are most in demand. Cut Nails are firm at \$1.75 at mill.

## Cincinnati.

Office of *The Iron Age*, Fourth and Main Sts. {  
CINCINNATI, June 10, 1889. }

**Pig-Iron.**—Further weakness, if such a thing is possible, destroyed the hopes of producers of Pig-Iron for immediate recovery of prices during the week under review, but the continued active demand from agricultural works, which have been stimulated by the improved general crop outlook, and the larger purchases of Pipe works, which have been tempted by the extraordinarily low prices to supplement previous purchases on a higher level, have encouraged the attachment formed for the spirit of confidence which is so necessary to assist real facts to redeem the market. In addition to the larger transactions on the account referred to, there have been increased sales of a scattering nature, foundries and various shops being desirous of increasing stocks. A number of furnaces are making Iron at a loss, but while impatient and restive under the business ban, refuse to blow out while expecting a turn in the market. The volume of business transacted here during the week has been largely made up of small lots, between car lots and 500 tons, but there have been several 1000-ton lots on the basis of current quotations. There has been some trouble in harmonizing views of deliveries, or even larger sales might be added to the list. The aggregate sales, however, have been quite large, being in the neighborhood of 24,000 tons, all told. The following are the approximate prices current here at the close for cash, f.o.b.:

### Foundry.

Southern Coke, No. 1 .....	\$14.00 @ \$14.50
Southern Coke, No. 2 .....	13.50 @ 14.00
Southern Coke, No. 3 .....	13.00 @ 13.50
Ohio Soft Stone Coal, No. 1 .....	15.50 @ 16.00
Ohio Soft Stone Coal, No. 2 .....	14.50 @ 15.25
Mahoning and Shenango Valley .....	16.00 @ 16.50
Hanging Rock Charcoal, No. 1 .....	20.00 @ 22.00
Hanging Rock Charcoal, No. 2 .....	19.00 @ 21.00
Tennessee and Alabama Charcoal, No. 1 .....	17.50 @ 18.00
Tennessee and Alabama Charcoal, No. 2 .....	16.50 @ 17.00

### Forge.

Strong Neutral Coke .....	12.75 @ 13.00
Mottled Neutral Coke .....	11.75 @ 12.00
Gray Forge .....	12.50 @ 12.75

### Car-Wheel and Malleable Irons.

Southern Car-Wheel .....	20.00 @ 24.00
Hanging Rock, Cold Blast .....	22.00 @ 26.00
Lake Superior Car-Wheel and Malleable .....	20.00 @ 21.00

**Manufactured Iron.**—There has been a moderate trade only and an easy tone has prevailed, without essential change in prices.

**Nails.**—The demand has been a little improved, but prices have not changed essentially. Steel Nails, 12d and 40d, sell at \$1.80 @ \$1.90 # keg, with 10¢ rebate in carload lots at the mills, and Steel Wire Nails at \$2.40 @ \$2.50 # keg.

**Old Material.**—There has been a moderate demand for Rails and a steady market, with sales at \$20, spot. Old Wheels have met a moderate demand at \$16, but holders generally demand more, without success.

## Detroit.

WILLIAM F. JARVIS & Co., under date of June 10, 1889, report as follows: The condition of the market remains about the same as it has been for the past two or three weeks. Furnace men in this section feel confident that an advance will take place in the near future, and are holding very firm at present prices, and some refuse to contract for delivery extending beyond August. Inquiries for larger amounts of Lake Superior Charcoal Iron have been received in the last few days than for some time past, and this, with the present restricted production, we think, will very soon have its effect upon the market. Business has been quiet during the past week, and we quote as follows:

Lake Superior Charcoal, all numbers.....	\$19.50 @ \$20.00
Lake Superior Coke, all ore.....	18.00 @ 19.00
Lake Superior Coke, cinder mixed.....	17.75 @ 18.25
Standard Ohio Black Band.....	18.00 @ 19.00
Southern No. 1.....	18.50 @ 17.00
Southern Gray Forge.....	15.00 @ 15.50
Southern Silvery.....	16.00 @ 16.50
Jackson County (Ohio) Silvery.....	18.00 @ 18.75
Old Wheels.....	18.50 @ 19.00

## New York.

Office of *The Iron Age*, 66 and 68 Duane street, New York, June 12, 1889.

A distinctly better feeling is perceptible among sellers, and for some Iron and Steel products a somewhat higher range of prices prevails. Even where no advance has been made the prices now obtained are closer to the quotations heretofore given. The day for concessions seems to have passed, all indications pointing to a more satisfactory condition of trade in the future.

**Pig-Iron.**—A great deal of Iron is being sold in this market at present, but the transactions are mainly confined to Southern brands. Northern furnace companies appear to be well sold up, and are making heavy shipments, some of them having delivered more Iron to consumers during the past week than in any previous week for a very long time. Although the inquiry is increasing and a better feeling prevails all along the line, there is no advance in prices save in the case of the Thomas Iron Company, whose quotations have been marked up to \$17 for No. 1 and \$16 for No. 2. Enough other furnace companies are still to be found willing to accept old price to prevent a general advance. Representatives of Ohio furnaces making Soft Irons report increasing sales among consumers in this vicinity at \$18.50 @ \$19, which is much under the rates at which Scotch Pig can be imported. Northern Irons of good quality are quoted at tide-water all the way from \$16.50 to \$18 for No. 1, according to brand; \$15.50 @ \$17 for No. 2; \$14.50 @ \$15.25 for Gray Forge. Southern brands sell at \$16 @ \$17 for No. 1; \$15.50 @ \$16 for No. 2; \$14.75 @ \$15 for No. 3; \$14.25 @ \$14.50 for Gray Forge, all delivered at New York.

**Scotch Pig.**—Business in Foreign Iron is now of very small proportions; nevertheless shipments continue to be made this way. Quotations are as follows: Dalmington, \$19.50 @ \$20; Summerlee, \$21.50; Langloan, \$21; Coltness, \$21.50 @ \$21.75.

**Spiegeleisen.**—Transactions are limited at \$28.50 for 20% English and \$60 for 80% Ferro.

**Wire Rods.**—Importers are unable to quote better than \$43.50, which is prohibitory.

**Bar-Iron.**—A light business is reported in this line, but inquiries are being received from heavy buyers who are evidently of the impression that bottom has been touched. Some mills are asking  $\frac{1}{8}$ ¢ advance on the following quotations: Common, 1.6¢ @ 1.65¢; Medium, 1.7¢; Refined, 1.75¢ @ 1.9¢, for carload lots on dock.

**Structural Iron and Steel.**—Heavy orders for this class of material have been entered during the past week and prices are decidedly firmer. The market is more active than at any previous time this year. New bridges, new roofs, &c., are needed to take the place of those destroyed by the recent floods, and the mills are already feeling this impetus to trade, which promises to continue for some time. Quotations for delivery on dock are as follows: Sheared Plates, 1.95¢ @ 2.1¢; Universal Mill Plates, 2.1¢ @ 2.15¢; Angles, 2¢ @ 2.1¢; Tees, 2.4¢ @ 2.6¢; Beams and Channels, 2.8¢.

**Plates.**—Some good-sized transactions are reported and the market is strong, with an upward tendency. Quotations are as follows for delivery on dock: Tank Iron, 2¢ @ 2.1¢; Shell, 2½¢ @ 2.5¢; Steel Tank, 2.25¢ @ 2.3¢; Shell, 2.4¢ @ 2.5¢; Flange, 2.7¢ @ 2.8¢; Fire-box, 3.25¢ @ 4¢.

**Merchant-Steel.**—Small lots are moving freely, but large sales are rare. Tool Steel, good brands, in large lots, is still quoted at 7¢ @ 7½¢; specials, 12½¢ @ 20¢; Crucible Spring, 3½¢ @ 4¢; good Open-Hearth Machinery, 2.80¢ @ 2.5¢; common ditto, 2¢ @ 2.25¢; Open-Hearth Spring, 2½¢ @ 2.5¢; Sheet, 6½¢, 8½¢ and 10½¢. Some orders are now being received in this market which belong naturally to the West.

**Steel Billets.**—A limited demand has been experienced for some time, but new inquiries are now coming forward which may lead to business. Four-inch Billets are quoted at \$30, at mill, with some makers probably ready to shade these figures.

**Wrought-Iron Pipe.**—A contract for 25 miles of 6-inch Pipe for an oil line was made this week at the advanced rates, and further lots of considerable magnitude are under negotiation.

**Steel Rails.**—An order for 27,000 tons, which may be increased to 37,000 tons, is understood to have been taken by mills in the West. The Eastern manufacturers have entered orders during the week for small lots only, ranging from 200 tons to 1000 tons, but which aggregated quite a considerable amount. Inquiries are in the market for 15,000 tons or so, representing desirable cash purchases, while there are numerous others in which bonds and stock or long notes are important elements. An increased allotment of 200,000 tons has been granted to some of the mills whose sales have covered the amounts formerly awarded them. Inquiries from foreign buyers have made their appearance to some extent. Our manufacturers have been asked to bid on Canadian and Mexican orders. There is some chance of their securing the latter, as the Rails are needed promptly and the buyers assert that they cannot wait for shipments by Transatlantic makers. Prices are firm at \$27.50 at mill, with every indication of a further advance in the near future.

**Track Supplies.**—Large sales of Fish-Plates were made during the week, but at very low prices. In some instances Steel Fish-Plates were sold lower than Iron. There are more inquiries now than for the whole of the previous month, and probably some of the low sellers may soon fill up. Quotations for Fish-Plates of Iron or Steel range from 1.75¢ to 1.85¢; Track Bolts, Square Nuts, 2.70¢ @ 2.75¢; Hexagon Nuts, 2.80¢, Common Iron, and 3¢, Refined; Spikes, 1.95¢ @ 2¢.

**Old Material.**—Consumers of Old Iron Rails are actively searching for cheap lots, but are finding none, and are paying the prices asked. Sales have been made at \$22. No. 1 Scrap is in better demand, but buyers are only offering \$20, which does not quite come up to the ideas of sellers. Cast Scrap is particularly dull, and is quoted at about \$14.50, with \$15 as the top notch. Other values are not changed, with \$13.50 @ \$14 for Turnings, delivered, and \$9.50 @ \$10 for Cast Borings.

Frank D. Moffat & Co., agents for Columbia Iron and Steel Company, Central Forge Works, Brier Hill Iron and Coal Company and Rochester and Pittsburgh Coal and Iron Company, have removed their offices from 100 Beekman street, New York, to the Market and Fulton Bank Building, 81 Fulton street.

L. Hershheim, who had charge of the Iron department of John A. Jansen, of this city, and who is well known in the Iron trade, has resumed business on his own account at 40 and 42 Wall street. Mr. Hershheim has close connections with all the more prominent producers abroad, and will continue to import Spiegel, Wire Rods, Billets, &c.

## Financial.

The instantaneous destruction of at least \$50,000,000 of property, principally by floods in Pennsylvania, but including, say, \$6,000,000 by the burning of the city of Seattle, on the Pacific Coast, has a more or less disturbing effect in several departments of business, from which recovery cannot be immediate. The consequences more directly apparent are the interruptions of transportation, but already the Pennsylvania Railroad has resumed through traffic with the West, and thousands of skilled men are building bridges over all the flooded region. The iron-works and other manufacturing establishments that were partially wrecked are being restored without delay. The lumber market will doubtless be affected by the destruction of the timber booms at Williamsport, the equivalent of probably 250,000,000 feet being withdrawn from the usual supply. The coal companies are enabled to maintain their full schedule of prices, in consequence of the flooding of collieries and the enforced shortened production. The wheat harvest has commenced actively in several States, with excellent prospects. In San Francisco the first new wheat came to hand 24th ult., and the promised yield is fully 72,000,000 bushels, the largest ever known in California. The Kansas board reports an unusually good condition of the crops. The product of winter wheat is estimated at 33,780,000 bushels, an excess over previous years.

The stock markets were moderately active, with a firm undertone. The news generally has been unfavorable, indicating a fresh outbreak of rate disturbances in the West. Crops have suffered from storms, the bank statement was depressing, showing the effect of gold shipments. The coalers on Monday were strong, on the improved prospects of the trade. The principal demand was for New Jersey Central, and Delaware and Hudson rose nearly to the price of Lackawanna. New York Central and Lake Shore were also conspicuously strong. The stock of the Cambria Iron Company, whose par is 50, sold up to 92 in Philadelphia, or only 8¢ below its price just before the flood.

Tuesday was a great day for coal stocks. In the afternoon the feature was a further sharp advance in Central New Jersey and in Delaware and Hudson, which crossed Lackawanna for the first time in many

years. This advance is on the idea that the anthracite coal trade is under the control of the producers, and that the public will be compelled to take coal at the prices named by the companies. Another theory was that some parties had an inkling of the coming Interstate decision in the suit of Cox Brothers & Co. against the Lehigh Valley, and that they were working the market. The street talk is that the Sugar Trust made \$3,500,000 last month.

An examination shows that the Chesapeake and Ohio Canal can be repaired for \$300,000.

United States bonds are quoted as follows:

U. S. 4½, 1891, registered.....	106½
U. S. 4½, 1891, coupon.....	106½
U. S. 4, 1907, registered.....	128
U. S. 4, 1907, coupon.....	129
U. S. currency 6s.....	118

The bank statement of Saturday showed a loss of over \$3,500,000 in surplus reserve, which now stands at \$11,026,785. In loans there was an expansion of \$2,071,200. Thus far the money market has not been affected by the loss of gold beyond a slight hardening tendency. Time money has been firm at 3½ % @ 4½ % for terms ranging from 60 days to nine months. Commercial paper continued in good demand, with light offerings. There is very little paper-making, and a 4 per cent. rate does not bring out much paper even from those who will need funds a little later.

The imports at New York for the last month were \$42,908,000, the largest May receipts for seven years, and with two exceptions the largest in the history of the past. The total in merchandise, exclusive of specie, is \$4,500,000 in excess of the corresponding month of last year. For 11 months ending May 1 the imports were \$429,738,900, exclusive of specie, as compared with \$422,609,900 for the corresponding period last year. Turning now to the exports, the total for May was \$42,296,000, which is a gain of over \$2,000,000 in produce and merchandise and of \$7,000,000 in specie upon the corresponding month of last year. For 11 months the total is \$355,839,000, including nearly \$60,000,000 in specie. The continued large export of gold, despite a balance of nearly \$60,000,000 in favor of this country, is believed to be due to the withdrawal of foreign capital under apprehension of the ultimate adoption in the United States of the silver standard. It may be said, therefore, that gold shipments are the special feature in our foreign commerce and of much significance.

The general markets were dull. Breadstuffs favored buyers, with no important changes, and for grain there were no important orders from any source. Provisions were duller than for months.

The total clearings of 38 cities last week showed an increase of 28.1 %. Outside of New York the increase was 9.8 %. New York gained 40.5; Boston, 14.8; Philadelphia, 17.1; St. Louis, 24.9; Cincinnati, 11.4; New Orleans, 21.4; Kansas City, 7.7; Louisville, 33.9; St. Paul, 20.5; Memphis, 16.2; Cleveland, 15.9; Columbus, 33.2. Chicago decreased 5.1.

The American Bankers' Convention hold their annual meeting in Kansas City, September 25 and 26.

The Birmingham clearing-house, the first organization of the kind in Alabama, begun business a week ago with nine members and an aggregate capital of \$2,300,000. The clearings for the first week aggregate \$554,744.

A. G. Wilson was re-elected president of the Consolidated Exchange.

The imports of merchandise for the week at this port were valued at \$8,731,000, and the exports, \$6,382,344. The latter included 250,000 bushels of wheat, 781,000 bushels of corn and 15,381 bales of cotton.

## Metal Market.

**Copper.**—After some slight fluctuations London closed last night at the same figure with spot Copper that ruled on Wednesday of last week, £41. 12/6, and with futures at £41. 5/, sales being light, some 700 tons. Nor has there been any change here, nothing being obtainable under 12¢, Lake Ingot, which is jobbing at 12½¢ @ 12¾¢ in a moderate way, and for casting brands the asking rate is 11¢ @ 11½¢. Messrs. James Lewis & Son, Liverpool, in their monthly report of June 1, express themselves as follows: "The official liquidator of the Comptoir d'Escompte visited London on the 28th ult., but so far his interviews with the representatives of the mining companies located there do not appear to have led to any satisfactory result, as it is understood that some of the companies decline to be parties to any fresh combination to advance prices and reduce production." The following telegram takes a favorable view of the situation on this side: "Boston, June 8.—The total figures of the Lake Superior production of Copper in May show an increase of 523 tons of mineral from the 12 active mines over 1888, an increase of over 750,000 lb, while the total product for the first five months of this year aggregates fully 35,500,000 lb, or 4,000,000 lb more than the same time last year. This, in the face of the fact that a year ago the Copper Syndicate operations were in force and now the price is 4½¢ @ lb less, and stocks have accumulated so largely, is significant. The reason is that foreign bankers have agreed to keep their holdings of Lake Copper off of the American market, and as domestic consumers are bare of stocks by reason of the very small purchases while the price was unsettled, they are now buying freely at 12¢, and it is believed that an increased production is warranted by the increased demand on this account, as well as by the increased uses for the metal." The import of American Copper into Liverpool and Swansea during the first five months has been 11,561 tons Fine, against 12,316 same time last year and 2963 in 1887. The domestic export of Ingot Copper from this country during the first ten months of the fiscal year was 13,469,686 lb, as compared with 21,805,946 the previous year. The closing price on the Metal Exchange was 11.95¢ bid.

**Tin.**—The London market has been irregular, without any well-defined tendency. At the time of our last report London stood £91 with spot and £91. 15/ futures, the respective quotations last night being £91. 10/ and £92. 5/; sales 500 tons. Here Tin has gone on offering rather freely, without much readiness being shown to take hold of the metal either for speculative or consumptive purposes, 10 tons August and 10 tons September bringing 20.50¢ and spot 20.40¢. The import of Tin into this country the first ten months of the fiscal year has been 28,254,366 lb, as compared with 25,218,068 the previous year. Tin, on the spot, closes to-day 20.37½¢ @ 20.40¢. Closing quotations on the Exchange are 20.25¢ bid and 20.35¢ asked.

**Tin-Plates.**—There is no material change in the situation; the price of Coke Tins is a shade weaker, as the dealers prefer to sell current arrivals rather than store. Future orders are still held in abeyance on account of the makers not yet being ready to concede the 3d per box which stands between buyers and sellers. We quote large lines, ordinary brands, 3 box: Siemens-Martin Steel, Charcoal finish, \$4.75 @ \$5.50; Coke finish, \$4.55 @ \$4.65; Terns, \$4.12 @ \$4.30; Coke Tins, \$4.22½ @ \$4.32½, and Wasters \$4.12½ @ \$4.15. There were imported into the United States during the first ten

months of the fiscal year, 505,920,443 lb of Tin-Plates, against 514,374,629 in 1888.

**Lead.**—Sales of Common Domestic for the week sum up some 1200 to 1500 tons at 3.97½¢ @ 4¢, the bulk being taken by consumers, but only about 200 tons of the above this week, there being a lull in the demand for the moment, but no recoil. The quotation to-day in the open market is 4¢, and at St. Louis it is 3.75¢ @ 3.80¢. At the Metal Exchange between calls 32,500 tons of August Lead were sold to-day at 3.95¢. Mr. Maas, the manager of the Stolberg Company, in Germany, has for over a year past been striving to bring about a European Lead syndicate for the creation of a common sales office and a curtailment of output, but in vain, the Spanish mines raising too many difficulties. It is now asserted that the latter are purposely modifying their future contracts with smelters, and that this accomplished they have notified Mr. Maas they would then be ready to join the compact. On the Exchange closing quotations are 3.90¢ bid and 4¢ asked.

**Spelter.**—Domestic Spelter is selling in St. Louis at 4.85¢, equal to 5.15¢ in New York. The last sales made during the week in this city have been at 5¢. Silesian remains 5½¢.

**Antimony.**—The improvement in London is due to the scarcity of Ores over there. At the advance recently established our market has been quite active at 14¢ Hallet's and 15½¢ Cookson's.

### New York Metal Exchange.

The following sales are reported:

FRIDAY, June 7.

16 tons Lead, spot.....	4.00¢
96 tons Lead, June.....	4.00¢
162 tons Lead, July.....	4.00¢

TUESDAY, June 11.

10 tons Tin, August.....	20.50¢
10 tons Tin, September.....	20.50¢

WEDNESDAY, June 12.

16 tons Lead, August.....	3.95¢
---------------------------	-------

## Coal Market.

The Anthracite Coal market is affected but slightly by the recent deluge in the mining regions, beyond a temporary curtailment of supplies and consequent stiffening of prices. The small sizes of Steam Coal, such as Pea and Buckwheat, have been in better demand, the ordinary receipts of Bituminous having been reduced by interrupted transportation. The reported production for the week is 580,000 tons, which is considerably below the average for some weeks past, and at least 100,000 tons below the corresponding week last year. Reading's contribution dropped to 85,000 tons, against 125,000 tons for the previous week, showing the effects of the flood. Since January 1 the total is 12,733,601 tons, a decrease of nearly 1,500,000 tons compared with the same time in 1888. Quotations f.o.b. are for Free-Burning Broken, \$3.85; Egg and Chestnut, \$4; Stove, \$4.30; Hard White

Ash at Port Liberty, \$4.25. Bituminous Coal is still quoted at pool prices, \$3.25 f.o.b., though sales have been made during the week at an advance, to meet emergencies. The Beach Creek Railroad, it is said, will be crippled for some weeks to come. The main lines of the Bell's Gap Railroad, the Clearfield and Jefferson Railroad and the Tyrone and Clearfield Railroad are reported to be in good condition and are now in operation. The Cumberland reports 49,000 tons for the week, to June 1. In Philadelphia local companies having steamship contracts to fill in Clearfield Coal made extensive purchases of Virginia Coal to prevent delays in sailing.

In consequence of the liberal supply of vessels, the Reading Company have been able to make large shipments to the East and have reduced their stock at Port Richmond fully 50,000 tons, leaving only a fair working supply on hand. They now have 25 collieries working, an increase of 12 since Monday. It is said by some of those close to the Coal and Iron Company that a few of the flooded collieries will not be pumped out.

Harrison Coal Company get the Newark Water Works contract at \$2.38 gross ton for Pea, delivered at the pumping station, and the Lehigh Valley Coal Company were awarded by the Brooklyn Bridge trustees the contract for furnishing Broken and Red Ash Coal at \$4.10 and \$4.20 per ton. About 7000 tons of Coal are used yearly.

In the Pittsburgh region a number of the smaller Coke producers have shut down their works until the dull season is over.

## British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]

LONDON, WEDNESDAY, June 12, 1889.

Prices for Copper have fluctuated considerably, but business has been moderate and the market has been devoid of new features. There have been further interviews between the mine officials, but nothing tangible has resulted. The Tharsis Company, it is said, refuse to join any proposed combination. The public sale at Bordeaux of 800 tons mixed brands, for account of French banks, which has been advertised, was adjourned at the last moment at request of French consumers, and the secretary supplied the holders with cash warrants.

Block Tin recovered the early decline, in part, under the support of cash purchases. Advices from the Straits regarding the production have been conflicting. It is asserted that the dealers determined to ship sparingly this month in order that the market might improve, but it is believed that shipments will be correspondingly larger later on.

Scotch warrants sold at as high as 43/ under the influence of attempts to squeeze the "bears." This and realizations by outsiders resulted in a good business at about 42/9. There has, however, been an absence of fresh outside speculative buying and the market is now easier. The exports of Pig-Iron to the United States during May were only 8000 tons. There has been very little change in makers' brands of Scotch or in Middlesborough Pig or Hematites, and business, except in the latter, has shown no spirit.

Decided improvement in the demand for Tin-Plate is reported, and large orders are said to have been placed for some descrip-

tions at makers' prices. The belief is that there will be a further improvement. The Vernon Works are starting up four more mills and operations are being resumed at the Lewyarth works. The total stock at shipping ports is estimated at 319,000 boxes, against 282,000 boxes the corresponding time last year. The exports to the United States last month were 32,000 tons, against 26,000 tons during May, 1888.

Heavy orders for Steel have been booked at several establishments and the general market remains strong, without, however, any advance on the prices ruling last week.

The market here is said to be practically bare of Old Iron Rails and Scrap Iron. Prices are therefore nominal.

**Scotch Pig.**—There has been only a moderate business, and prices show little change.

No. 1 Coltness, f.o.b. Glasgow	54/6
No. 1 Summerlee, " "	53/
No. 1 Gartsherrie, " "	51/6
No. 1 Langloan, " "	58/6
No. 1 Carnbroe, " "	46/6
No. 1 Shotts, " at Leith	52/6
No. 1 Glengarnock, " Ardrossan	51/6
No. 1 Dalmellington, " "	45/
No. 1 Eglinton, " "	43/

Steamer freights, Glasgow to New York, 2/; Liverpool to New York, 10/.

**Cleveland Pig.**—The market is very quiet, with buyers and sellers apart. No. 3 Middlesborough quoted 38/6 @ 39/6, prompt.

**Bessemer Pig.**—In this line there continues to be a good trade at firm prices. West Coast brands, mixed numbers, 49/6, f.o.b. shipping point.

**Spiegeleisen.**—The demand continues fairly active, and prices are strong. English 20 % quoted 82/6, f.o.b. at N. W. England shipping point.

**Steel Rails.**—The demand is good and the market very firm. Heavy sections quoted at £4. 12/6, and light sections £4. 17/6 @ £5. 2/6, f.o.b. at N. W. England shipping point.

**Steel Blooms.**—There is a good demand and prices remain firm. We quote £4. 5/ for 7 x 7, f.o.b. at N. W. England shipping point.

**Steel Billets.**—Prices as before and market firm, with demand good. Bessemer, 2½ x 2½ inch, £4. 5/, f.o.b. at N. W. England shipping point.

**Steel Slabs.**—Not much doing in these, but prices firmly held. Bessemer, £4. 5/, f.o.b. at N. W. England shipping point.

**Old Rails.**—The market firm but quiet. Tees quoted at £3. 5/ @ £3. 7/6, and Double Heads, £3. 12/6 @ £3. 15/, c.i.f., New York.

**Scrap-Iron.**—Dealings moderate, but prices firm. Heavy Wrought quoted at £2. 2/6 @ £2. 5/, f.o.b.

**Crop Ends.**—Moderate sales at unchanged prices. Bessemer quoted £2. 10/ @ £2. 12/6, f.o.b.

**Tin-Plate.**—More business passing and the market showing better tone. We quote, f.o.b. Liverpool:

IC Charcoal, Alloway grade	15/3 @ 15/6
IC Bessemer Steel, Coke finish	13/6 @
IC Siemens	14/ @
IC Coke, B. V. grade	13/ @
Charcoal Terne, Dean grade	12/ @ 12/3

**Manufactured Iron.**—Business rather quiet, but prices quite firm. We quote, f.o.b. Liverpool:

Staff. Marked Bars	£ s. d.	£ s. d.
Common	8 2 6	5 17 6
Staff. Bl'k Sheet, singles	7 12 6	7 15 0
Welsh Bars (f.o.b. Wales)	5 5 0	5 7 6

**Copper.**—A very good business done, but at irregular prices. To-day's prices for Bars were £41. 10/, spot; £41. 5/, three months' futures. Best Selected, £48.

**Tin.**—Transactions on a larger scale and irregular but firmer prices. Straits quoted to-day at £91. /10, spot, and £92. 5/ for three months' futures.

**Lead.**—The market very quiet and prices barely steady. Quoted £12. 10/ for Soft Spanish.

**Spelter.**—Demand moderate but the market steady. Quoted at £18 for ordinary Silesian.

## Foreign Markets.

### EQUIVALENTS.

	Cents.
Franc, Peseta or Lira	10.5
Florin (Netherlands)	40.2
Florin (Austria)	35.9
Milreis (Portugal)	51.08
Milreis (Brazil)	54.6
Mark (Germany)	23.8
Kilogram	2.205
Picul	134

### EAST INDIES.

**MANILA, June 3, 1889.**—**Hemp.**—There are buyers at \$15.75 per picul, as compared with \$8.12½ same date last year, equaling per ton, cost and freight, \$250, against £27.15/. Clearances for the United States since January 1 sum up 109,000 bales, against 76,000 same time last year; loading for do., 23,000, against 16,000. Cleared for England since January 1, 111,000 bales, against 137,000; loading, 10,000, against 11,000. Cleared for all other ports, 20,000, against 36,000; receipts at all ports since last cable, 7000, against 9000, and since January 1, 258,000 bales, against as many last year and 200,000 in 1887. **Freight.**—\$7.50, against \$5.50. **Exchange.**—Six months' sight, 3/5, against 3/5½. **Ker & Co.,** per cable direct to their agent in New York, Mr. Charles Nordhaus, 89 Water street.

**COLOMBO, Ceylon, April 26, 1889.**—**Plumbago.**—Our market has remained firmly sustained at the following quotations in rupees per ton: Large lumps, 145 @ 170; ordinary lumps, 125 @ 160; Chips, 80 @ 95, and Dust, 40 @ 55. Shipments since October 1 have been as follows: To England, 86,144 cwt.; to Hamburg, 6206; to Antwerp, 6097; to Bremen, 659; to Holland, 437; to India, 96; to Australia, 203, and to the United States 76,340—altogether, 176,182, cwt., against 143,620 in 1888, 126,278 in 1887 and 108,078 in 1886. **Cair Yarn.**—Has been steady at 7 @ 13 rupees per cwt. **Exchange.**—1/4 9-16, six months' sight, credit drafts. **Volkart Bros.** through their agent in New York, Mr. John W. Greene, 83 Wall street, New York.

### CHINA.

**HONG KONG, May 3, 1889.**—**Petroleum.**—The aspect of the market is unchanged. Prices for spot cargo hold their own despite the slack demand. We quote, \$2.30 @ 2.35 per case, Comet, and \$2.25 @ \$2.27½ per case, Stella brand. It is impossible to furnish a reliable quotation for cargoes to arrive, there being no buyers at any reasonable rate owing to the heavy supplies afloat. A larger portion of the cargo per Titan, in more or less damaged condition is being sold at auction, and it is feared that this sale will further depress the market. **Vermilion.**—\$47 per box of 50 cattie. **Exchange.**—Firm at 3/9½, for four months' credit drafts. **Arnhold, Karberg & Co.**

### SPAIN.

**BILBAO, May 18, 1889.**—**Iron Ore.**—Transactions have been confined for the week to single cargoes at 8/4 @ 8/8 Campanil, 7/ @ 7/3 Rubios, and 6/7 @ 6/9 inferior. Steamers in search of cargo have become scarcer. The English coal trade absorbing a good many at present; the freight to England is 6/10½ and to Holland 7/10½, showing an advance in a couple of days of 1½d. Total shipments since January 1 aggregate 1,558,820 tons, against 1,481,791 in 1888. **Pig-Iron.**—Shipments to Italy during the week reached 5342 tons and coastwise 380. May 25.—This has been a dull week in Ores, without change in prices, but with an easier tendency in freight rates. Export of Iron Ore to date, 1,624,245 tons, against 1,540,736 in 1888. Of Pig-Iron only 483 tons went coastwise. **Bilbao Maritimo y Comercial.**

William F. Jarvis, of the firm of William F. Jarvis & Co., Detroit, Mich., has just returned home after several months' absence in Europe.

## Hardware.

While the market is without special feature, there is a fair business doing and the impression prevails that trade continues pretty satisfactory for the time of year. Prices are without material alteration and are still characterized by a rather weak tone, but there are indications in certain directions of a slight improvement and in the trade there seems to be a hopeful feeling. The very satisfactory reports received in regard to the condition of business throughout the country and the prospects for large crops tend to produce the expectation that there will be a good summer's and a fine fall business.

### Wire Nails.

The new card has been adopted by the principal manufacturers, but the part relating to the miscellaneous goods has not been adopted by the principal Tack-makers and some others who do not make the standard Nails. The card as a whole is, however, received by the trade generally with a good deal of favor, and it appears likely that it will come into general use. The trade refer to the convenience under it in obtaining quotations or making purchases without regard to the assortment, and also appreciate the effort of the manufacturers in the part of the list relating to Miscellaneous Nails to check the tendency to carry an unnecessary number of sizes, as the new card tends to make the designated sizes the standard sizes to the sale of which trade will naturally drift. There is, however, some question as to the manufacturers' prices on special sizes not designated in the card. Since its adoption by the manufacturers there has not been a heavy amount of business done, but the transactions that have taken place indicate that the card price will remain about as heretofore under the old card, namely, on a basis of \$2.25 per keg in carload lots at factory.

### Cut Nails.

A large business is in progress and the impression is strengthening that an improvement in the condition of this branch of the Iron trade is near at hand. Quite a speculative movement has developed, parties having made overtures for the purchase of large quantities with this end in view. Such orders have been refused by several of the manufacturers' agents, and it is not known that any of them were found willing to make sales of this character. They are cautiously handling the trade coming to them, as stocks here are not heavy and a large number of the factories are not in shape to speedily replenish them. The works in Central Pennsylvania which have not been damaged by the flood have had their soft-coal supply cut off by the interruption to the railroad service, so that the output of Nails is being more curtailed than had been anticipated. Dealers in this section are known to be carrying very light stocks also, and if any considerable proportion of them were to enter the market to stock up the effect on prices would be marked. In a small way prices have already been advanced 5 cents per keg, but quotations for quantity have not been changed from \$1.80 to \$1.90 for Iron Nails, although indications of an upward movement are more promising than have appeared for a long time.

### Ammunition.

There have as yet been few recent developments in this field and matters are apparently moving on about as heretofore. There are, however, some features in the situation that make it interesting and may before long materially alter the existing condition of things. The Ammunition

Manufacturers' Association, under its present arrangements, which are recognized as skillfully devised and efficiently carried out, are succeeding in controlling to a good degree the prices of their goods, and are thus securing to themselves and the jobbers satisfactory margins. The method by which the special houses are given stipulated sums in lieu of commissions, as heretofore, is in general working very well, though it is understood that there is some dissatisfaction on the part of these houses in regard to the amount paid them, which is not in all cases proportioned to the amount of goods sold by them under the former system. There are also intimations that these houses, while their remuneration does not depend upon the amount of Ammunition at present sold by them—the policy of the association being by its present arrangement to check the recent tendency by which a constantly increasing proportion of goods was marketed by these specials—are desirous of holding their trade, and are in some cases in one way or another offering inducements to the trade to purchase from them. The general situation is, however, so far as the Ammunition Association is in these respects concerned, quite satisfactory.

There is, however, some uncertainty in regard to the future of Powder and Loaded Paper Shells, and these two lines are at present connected in a way in which they have not heretofore been, so that it seems not unlikely that an entirely new factor will hereafter be found in the market, the effect of which may possibly be felt to a greater or less extent by the Ammunition Association.

The existing combination on Powder has been quite well maintained, and regularity to a good degree secured in prices. There are, however, rumors that some of the companies are dissatisfied with their allotment, and unless their demands are met it is thought that not unlikely there may be a disruption in the combination and a more or less active Powder war. The manufacturers will, however, make earnest efforts to avoid this, and it is quite possible that they may succeed in adjusting their interests satisfactorily to all concerned.

The simple matter of Loaded Paper Shells is, however, somewhat complicated, and directly connected as it is with the Powder manufacturers on the one side, and the Ammunition manufacturers, who make the Paper Shells, on the other, is not unlikely to be a disturbing element. It is a well known fact that these Loaded Shells have for the last few years been rapidly coming into favor, and it seems probable that they are to occupy a large place in the market and be very extensively used for sporting purposes. This fact has led some of the regular Ammunition manufacturers to put them on the market, and there has been between such manufacturers an eager but quiet competition for the sale of the goods. The manufacturers of Powder, on the other hand, recognizing the growing importance of this line, have, as we recently noticed, entered also on the manufacture of the goods and have threatened to become somewhat formidable competitors in the field. The fact that an opportunity would be thus given them for making a reputation for their Powder which would not be the case if the goods were made by other manufacturers was doubtless also a motive in inducing them to take this new departure, the empty Shells being purchased from the Ammunition companies. It would appear, however, that the latter did not regard this enterprise of the Powder manufacturers with satisfaction, and it is significant to note that within a short time they have made a change in their prices by which their Loaded Shells are offered at materially lower prices, while their

empty Paper Shells of second quality, the grade used in the Loaded Shells, are materially advanced, the new discount being made 20 and 10 per cent., instead of 33½ and 10 per cent., as heretofore. It is thought that this action was taken in part to discourage the Powder manufacturers in the manufacture of Loaded Shells, especially as it is understood that the association had previously indicated an unwillingness to sell the shells to them, making it necessary for the Powder companies to obtain the goods indirectly through parties in the trade.

The Powder companies, however, are possessed of abundant capital, and it is intimated are not disposed to be thwarted in what they regard as a legitimate enterprise by a little difficulty of this kind, and have accordingly, we are advised, been conferring as to the feasibility of making their own Paper Shells, reaching the conclusion, it is understood, that something could advantageously be done in this direction. It was accordingly more or less definitely decided to form a company for this purpose, in which some of the largest Powder companies in the country will be represented. The Powder manufacturers will thus be in position to manufacture Loaded Shells in accordance with their earlier plans, and perhaps on an enlarged scale.

It remains to be seen precisely how this new enterprise, which we understand has taken somewhat definite form, will be carried out, and to what extent it will affect the Ammunition market. The price of the Loaded Shells is now irregular and some parties, especially in the West, are offering the goods at exceptionally low figures. It is obvious that this new departure, if it should be entered upon, might have an important bearing on other lines, as the Powder companies if they should see fit might become important competitors in the Ammunition field.

### Miscellaneous Prices.

The following is the price-list of the Standard Fiber Ware Company, Mankato, Minn., and 173 and 175 Adams street, Chicago, Ill. It will be observed that most of the goods are made in two styles, plain and decorated, prices being given for both:

Articles.	—Per dozen.—	
	Plain.	Decorated.
Water-Pails, 12-quart.	\$4.00	\$4.50
Dairy-Pails, 14-quart.	4.50	5.00
Fire-Pails—No. 1, 12-quart; No. 2, 14-quart.	4.50	5.00
Sugar-Pails (with cover).	6.00	6.50
Chamber-Pails—No. 1, 12-quart; No. 5, 14-quart.	6.50	7.50
Slop Pails—No. 1, 12-quart; No. 5, 14-quart.	6.50	7.50
Commode Pails—No. 1, 12-quart; No. 5, 14-quart.	6.50	7.50
Slop Jars (balance trap)—No. 5, 14-quart.	8.00	9.00
Commode Rings.	1.50	1.50
Wash-Basins, 10½-inch.	2.00	2.25
Wash-Basins, 12-inch.	2.25	2.75
Wash-Basins, 13½-inch.	2.75	3.25
Wash-Basins, 15-inch.	3.25	3.75
Fruit-Bowls.	2.00	2.50
Servers, 12-inch.	2.00	2.50
Keelers, 11¼-inch.	4.00	4.00
Waste-Paper Baskets, 18 inches high.	6.00	6.00
Mats, 9 inches (for table use).	1.00	1.25
Mats, 15 inches (for Cuspidors, &c.).	3.00	3.50
Mats, 17 inches (for Slop Jars, Spittoons, &c.).	3.50	4.00
Mats, 20 inches (for Slop Jars, Spittoons, &c.).	4.00	4.50
Cuspidors.	8.00	8.00
Cuspidors and 15-inch Mat combined.	11.00	11.00
Spittoons, Daisy, 8-inch.	4.00	4.50
Spittoons, 10-inch and 11-inch.	6.00	6.50
Peck Measure.	4.00	4.00
Half-peck Measure.	3.50	3.50

### Items.

A decision has been rendered by Judge Blodgett, of the United States Circuit Court, in the suit brought by the Coleman Hardware Company, Chicago, Ill., against the Pullman Sash Balance Company, Rochester, N. Y., for an injunction to restrain the latter from manufacturing or selling their Sash Balance. This injunction, we

are advised, was granted, the court holding in substance that the class of inventions in question was not new, but that the matter of the brake, as covered by the Coleman Hardware Company's patent, the Shumard, was new and meritorious, and that there was no essential difference between the brake covered by their patent and the one used by the Pullman Sash Balance Company.

New Haven Copper Company, 294 Pearl street, New York, announce that they have withdrawn the agency for the sale of their well-known Augers and Bits and are now selling the goods themselves at the above address. More detailed information in regard to their manufactures is given in their advertisement on page 49.

Fulton, Conway & Co., Louisville, Ky., general Hardware dealers and manufacturers of Hubs, Spokes and Felloes, report that May was the largest and most successful month of their entire business experience. They have a fine local trade, and do a large jobbing business, principally south of the Ohio River and running down into the cotton region.

The Brinkerhoff Company, Auburn, N. Y., are manufacturing the Crown Trolling Spoon, which is so constructed that the hook is so protected that it is prevented from catching in grass or other obstructions in the water, while at the same time it is in such a position that when seized by the fish it is at once exposed and ready for effective work.

A. C. Parker & Co., Memphis, Tenn., issue a new edition of their circular relating to the Parker Elevator Purifying Pump, giving a description of it and pointing out its advantages.

V. A. Avery, for several years past book-keeper with Esberg, Bachman & Co., Portland, Ore., has purchased an interest in the business of Dayton & Hall, of that city, the firm name being Dayton, Hall & Avery.

The Westphal-Hinds Hardware Company, Dubuque, Iowa, reorganized on the 5th inst. by electing the following Board of Directors: President, C. H. Kingman; general manager, G. B. Mansfield; directors, L. Fockler, M. R. Amsden, C. J. Lasure; secretary, C. D. Scott.

In their announcement on page 49 the Westphal-Hinds Hardware Company, Dubuque, Iowa, offer their entire line of Wagon and Carriage Makers' Hardware and Wood Stock, the trade for which has been established for 30 years. Their reason for selling is because they intend to confine themselves to General and Shelf Hardware exclusively.

The partnership heretofore existing between L. E. McKinnon and A. L. Mitchell under the name of McKinnon & Mitchell, St. Catharines, Ont., has been dissolved. The manufacturing business in Carriage Dashes and Hardware will hereafter be carried on by L. E. McKinnon under the name of McKinnon Dash and Hardware Company, and the importing and jobbing business in Carriage Hardware, Trimmings, &c., will be carried on by A. L. Mitchell under the name of A. L. Mitchell & Co.

The Iowa Farming Tool Company, Fort Madison, Iowa, issue circulars calling attention to their Prize Grain Cradle, in which a description is given of it and its advantages pointed out.

Hoag & Titchener, Binghamton, N. Y., issue a convenient illustrated catalogue of Double-Pointed Tacks, Wire Nails, &c., of their manufacture. They direct particular attention to their Blind Staples, which have been a specialty with them for a number of years, and to the quality of which they refer. Their chisel-pointed

Staples are in use by some of the largest mills in the country, and are referred to as especially desirable for hard-wood Slats.

In his announcement signed "D," Box 212, care of *The Iron Age*, a gentleman widely known to the trade and with excellent connections states that he is open to make an engagement with some manufacturer of Heavy Hardware, Metals or Tools of established reputation for the purpose of representing them to the large buyers in the Eastern or Western States.

In his advertisement on page 62 Walter Hart, 22 Warren street, New York, calls attention to the National Flagstaff Bracket, of which an illustration is given. The fact that this Bracket was in especial demand during the Centennial celebration in this city is alluded to, and as the Fourth of July approaches it will doubtless be in further requisition.

Sargent & Co. desire to call attention to the fact that the Chic Door Check is intended especially for Screen Doors such as are worked with ordinary single-acting spring hinges or light screen-door springs. They accordingly should not be used upon wooden doors nor with heavy door-springs of any kind.

The Central Hardware Co., Philadelphia, are putting on the market a line of Brass and Wrought-Iron Hardware, which is illustrated in a catalogue and price-list of recent date. It covers Cast-Brass Hinges, Refrigerator Hinges, Hasps and Butts and an extensive variety of Wrought-Iron Goods.

Pelton, Rau & Sibley, Philadelphia, Pa., issue convenient and comprehensive price-lists of Varnishes, Japans and Fine Colors, which they are now offering as importers and manufacturers. These price-lists are issued in two forms, one being with prices for dealers only.

It is reported that executions for a small amount have been issued against the Nimick & Brittan Mfg. Company, of Pittsburgh, manufacturers of Builders' Hardware, but we are informed by the secretary of the company that none of the creditors will lose anything, but that the indebtedness of the company will be paid in full. The works of the firm have been idle for some months, and, as a result, the firm have been losing money, and the stockholders have decided to reorganize the company as soon as possible. When this is done the plant will again be put in operation.

#### The Hardware Houses at Johnstown, Pa.

The hardware interests of Johnstown, Pa., suffered severely in the calamity which recently overwhelmed that city. The Hardware houses of prominence were three in number, as follows: John Dibert, whose capital was rated at \$75,000 to \$125,000; Jacob Swank, Son & Co., \$40,000 to \$75,000; Bentley & Fronheiser, \$20,000 to \$40,000. John Dibert and Jacob Swank are reported to have fallen victims to the flood, while the other Hardware merchants escaped. Their stocks of goods were submerged in all cases, and the buildings badly damaged, so that the financial loss of the several concerns will be heavy. All of these establishments were well managed; all did a prosperous business, and their credit stood high. Jacob Swank, Son & Co. had recently extended their operations into the wholesale field, and promised to develop into one of the most enterprising houses in their section of the State. The Stove and Tinware merchants also suffered heavily, both in loss of life and property. Frank W. Hay & Son had one of the largest Tin-shops in Western Pennsylvania, and carried a very heavy stock of Tin-Plate and Tinware. The building has

been utterly obliterated. The senior member of this firm was the first subscriber to *The Iron Age* in Johnstown and has continued on our list up to this time.

#### Help for the Pennsylvania Sufferers.

At the special meeting of the Hardware trade of Philadelphia, held at their room, 912 Drexel Building, June 4, the following committees were appointed to solicit aid for the Johnstown sufferers:

**Jobbers' Committee.**—Chas. M. Biddle, 507 Commerce street; John R. Griffiths, 119 North Third street; Chas. M. Ghriakey, 506 Commerce street.

**Manufacturers' Committee.**—T. Henry Asbury, Third and Dauphin streets; Hugh McCaffrey, 1839 North Fifth street; Thomas Devlin, Lehigh avenue and American street; Fayette R. Plumb, Frankford, Pa.; Samuel Diston, Tacony, Pa.

**Retailers' Committee.**—E. W. Richards, 2029 Frankford avenue; Chas. McFadden, 1025 Market street; Wm. J. Framer, 1921 Market street; Samuel P. Swoope, 3800 Market street; Henry Gildemeyer, 927 Girard avenue; Paul J. Devitt, 1107 South Second street; Henry Stutz, Jr., 4809 Germantown avenue; E. F. Wagner, 838 Richmond street; J. L. Kinkarter, 4773 Frankford avenue.

As the result of the efforts of these committees the following amounts were contributed:

Through the Retailers' Committee....	\$906.55
Through the Manufacturers' Committee.....	2587.41
Through the Jobbers' Committee.....	2389.25
Total.....	\$6413.21

There was previously sent to Drexel & Co. \$3274, making a total of \$9687.21. Of this first contribution we are advised that Henry Disston & Sons and their employees gave more than \$2000. There were also contributions in merchandise: Beuler, Bonbright & Co., sundry Hardware amounting to \$175; Geo. Griffiths Company, 200 Shovels; and Barrows-Savery Company, 200 Pots and Kettles. The following list gives the names and amounts of the various contributors:

W. J. Cramer & Co.....	\$20.00
C. H. Ulmer.....	20.00
Joseph H. Hutchinson.....	5.00
T. W. Manship.....	10.00
Thomas Devlin & Co.....	100.00
W. H. & G. W. Allen.....	100.00
Philadelphia Cutlery Co.....	25.00
E. W. Richards.....	20.00
Weber Bros.....	20.00
R. Nuttall & Son.....	25.00
Brewer Bros.....	10.00

F. Glaser, Jr.	5.00
Cash	1.00
J. K. Johnson	5.00
Palmer Street School	1.80
Employees Newlin Knight Co.	25.00
Anna M. Biddle	25.00
Sarah Mitchell	1.00
Mrs. S. F., an old lady 96 years old	20.00
Wm. Adams & Co. and employees	71.50
Employees W. H. & G. W. Allen	20.00
McFadden	2.00

Since the receipt of the above Chas. M. Biddle reports the following additional subscriptions:

Bevin Bros. Mfg. Co., East Hampton, Conn.	\$25.00
J. B. Shannon & Sons, Philadelphia, Pa.	50.00
Pike Mfg. Co., Pike Station, N. H.	200.00

The wholesale and retail Hardware dealers in Boston have subscribed the following amounts for the relief of the sufferers by the late flood in Pennsylvania:

Bigelow & Dowse	\$100.00
41 Employees of Bigelow & Dowse	32.00
Brooks, Baldwin & Robbins	50.00
Bolles, Kimball & Wilde	50.00
Frye, Phipps & Co.	50.00
M. C. Warren & Co.	25.00
J. W. Vinal & Co.	25.00
Burditt & Williams	25.00
John Herbert, 20 Dock square	5.00
William Noble & Sons	10.00
George Allen	5.00
Goodnow & Wightman	10.00
A. J. Wilkinson & Co.	25.00
Chandler & Farquhar	5.00
Cutler, Woodrough & Co.	25.00
John Wales & Co.	50.00
Chandler & Barber	10.00
Curry & Hamner	10.00
A. M. Gardner	10.00
J. B. Hunter & Co.	10.00
Butts & Ordway	5.00

Total.....\$537.00

A. T. Young, agent of the Yale Lock Company, is deserving of credit for his exertions in making this collection. Some of the wholesale dealers sent their donations direct, and some of the retail dealers subscribed through other sources, so that this list does not show the full amount paid by the Hardware trade. It will be observed that the employees of Bigelow & Dowse contributed \$32, of which a statement of the individual subscriptions has been sent us. This collection was taken, we are advised, at their own suggestion, and their action will be regarded as very commendable and as setting an example that the employees of other large houses might advantageously follow.

The following additional subscriptions in aid of the sufferers by the flood in Johnstown and vicinity are reported by the Hardware Board of Trade, 4 and 6 Warren street, New York:

Eaton, Cole & Burnham Company	\$100.00
Benedict & Burnham Mfg. Company	100.00
Waterbury Brass Company	100.00
Plume & Atwood Mfg. Company	100.00
Holmes, Booth & Haydens	100.00
Bristol Brass and Clock Company	100.00
Manhattan Brass Company	100.00
Edward Miller Company	100.00
The Okonite Company	50.00
Employees of Schoverling, Daly & Gales	44.00
J. H. Lau & Co.	25.00
Graef Cutlery Company	25.00
John G. Witte & Bro.	20.00
Employees of Stanley Rule and Level Company	17.50
Sise, Gibson & Co.	10.00
Ely & Wray	10.00
"Friends"	10.00
Wm. Oliphant	5.00
Thos. D. Cunningham	5.00
Pierce & Thomas	5.00
Cash	5.00

Total.....\$1,031.50

Amount previously acknowledged.... 1,135.00

Total.....\$2,166.50

### Mississippi and Missouri Valley Hardware Association.

This association held an interesting and enjoyable session in Omaha June 4 and 5. Apart from the business of the association one of the very enjoyable features was the banquet which was given to the members by the jobbers of Omaha, the menu for which was unique and very tastefully gotten up. Its first page represents in outline a keg of Wire Nails, and bears as a motto, "We'll Open a Keg of Nails, Boys." The menu, printed on handsome satin ribbon, represents a high order of cuisine, and occupies the third page, to which it is pinned by a Wire Nail. The second page is of more than passing interest, and we accordingly reproduce it in full:

#### WHAT THE POETS SAY OF US.

How many a vulgar Cato has compelled His energies, no longer tameless then, To mold a pin or fabricate a nail!  
—SHELLEY—*Queen Mab*.

As one nail by strength drives out another,  
So the remembrance of any former love Is by a newer object quite forgotten.  
—Two Gentlemen of Verona.

Screw your courage to the sticking place!  
—Macbeth.

Thy combined locks to part.  
—Hamlet.

Ah, me! What perils do environ  
The man that meddles with cold iron.  
—BUTLER—*Hudibras*.

Give them great meals of beef, and iron and steel,  
they will eat like wolves.  
—Henry V, Act III.

And the smith his own measures hammered to the anvil's chime.  
—LONGFELLOW.

If they cannot cut, it may be said  
His saws are toothless, and his hatchets lead.  
—POPE—*Epilogue to Satires*.

The carpenter dresses his plank—the tongue Of his fore-plane whistles its wild ascending lisp.  
—WALT WHITMAN—*Leaves of Grass*.

No sound of hammer or of saw was there.  
—COWPER—*The Task*.

Thou shalt be whipped with wire.  
—Antony and Cleopatra.

A slave that keeps the keys.  
—D. M. MULOCK.

Put golden padlocks on Truth's lips.  
—LOWELL.

The spade, the ploughshare and the rake.  
—COWLEY.

Cast forth thy plummet.  
—QUARLES.

Put your trust in God, but mind to keep your powder dry.  
—EDWARD HAYES—*Ballads of Ireland*.

One of the novel features of the entertainment accorded to the visitors by the hospitable Hardwaremen of Omaha was a trip through the city, visiting all its prominent points, on two Concord coaches, each drawn by six horses. This, we are advised, was a very enjoyable affair, which was fully appreciated by the association.

### E. D. Clapp.

The widely-known manufacturer of Carriage Hardware, E. D. Clapp, died in Auburn on the 9th inst., after a short illness, aged 61 years. As early as 1852, or long before the era of large wagon factories, he was a strong advocate of the plan of building wagons on a large scale by machinery. He foresaw the vast importance such a system of manufacture would attain in competition with the hand methods then in use. Since 1856 Mr. Clapp has been one of the most active and successful business men in Auburn. In 1864 he procured a patent on a Thill Coupling for vehicles, which soon secured for itself a large sale all over the country. This was the beginning in Auburn of manufacturing Carriage Hardware, which has grown to be the largest of its kind in the United States. In addition to the patent Thill Coupling, other lines of Carriage Forgings were from time to time introduced, until now the forging of Carriage Irons by hand in small blacksmith shops has practically ceased. The first die-sinker employed to make the tools for the Clapp Patent Thill Coupling was M. F. Van Patten, a mechanic of long experience, who has ever since been associated with Mr. Clapp as partner and superintendent of all the manufacturing processes. In 1880 Mr. Clapp organized the Auburn Wrought Bit and Iron Company, with a capital of \$60,000, for the purpose of building and putting into operation a rolling-mill and machinery for manufacturing Bridle Bits. The next year the company were merged in the E. D. Clapp Mfg. Company, and the rolling-mill has since been almost exclusively em-

ployed to furnish iron for the Carriage Hardware of the latter company. In 1880 Mr. Clapp organized the E. D. Clapp Wagon Company, Limited, for the purpose of manufacturing Farm Wagons on a large scale by machinery. This system was attended with great success. In addition to his offices of president of the E. D. Clapp Mfg. Company and the E. D. Clapp Wagon Company, Limited, he was president of the National Association of Carriage Makers' Hardware and other organizations. The funeral will be attended Thursday, June 13, at 3 p.m., from the First Presbyterian Church, Auburn.

## REVIEW OF THE WHOLESALE MARKET IN PAINTS AND OILS.

*It should be understood that the prices quoted in this column are strictly those current in the wholesale market, and that higher prices are paid for retail lots. The quality of goods frequently necessitates a considerable range of prices.*

### Paints and Colors.

**White Lead.**—The event of the past week was the *entrée* of the Collier Company, the Southern Company and the Eckstein Company, into the National Lead Trust. Officials of the trust, for reasons of their own (the anti-trust legislation in certain States doubtless being a prominent one), observe a certain degree of secrecy regarding the deal. Indirectly, or, rather, negatively, the fact is established that the companies referred to are in the trust, however, and that consolidation of interests now involves all but four or five of the 32 White Lead manufacturing establishments in the country, or 85 to 90 % of the entire output. The Atlantic remains neutral, as does also the Davis-Chambers and some smaller companies, all of whom, while maintaining their individuality, will very probably follow in the path cut out by the trust. It is also probable that the newly organized Standard White Lead Company will refrain from antagonistic policy. As for the trust management, it is more likely to be in the direction of earning a dividend upon its large capital than to war upon the few independent corrodors by "cutting" prices. Present prices for White Lead are relatively so high that ready-mixed paints come into steadily-increasing competition, and the probability of an advance being made is, therefore, extremely vague. In point of fact, present indications suggest that current prices will be maintained and also that rebates, free-delivery points, &c., will be no more liberal to the jobbing trade in the future than at the present time. The prominence of the Standard Oil interest in the Lead industry, it is asserted on good authority, is not so much from desire to monopolize the White Lead manufacture as to control the supply of Litharge. In explanation of this the fact is cited that the latter commodity has been found to be a valuable flux in the refining of Lima crude petroleum. The inference is that the Standard not only intends to be assured of an ample supply at practically its own prices, but that it seeks also to control the supply for purposes disadvantageous to rival refineries of the Ohio Oil. Inquiry among corrodors, however, elicits facts that throw some doubt around to the merit of this supposition. For example, it is asserted that works might be erected for the special manufacture of Litharge at comparatively small cost, and, furthermore, that the investment of a fraction of the capital employed in organizing the trust would suffice to provide all the Litharge that the Standard Oil Company, or they and other refineries combined, could possibly use.

With respect to business in White Lead there is little to report save that the popular city makes have found steady sale, while Western brands have been rather slower in this market. Prices remain firm at 7¢ for Lead in oil in lots of 500 lb or over.

**Zinc.**—The movement of American Zinc, while yet of very fair volume, has not been quite as free as during the preceding week. Supplies are offered in a conservative way and prices are held quite firmly. Foreign Zincs, dry and oil, are selling to a very fair extent, with prices and rebates the same as have been quoted for some time past.

**Colors.**—Paris Green manufacturers report a good steady movement, and the association rates are firmly maintained. Other Greens are also doing well. Reds generally continue to meet with fairly the average movement. Low grades of English Venetian Red and American ditto are a trifle irregular, but other Reds steady. Browns, Blacks and Blues sell at within the former range of prices and to a fair extent.

**Chalk** is rather weak at \$3 to \$3.10 for large lots, being in limited demand. **Whiting** is also rather slow, and while 45¢ for Common and 57½¢ for Gilders' are named as inside prices, it is intimated that business has been done at a shade less. There were rumors of supplies having been offered from abroad at prices equivalent to about \$2.75 laid down here, and bids of even \$2.62½ were said to have been solicited. These low figures, it was also stated, have led to offers of Common Whiting at as low as 40¢ @ 42½¢. For the present, however, there is neither business nor outright offers that would warrant placing reliance upon those quotations.

**Paris White** has continued to meet with very fair sale at prices within the range current heretofore.

**Barytes, Terra Alba and Talc** are without movement of importance at the moment, and show no change of importance in values.

### Oils.

**Linseed-Oil.**—The advanced prices noted last week are maintained and the general position of the market is unchanged. Seed continues rather scarce and high in price, compelling crushers to gauge their output closely to what the market will absorb. The use of substitutes continues as far as practicable, but pure Linseed product moves remarkably well despite that fact and its high cost.

**Lard-Oil.**—The present price of raw material and the comparatively good return received by pressers for their Stearine make Oil appear rather high at current figures. Leading city makes are well sold up, however, and in the absence of extensive offerings of Western brands no concessions are made except possibly on future deliveries to large buyers.

**Cotton-Seed Oil.**—Business in this line has been slow. The trust selling agents give no information to the contrary at all events, and outside sellers report few and generally small sales. Last week's prices are quoted, but the market looks rather easier, particularly for the off grades.

**Menhaden Oil.**—A large lot of Crude Menhaden has been purchased for export, 3000 barrels being involved. The price is not made public, but is understood to be very little if any above 25¢. The new fishing season will soon be inaugurated, pending which values are unsettled. The manufactured products are slow and rather weak.

**Cocoonut Oil** has been more active and is stronger. Some 200 tons of Cochin have been worked off at 6¢ @ 6½¢, and about 450 tons Ceylon at 5.40¢ @ 5½¢ to arrive and 5.45¢ @ 5½¢ on spot. Supplies are now concentrated. A ship with 800 tons aboard was reported wrecked.

REBATES, &c.—White Lead. ½¢ rebate on purchases of 500 lb and over, if paid for within 60 days of date of invoice; terms, 60 days or a discount of 2½% if payment within 15 days from date of invoice. Extra rebate of ½¢ payable July 1 and December 31 to buyers of a total of 10 tons pure Lead during the year.

French Zinc.—Discounts to buyers of 10 bbl. lots of one or assorted grades, 1¢; 25 bbls. 2¢; 50 bbls. 4¢. No discount allowed on less than 10 bbl. lots.

Paris Green.—Rebates to buyers of 500 to 1000 lb during season, ½¢; to buyers of 1000 to 2000 lb, 1¢; to buyers of 2000 to 4000 lb, 1½¢; to buyers of 4000 to 10,000 lb, 2¢; to buyers of 10,000 lb and over, 2½¢. Buyers of 5 tons or over at one time receive an additional ½¢.

Litharge.—Rebate of ½¢ for cash in 60 days and 2½¢ additional for cash in 15 days.

**Wilson's Sliding-Door Hanger.**

The Scranton Iron and Brass Company, of Nos. 1821-1829 Capouse avenue, Scranton, Pa., are directing the attention of those interested to the Wilson Sliding-Door Hanger, a general view of which is shown in the accompanying illustration. From an inspection of the cut it will be seen that neither rail nor track is required, and that it is unnecessary to cut or deface the door in order to place this hanger in position. The parts are strongly made of wrought-iron, with the exception of the geared portions, which are made of cast-iron. Before leaving the factory each

size special hangers are made to order. It is also claimed that a horizontal movement of the door is at all times secured; that it can never sag or get out of plumb, and that a door with this hanger can be readily hung and adjusted in a quarter of the time necessary to hang a door with wheel hangers and at one-fifth the cost.

**Type-Writer Mat.**

The United Rubber Company, of Trenton, N. J., have brought out a mat for use under type-writers, for the purpose of reducing the noise to the lowest point. The mat is of soft rubber, with points for fit-

*Wilson's Sliding-Door Hanger.*

hanger is carefully fitted and tested. It is designed for use upon either right or left hand doors, as may be desired, the hanger being entirely concealed from view. Referring to the engraving, C is a bracket, which is readily secured to the studding and extends inward and parallel with the face of the door. Upon this bracket (C) and within the recess are pivoted, near the geared portions, the levers B B. To these levers are pivoted two arms shown at A A, which extend and are pivoted by their opposite ends to the plate D. This plate in turn is firmly secured to the edge of the door at or near its middle portion. The ends of the levers B B are each attached to a button made to slide perpendicularly in corresponding slots in the two plates F F, all of which are clearly shown in the cut. These plates are bent at right angles and are firmly secured to the edge of the door near its top and bottom. In case it is desired to make the door more steady at the top this may be done by the casing or by dowels, while the same result may be accomplished at the bottom by the floor guide indicated by G in the cut. The manufacturers state that the longer the hanger in proportion to the width of the door the easier it will move. In case the doors are too heavy for the length of hanger required and not of sufficient height to permit the use of the next

ting into the bottom frame of the machine in place of the small cushions furnished with the machine. The general appearance of the device is clearly indicated by the accompanying engraving. The advantages claimed by the manufacturers are, first, lessening the noise; second, securing an easier and more agreeable touch to the machine; third, keeping the machine level, and, fourth, saving wear and tear of the machine. The company have

*Type-Writer Mat.*

arranged to supply these mats for the different machines now in the market and to send them post-paid to any part of the country. This is a novelty well worthy of the attention of all users of office appliances.

The cotton acreage for 1889 is estimated by the *Financial Chronicle* at 20,809,480, which is an increase of 2.34 per cent. over the previous year. There is everywhere

a tendency to enlarge the cultivation of the plant, more especially in the richer lands of the Southwest. Georgia alone records a decrease

**Check-Rein Terret.**

This terret is manufactured by Johnson & Colton, Montpelier, Vt. It is used on the hame-strap, and the advantages

*Check-Rein Terret.*

claimed for it are that it prevents the check-rein from wearing on the leather covering or plating on the hames, and also prevents the check-rein from catching under the shaft, thus causing accidents. It is also cheaper than the ivory or substitute for ivory rings now in use for the same purpose. It is referred to as being received with favor and meeting a want of the trade.

**The Colby Improved Wringer.**

The Colby Wringer Company, Montpelier, Vt., manufacturers of the well-known Premium wringers, are now putting on the market their Colby improved wringer,

*The Colby Improved Wringer.*

which is represented in the accompanying illustration, and which they claim possesses several advantages over other machines of this class. The frame is described as made wholly of malleable iron galvanized and the rolls of superior quality white rubber, vulcanized, not cemented, to the shaft. A novel feature to which they call attention is in the combination of a cam at each end of the apron with the inner leg or upright which clamps the wringer to the tub and a lever which raises and presses the lower against the upper roll. As a result of this construction the wringer can be removed from the tub without at the same time relieving the rolls of all pressure, thus securing their greater durability. The point is also made that as the frame is of malleable iron it is

possible to reduce the weight to a minimum with due regard to strength and durability. The wringers are fully warranted and the company agree to replace all defective parts.

#### H. M. Quackenbush's New Patent Nut-Crack.

This article is represented full size in the accompanying illustration and is manufactured by H. M. Quackenbush, Herkimer, N. Y. It will be perceived that the pattern is a modification of the nut-crack which he has been making for several years, which was made of square stock and

and then locked in position by its set-screw. This drill, which is made of steel, and the working parts of which are tempered, is manufactured by F. F. Waters Mfg. Company, of 88 Oliver street, Boston, Mass.

#### Standard Expanding Water-Conductor.

Armor, Marlin & Co., with office and factory at Nos. 206 and 208 Robinson street, Allegheny City, Pa., are offering the trade an expanding water conductor, made under the general name of Standard, a form of which we show in the accom-

panying them from becoming wet or soiled by the overflow of the eaves or heads. Each fastener, as will be seen from an inspection of the engravings, is provided

Fig. 2.—Fastener for Wood Walls.

with an opening to receive the fold of the conductor, and also with a screw, by which the conductor and fastener are united. The manufacturers claim that this form of construction prevents the

New Pattern Nut-Crack.

left square in the portion by which the nut is gripped. The new nut-crack has also special features which are covered by patents. The one represented above is made, it will be seen, of round stock and the lines are cylindrical throughout, thus making a material saving in the manufacture, as there is no loss of stock or time by turning down the handles, as required in the make of the square crack. As a result Mr. Quackenbush is enabled to place this crack on the market at a list price about one-third less than the square crack, although it is referred to as in every way as good, besides being pleasanter to handle, as there are no square corners. Another feature of this article which is covered by patent is the fact that the parts coming in contact with the nut are substantially cylindrical in form and the face of the serrated portion which holds the nut is narrower than the body of the jaw of the lever, whereby the sides of the jaws are caused to project beyond the bearing faces, and thus guard the fingers against injury. These goods are heavily nickel-plated and handsomely finished.

#### Friction Track Drill.

The friction track drill here illustrated has no lost motion, as the clutch is instantaneous; it is evident, therefore, that a

panying illustrations. This conductor is made of soft sheet-steel, galvanized, each section consisting of a single sheet 7 feet in length. Every pattern is made with a fold extending the entire length of

Standard Expanding Water-Conductor.—  
Fig. 1.—View of Section of Standard Expanding Water-Conductor.

each section, thus providing for expansion, and permitting the fastening inserted in the wall to be securely attached to it at any point. The longitudinal seam of these sections is so locked by the base of the fold that neither internal nor external

necessity for any hammering or jarring in the adjustment of the parts, while for convenience in shipping the sections may be nested, if the sizes will permit, and crated.

In Fig. 4 of the accompanying illustrations we show a section of eave-trough which this firm are also manufacturing.

Fig. 3.—Fastener for Brick Walls.

It is made of sheet-steel, galvanized, and put together with detachable couplings, a view of one of which is shown in Fig. 5 of the cuts. The eave-trough is made in 8-foot lengths without cross seams. The coupling is of simple construction, is easily connected with the eave-trough and

Fig. 4.—Eave-Trough, Showing Use of Adjustable Coupling.

makes, it is said, a strong and perfectly water-tight joint without the use of either solder or rivets.

The statistics of lake commerce since the opening of navigation show that the formidable aggregate of previous years is being surpassed the present season. During the month of May a total of 1412 vessels passed through Sault Ste. Marie Canal, 936 of them being steamers. The total registered tonnage was 1,036,882 tons and total freight tonnage 907,237 tons. A

Fig. 5.—Eave-Trough Coupling.

comparative statement of canal traffic from the opening of navigation to June 1, 1889, shows registered tonnage 1,225,369 tons— increase over the same time in 1888, 744,484 tons; freight tonnage, 1,026,859 tons— increase, 396,200.

Smith's Friction Track Drill.

hole can be drilled in a rail with this tool in much less time than with a ratchet. The construction of the drill and the method of holding it to the rail are clearly brought out in the drawings. The feed-screw passes through a block which slides on a bar held parallel with the rail by two flat strips having hooked ends, which engage with the rail flange. The block may be moved to any desired point on the bar,

pressure on the conductor can open it. In Fig. 1 of the illustrations we show a section of an octagon conductor, Fig. 2 shows a fastener adapted for wood walls, while Fig. 3 is a fastener for brick walls. The fasteners are so constructed as to allow the fold of the conductor to expand in case of water freezing in it. The fasteners are of such shape and size as to keep the conductor from touching the walls, thus

## Washington News.

(From Our Regular Correspondent.)

WASHINGTON, D. C., June 11, 1889.

Assistant Secretary Tichenor has commenced the investigation of the testimony in the case of the lead-ore importations from Mexico. The views of the Treasury Department are evidently in the direction of carrying out the spirit of the law with reference to the importation and assessment of duties on lead ore.

It is claimed that while the object of the law was stimulation of the importation of silver ores into the United States, the same law contemplates a duty on lead ore, as that is provided at a specific rate in the statutes. The presence of a small amount of lead in silver ore, it is admitted at the Department, could hardly be interpreted as a violation of the statutes with reference to classification, as it is very rarely that silver ore is found without the presence of lead, but when lead bears so prominent a part as the metal of greater weight in the so-called silver ore its character becomes changed, and instead of silver ore free of duty becomes lead ore subject to a specific rate.

The amount of testimony submitted on both sides is enormous, and will require considerable patience on the part of Assistant Secretary Tichenor in order to compass all the arguments and statistics submitted by the opposing interests. The intention of the Assistant Secretary is to render a decision as soon as possible, and from present indications there is no reason to change the original statement that when the testimony is all examined a decision will be made in accordance with the spirit of the statutes. The Secretary's decision will classify certain grades of so-called silver ore under the provision for a duty of 1½ cents per pound on lead and lead dross. As the tariff will be a subject of legislation by the next Congress, the question at issue will be specially provided for, so that no further question of classification will be possible.

The Bethlehem Works, after about two years of energetic labor and a large expenditure of capital in getting their plant completed, having commenced the manufacturing of forgings for high-power guns, will now be kept very busy in supplying the armament for the three ships which are being constructed.

The Secretary of the Treasury has announced the following decisions in metallurgical cases:

Certain so-called tempered flat steel which, upon careful investigation, was found to consist of steel strips imported in coils varying from 300 to 500 feet in length, made from steel wire-rods, which are drawn to the requisite thickness and then cold-rolled, the same varying in their completed form from about ½ to 1 inch in width, and being 26 wire gauge or finer, used chiefly if not exclusively in the manufacture of corsets, and commercially known as "corset-wire," is held to be dutiable at the rate of 7 cents per pound, under provisions which impose a duty of 8 cents per pound on steel wire smaller than number 26 wire gauge, and 4 cents per pound additional on wire commonly known as "corset-wire."

Residuum from burnt pyrites, although imported in the form of bricks, is held to be dutiable at the rate of 75 cents per ton, under the provision for "iron ore," also the dross or residuum from burnt pyrites.

A chime of bells is not comprised within the terms "philosophical and scientific apparatus, instruments, and preparations," as contained in the free list, and is, therefore, not entitled to free entry, although imported for the use of a church.

## Restoration of the Cambria Iron-works.

The Johnstown correspondent of the Philadelphia Press writes on the 10th inst. as follows:

It has been said often enough before that the Cambria Iron Company meant Johnstown. To-day, in all that means local pluck in face of the great disaster, it can as truthfully be said that Johnstown means the Cambria Iron Company. But for the spirit shown by the Cambria Iron Company in inspiring local confidence the 20,000 odd survivors of Johnstown's 30,000 would to-day be sitting on the few curbstones that are left and lounging amid the ruins bewailing their lot, just as the Charleston people did ten days after the earthquake. The Cambria Company have done some of the most amazing things in the way of reconstructing the town. On Saturday night they had the natural gas mains under the river bed repaired, and the gas has been blazing there ever since. To-day the machine-shop, employing hundreds of men, is in operation. The boiler-shop is clanging with the hammers of a full force of workmen. The blacksmith shop is running full, and, what is more wonderful, the six blast-furnaces, with their small army of workmen, were started up this morning. This will not read in type like such a big accomplishment, and only those who have seen the utter undoing of these works by the flood can realize what a bound toward getting back to their former state has been taken by the company. The whole organization of the Cambria Company is in active operation. There are nearly 3000 men clearing away the wreckage and operating the departments that are open.

There are about two-thirds of the over 7000 workmen whom the company employed left alive by the flood. The mortality among the Cambria hands is fully as great as was expected. The Gautier hands have been steadily reporting day by day and the total of the survivors has swelled to nearly 700. If it reaches 700 that will be but half of the number formerly employed. The loss of men in the lower works will enable the other Cambria employees to get work whenever they want it. For the most part they are men who owned their little homes, which were swept away, and they are now endeavoring to provide quarters for their families.

It has been a rule of the Cambria Company to assist their men to own their own homes. Whenever a man has secured the ownership of a lot the company have loaned him money to build a house on it. The company years ago built many houses all through the town, and encouraged the men to buy them on easy terms. Now the policy will not change. Two million feet of lumber has already been ordered by the company for the men to use in rebuilding. The supply will be added to as rapidly as needed under Vice-President Powell Stackhouse's orders, and all the sawmills in this section will be kept busy if necessary.

What the Cambria Company have done, are doing, or intend to do will particularly interest Philadelphia people. Aside from the starting of the blast-furnaces, the machine, boiler and blacksmith shops, it is declared by the company that steel rails will be rolled before the end of June. A very careful examination of the new steel plant, made to-day by experts, showed that it was not injured. It had been completed shortly before the flood at a cost of \$300,000. No. 2 rolling-mill is nearly ready for work. The time office is open with full hands and is in full operation, as well as the draftsmen's room. The rod mill, which will be running in two days, will turn out 120 tons of finished material

a day. The blowing-engines of the blast-furnaces are being rapidly put in shape, and it has been ascertained that they were not badly injured. The general offices, which stood, while the Free Institute just across the street, which the company gave to Johnstown, went down, are already occupied by General Manager Fulton, General Superintendent Fronheiser and General Agent L. L. Smith.

The report which gained credence last week that General Manager Fulton was one of the victims of the flood was an error, as his many friends in the iron trade will be glad to know.

We are advised by telegraph from Pittsburgh, under date of the 12th, that the convention of the Amalgamated Association of Iron and Steel Workers was then still in session. The wage-scale had not yet been completed, but that it will be very little different from the present scale. Puddling will be \$5.50 on a 2-cent card. Nail cutting has been reduced about 38 per cent. for sizes under 4d, and 12½ per cent. for sizes above 4d.

Francis Alexandre, the founder of the steamship line to Cuba long associated with his name, died in this city on Saturday at the age of 81 years. He was born in the Isle of Jersey, settled in this city and engaged in the commission business. After this he became the owner of several vessels which composed the Alexandre Line and ran between here and Cuba and Mexico. He retired from business a few years ago, and for the past three years had been more or less of an invalid.

# CURRENT HARDWARE PRICES.

JUNE 12, 1889.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers' prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers, at the figures named.

# THE IRON AGE

THURSDAY, JUNE 20, 1889.

## Transmission of Power in Mining.

The cost of transmitting power through long distances to reach the point at which it has to be applied in mines has very often proved to be prohibitory of the adoption of mechanical agencies. A method has recently been tried with success at the Spring Hill (Nova Scotia) mines, which, under certain conditions, promises to overcome many of the costly difficulties arising both from excessive friction in some cases of applying power and from leakage in others. The depth below the surface at

may be of ready application, and its simplicity and economy in such cases can hardly fail to recommend its adoption. It would probably be found in practice that 600 feet perpendicular need not be held as the limit of depth at which such a system could be economically applied.

**Canada's Iron Production in 1888.** Advance sheets of the annual report of Mr. E. Costa, in charge of the Mineral Statistics Division of the Geological Survey of Canada, give the following state-

was \$16,500,000, as against \$12,959,078 in 1887, but in reality \$1,847,102 of this increase is a miscellaneous item not included in last year's returns.

## The Latrobe Steel-Works Engines.

We here present illustrations of the engines for the tire mill of the Latrobe Steel Works, of Latrobe, Pa. These engines were designed and built by William Tod & Co., of Youngstown, Ohio, in accordance with the general specifications of

THE LATROBE STEEL-WORKS ENGINES, BUILT BY WILLIAM TOD & COMPANY.

the point where the power was required to be applied being but 600 feet, a bore of 4 inches in diameter was made directly above that point, and an endless wire rope being lowered through it and passed over a pulley at the bottom, the power of a steam-engine at the ground level was by this means transmitted directly to the workings below. It had been calculated that the cost of this bore-hole would be considerably less than the prime cost of the 1800 feet of steam-pipe which would have been required to reach the working point, while loss by leakage and repairs required to such a length of suspended piping were further saved. The diameter given to the bore is said to be ample for the rope to work without friction, as also to admit of a signal rope being placed with it to enable the workmen in the mine to communicate with the driver of the engine above. There are many cases where this novel method

ment regarding the iron and steel production of the Dominion for 1888 :

	Tons (2000 pounds).	Value.
Iron ore .....	44,410	\$139,393
Pig-iron.....	18,191	226,443
Rolled and forged iron	40,962	1,442,974
Steel.....	9,508	470,819

The production of iron ore has fallen off in recent years, it is said, on account of the presence of sulphur in the ore, rendering it in a measure unmarketable. This is particularly true of the Coe Hill mines, owned largely by Americans. The statement as to the production of rolled and forged iron includes four rolling-mills, one forge and the Londonderry Iron Works, but returns have not yet been received from six similar works. The total manufacture of iron will, however, be much larger than that of last year. Nominally, the value of all Canadian mineral products for 1888

Julian Kennedy, chief engineer of the Latrobe Steel Works.

As the work requires frequent stopping and starting it was necessary to use coupled engines, and as direct connection was desired one of the engines is made center-crank. The beds are of the Porter type, similar to that of the Porter-Hamilton engine as made by the builders. The valves are of the piston type, with large and direct steam openings, and have a travel of 6 inches. The cylinders are placed 8 feet 8 inches between centers, and are 26 inches in diameter, the stroke being 42 inches. The shaft is 12 inches in diameter, and the fly-wheel 8 feet in diameter. The admission of steam is controlled by a single-piston throttle-valve, which we show in section in the small drawing. The large drawing shows clearly the form and arrangement of the principal parts of the engine.

### The Industries of Southwest Virginia.

In a letter to the *Manufacturers' Record* Mr. Chas. G. Eddy, of Roanoke, who, as vice-president of the Norfolk and Western Railroad, has done so much for the advancement of Southwest Virginia, writes as follows:

There has never been established upon our line a manufacture that has not prospered, and the developments in the next 12 months will be as remarkable as anything in the past. We desire no "boom;" we want manufactures. Steady, honest, successful growth has been displayed by the city of Roanoke in the last seven years, jumping from a village of 450 people to a city of 15,000 population. It has the finest water-works system in the State, gas-works and electric plant; street railway now being built; locomotive and car works employing from 900 to 1000 men; rolling-mill manufacturing bar-iron, angle-iron, bridge iron and small rails, employing from 150 to 200 men; the American Bridge and Iron Works, now just being completed, for the manufacture of iron bridges, blast-furnaces, &c.; the Crozer Steel and Iron Company, with one large coke iron furnace (which has been in operation over six years) and a duplicate of the same now being erected, which will give them an output of 800 tons of pig-iron per day; basic steel plant projected which will have a capacity of 15 to 20 tons of basic steel per day, to be converted into steel plates of all descriptions, but looking forward especially to furnishing steel plates to ships at Norfolk, the Virginia navy-yard that will eventually be able to build ships using only material

Ivanhoe, on the Cripple Creek line, a furnace has been in operation only six months, and most successfully. And so on to the State line at Bristol is found an unlimited supply of ore, backed by the best coke in the world—the Pocahontas or Flat Top.

Single-Piston Throttle-Valve.

Then passing on to our Clinch Valley line, which is to connect us with the Louisville and Nashville system through Cumberland Gap, the development of iron ore, coal, barytes and other minerals has been most extraordinary up to the present

grounds will comprise 45 acres, and there will be exhibited railway rolling-stock and railway appliances, electric light, power and other electrical devices, and all kinds of implements, tools, &c. The buildings and grounds will be opened for the reception of articles from the 5th of August. Some facts are stated by the association which are of interest. They say that St. Joseph is in the geographical center of the United States, being 1400 miles from Boston, 1400 from San Francisco, 700 from Galveston and 700 from the north line of the United States. It is in the center of the territory comprising the four great States of Kansas, Nebraska, Iowa and Missouri, claimed to be "the richest country in natural resources on the face of the earth." Within a radius of 200 miles from St. Joseph there is a population of 4,000,000 people, while the city itself contains 75,000. The fruit and agricultural display will undoubtedly be one of the finest ever made, owing to the richness of the agricultural section in which the city is located.

**Chilled Slide-Valves.** — *L'Ingenieur-Consail* states that M. Bollinckx is casting the valves of Rider engines in a mold which chills the faces. The chill penetrates to a depth of  $\frac{1}{4}$  inch to  $\frac{1}{2}$  inch. As the surface cannot be cut with a tool, it is ground with emery rollers until a perfect true and polished face is obtained. It is claimed that not only do these surfaces not wear, but that, thanks to their exceeding smoothness, they do not wear the faces on which they work. Further, the coefficient of friction is naturally very

THE LATROBE STEEL-WORKS ENGINES.—SECTIONAL-PLAN VIEW AND END ELEVATION.

manufactured from the products of the mines and mills in Virginia; an additional iron furnace projected, which will probably be built within the next 12 months. The development of iron-ore properties within 20 miles of Roanoke in the past year has been unparalleled in the history of Virginia mines.

Passing on to Radford, there are two furnaces projected at that point, which will in all probability be built this year. At Pulaski is the Pulaski Iron Company's furnace, which has been more successful than any other furnace in the South, and has only been in operation one year; there are ten zinc furnaces at that point and additional furnaces projected. At

time, and will be exceeded as the prospecting goes on. I claim that Southwest Virginia is the best district for successful manufacturing in the United States, not excepting the Birmingham district.

The National Railway, Electrical and Industrial Exposition Association, of St. Joseph, Mo., will hold an exposition at that place this fall, commencing on the 3d of September and closing on the 5th of October. Every effort will be made to have this exposition attain a standing of national importance. The main building for machinery and other exhibits will have a floor space of 80 x 1040 feet. The amphitheater will seat 10,000 people. The

small. The administration of the State railways has sent a representative to examine the application of the mode of construction to the slide-valves of locomotives. The plan of chilling the slide-valves of engines has been tried in this country on a small scale, and has been found to work well.

The leading railroad lines from Chicago agreed to a reduction in rates on iron bound eastward, to correspond with the cut on west-bound shipments. The rate to Buffalo is reduced from \$2.50 to \$2.20 a ton; to Cleveland, from \$2 to \$1.60; to Detroit and Toledo, from \$1.70 to \$1.40, and so on.

## Use of Softeners in Foundry Practice.

BY WALTER GRAHAM, BELLEFONTE, PA.

When the furnace of the Bellefonte Furnace Company, at Bellefonte, Pa., went into blast, owing to the irregularity of the silicious hematite ores and of the limestone used, a small amount of pig-iron, containing from 8 to 6 per cent. of silicon, was made before the stock and burden could be regulated. This iron contained of combined carbon 0.25 per cent.; graphitic carbon, 8 per cent.; total carbon, 3.25 per cent.; silicon, 8 to 6 per cent.; phosphorus, 0.85 per cent.; sulphur, 0.02 per cent.; manganese, 0.50 per cent. The iron containing the highest percentage of silicon was quite light in color, and was readily disposed of as silvery or carbonized iron. The lower silicon iron was not wanted, because it was, "strictly speaking, not a carbonized iron," or because it was not well-grained No. 1 and No. 2 foundry iron; "iron being bought from its fracture and not from analysis," as we were informed. This iron has been graded from analyses, according to its percentage of silicon, as No. 1 soft and No. 2 soft foundry iron. It has little or no grain and is very soft under the drill or chisel. At 3.25 per cent. silicon the iron is dark, growing lighter in color as the silicon is increased. No. 1 soft contains 3.25 per cent. silicon and is dark with some grain. No. 2 soft contains 3.50 to 4 per cent. silicon and is dark and close-grained. With the easily reduced silicon hematites of the Buffalo Run Valley, containing iron 85 to 50 per cent.; silica, 18 to 40 per cent.; sulphur, 0.02 to 0.04 per cent.; phosphorus, 0.08 to 0.16 per cent., and manganese, 0.50 to 0.70 per cent., these two grades of iron can be readily made when the furnace is on No. 1 foundry iron by an increase in the temperature of the furnace, produced from a variation of 50 pounds in the burden and an increase of 2 per cent. of silica in the cinder.

I was convinced from its analysis that this iron would prove most useful in foundry work, and, for reasons to be stated further on, believed it to be an ideal softener. I tried to explain to several foundrymen, in chemical terms, how it could be used to advantage. My explanation of the proportions of chemical elements in the iron and their effect when remelted with other irons was generally interrupted with the remark that "they were not chemists, and so did not understand that sort of thing." "Their experience had, as a rule, been that an iron that was well grained out to the edge of the pig was a soft, strong iron, and for such an iron, when they found it to suit their purpose, they did not mind paying an extra dollar a ton." The experience of intelligent consumers of pig-iron cannot be neglected, and men who pay an extra price for an iron for a special purpose must have satisfied themselves that it is worth the money. An experience of several years in the laboratory and steel-works of one of the largest steel companies in the country and the subsequent change of two little Bessemer plants led me to believe, however, that chemical analysis is the best guide that we have for the use and manufacture of iron in any form.

Recently I went to the shop of one of the foundrymen spoken of above to examine a broken casting. Pieces of a very hard and brittle pulley were shown me, and I observed on a lathe a pulley of the same pattern that had been on the lathe all day and was not yet turned up. After seeing their iron and scrap pile, I asked them to let me send them a few tons of the high-silicon and low-phosphorus iron described above. They cast from it a strong, soft pulley that was machined in three hours. They gave an order for two

cars of this iron, to be delivered at once, and although the grain of the iron was not open, they declared themselves satisfied. Since then they have used it in various proportions. A spur-wheel containing 1800 pounds charcoal iron and 1800 pounds No. 2 soft Bellefonte gave unusual strength and softness.

In many foundries nothing is known of the chemical elements in the irons used by them or in the castings made, and they have no chemical standards or formulas for the different classes of castings; their only guide in purchasing and using pig-iron being the fracture. Such practice seems to be very much behind the age of steel, but it prevailed in the age of iron, and still greatly prevails among the users of pig-iron. Pig-irons containing the same amounts of combined carbon and graphitic carbon and other elements may have different fractures, and irons having different fractures may contain the same amounts of the chemical elements that affect the quality of the iron.

Close-grained iron is found in the same cast as opened-grained iron. Foundry iron run rapidly from the furnace will usually have an open grain, while iron which is allowed to run slowly will have a close grain. In either case the iron only differs in appearance, even the amounts of graphitic and combined carbon being practically the same. Were iron bought and sold on analysis this would become evident.

Professor Turner says: "There is a suitable proportion for each constituent present in cast-iron. This proportion depends upon the character of the product which is desired and upon the proportions of the other elements present." The neglect of this law is the reason why two or three high-grade and costly irons melted together may give weak castings. It is by careful attention to the mixing of low-grade irons, scrap and high-silicon irons, so that the proper proportion of each constituent is produced, that strong castings are made from what was considered inferior material.

The knowledge of the effect of the several elements, carbon, silicon, manganese, phosphorus and sulphur, on cast-iron would be most valuable to foundry men, as by it they might save the extra dollar spoken of above paid for an imported or well-known brand to insure them in getting the proper proportion of the constituents ready made. They would also save many extra dollars thrown away on worthless castings and time wasted in machining iron that is too hard. They could use more low-grade irons and scrap, and having an exact and scientific language in which to communicate their wants to the furnace men they would receive what they are in search of.

This need of a common language, so to speak, between the producers and users of pig-iron has been frequently urged. As the best literature on the subject deals with the chemical analyses of iron and valuable deductions and conclusions have been drawn from them, the knowledge and use of a few chemical terms seem necessary in an intelligent discussion of the qualities of iron.

The labors of Mr. W. J. Keep, of Detroit, and others recently; the experiments and conclusions of Colonel Caron, of France; Professor Turner, of England; M. Ferd. Gautier, of Paris, and other European writers on the qualities of cast-iron, have been republished in our trade journals. These, with Mr. Keep's and his associates' experiments and the discussions to which they have given rise, have opened to all in this country the scientific treatment of the subject. The following are some of the most recent and accessible papers and discussions that are useful to those interested in the manufacture and use of pig-iron:

"The Constitution of Cast-Iron," Professor Turner, England; "Silicon in

Foundry Iron," M. Ferd. Gautier, Paris. The papers of Mr. W. J. Keep and his associates, Mr. H. S. Fleming, Prof. C. F. Mabery, Mr. L. D. Vorce and Mr. Ed. Orton in *The Iron Age* and *Journal of Charcoal Iron Workers*. The contributions of Messrs. C. A. Meissner, A. E. Hammer, E. S. Cook, S. H. Chauvenet and J. Birkenbine, to *The Iron Age*. In the *Journal of the British Iron and Steel Institute*, by Messrs. Ed. Riley, Thos. Turner, I. L. Bell, Dr. Percy, Prof. Miller, Chas. Wood, Sir Fred. Abel, Sir W. Fairbairns and others. The above, which occur to me as I write, and many more which I need not name, give much information, which when read in connection with the practical knowledge of iron obtained in the foundry and shops will prove of great value commercially.

Going further into the subject, the researches of Herr Martens, Dr. Herman Wedding, Mr. F. Linwood Garrison, Dr. H. C. Sorby and others, in the microscopic structure of iron and steel, are of great interest. To those who read German, the papers and discussions in *Stahl und Eisen* and the works of Akerman, Karsten, Ledebur, Mueller, Von Tunner, Wachler, Wedding and others will present themselves. While the above list is familiar to many readers of *The Iron Age*, I have found that many to whom the above discussions might prove of value in dollars and cents in their business consider that they are only matters concerning chemists, and so remain ignorant, or very nearly so, of what concerns themselves.

Although there is much that is fragmentary and conjectural written about cast-iron, yet there have been conclusions drawn and clearly stated that have been applied in the most wide-awake foundries and mills to their profit. They have fallen into line with the steel-works and furnaces supplying steel-works, and are operating understandingly on a scientific basis. It remains for the iron trade generally to adopt standards and chemical formulas and an exact language in common to express their wants. The subject of softeners has been treated upon largely by the writers referred to, and the use of Scotch pig or imitation of Scotch pig, containing, generally, high silicon, phosphorus and manganese and of ferro-silicons containing very high percentages of silicon and low carbon, is becoming more and more frequent. It may be well to state broadly the effect, as now understood, of the elements carbon, silicon, phosphorus, manganese and sulphur on iron and on each other when present in iron.

### CARBON.

Carbon being considered the most important of the constituents of cast-iron comes first in the list. Professor Turner takes as a standard the average British cast-iron, which contains 3.4 per cent. of total carbon. One of the best brands of foundry iron in our market contains of silicon, 2.43 per cent.; phosphorus, 0.84 per cent.; sulphur, 0.02 per cent.; manganese, 0.24 per cent.; combined carbon, 0.40 per cent.; graphitic carbon, 3.12 per cent.; total carbon, 3.52 per cent. Bellefonte No. 1 foundry iron contains of silicon, 2.60 per cent.; phosphorus, 0.85 per cent.; sulphur, 0.03 per cent.; manganese, 0.50 per cent.; combined carbon, 0.30 per cent.; graphitic carbon, 3.18 per cent.; total carbon, 3.48 per cent. Carbon exists in cast-iron as combined carbon and graphitic carbon. In the molten state the metal is supposed to contain carbon as combined carbon or carbide of iron. The strength of irons low in phosphorus and sulphur depends upon the proper proportion of combined carbon and graphitic carbon.

### COMBINED CARBON.

Combined carbon in cast-iron increases its hardness and brittleness. Metal that

contains much combined carbon shrinks more in cooling than metal containing its carbon in the graphitic state. Sudden cooling of metal prevents the separation of carbon as graphite, and retains it in the state of combination with the iron. Successive remelting of iron increases the amount of combined carbon. Carbon discovered that combined carbon is replaced by silicon. Gautier and Akerman conclude that combined carbon is replaced by silicon, and the carbon, being separated from the iron, is precipitated as graphite; therefore silicon added to iron produces graphite, and when silicon is taken from iron combined carbon is formed. Irons low in silicon generally contain much combined carbon.

The presence of sulphur or manganese promotes the formation of combined carbon, as they act in a contrary direction to silicon. So "any required proportion of combined carbon may be obtained by altering the amount of silicon on one hand and the amount of manganese and sulphur on the other." Small variations in the amount of combined carbon are important. Professor Turner gives 0.40 per cent. of combined carbon as the figure at which the maximum general strength is obtained. "The metal being sufficiently soft to work with a tool and the crushing and tensile strengths being high." His conclusions as to the best proportions for the constituents of cast-iron are drawn from the Woolwich experiments.

#### GRAPHITIC CARBON.

Carbon existing as graphite in cast-iron makes it soft and tough. Mr. F. L. Garrison observed under the microscope that strong iron contained graphite in an irregular mass of fine black lines, evenly distributed throughout the mass. In the weaker irons the graphite was in irregular and somewhat isolated patches of comparatively large size, and without any regular grouping. When the constituents are in the proper proportion and the metal not suddenly chilled, the change of carbon from the combined to the graphitic state occurs at the instant of crystallization, which causes the carbon thus liberated to be distributed uniformly throughout the mass of metal, thus preventing these weakening spots.

Professor Turner deduces from the Woolwich experiments for crushing strength that graphite should be under 2.6 per cent.; for general strength it should be about 2.8 per cent.; for strength and softness it should be about 3 per cent.; for softness it should be over 3.10 per cent, when the total carbon is 3.4 per cent.

(To be continued.)

A need of better facilities for the handling of supplies and products in large manufacturing establishments has led to the adoption of tramway cars propelled by electric motors. A greater part of the large mills being supplied with electric-light systems renders this an easy matter, and it is safe to predict that before long the electric tramway will come to be considered a necessary feature in mill equipment. The Thomson-Houston Electric Company have already equipped several tramways and have contracted for others which will soon be put in operation. The tramway car at the company's works in Lynn is used for carrying heavy machinery to different parts of the factory, and its use permits the handling of apparatus with much greater ease in less time and with less labor than could possibly be accomplished by any other method. The car is equipped with two 3 horse-power motors, and easily carries up a grade of 13 per cent. a load of 5 tons, while from 8 to 10 tons can be carried on a level. The motors receive their current through an overhead wire from one of the generators in the factory.

## THE ENGINEERS ABROAD.

(Editorial Correspondence.)

The greater number of the party of American engineers who joined the excursion to England and France left New York on the City of Richmond, Saturday, May 25, steaming down the harbor amid the cheers and farewell salutes of numerous friends. As soon as the high seas were reached it became evident that high attainments in steam engineering, iron-smelting, mining or machine construction are by no means a guarantee against the discomforts caused by an unstable equilibrium, although woeful countenances were generally explained by the grief occasioned by departure from home and friends. A few days of smooth sailing, as comfortable as a trip on a new boat, brought smiles to tearful countenances and appetites to the most dyspeptic. The engineers and their ladies whiled away the intervals between meals, the four great events of the day, as best suited their tastes. Special efforts were generally made to make the evenings memorable; a dance, a concert, an initiation into the Order of Neptune following one another in rapid succession. To a number of the members of the party frequent committee meetings caused additional diversion, the object being to arrange for a provisional organization. Subject to confirmation by the party on the City of New York, the following joint committee was appointed: Henry R. Towne, of Stamford, Conn., president; S. J. Whittemore, O. Chanute, C. J. H. Woodbury, of Boston; Alfred E. Hunt, of Pittsburgh, Pa.; S. W. Baldwin, agent Pennsylvania Steel Company at New York; John T. Hawkins, Campbell Printing Press Company, of Taunton, Mass.; Oberlin Smith, Ferracute Machine Company, Bridgeton, N. J.; Alexander Dempster, W. H. Wiley, of New York; William Forsyth, C. B. and Q. Railroad, Aurora, Ill.; Herbert G. Terry, U. S. Assay Office, New York; C. E. Emery, New York Steam Heating Company, New York; C. Kirchhoff, Jr., editor *The Iron Age*, secretary.

Just before departing invitations were received from a committee of Liverpool engineers to take part in one of two excursions arranged for Thursday, the day following the probable date of arrival of the City of Richmond. One of these excursions is to be conducted under the auspices of the Liverpool Dock Estates Trust, and the other is to visit the famous ship-building yards of Laird Brothers, at Birkenhead, opposite Liverpool, going from there to the pumping and ventilating plant of the great Mersey Tunnel. In the evening a reception is to be held at the Liverpool Town Hall by the mayor of the city. On Friday the members divide into a number of groups who will spend the Whitsuntide holidays amid the mountains of Wales or the charming lake region.

It is only natural, since the trip was originated by the American Society of Mechanical Engineers and was principally pushed by the officers of that body, that the greater number of gentlemen in the party are identified with it. Among those who sailed on the City of Richmond are: Robert Allison, of the Franklin Iron Works, Port Carbon, Pa.; D. L. Barnes, consulting engineer, of Chicago, who has lately designed steel cars for the Illinois Steel Company; G. H. Barrus, of Boston, Mass.; W. H. Baldwin, manufacturer of bolts and nuts at Youngstown, Ohio; S. W. Baldwin, of the Pennsylvania Steel Company; C. S. Beach, Bennington, Vt.; M. A. Beck, Chicago, Ill.; Jerome L. Boyer, Chestnut Hill Iron Ore Company, Reading, Pa.; Morgan Brooks, St. Paul Gas Light Company; W. D. Caldwell, cot-

ton manufacturer, Nashua, N. H.; F. A. Canfield, of Dover, prominently connected with New Jersey iron ore interests; R. E. Curtis, Newburyport, Mass.; C. M. Collins, of Studebaker Brothers, South Bend, Ind.; James Christie, chief engineer Pencoyd Iron Works, Philadelphia; F. H. Daniels, Washburn & Moen Mfg. Company, Worcester, Mass.; E. V. D'Inville, of the Second Geological Survey of Pennsylvania; Fred. P. Dewey, curator of metallurgy, National Museum, Washington, D. C.; W. V. Fairbairn, chief boiler inspector of Massachusetts; Robert Fraser, mining engineer, of Philadelphia; Edward O. Goss, Scovill Mfg. Co., Waterbury, Conn.; George A. Gray, manufacturer of tools, Cincinnati; G. N. Hewitt, Aspen, Col.; O. S. Harmon, of Brooklyn, who is connected with the Lorillards, of Jersey City; William Hill, Collins Company, Collinsville, Conn.; H. D. Hibbard, steel melter, of Pittsburgh, Pa.; Edwin T. Howard, fire-brick manufacturer, of St. Louis; Chas. E. Hyde, of Bath, Maine, who is interested in marine engineering and ship-building; Frank E. Kirby, who is similarly engaged at Detroit, Mich.; Prof. D. S. Jacobus, of the Stevens Institute of Technology; W. T. Magruder, of Vanderbilt University, Tenn.; G. T. Alden, of the Worcester Polytechnic Institute; Allyne L. Merrill, Edward T. Miller and Peter Schwamb, of the Massachusetts Institute of Technology; F. F. Sharpless, of the Michigan Mining School; E. P. Jennings, of Stambaugh, Mich.; William Kent, of the Springer Torsion Balance Company, Jersey City, N. J.; Chas. Kirchhoff, Jr., editor *The Iron Age*, New York; G. Lavagnino, engineer of the Old Telegraph Mine, Salt Lake City, Utah; Edwin Mickle, Thomas Iron Company, Hokendauqua, Pa.; E. H. Mumford, Union Pacific Railroad, Leavenworth; Edward McIlvain, manufacturer of plate iron, Reading, Pa.; F. P. Grosvenor MacLean, United States Patent Office, Washington, D. C.; Edward Nichols, Brooks Locomotive Works, Dunkirk, N. Y.; John D. Ormrod, Donaldson Iron Company, Emaus, Pa.; Edgar Richards, chemist United States Treasury Department, Washington, D. C.; T. H. Roberts, Grand Trunk Railway, Detroit, Mich.; D. W. Robb, Amherst, Nova Scotia; T. A. Robinson, Illinois Steel Company, Joliet, Ill.; Walter S. Russell, Russell Wheel and Foundry Company, Detroit, Mich.; Newell Sanders, Chattanooga Plow Company, Chattanooga, Tenn.; T. Jackson Shaw, ship-builder, Wilmington, Del.; Oberlin Smith, Ferracute Machine Company, Bridgeton, N. J.; G. R. Stetson, superintendent Morse Twist Drill Machine Company, New Bedford, Mass.; A. A. Stevenson, Standard Steel Works, Lewistown, Pa.; H. H. Supple, editor *Mechanics*, Philadelphia; Ambrose Swasey, of Warner & Swasey, Cleveland, Ohio; J. Archie Taylor, Pusey & Jones Company, Wilmington, Del.; James A. Tilden, Hersey Meter Company, Boston, Mass.; E. A. Uehling, superintendent of blast-furnaces of Bethlehem Iron Company; F. H. Underwood, manufacturer of belting, Tolland, Conn.; Baxter D. Whitney, manufacturer of wood-working machinery, Winchendon, Mass.; W. C. Williamson, engine builder, Philadelphia, Pa.; James Wister, iron merchant, Philadelphia; Walter Wood, of W. D. Wood & Sons, manufacturers of cast-iron pipe and gas works, Philadelphia; Maunsel White, Bethlehem Iron Company, Bethlehem, Pa.; C. J. H. Woodbury, consulting engineer of the Manufacturers' Mutual Insurance Company, Boston, Mass.; Horace Wyman, manager machine works, Worcester, Mass., and H. Winfield Wyman, manufacturer of forgings, from the same city.

It will be seen that there is quite a representative body of engineers, the greater

majority of whom are members of the American Society of Mechanical Engineers, while there is a fair number of members of the American Institute of Mining Engineers. An additional number of both bodies follow on the City of New York, which, however, contains in its passenger list nearly all the members of the American Society of Civil Engineers who accepted the invitation of their English hosts.

#### Belt Strapping Machine.

This machine is built for the purpose of running belts covered with emery, for strapping and polishing. It consists of a rigid bed, upon which are clamped two heads, each having a steel spindle carrying a driving-pulley between the bearings, and a flange-pulley close on the outside. A hand-wheel at one end of the bed

This machine is made by the Diamond Machine Company, of Providence, R. I., and Chicago, Ill.

#### Judge Thayer's Railroad Decision.

The opinion of Chicago railroad men is greatly divided on Judge Thayer's decision. Some consider it the beginning and the end of the Interstate Commerce act, or of a revolution in the existing state of affairs. Chairman Walker, of the Interstate Commerce Railway Association, and until March a member of the Interstate Commerce Commission, spoke freely on the subject. Said he: "The decision is, I think, an extremely important one. Contrary to most of the reports, Judge Thayer did not say, however, that the through rates should be the sum of the locals. On the other hand, although he does not say in so many words that there should be a

sult a state of affairs which would revolutionize business and bankrupt the Western grain-raising States. No grain could be moved from the interior to the seaboard. It is not likely that this state of affairs will come to pass, but it might. This case being a criminal one, it may be appealed from the district court where it was tried. If then the circuit court judges agree there is no further appeal. As far as regards this case, I believe it can be easily defeated. The defendant, Tazer, or, more properly, the Missouri Pacific road, was found guilty of discriminating against the Hayward Grocery Company, the shippers in both cases. The through barrel of sugar, which was shipped from Chicago, cost 34 cents per 100 from Hannibal to Hepler, and the local barrel cost 46 cents per 100 between the same places. The very fact that the shipper was one and the same in both

THE DIAMOND BELT STRAPPING MACHINE.

operates a square-thread screw for drawing one of the heads along the bed to secure the proper tension for the belt. To facilitate the changing of belts the other head is provided with a handle whereby it can be pushed quickly along the bed. Each head is clamped by a lever and cam, as shown, and a slight movement is sufficient to release or tighten it. One spindle is provided with the regular arrangement for carrying leather-covered or cloth wheels on the end opposite the flange-pulley. Two adjustable rests are furnished for different varieties of work, one being used under the lower belt, the other under the upper one. The machine is heavy, well proportioned, and arranged to run at a high rate of speed. The most important measurements are as follows: Length of bed, 6 feet; height from floor to center of spindle, 39 inches; size of flange-pulley furnished, 12 x 2½ inches; length of bearings, each, 4½ inches; diameter of spindle in bearings, 1½ inches; diameter of spindle between flanges, 1 inch; floor space, 2 x 6 feet; weight, complete, with counter-shaft, 600 pounds.

difference, he intimates that there might be by the words: 'Now, conceding that some difference between the local rate and the Missouri Pacific's proportion of the through rate is permissible under the Interstate Commerce law, owing to the different conditions affecting the two shipments, the one being a through shipment and the other a local shipment, the question I submit under the second and third counts is whether the difference shown in this case between the two rates of 12 cents per 100 pounds is, under all the circumstances of the case, a reasonable difference or an undue and unreasonable difference not justified by the circumstances under which through shipments from Chicago and local shipments from Hannibal are made.' Now, whether or not this definitely means that a difference of rates can be made, it would practically result in a jury, when called upon to figure the proper difference, deciding in favor of its own locality. In other words, this leaving of railroad rates in the hands of a jury would result in the through rate being the sum of the locals. From this would re-

cases will, I think, destroy all ground for discrimination. The act states that no greater or less rate shall be made to one person than to another person. In this case Hayward cannot be two persons."

General Freight Agent Paul Morton, of the Burlington, was a witness in the case. Said he: "We don't propose to get excited unless we see the necessity for it, and as yet I see no cause for alarm, because the decision will be reversed. It comes up on appeal before Judge Brewer, and I am confident he will not agree with the lower court. The decision is entirely against the public. If it is carried out it will end in the railroad's carrying a much smaller tonnage at a much smaller rate."

Judge Beckwith, of the Alton road, and Chairman Blanchard, of the Central Traffic Association, both agree that according to the wording of the act the through rate must be the sum of the locals.

The American square-rigged ship State of Maine arrived at this port last week in 92 days from Hong-Kong.

### The Wenstrom Magnetic Separator.\*

As the margin of profit in the manufacture of iron continues to decrease attention is called more and more to economics in every department. Beginning at the bottom, in the preparation of the ore at the mine, we notice a general tendency is toward the shipment of richer ores, securing to the mine-owner a better price per ton, which the purchaser is glad to pay by reason of the saving in freight of iron and in the cost of reduction, which depends so largely upon the amount of fuel and flux and the productive capacity of the plant. In other words, the difference in value between rich and poor ores is much greater than their relative percentages of iron indicates, because the barren material in a lean ore is not merely worthless—it is a positive source of expense, requiring transportation, handling, fluxing, smelting, and its due share of general expenses; in return for which it yields nothing and decreases the available capacity of a given plant and capital for profitable work.

The enriching of the ore is done in most places by hand picking, and in a few by wet concentration; but the managers of several magnetite mines in Sweden have been practically successful in doing it by machinery. The only magnetic separating-machine which has actually taken the place of hand picking was designed and patented by Mr. Jonas Wenström, of Örebro, Sweden.

In this machine, which is illustrated herewith, Mr. Wenström has taken advantage of the property of soft iron to become magnetized by induction. The machine consists of a barrel made up of soft iron bars and some non-conducting material (usually wood), which is rotated around a stationary shaft by means of a cog-wheel. Inside of this barrel, on the shaft, is placed eccentrically a cylindrical electro-magnet, provided with a number of flanges, Fig. 1, between which wire is wound in such a manner that the flanges are of negative and positive polarity, but energized by a current passing through the wire coils from a small dynamo. As will be seen in Fig. 1, the flanges are circular and follow the internal contour of the barrel on the front side, while on the opposite side they are cut down to the line B B', in Fig. 2. Hence the bars of the revolving barrel on the front side of the machine are magnetic only while passing from B to B'; and after they pass the point B' in the lower part of the machine they cease to be so, and remain entirely without magnetism in passing through the space from B' to B, at the back of the machine. The bars have alternately two and three projections coming close to the polar flanges, so that each bar becomes virtually a prolongation of the magnetic poles.

The ore and rock are fed on top of the revolving barrel during half a revolution, being only released after it had passed out of the magnetic field at B'; the non-magnetic material rolls off the barrel and falls in front of the dividing-board, while the magnetic material drops off behind it.

Two sizes of this separator have been introduced. The largest size treats from 6 to 7 tons per hour, and the magnetism is strong enough to support pieces of ore up to 7 pounds in weight, and separate them from the rock. The smaller size treats from 2 to 3 tons per hour of finer material, below  $\frac{1}{2}$  pound in weight of single pieces.

In Sweden these separators are used at the iron mines for extracting from old and new dumps of waste material the good ore which has been missed in the hand picking, or was too fine to be picked out in that way. They are

also applied to the ore now being mined, which in former times was selected by hand. Three of the Swedish mines use the larger size of the machine and four the smaller.

During a recent journey in Sweden (unfortunately in the winter, when the dumps were frozen and the machines idle) the writer visited five of the mines where these machines are used, and obtained the records of their working results. It is deemed sufficient to give in this paper, as a typical example, the data thus collected at the Dannemora Mine. Practice elsewhere is essentially similar, the cost varying at each mine in proportion to the handling necessarily given the ore before it comes to the separator.

The Dannemora plant consists of a separator, 24 inches on the face and 27 inches in diameter, a small dynamo and

pieces of ore which may have been mechanically knocked off by larger pieces of rock. The men's work consists of shoveling the ore into the elevator and taking the rock and ore in the cars to the dumps. The amount of material handled averages  $6\frac{1}{2}$  tons per hour.

The cost of hand picking at Dannemora previous to the introduction of this machine was 32.6 cents per ton. It now costs 9.8 cents per ton,\* and 80 per cent. more ore is obtained from the same material. Analyses of these ores are not frequently made, but it is known that the separated ore averages 59 per cent. iron for the coarse and 45 per cent. for the fine. If the fine ore can be fed by itself in a somewhat different way the results as to that part would be much better.

The separator was introduced in 1886, during which year no permanent plan,

Fig. 1.—Cross Section.

### THE WENSTROM MAGNETIC ORE SEPARATOR.

a portable engine, which runs not only the separator but also a bucket-elevator and a hoist capable of raising a car loaded with  $\frac{1}{4}$  ton of ore. The material, which is anything below a 4-inch mesh, is dumped from a trestle at the elevator, which conveys the material to the feed of the separator, and the separated rock falls into a chute, and is thence delivered into a car and run off to the waste-dump. The ore runs down into a barrel-screen of perforated steel, the holes being 1 inch in diameter. The pieces which pass through fall into one car, while the coarser portion falls into another. These cars are then hoisted on the elevator and run off to the point of shipment. The fine stuff, below 1-inch mesh, is kept by itself for reasons connected with the subsequent roasting. All the ore is roasted, and there is some difficulty in roasting the fine ore. Consequently not more than 5 or 10 per cent. of the charge in the roasting-kilns is permitted to be fine. The fuel used in the kiln is the tunnel-head gas from the blast-furnace. Four laborers and an engineer are required to run the machine to its fullest capacity, with a boy to pick out from the rock any

was erected, but the machine was moved from one small waste-heap to another. The present plant was erected in 1887, and during that year, as also in 1888, the separator was run intermittently through a season of five months. The work of the three years was as follows:

Year.	Total material treated. Tons.	Ore obtained. Tons.	Percentage of total material obtained as ore.	Rock. Tons.
1886....	2,000	No data	...	2,111
1887....	5,720	3,809	63	1,911
1888....	5,169	3,923	76	1,246

Any invention adopted from a foreign country, where the plans of working, as well as the ore treated, are different from our own, must necessarily be changed to some extent to do the work required in

\* This includes interest on plant and depreciation. The cost for repairs has been nothing, and the machine shows no wear

\* A paper read by Robert Anderson Cook, A.M., of New Brunswick, N. J., at the New York meeting, February, 1889, of the American Institute of Mining Engineers.

America. Apart from this consideration, each ore must be treated in a different way. But that this invention is of practical value to us in America is demonstrated by the fact that it is used profitably in Sweden, where labor is not worth more than 50 cents per day.

There are three different cases to which this machine can be successfully applied, with only one change in the feed (namely, when the ore is below a  $\frac{1}{4}$ -inch mesh). First, where there are waste-dumps, and the run of mine has to be hand-picked. Second, where only what might be called preliminary crushing is necessary to break the greater part of the ore free from the rock—that is, by passing it through an ordinary crusher to a  $\frac{1}{4}$ -inch mesh, which ought not to cost more than 15 cents per ton. Third, where the ore must be pul-

One, which the Swedish Government settled to the satisfaction of its furnace manager, is that of the use of fine ore in the furnace. It had always been supposed to be a detriment to the furnace to charge a large proportion of fine ore. Experiments were made at the expense of the Government, under the charge of Mr. Granstrom, of Norberg, the eminent Swedish engineer, in the preparation of briquettes of a mixture of fine hematites crushed and concentrated to 85 per cent. of iron with slacked lime in a powerful brick machine. These briquettes were very nice-looking, but when put in the furnace they all went to pieces. Mr. Granstrom then resolved to see exactly how much fine ore a furnace would stand. Taking one of the charcoal furnaces in his charge, he began by using a mixture of 10 per

pieces of iron from the dirt in yards where pig-iron has been stored or from any old heaps of waste material; for instance, where the dumpings from cupolas have been piled.

One of the small Wenström machines was brought over from Sweden to this country last year, and tested with very satisfactory results on limited quantities of different ores and waste material from around steel-works. One instance in particular may be mentioned—namely, the treatment of cinder from the Bessemer converter, a material which is almost wholly thrown away at American steel-works, a small portion only being used in the blast-furnaces. A hundred pounds of this material, crushed in an ordinary Blake crusher, was run over the separator, the result being 25 pounds of magnetic material containing 70 per cent. of metallic iron. The same quantity of this waste product from another steel-works gave 38 pounds of magnetic material.

A machine was sent a short time ago to the Lackawanna Iron and Coal Company, at Scranton, Pa. At these works the waste from the cupolas and from around the runners at the converter has been for a long time treated by putting it in a "rumbler" such as is used for cleaning castings at foundries, only of a larger size. The fine pieces of slag and iron are thus broken up and fall through the rumblers, and these have always been sent to the waste-dump, while the coarser pieces are taken from the rumblers and sent to the cupola to be melted over again. At present the fine waste before it goes to the dump is put over the Wenström separator.

The following is the result of 11 days' running (from March 8 to 13, 1889), four and a half hours per day, 198½ tons of waste being put over the machine. From this quantity there was obtained 35 tons 3 cwt. of iron. Two men were added to the force at the rumblers to handle the material to and from the separator. The engineer was the same who ran the rumblers, and the steam for running the separator was obtained from the same boiler, so that the total expense was only \$2.50 per day for coal, labor and oil.

The handling of converter-cinder on a large scale has not been undertaken as yet by the Lackawanna company, the crusher required not being ready.

Fig. 2.—Longitudinal Section.

#### THE WENSTRÖM MAGNETIC ORE SEPARATOR.

verized by further machinery to a  $\frac{1}{4}$ -inch mesh or some smaller size.

The first two of these cases are very simple, but the third is a problem by itself, in which the cost of mining, the number of tons which must be crushed to obtain one ton of concentrate and the cost of crushing are items of far more importance financially than the mere separation of the ore from the rock. Each mine-owner must decide for himself whether it will pay. The cost of separating ore per ton of finished product by any machine it is impossible to give, since it varies with the richness of the ore. A Wenström machine requiring 1½ horse-power to run the dynamo and  $\frac{1}{4}$  horse-power or less to run the separator has a capacity of 50 tons of fine (or a larger amount of coarse) material in ten hours. The feeding should be automatic, and the ore and rock should fall by their own weight into the cars, so that there need be no hand-labor except that of feeding the crusher or screen if coarse material is to be used.

Some interesting questions arise in connection with the concentrated fine ore.

cent. fine ore and gradually worked it up to a maximum of 75 per cent. The only change he found with the latter mixture was that the gases were a little hotter, and he was able to carry a little heavier burden on the furnace. The pressure was the same, and the conclusion reached was that the manufacture of briquettes was entirely unnecessary.

Another question concerns the effect of fine concentration in reducing such impurities of the ore as enter the pig-iron made from it. This has never yet been carried so far in practice as to convert a non-Bessemer ore into a Bessemer ore by eliminating, through the process of concentration, the phosphorus contained in the gangue; but in all the concentrations of ores, wet or dry, the impurities have been materially reduced, and it seems not unreasonable to expect that many ores which are but little outside the "Bessemer limit" will be brought within that limit and thus made more valuable.

There are other uses to which this magnetic separator has been profitably applied in Sweden. One is that of separating the

#### New Tool-Holder.

A neat form of tool-holder has lately been devised, says *Engineering*, of London, by Mr. Baldwin H. Bent, B.A., Demonstrator of Mechanism and Mechanics in the University of Cambridge. It is

Bent's Tool-Holder.

illustrated in the annexed views. The tail of the cutter lies in a hollow formed in the handle of the holder. By reason of this arrangement a relatively long piece of steel may be used to form the cutter, and when it is so far reduced that the remainder has to be thrown away the piece wasted bears only a very small proportion to the part which has been used. The cutter is secured by being passed through a slot formed in the shank of a bolt just

beneath the head. When the nut of the bolt is tightened it nips the cutter between the bolt-head and a flat surface on the holder, holding it very stiffly and securely.

#### Aerated Fuel.

Manufacturers are always interested in the question of cheaper fuel, and none are more deeply concerned than the iron-workers, especially those who cannot dispose of their present valuable plant and move into the coal or natural gas regions. The subject here presented is therefore of timely interest. For nearly two years past the Aerated Fuel Company, of Springfield, Mass., have been placing their oil-burning system upon the market, and seem to have accomplished remarkable results, if we are to rely upon what some of the large manufacturers who are using their process claim for it. The accompanying engravings show the form and arrangement of a burner-cylinder and the application of this method of burning oil to a boiler and a forge. The air space, Fig. 1, is filled by a compressor which should

of general work. One cylinder containing six burners is placed on one side only, leaving one end open to receive the work. If desirable both ends may be left open, especially when it is desired to heat long pieces of iron or steel at the center. By putting an adjustable movable brick partition in the center as many burners as are not wanted can be shut out, thereby reducing the area of the fire-box, and only using one or two burners, as may be best suited to the work being done. This style of forge is in use at the repair shops of the Boston and Albany Railroad, at Springfield, and is regarded by the superintendent as being far superior to that using coal for all work requiring a high degree of heat at short notice.

The above company have many forges, muffles, ovens and similar fires, using over 1800 burners, consuming crude Lima oil burned by being atomized by governed air-pressure, and producing heat similar in quality to that of natural gas, but yielding, it is claimed, better effect upon iron, steel, brass and other metals. It can be adapted to nearly any forge now in use, but a compressor is necessary, as a blower

as the Atlanta, but will be much more formidable craft, better armed, of higher speed, and in fact representing six or seven years' advancement in naval construction. They are patterned generally upon the Medea, an English cruiser of great speed and combining many good qualities. They will be larger, however, by 100 tons and embody many improvements suggested by the working experience of the Medea. It would appear that particularly good inducements are held out to bidders for constructing them, for the designs of the Department, which are based largely upon the performance of the Medea, supplied 10,000 horse-power, which is estimated to be sufficient to drive the vessels at 20 knots speed. If this expectation is realized upon trial the contractors will receive the respectable bonus of \$200,000, or \$50,000 for each quarter knot above the 19 knots they must guarantee. The dimensions of the new cruisers will be as follows: Length, 300 feet; breadth, 42 feet; draft, 18 feet; displacement, 3100 tons; full coal capacity, 628 tons. The armament will consist of one 6-inch and ten 4-inch rapid-fire guns (the latest idea in naval arma-

Fig. 1.—Interior and End View of a Burner Cylinder.

maintain an air-pressure of from 10 to 25 pounds per square inch, according to the kind of work being done. Although the nozzle of the burner is small—from  $\frac{1}{8}$  to  $\frac{1}{4}$ —and only a small quantity of air is used, yet it must be under an equal pressure in order that the oil may be finely atomized before igniting. The object of the float is to prevent the flowing of oil into the cylinder and rising above the mean level as established by the governing device in each cylinder. The float falls of its own weight so as to open the valve and allow the oil to rise again to the mean level. The process does not depend upon the oil flowing to the burner by gravity, and therefore the oil reservoir is placed at any convenient point below the burner, to which the oil is drawn by the current created by the escaping air. For this reason the oil ceases to flow through the burner when the air-pressure is removed and the flooding of the furnace is rendered impossible. One valve controls both the oil and air. The application of this system to the heating of boilers has met with success. The following advantages are claimed for it over coal: Uniform heat, constant pressure of steam, no ashes, clinkers, soot or smoke, and consequently clean fires; one man can attend to from 10 to 15 100 horse-power boilers.

Fig. 3 shows the system applied to a forge adapted to a large variety

will not maintain the pressure required. One important point regarding the safety of this system is the fact that although some 1800 of their burners are now in use, as stated above, in not a single instance have the insurance rates been increased.

#### Bids for More Cruisers.

The Navy Department has issued advertisements inviting proposals for the construction of two steel cruisers of 8000 tons displacement, under the authority conveyed by the Appropriation act of September last. The contractor is required to guarantee a minimum speed of 19 knots for four consecutive hours, and there is a bonus provided of \$50,000 for every additional quarter knot and a deduction of the same amount for each quarter knot deficiency. The vessels are to be completed in two years, and exclusive of the speed bonus their cost is not to exceed \$1,100,000 each. The contractors are allowed to bid for the construction of the hull and machinery according to their own designs or to accept those furnished by the Department. The proposals are to be opened August 22, and the time for the receipt of proposals for building the three 2000-ton cruisers has also been extended from August 1 to the same date.

The new vessels will be about as large

ment) and eight machine guns. The ships will be two-masted-schooner rigged, but will carry sail enough only to steady them in a sea-way. Altogether, if the vessels realize expectations they will be the fleetest and hardiest vessels in the navy.

We have been favored by E. J. Jacobus, Potter Building, New York, agent for Charles Cammell & Co., Limited, with a full account of a disastrous railroad accident which occurred at Penistone, England, some weeks since, and in which the excellent character of the Cammell steel rail was demonstrated in a very striking manner. A broken axle threw the train off the track over which it was running at a high rate of speed. The cars were badly wrecked and a number of people severely injured, one being killed. Describing the scene after the wreck, the *Sheffield Telegraph* says: "On the permanent way the effects of the accident were equally visible. The rails, made at the works close by, were branded 'Cammell's toughened steel,' 25 feet in length and 75 pounds to the yard. Yet the engine bent and twisted them like strands of wire. One massive rail was curved into the shape of the letter 'S,' and another was bent round to form a huge horseshoe. That they were 'toughened' were clear enough, for in no instance had

the force to which they were subjected caused them to snap or even to 'peel,' Messrs. Cammell & Co. should secure these rails as specimens of what they can do in rail-rolling." The axle which was the cause of the accident was made by

per cent. more than some of our competitors paid for the same work. This took place here in Pittsburgh in Amalgamated mills and has been going on for years, and there are several such mills here. I can name many such cases, differing from this

the wages question; they have abolished the advance that formerly existed in Western prices over Pittsburgh and the valleys; they have totally failed in their efforts to raise the Eastern prices to Pittsburgh rates; they have held Pittsburgh prices so high as to make the manufacture of iron here unremunerative. This is proved by the fact that some of our old and well-managed establishments have failed and their mills are now idle, and few of the others are working to advantage. Four years ago the officers of the Amalgamated Association saw what was just and necessary, and proposed and carried a reduction (but it was recalled next year), and for this they were nearly thrown overboard. The rapid and increasing use of steel makes a reduction in the rates of wages more necessary now than ever before. It is no answer to say that manufacturers show, by keeping their mills in operation, that they are able to pay the present prices; that is neither an intelligent nor an equitable way of settling the question. Manufacturers have undergone a great deal of twitting and misrepresentation in consequence of their unwillingness to undergo the heavy losses incident to a strike and stoppage of their business and its transfer to other districts not affected, and an intelligent and fair association should not require it.

I am firmly of the opinion, in which I am joined by many intelligent workmen, that the very best thing the convention of the Amalgamated Association can do for themselves and the business interests of the employers would be to calmly investigate the whole situation and propose a readjustment. By so doing they will show their capacity for appreciating the needs of business, and prevent the enlarging of the list of non-union mills.

Dynamite explosions under the direction of General Hastings, who is clearing away the *débris* at Johnstown, add new terrors for the inhabitants of that afflicted city. On Saturday chimneys and glass suffered severely, and in the evening General Manager John Fulton, of the Cambria Iron

Fig. 2.—Application of the System Under a Boiler.

Vickers, Sons & Co., Limited, of Sheffield, who are regarded as very reliable manufacturers.

#### Western Prices for Puddling.

David B. Oliver, of the well-known firm of Oliver Bros. & Phillips, large iron manufacturers at Pittsburgh, recently contributed the following letter to the *Pittsburgh Dispatch*:

Anent the *Dispatch* editorial of this date headed "Leveling Them Up," referring to the action of the Amalgamated Association in establishing lodges in the Eastern mills and their efforts to bring Eastern prices up to the prices paid here, it is certainly to be hoped they may succeed. They have been engaged in these efforts for the past 12 years and so far have but little to show. Last week's *Labor Tribune* indulged in congratulations on the successful result in a strike in the mill in Danville, Pa., which ended in fixing the price for boiling at \$3.60 per ton; in Pittsburgh the price is \$5.50 per ton; both these are Amalgamated prices. All practical men I think will agree with me in saying that the facilities are better in Pittsburgh for doing this work than they are in Danville.

While the Amalgamated Association are engaged in this laudable work in the East it is to be hoped that they will not allow these outrageous discriminations to take root and grow up right here at home. It is a fact well known to many manufacturers and workmen that for several years past the scale of prices in many important respects in some Pittsburgh mills has been a dead letter, to the advantage of some employers and the disadvantage of others—their competitors who pay the prices called for by the scale. A short time since a large order was distributed among several Pittsburgh mills. Our company received a portion of it, and for the rolling of the part that we made we paid just 300

one only in degree, and I am ready to furnish the details to any one who may call on me and who may have the right to know them.

These discriminations cover a large part of the product of some of our largest mills.

Fig. 3.—The System Applied to a Forge.

To say they are unjust is no description. They are dishonest and they must be remedied. I am not overstating the case when I say that for several years past the Amalgamated Association have been discriminating heavily and directly against the business of Pittsburgh and the Mahoning and Shenango valleys in their treatment of

Company, dictated a forcible protest to Governor Beaver, saying that the mills and offices of the company were being ruined by the blasting; that no attention had been paid to two requests for its discontinuance, and that the State would be held responsible for any further damage done.

## THE WEEK.

Mayor Grant declares his hostility to the particular form of rail commonly in use by street-cars in this city, known as the center-bearing rail, and he is determined that there shall be no delay in making a change if improvement can be enforced.

An Ottawa dispatch says: "The refusal of the Washington Government to grant bonding privileges to the Canadian Pacific Railway over their line through the State of Maine to the Atlantic sea-board is causing considerable alarm in official circles here. The Canadian Pacific claim that the refusal of the United States authorities will render useless the entire line for freight-carrying business, and will involve a loss of several millions, besides defeating the object of the line in securing a short line to the Atlantic sea-board. A cabinet minister said: 'The refusal of the American Government to grant privileges precisely the same as are now enjoyed by other Canadian lines in the United States and several American lines in Canada was most extraordinary and would not at all tend to improve the strained relations now existing between the two countries.'"

Within the last 12 months 11 American breweries have been capitalized in London at figures averaging £578,000. The *Statist* remarks quite sensibly: "The Americans are at least as enterprising and as keenly alive to the value of a good business as any Europeans, and they would hardly allow these brewery companies to come to Europe if they thought them worth the price at which they have been sold."

A trial run of the latest improved Sims-Edison electric torpedo was made at Willett's Point last week in presence of Captain Roessler and a number of officers of the regular army stationed at the Point, the improvement being an increase of speed from 10 miles an hour to from 18 to 22 miles, attained by making the lines of the hull of the float much finer and by an increase of the motor power. Heretofore the highest average rate of speed attained was 10.04 miles per hour. In a run of over 800 feet the speed made was at the rate of a fraction over 21 miles per hour, the time elapsed being 25 seconds. The current which was sent through the cable during the 800-foot run registered 900 volts and 25 amperes—equal to 30 horse-power. The 30-inch screw made about 900 revolutions per minute. The improved torpedo is 30 feet long and 20 inches in diameter and weighs 3000 pounds. It has a screw propeller and rudder, the former being at the stern and the latter on the back a few feet from the stern. The hull is supported at a submerged depth by an indestructible float, which, like the hull, is entirely of copper, and is attached to the hull by an upright steel stanchion and steel blades, which run at sharp angles, connecting the hull and float both at bow and stern, which enable it to dive under any obstructions met with when running.

It is learned that the Canadian Pacific Railway propose to establish large car works in the State of Maine at a point on their line through that State. The company hope by this means to evade the possibility of any interruption to passenger traffic by using American-built railway cars.

To prepare for the fall trade the Reading Railroad Company have given orders for 750 coal cars, of which 500 are in course of delivery.

The great "Sugar Trust" appears to be working satisfactorily to the members of that organization, despite a decision of the courts declaring its illegality. The profits are enormous and increasing. The consumption of sugar in the United States

last year was estimated at nearly 1,500,000 tons, of which 1,000,000 tons passed through the refineries controlled by the trust. The net profit to the same at 4 cent per pound—or say \$14 per ton—yielded \$14,000,000; refiners outside at the same time realizing altogether \$5,000,000 profit. The sugar brokers Willett & Hamlin, of this city, who make these calculations, say in their circular just issued that up to April 1, 1889, there was no special profit to refiners over the preceding year, but for the last two months the meltings yielded at least 4 cent per pound additional profit—"say a total net profit for the five months of \$8,280,000" for the so-called Sugar Refineries Company and \$3,410,000 for outsiders. Next to the Standard Oil concern the Sugar Trust is a success.

W. J. Coombs, of New York, head of the long-established exporting firm of Coombs, Crosby & Eddy, in addressing the National Furniture Manufacturers' Association, at their meeting in this city last week, spoke of the increasing popularity of American products in foreign markets. He said the principal reason the country had no maritime marine was that vessels could not obtain return cargoes. American manufacturers were competing in the foreign markets and driving all others out. Twenty years ago there was hardly anything going out but axes and wooden ware, and now almost everything made in the country had a good market abroad. That was due to the superior skill, intelligence and energy of the American workman. America was now doing a large trade with the English colonies and sending carriages to Africa. American goods were paid for in cash in countries where the English merchants had to give credit.

Pensacola has been chosen as the shipping point for coal from the Alabama mines to supply Cuba and the West Indian trade, which is expected to reach 400,000 tons annually. Steel barges will be employed.

The Carson Mint, in Nevada, has been reopened.

American machinery is in some respects unsurpassed. Yet we see it stated that the United Kingdom exports over \$55,000,000 worth in a single year, as compared with less than \$10,000,000 sent to other countries from the United States.

A number of prizes for technical work were awarded at the fifth annual exhibition of the Hebrew Technical School, held in this city a few days ago.

The agreement negotiated by the Commissioners to the German Conference for the settlement of affairs in Samoa was signed at Berlin by all the members of the conference on the 14th inst. As described in a Berlin dispatch the draft guarantees an autonomous administration of the islands under the joint control of Germany and America, England acting as arbitrator in the event of differences arising. The Samoans are to elect their own King and Viceroy and to be represented in a Senate composed of the principal chiefs and chambers elected by the people. Samoa is to have the right of levying duties of every kind. The agreement also stipulates that the Germans shall receive a money indemnity for their losses. A special court will be appointed to deal with the land question. The *status quo* will be maintained in Samoa until the treaty is ratified in the United States Senate.

The signing by Governor Hill of the so-called "bucket-shop bill" will have a tendency to suppress stock-gambling outside of the regular exchanges.

The Montgomery Bridge, crossing the Susquehanna River above Sunbury, Pa., was completed in a little less than four

days by 400 men under the personal direction of Vice-President Frank Thomson. It gave the Pennsylvania Railroad a route to the West without using the main line west of Harrisburg. The bridge is nearly 1000 feet in length, and the swiftness of the current made the work of construction extremely difficult.

The Nicaragua Canal Company are reported to have bought the Pallas Line of steamships for \$400,000, the new enterprise to be represented by Mr. Hall, ex-Minister to Central America.

An increase of \$34,500,000 in the capital stock of the New York, New Haven and Hartford Railroad Company will be applied, in part, to four-tracking the main line, double-tracking the Shore Line from New Haven to New London, and for exchanging with the stock of leased lines.

About 15,000,000 gallons or one-sixth of the entire daily consumption of Croton water in New York City go directly to supply the demand of manufacturers. As there were only 53 days during 1888 when the natural flow of the river was not sufficient to supply the aqueduct to its full capacity, there is liable to be no scarcity. Next year the new aqueduct will probably be ready for use, and the Sodam Dam capable of performing its functions in forming an additional storage reservoir, while the Bronx River supply will also be augmented.

A "submarine bridge" is proposed between Elsinore and Helsingborg, to be incased in a double tube, having the outerskin iron and the inner one steel, the space between the shells being filled with concrete. It is proposed submerging this bridge sufficiently to allow ships to pass over it.

Experiments in welding wire rope by the electrical process show that the strength of the finished welding is within 18 per cent. of the normal strength of the cable.

Canada will soon have an independent Atlantic cable to England, the \$2,000,000 required having been nearly all subscribed, and Honolulu merchants expect soon to have a cable to San Francisco.

The New England Water Works Association held its eighth annual convention in Fall River last week, President Hiram Nevins, of Cambridge, delivering the address. Superintendent George A. Stacy, of Marlboro, read a paper on hydrants, in which he explained the conditions which existed in his town, with the method of setting and caring for hydrants. A discussion followed, which was participated in by Superintendents W. R. Richards, of New London; Dexter Brackett, of Boston; Edward Darling, of Pawtucket; J. M. Clark, of Northampton; Charles Eglee, of New York; George E. Winslow, of Waltham; H. W. Rogers, of Salem; Chief Engineer Keating, of Halifax, and others. At the evening session Prof. J. G. Denton, of the Stevens Institute of Technology, Hoboken, N. J., addressed the association on "The Economy Attained by Modern High-Expansion Type of Pumping-Engines."

There have been fewer strikes thus far this year than there were during the same period of the previous two years. We quote from *Bradstreet's* the following statistics: "Since January 1 there have been reported 296 strikes, involving 75,110 strikers, against 389 strikes and 111,201 strikers in 1888 and 511 strikes and 212,317 strikers in five months of 1887."

The damage done at Holyoke, Mass., last week by the bursting of the canal bank is now placed as high as \$200,000, without counting the loss in wages, to the mill owners and the water-power company. Some idea of the extent of damage may be understood when it is known that there are in the city 24 paper mills with a daily

product of 200 tons, and owning 121 mill-powers, in addition to which there are 14 other manufactories, owning 71 mill-powers, all of which are either wholly or for the most part shut down on account of the break, thus throwing out of employment from 10,000 to 12,000 people, at a daily loss of at least \$15,000.

A 300,000-gallon iron tank in the oil yard of the National Storage Company, in Jersey City, was struck by lightning on Saturday afternoon and exploded with a force that blew the iron top 70 feet in the air and shook houses a mile distant.

A committee of investigation find that an explosion of malt dust originated a fire that recently occurred in Opperman's brewery, in this city. As a preventive malt mills are equipped with magnetic devices for arresting iron and steel substances before they reach the steel rollers, causing sparks. There is, however, no device which will arrest small flinty stones, and it is believed that in this case a small stone, coming in contact with the roller, caused a spark which ignited the dust, thus making an explosion.

It pays to plant willows. The examination which the Government engineer in charge of the Potomac River improvement made shows that the water reached a height of 2 feet 7 inches above the high-water mark of the freshet of 1877, which was the highest of any known or recorded freshet. The wisdom of planting willows upon the new lands has been justified. That portion of the newly-made flats upon which willows were planted was protected from washing, so that practically no damage was done there, while in the portions of the improvement which were not so protected there has been great loss.

The removal of broken stone at Flood Rock, in Hell Gate, the debris of former explosions, will be renewed at once, but will not be finished under two years. Colonel Gillespie, who has direction of the work, will seek authority for removing other obstructions from the river which are equally dangerous, notably Diamond Reef, between the Battery and Brooklyn, a reef off Thirty-third street, East River, also the obstruction known as the Middle Ground, and which lies just beyond Ward's Island, in mid-channel, over which there is a draft of but 12 feet at low water.

Governor Beaver, of Pennsylvania, announced that he had abandoned the plan of taking money from the State Treasury for the relief of Johnstown, and that he had accepted the offer made by officers of Philadelphia banks to advance him \$1,000,000, without interest, and without security other than the Governor's promise to endeavor to have the Legislature make an appropriation to repay the loan.

The amount of water passing over Niagara Falls varies with the height of the river. Prof. W. D. Gunning estimates the average amount at 18,000,000 cubic feet per minute. Allowing 62½ pounds to the cubic foot, this would give a total of 562,500 tons per minute, or 25,312,500 tons in 45 minutes, of which somewhat more than two-thirds passes over the Horseshoe Falls. Other estimates place the total amount passing over both falls as high as 100,000,000 tons per hour. In comparison, the flood at Johnstown was a gill.

The Minnesota Iron Company, at their meeting at Duluth, after reporting a surplus for this year's business amounting to \$1,800,000, decided to put it into a line of ships for the ore trade, to be built at once. The sum of money to be expended would build about 80 300-ton vessels; but there will be several large and costly steamships of the most approved lake

models, none of them to be less than 3000 tons capacity and fast travelers. They will probably be fitted with triple compound engines of not less than 1200 horse-power. The Minnesota Iron Company are shipping this season, together with their associate mine, Chandler, nearly 80,000 tons a week. The vessels to be built will be capable of carrying considerably over 100,000 tons a month, thus enabling the company to handle nearly all their present output of ore.

The Chesapeake and Ohio Canal stockholders have resolved to repair the damage by the flood as soon as possible. About \$300,000 will be the cost of the work.

The Institution of Civil Engineers gave a reception on the 14th inst. at London in honor of the visiting American engineers. President Goode warmly welcomed the guests, and said that their influence had been one of the principal factors in raising the United States to the place of one of the foremost nations of the earth. Professor Thurston, in behalf of the visitors, returned the heartiest thanks for the cordiality with which they were received.

A floating workshop, to be known as the steel torpedo-depot ship Vulcan, was launched at Portsmouth, England, last week. It is intended that she shall accompany a fleet and carry a large equipment of torpedo-boats. She will be supplied with hydraulic cranes on which torpedo-boats can be twisted in and out of the water. The Vulcan is of 6620 tons burden and 12,000 horse-power.

Senator Cullom says he has already made up his mind with reference to railway management that ultimately Canada and the United States will have to inaugurate an arrangement corresponding to the present Interstate law. "So far in the investigation," he said, "the Canadian officials all affirm that the present law hurts them, and those in this country are positive that Canada profits most by the measure. The argument of our managers was that where the Canadian roads lost on the long hauls extending into this country they recouped on local rates in Canada, while with roads wholly under the operation of the Interstate law this was impossible."

Engineer Burke, of the British man-of-war Calliope, the only vessel that escaped from Apia harbor during the great storm there, has been promoted to be fleet engineer as a reward for his services in enabling the vessel to steam out of the harbor.

The Union Trust Company will erect an 11-story brick and granite front office building at Nos. 78 to 82 Broadway and Nos. 3 to 7 New street. It will have a frontage of 72 feet, will run back 106 feet and will cost \$800,000.

Experiments recently made in electric-subway ventilation in this city have been eminently satisfactory. A large blower has been placed in the basement of the Hotel Metropole, at Forty-second street and Broadway, and connections made with the subways. A constant current of air is sent down along the line, and at Fourteenth street a pipe runs out of the man-hole to the roof of one of the houses. Mr. Kearney, the engineer, says that the system will be applied in other places and that all danger of man-hole explosions is now over.

Farming lands in New York State are depreciating. The assessors in 14 counties visited found that farming lands had depreciated in value while city property had increased in value. State Assessor Wood is of the opinion that in a few years there will be nothing much but tenant farmers in this State. The same facts are observed in Pennsylvania.

## MANUFACTURING.

### Iron and Steel.

The Riverside Iron Works, of Wheeling, W. Va., booked an order last week from the Standard Oil Company for 27 miles of steel pipe. The concern are enjoying an excellent demand for this article at present.

The following is the report of Fayette Brown, receiver of Brown, Bonnell & Co., of Youngstown, for April, 1889: Balance on hand, April 1, \$6,729.98; receipts in April, \$228,720.81; total, \$235,450.24; disbursements in April, \$229,722.98; balance on hand April 30, \$5,727.81.

McClure & Schuler, engineers and contractors, of Pittsburgh, who have the contract for the erection of three hot-blast stoves of the Massick & Crookes design, for the blast-furnace of the Bellaire Nail Works, at Bellaire, Ohio, are pushing the work forward to completion as rapidly as possible. When completed the stoves will add considerably to the productive capacity of the furnace.

A press dispatch from Newcastle, Pa., under date of the 13th inst., says: Samuel S. Brown, William Henry Brown, Lizzie B. Ward and James Ward have begun proceedings in the court of Lawrence County against James M. Schoonmaker and Hugh Burgwin, executors of Alice B. Schoonmaker, deceased, for partition of the real estate situated in this county of the late William H. Brown. The property is known as the Shenango Iron Works property, on which is located Oliver Bros.' Rosena Furnace, and other real estate in this city, and 45 acres of coal lands in Shenango Township. The property is valued at \$100,000 and the greater portion of it has been lying idle for years. It was lately owned by the old firm of Reis, Brown & Berger. The Alice B. Schoonmaker mentioned above was a daughter of William H. Brown, and the property is tied up in such a shape that nothing can be done with it.

Singer, Nimick & Co., Limited, steel manufacturers at Pittsburgh, are putting in a Boulton apparatus for making steel ingots, manufactured by the Solid Ingot Company of Newark, N. J.

The Keystone Bridge Company, of Pittsburgh, report bridge-building as unusually brisk this year. They have orders for 10,000 tons of work in hand, which will keep the plant busy until next fall. Altogether the works will turn out 17,000 tons of structural iron this year, which is 2000 tons more than ever before in the same time.

On Monday, the 10th inst., the mud-drum in a boiler in the sheet-iron department of the Mahoning Valley Iron Company's Works, at Youngstown, Ohio, gave way, causing the boiler to explode and wrecking four other boilers in the battery. One man was killed and several others were severely injured.

At a recent meeting of the stockholders of the Glasgow Iron Company, of Pottstown, Pa., it was voted to increase the capital stock of the concern from \$300,000 to \$500,000. Of a total of 8000 shares 2765 were voted unanimously for the increase.

The sale of the property of the Newport Iron and Steel Company, at Newport, Ky., which took place a few weeks ago, has been confirmed by the Chancery Court. The plant is now owned by the sureties on Mr. Shriver's bond. It is not probable that the works will be started again very soon.

Under date of the 15th inst., Alex. Laughlin & Co., engineers and contractors, of Cleveland, Ohio, issued the following

announcement to the trade: "We beg to advise you that on June 18 we sold our patents, drawings and such good-will as we may enjoy to Alex. Laughlin Company, Incorporated, who assumed entire charge of our business on that date, and will conduct it in the future, the primary object of this change being to better equip ourselves to handle our constantly increasing business, and at the same time the new company will take up some features in a field for fuel economy, to which heretofore but little attention has been paid by gas engineers. We take pleasure in assuring you that the above-mentioned change will in no way alter our business methods, as the officers of the new company will be selected from our late firm, and the new owners of our patents propose pursuing the same policy as have we. That is, they will guarantee to demonstrate a fixed economy from all plants erected by them before they ask final payment for the same."

The Attalla (charcoal) Furnace, at Attalla, Ala., went into blast on the 15th inst. under very favorable circumstances, as stated by the following private letter from a representative of the company to a friend in Chicago: "You need not hesitate to guarantee our iron as good as any made in the South. . . . More than a dozen different parties who have seen the brown ore in our stock-house say we are very particular, and our furnace man claims that it is a very superior article. We are taking every possible pains with the stock, and I am quite sure I have never seen cleaner and better-looking ore. . . . When we ship a car you need not have any fears about it not being first-class. The heavy rains delayed us and we now expect to light the furnace on Saturday, but it will take some days to get down to work. . . . We want to sell some iron, but must have the top of the market. Not willing to cut prices." This is a new furnace with a capacity of about 60 tons per day. From another source we learn that it started off well for a new furnace, being up to 45 tons, making car-wheel iron. It has been conjectured that the blowing-in of this plant would materially affect the price of Southern car-wheel iron in the Chicago market, but if the Attalla Furnace Company adhere to the policy above quoted buyers may be disappointed in their expectations of a break. Messrs. Rogers, Brown & Co., Cincinnati and Chicago, are the sales agents for the West and Northwest.

The large new plant of the Kellogg Seamless Tube and Mfg. Company, in Findlay, Ohio, has gone into operation with a large force making seamless tubes, and the test of the machinery is claimed to be a grand success. So well are the company satisfied that an increase in their capacity has already been ordered. Hon. Howes Norris, of Boston, Hon. Benjamin Butterworth and Powell Crosby, of Cincinnati, are leading stockholders in the concern.

The first blast-furnace put in operation since the flood by the Cambria Iron Company, of Johnstown, Pa., was fired up on the 12th inst. The furnace was No. 5, and one of those least damaged by the flood. Superintendent Price has made the following statement relating to the starting up of the balance of the plant: "We will be working full in the steel works, blooming-mill, No. 2 rail-mill, the 9-inch mill and merchant-mill by July 1, sure. Some departments will be in operation before that time, but we will not begin to roll iron and steel until then. One of the six furnaces has already been put in blast, and the others will be put in as soon as we can get them repaired. A number of the shapes formerly made at the Gautier works will be made in this

mill until they start up. In less than one month or six weeks at the most the entire plant will be in operation."

A press dispatch from Johnstown, Pa., under date of the 10th inst., says: "The Johnstown Switch Company, whose works were entirely swept away from Woodvale, on the Conemaugh River, are making preparations to rebuild their switch works plant on an extended scale at Moxham, three miles up the Stony Creek, and entirely away from any possibility of any recurrence of the disaster which has overtaken their works here. They employ from 1000 to 1200 men."

J. & J. B. Milholland, of Pittsburgh, manufacturers of engines, machinery and haulage plants for mines, have recently put into successful operation a plant for a coal mine upon the direct-action principle. This is the first plant of the kind built by this firm, although they have put down 75 geared plants, and its operation has been so successful in this instance that they are convinced it is superior to the geared plant, as it runs more smoothly, diminishes the wear and is simpler in construction. The plant was built for the Redstone Coke Works, at Uniontown, Pa. The cars are hauled up a slope  $1\frac{1}{2}$  miles in length, the grade being 20 feet to the hundred. The engines are 18 x 40 inches, connected at right angles to the shaft that carries the winding-drum. This drum is 4 feet 6 inches in diameter and holds  $1\frac{1}{2}$  miles of  $\frac{1}{2}$ -inch steel rope. It is provided with a double friction operated in the usual manner. The bed-plate to which the cylinders are bolted is 18 inches in height; in fact, all parts of the machinery are heavy and substantial, as is required in this class of work. The steam distribution is by the ordinary link motion, to provide for moving in both directions.

The large sheet-mill of the Brooke Iron Company, Birdsboro, Pa., in which there was a strike for a month past, resumed work on the 10th inst., all differences having been adjusted. The company's nail factory, which depended on the sheet-mill for its iron, was enabled to resume.

The rail mill of the Allegheny Bessemer Steel Co., at Duquesne, Pa., is in full operation with non-union men, and it may now be regarded as a non-union mill. The contest was whether the mill was to be union or non-union, and the company have won. The hitch was not so much in regard to wages; the company wanted to be independent of labor organizations, and they have been successful. In addition to the mill in question the Solar Iron Works, Black Diamond Steel Works and the steel works of Singer, Nimick & Co. are being operated by non-union men, and are therefore denominated non-union mills.

Under date of the 15th inst. M. V. Smith, metallurgical engineer, of Pittsburgh, issued the following announcement to the trade: "The following figures show the amount of coal used to heat a ton of iron or steel for seven consecutive months with seven Smith gas-producers and six solid-hearth regenerative gas furnaces at the Beaver Falls Mills of Carnegie, Phipps & Co., Limited, at Beaver Falls, Pa.:

	To gross ton finished product.
November, 1888.....	346 pounds coal.
December, 1888.....	324 pounds coal.
January, 1889.....	310 pounds coal.
February, 1889.....	392 pounds coal.
March, 1889.....	371 pounds coal.
April, 1889.....	343 pounds coal.
May, 1889.....	286 pounds coal.

Gas-makers' wages average 6 cents per ton finished product. The first three of these furnaces were built under the supervision of an engineer, and were of the following dimensions: One furnace working-hearth 7 x 14 feet in the clear; two fur-

naces each having working-hearth 7 x 21 feet in the clear. The last three of these furnaces were built under contract as follows: One furnace with working-hearth 7 x 18 feet in the clear, \$8350; two furnaces with working-hearth 7 x 14 feet in the clear, \$5570, making a total for the three furnaces of \$8920, including gas-producers and connections complete ready for work. Later developments with my system in connection with boilers indicate that a proportional economy may be obtained in generating steam, and I am prepared to contract under a guarantee that the amount of coal per ton of iron for steam and heating shall not exceed  $\frac{1}{4}$  ton to the ton of 2240 pounds finished product."

#### Machinery.

The American Nail Machine Company, of Findlay, Ohio, are engaged in the erection of a high-speed engine of an entirely new design. Patterns are complete and engines built of several sizes, with still more now under way, the full set being 2 to 150 horse-power, the special features being minimum of space, immense speed and direct power, durability and economy of fuel.

The blowing-engine now under construction for the Shenandoah Furnace Company, of Milnes, Va., by William Tod & Co., of Youngstown, Ohio, has positive valve-gear and round steel and brass air-valves faced with leather and closed with springs. The arrangement of the air-valves is such that the total clearance in the blowing-tube is less than 2 per cent. of the cylinder displacement. The above firm have just shipped one of their Porter-Hamilton engines to Carnegie Bros. & Co., Limited, at Pittsburgh, and are building another for the Lake Erie Iron Company, of Cleveland, Ohio.

The Wilson-Snyder Mfg. Company, of Pittsburgh, recently built two pumping-engines for the water-works at Allegheny City, Pa., that have a combined capacity of 85,000,000 gallons of water per day.

The Bucyrus Foundry and Machine Company, of Bucyrus, Ohio, have been established the past eight years, and have steadily increased their business, so that at the present time they are employing 150 hands. Their specialties are steam-dredges and steam-shovels. The products of this company are shipped all over the Union. They also have a good foreign trade. This year's trade shows a slight increase over last year's, and the company report the prospects for this season very good. The officers are: Col. W. H. Harris, president; Howard B. Hills, vice-president and treasurer; W. B. Crittenden, manager; A. B. Stetson, superintendent; A. W. Robinson, assistant superintendent.

The Leechburg Foundry and Machine Company, of Pittsburgh, report that they have plenty of business on hand. Among large orders recently received was one from the Rolled Steel Carriage Wheel Company, of Pittsburgh, for one 6-inch roll train, one 16-inch roll train and other special machinery; also a large roll order was received from the Cohoes Rolling Mill Company, of Cohoes, N. Y.

The American Nail Machine and Mfg. Company, formerly of Ashtabula, Ohio, have lately moved into their new and commodious plant at Findlay, Ohio. The buildings of this company are all built of stone; dimensions of the main building, 290 x 50; foundry, 50 x 80. This company manufacture the well-known American nail-machine and the American high-speed engine. This engine is especially adapted for electric-power plants, where high speed and power are a necessity. This company have splendid shipping facilities, being connected with switches to three different railroads. The officers of

the company are as follows: P. F. Good, president; John A. Scott, vice-president; A. W. Call, secretary.

Main Belting Company, of Philadelphia, finding that their business had outgrown their facilities, purchased a property on Carpenter street, and have just completed a new four-story building 180 x 50, which besides being in a central location has all the necessary improvements for meeting the steadily-increasing demand for their belting. Their trade extends to every State in the Union, from which it may be inferred that they turn out an article having great merit.

The Thomson-Houston Electric Company report the following sales: Narragansett Pier, R. I., 80 arc, 1000 incandescent; Seattle, Wash. Ter., 50 arc; Brockport, N. Y., 20 arc; Troy, Ohio, 50 arc; Somerville, Mass., 100 arc; Binghams, N. Y., 150 arc; Philadelphia, Pa., 100 arc; Lowell, Mass., 50 arc; Boston, Mass., 1000 alternating; Springfield, Mass., 90 arc; Minneapolis, Minn., 150 arc, 1200 incandescent; Rochester, N. H., 50 arc; Chelsea, Mass., 100 arc; Norwich, Conn., 400 incandescent; Goldsboro, N. J., 45 arc, 600 incandescent; Sorrento, Maine, 80 arc. Also the following isolated plants: Wamsutta Mills, New Bedford, Mass., 400 incandescent; Bennett Mfg. Company, New Bedford, Mass., 600 incandescent; Whittle & Hanrahan, Providence, R. I., 15 arc; H. Ricker & Sons, Poland Springs, Maine, 12 arc; Jewell Milling Company, Brooklyn, N. Y., 300 incandescent; M. W. Hyer, New York, 50 incandescent; Lawrence Line Company, Lawrence, Mass., 50 incandescent; Riverside Mills, Providence, R. I., 25 incandescent.

Ludlow - Saylor Wire Company, St. Louis, Mo., are running full in all their departments. They have just secured the contract for all the ornamental brass and nickel-plated work to be used in the new restaurant now in course of erection corner Broadway and Elm street, St. Louis.

Hall & Barr, of Cedartown, Ga., would like to correspond with manufacturers of cotton-elevating machinery.

W. Kyle, of Mitchell, Ont., wishes information regarding manufacturers of binder-twine machinery.

The Champion Blower & Forge Company, of Lancaster, Pa., have just issued a fully-illustrated catalogue showing the many styles of blowers manufactured by them. The catalogue also describes their exhaust fans, portable forges, pulleys and hangers, tire benders and shrinkers, drill presses, tuyere irons, &c. The apparatus described covers all the machinery used in the forge shop, and includes the improvements and new devices introduced by the above company.

Lodge, Davis & Co., the well-known manufacturers of machinery, have purchased the entire plant of the Cincinnati Corrugating Iron Company, which they will equip with improved machinery for the manufacture of their engine lathes, iron-planers, shapers, upright drills, &c. This will give them a plant about double the size of their present one, which has for some time back been unable to keep abreast of the demand.

#### Miscellaneous.

The Canton Steel Roofing Company, Canton, Ohio, say their orders for the first week of June amounted to nearly 8000 squares. They are putting on a 700-square roof for the Bellaire Goblet Works, Findlay, Ohio, and one of 500 squares for Deere & Co., of Moline, Ill., the large plow manufacturers.

The Giant Compound Mfg. Company, of Keyport, N. J., are manufacturing what they term Ground Crystals for hardening and toughening cast-steel tools, as well as

dies, taps, reamers, &c. They claim that Bessemer steel can be readily hardened with these crystals. They also manufacture the Giant Welding and Hardening Compound for welding cast-steel at separate heats, for hardening cold-chisels and other tools and for restoring burnt steel. They issue a circular giving a large number of testimonials from well-known iron and steel workers relative to the merits of these compounds, the manufacture of which is covered by letters patent.

The plant of the Lafayette Car Works, at Lima, Ohio, was closed down on the 11th inst. on account of a lack of orders. Three hundred men were thrown out of employment.

Evans & Howard, of 916 Market street, St. Louis, Mo., manufacturers of fire-brick gas retorts, St. Louis standard sewer-pipe and fire-clay goods in general, have just issued a catalogue in which they invite particular attention to the illustrations of 9-inch brick, cupola blocks, tiles and shapes, particularly blocks for retort settings, a large portion of which work is on special orders, and as various in kind as irregular and difficult.

#### PERSONAL.

Thomas Bray, superintendent of the tube department of the Riverside Iron Works, at Wheeling, W. Va., has resigned his position to accept a similar one with the Warren Tube Company, at Warren, Ohio. Mr. Boyd, formerly his assistant, has been promoted to the superintendency.

Irving M. Scott, manager of the Union Iron Works, in San Francisco, was given a hearty reception by his employees on his return from Washington. The men thanked him for his efforts in securing contracts for the new cruisers. Mr. Scott in reply dwelt on California's great resources for manufacturing, and declared that only brains and enterprise were needed to develop them.

The President has made the following consular appointments: Wakefield G. Frye, of Maine, at Halifax; Joseph A. Leonard, of Minnesota, at Shanghai; Zachary T. Sweeney, of Indiana, at Constantinople; Oliver H. Dockery, of North Carolina, at Rio Janeiro; Oliver H. Simons, of Colorado, at St. Petersburg; George W. Roosevelt, of Pennsylvania, at Brussels; Levi W. Brown, of Ohio, at Glasgow.

W. P. Thompson, of the Standard Oil Company, was elected president of the National Lead Trust Company, Henry Hertz, the first president, resigning.

Through the courtesy of P. M. Schwab, superintendent of the Homestead Steel Works, of Carnegie, Phipps & Co., Limited, at Homestead, Pa., a number of the visiting delegates to the convention of the Amalgamated Association of Iron and Steel Workers, in session at Pittsburgh last week, made a tour of the plant on the evening of the 12th inst. They expressed themselves as being delighted and surprised at the machinery and modern appliances in vogue at the works, and the skill required to operate them.

There is to be a convention in Hartford, Conn., on the 25th inst., continuing four days, of Chiefs and Commissioners of Labor Statistics. President Carroll D. Wright is hopeful that this gathering will be productive of great benefits. A liberal interchange of views is asked of each member.

W. Seward Webb, President of the Wagner Palace Car Company, started from New York to Vancouver by way of the Northern Pacific Railroad, and in about six weeks traveled 20,000 miles in a

special train. Only in the United States, with its wide domain and far extended lines of track, is such an exploit possible.

Andrew Carnegie is in London and gave a dinner to Mr. Gladstone and Mrs. Gladstone at the Hotel Metropole on the 18th, at which a number of distinguished guests were present, including Minister Lincoln, our representative at the English Court.

The announcement of the marriage of John A. Roebling, son of Washington A. Roebling and grandson of John A. Roebling, the great Brooklyn Bridge engineers, the *New York Press* says, recalls to the public mind the life and service of one of America's most gifted sons. Probably to William C. Kingsley and Henry A. Murphy the credit of the great enterprise known as the Brooklyn Bridge, connecting New York and the City of Churches, was in chief due. It would be absurd in these days to say that without Mr. Roebling the Brooklyn Bridge would never have been built, but it is simple justice to record the fact that he built it, and that without his unsurpassable ingenuity the plans of the bridge would have been delayed for many years. He was fortunate in having as his chief assistant and successor his gifted son, Washington, into whose hands came the literal work of building and of carrying out the plans prepared by the elder Roebling and himself.

The new General Appraiser of Merchandise at New York is Donald McLean, a well-known lawyer of this city, recommended by the two New York Senators and others. He is a graduate of Columbia College, and was elected an Alderman from the "brown-stone" district. He is a brother of Col. H. C. McLean, Assistant Architect of the Treasury.

Charles A. Ashburner, the well-known Pittsburgh geologist, had the honorary degree of Doctor of Science conferred upon him at the recent commencement of the University of Pennsylvania, held in Philadelphia, as an acknowledgement of the scientific value and merit of his surveys and reports for the Geological Survey of Pennsylvania. This is a high honor in recognition of individual distinction. Doctor Ashburner graduated from the University of Pennsylvania about 15 years ago with the highest rank in his class, and immediately entered the corps of the United States Light-House Service Survey. Upon the organization of the Pennsylvania Geological Survey he resigned from the Government work and was appointed assistant of Professor Lesley, State Geologist, with whom he has been associated ever since. About two years ago he gave up much of his active State work and went to Pittsburgh to assume connection with Mr. Westinghouse in his extensive mining interests, particularly in the mining of natural gas, latterly, however, making extensive geological and mining examinations in the Rocky Mountains and Pacific Slope.

William Taylor, a prominent citizen of Brooklyn, died on Monday night at his home, age 78. For 33 years Mr. Taylor was connected with the Columbia Iron Works, of which he was the head. He came to this country when 14 years old, from Manchester, England. Mr. Taylor never held any official position excepting that of Bridge Trustee.

Captain Zalinski, inventor of the dynamite-gun, was among the Americans presented at the Court of St. James at the Queen's last levee.

Desolation reigns at Panama, where merchandise and all sorts of personal effects are sold for what they will fetch.

# The Iron Age

New York, Thursday, June 20, 1889.

## Iron-Ore Supplies.

The thoughtful reader cannot fail to be impressed by the peculiar difference between two valuable papers on the subject of iron-ore supplies which have made their appearance this year. One treats of the subject from an American stand-point, with reference to the sources from which the blast-furnaces of the United States receive their supply, and was prepared by John Birkinbine, of Philadelphia, for the February meeting of the American Institute of Mining Engineers. The other paper is of English origin and formed the official address of President J. T. Smith at the May meeting of the British Iron Trade Association. It treated of the sources of ore supply for the blast-furnaces of Great Britain. Notwithstanding the huge annual output of pig-iron in the United States, which now falls but little short of that of the mother country, the paper of our American author deals very largely with domestic sources of the supply of iron ore and pays but little attention to foreign sources, as imported ores constitute but a small part of the great quantity required to keep our furnaces running. On the other hand, the British author devotes much space to the consideration of the iron-ore deposits of foreign countries and but little to those of his own, in recognition of the fact that British furnaces depend to a very important degree on foreign iron ore, particularly for steel-making. Mr. Smith says that as this description of ore is not found at home in quantities sufficient for steel-makers' requirements, "the sources of external supply become not only an important but a pressing question." Hence his inquiry into the subject, with the view of demonstrating to his fellow-members of the association that they need have no fears of the early exhaustion of the supply. Our American author writes in a justifiable spirit of exultation over the magnificent mineral riches of his country, without a thought as to the possibilities of the future save in the light of still greater development. His British co-laborer writes as one having some anxiety for the future and desiring to allay apprehension.

Mr. Birkinbine's paper states that the estimated product of iron ore in 1888 throughout the world was, in round numbers, 50,000,000 gross tons, of which the United States produced about one-fourth, its output being practically equal to that of Spain, France, Russia, Austria and Hungary combined. We produced last year nearly twice as much iron ore as Spain with all its exports. Great Britain leads this country in ore production by about 15 per cent., but the average richness of its ores in metallic iron is far below that of ours; in other words, if we mined and consumed ores as lean as those used in British blast-furnaces generally, we

would be obliged to raise very much more ore than we do in proportion to the pig-iron smelted. The richest ore used in Great Britain is taken there from other countries. The dependence of British iron manufacturers upon outside sources of iron-ore supply is shown by the rapid increase in importations. In 1868 about 114,000 tons were imported from Spain and Norway for use in steel-making. With the growing requirements for the Bessemer process the importations increased, although up to 1877 the quantity brought in annually did not exceed 1,000,000 tons. But in 1880 the British importations jumped suddenly over 1,500,000 tons, amounting in that year to 2,634,000 tons. This remarkable increase happened concurrently with the development of the basic process, which would naturally have been expected to check importations by rendering a very large part of the domestic output of ore available for steel-making. But the consumption of ore by the acid process continued to increase, and foreign Bessemer ores were required in large quantities from year to year, until in 1887 no less than 3,762,000 tons were imported. This is slightly in excess of the entire output of our Lake Superior iron ore mines in 1886, the comparison showing the magnitude of the British demand on foreign sources of ore supply.

Mr. Smith shows in his paper that the iron-ore resources of Spain and Sweden are equal to any demand which may be made upon them by Great Britain for a very considerable period, but he also reveals another fact of striking significance in the same connection—namely, that the cost of such ores laid down at British works will be enhanced by the early exhaustion of mines lying near the sea-board. Transportation charges have hitherto been very light on Spanish ores destined for Great Britain, but British manufacturers will ere long be somewhat handicapped in this respect. Their competitors in other countries will hardly mourn over the possible effects of the changes which this may bring. Referring to this country, Mr. Smith says: "The United States have so large a territory, transportation over long distances is so cheap, and there is such a constant tendency to move the centers of industrial gravity westward or southward, that the only thing that is certain about the future of the American iron industry is its uncertainty." He might have added, however, that the very great progress thus far made in this country, both in building up an iron industry and in developing vast deposits of good ores, presages a still more brilliant future with its superstructure resting on the solid foundation of an abundant home supply of the essential raw materials.

The *American Architect* for June 15 contains quite an interesting article on the nature and uses of iron and steel, by Louis De Coppet Berg. In the main the statements made are correct, but a few of the inaccuracies are most glaring. It would be inferred from one of the principles laid down for the manufacture of pig-iron that all iron ore is "broken in the stamping-mill and washed in streams, and then roasted or calcined in kilns to remove the moisture and carbonic acid." This bit of news will be highly appreciated by our furnace men. The author further says:

"There is a very strong and tough charcoal iron from South Carolina, but it is used mainly for car-wheels, being too expensive for ordinary work." We presume it must be very expensive, if there is any South Carolina pig-iron in the market, as the last made in that State, to our knowledge, was turned out in the early sixties. The manufacture of iron in any form in South Carolina has long been an extinct industry.

## Diverting Trade Channels.

American citizens since the year 1864 have not been permitted the use of canals in Canada on equal terms with inhabitants of the Dominion, and this regardless of treaty stipulations. It is generally believed at Ottawa that the recent order of the United States Treasury refusing to allow the transport in bond of goods passing from one Canadian port to another over the newly-constructed short-line railway through the State of Maine is one of the results of this unfair discrimination against citizens of the United States. In building this road the Canadian Pacific fully expected to divert to that line the trade which, in coming from the Atlantic sea-board, enters Canada through American channels, but if the recent order is persisted in this object will be entirely thwarted. With reference to discrimination against American shippers, a report from the Government at Ottawa, just published, shows unmistakably that, despite the efforts of the Dominion Government to prevent it, shipments of grain through United States channels have increased 260 per cent. during the past nine years, while through Canadian channels they have declined 52 per cent. This appears from the following statement of cereals—wheat, corn, peas, barley and rye (upon which articles the refund is given)—passing through the Canadian canals since 1880, discriminating between those passing from one United States port to another United States port (upon which full toll was collected) and those passing directly through to Montreal, subject to a rebate of 18 cents per ton:

Years.	From U. S. ports to U. S. ports, no refund. Tons.	From Lake Erie thro' to Montreal, refund. Tons.
1880	47,029	383,800
1881	64,251	144,127
1882	63,861	180,664
1883	121,876	186,814
1884	104,537	142,194
1885	117,346	96,569
1886	151,551	208,940
1887	134,863	185,034
1888	169,664	160,368

Other tabulations of statistics relating to the traffic of the Welland Canal and to the freight movement from Lake Erie via Montreal enforced the same truth respecting the futility of efforts to divert United States traffic from its natural channels. These statements, if they cannot be refuted, possess a deep significance to English investors and others who have put their millions of pounds sterling into Canadian public works, and they point, furthermore, to the expediency of arriving at a fair mutual adjustment of outstanding differences between the two Governments, rather than a persistence in measures that embarrass and exasperate without serving any practical end.

### The Law of Industrial Conspiracy.

An interesting article in a recent issue of the *Political Science Quarterly* by E. P. Cheyney, on conspiracy and boycott cases, has brought out a very forcible reply from the *Commercial and Financial Chronicle*. The former believes that the courts have done the workmen scant justice in these matters. The latter defends the action of the courts, arguing that their work, even when they went rather out of their way to find law, has the elements of permanence and growth. The former proposes that State legislatures enact specific laws on this subject, to curb the disposition of the judges to build up a body of decisions affecting it, while the latter is wholly out of sympathy with such a course of procedure, believing that legislators would do well to keep their hands off. Mr. Cheyney alleges that the restraint of trade by labor organizations is a mere trifle compared with that which results from organizations of capital. The disturbance and fluctuation resulting from strikes is not peculiar to those trades where labor is organized, but is even more severe in some others. It is therefore, in his opinion, highly unfair to hold labor organizations responsible for such restraint or disturbance. Nor does he admit that all interference with the employer's independence is necessarily "unlawful." He holds that a business "cannot properly be looked upon as belonging entirely to the employer, but is, in a certain sense, a joint concern." The point with regard to coercion he admits as partly justified by the facts, but he believes that it has been exaggerated by the courts to an extent at once unwarrantable in theory and unwise in practice. He is especially severe on some of the decisions respecting boycotts, holding that the coercion of a boycott cannot be treated as a conspiracy, and that the action of labor combinations in such cases is to be regarded as an accidental rather than an essential element.

In reply to this the *Chronicle* says that the point where courts have been most clearly right and where Mr. Cheyney is most clearly wrong is on the question of interference with employers. Whenever labor disturbances reach an unusual height we have a conflict between two systems of management—one where the employer has the power of dictating the terms and the other where that power is to an equal or greater extent in the hands of employees. In specific cases the employer's power may be and often is abused; but in comparing one system with another there can be no question that it is better to give a man who controls the capital the power to arrange the methods of management, rather than to put it primarily into the hands of those who furnish the labor. The prevalence of the existing system is by no mere accident. It is a result of the survival of the fittest. The fact of its survival is to a great extent its justification. The control of industry by guilds of workmen involves more trouble and abuse and restriction to trade than its control by capitalists. As industry was organized on a larger and larger scale the necessity for capitalist control became more and more obvious. The failure of most of the efforts at co-operation in complicated industries only emphasizes the continuance of this necessity at the present time. The man

who furnishes the capital will generally manage the business more wisely and can be held more fully responsible to other parties in interest than the man who furnishes the labor, with little or no capital behind it.

Mr. Cheyney's general proposition, that what is right for one man to do is right for a large number to do by simultaneous motion, the *Chronicle* says, cannot be maintained. It is right for one man to walk down Broadway, but if 10,000 people agree to walk up and down a certain part of Broadway simultaneously, with the view of obstructing the traffic, the character of the action at once becomes changed. As Jevons says in discussing this matter, many of the arrangements of society are based upon the assumption that individuals will act as individuals. The streets of New York are arranged with a view to accommodate the ordinary demands of traffic, and will accommodate such demands as long as men act independently. If a number of persons insist on doing the same thing at the same time the fact of combination may make a difference at once in the convenience of the public and in the character of the action. So it was with boycotting. The combined refusal to buy of a certain person when he had given no direct ground of dissatisfaction to his patrons except the refusal to obey the demands of an organization more or less remote from him and connected with totally different matters was an obvious perversion of right.

It is clearly true that the decisions of the courts on these questions have been directly in line with public sentiment. The decisions would not have been received so quickly and with such general acquiescence if they had not been in entire harmony with intelligent public opinion. The efforts made in many States to set aside the effects of these decisions would otherwise have been successful, and the boycott would to-day be wielding its demoralizing power in many important industries. The courts have been sustained in the place of last and highest appeal, the minds and conscience of the people, and it is not likely that a new sentiment can now be awakened which will work a reversal of the judgment.

### Late Developments in Chili.

Chili has recently been attracting more attention in the United States since American railway builders succeeded in making a contract with the Government to build 600 miles of railway, for the construction of which there was competition from Europe. The only difficulty which arises with public works and private enterprises in that distant republic is the small immigration of laborers from Europe. To enable the American company to build the 600 miles alluded to the Government has, for example, engaged that the number of workmen required shall be forthcoming, and strenuous efforts are being made to push immigration from Europe and elsewhere. Thus some 3000 laborers were picked up and shipped to Valparaiso at the time of the recent collapse of the Panama Canal enterprise. While Brazil has received 120,000 immigrants and the Argentine Republic 300,000 this year, it is difficult to establish a good current from

Europe to Chili, although the latter is in every respect as desirable to settle in as either of the other countries, if not more so. The only difference is that it lies on the west coast and is, therefore, more out of the way. In a year or two there will be a change in this respect, as the Trans-andine Railroad, to connect Buenos Ayres with Valparaiso via Mendoza, will then be in operation all the way through across the Andes. Even now the Argentine Republic is beginning to restrict the number of certain undesirable new-comers from Italy which the general rush thither carries along, and gradually the great inducements which Chili holds out will no doubt procure the latter all the hands needed, thus somewhat dividing the current which almost overwhelms the neighboring State.

Chili stands at present in all the greater need of a copious influx of desirable immigration, as the spirit of enterprise which animates both the Government and the ruling classes has at no time been greater. The finances of the Republic are improving year by year, and its bonds are looked upon as gilt-edged in Europe. Thus the entire indebtedness of a nation of 2,700,000 inhabitants did not exceed \$88,485,071 last year, including \$24,887,916 paper money in circulation gradually being withdrawn; \$40,000,000 of the above amount is payable in gold, abroad, and the balance in silver. The budget shows a surplus since 1886. In 1887 the income was \$45,888,954 and the outlay \$87,118,408; last year the amounts were respectively \$46,775,546 and \$39,615,770. The German Bank and Mendelssohn & Co., Berlin, took a  $\frac{1}{2}$  per cent. Government loan for £1,500,000 last month, the bonds commanding 104 to 108 in the London market. Nothing would be easier than to issue a £4,000,000 loan and redeem the paper money, but after due consideration it was decided more advisable not to disturb the local finances at a blow, the people of Chili finding their interests too much bound up with this paper circulation, at least for the present. The Government uses its surplus for the reduction of taxes and for public works. Thus Valparaiso is to have a dry-dock involving an outlay of \$4,000,000. Next, negotiations are going on with a French company for the building of additional light-houses, in which the electric light will be used, the cost being estimated at \$8,500,000. This amount will in course of time be coming back in the shape of additional ships' dues. The Government income accruing from nitrate refining works is rapidly on the increase, and there is consequently all the greater readiness to reduce taxes. The one on inheritances is to be abolished, also on the furniture in use by residents, and, furthermore, the duties on certain articles of necessity are to be lowered.

The so-called trade balance is all along in favor of that country, as is shown by the following table of imports and exports:

	1886.	1887.	1888.
Imports.....	\$50,000,000	\$48,630,862	\$44,170,147
Exports .....	70,000,000	59,549,958	51,240,149
Excess of exports.....	\$20,000,000	\$10,919,096	\$7,070,002

This year the exports may not reach last year's value in consequence of the decline in copper. The exports of this commodity during the first five months were as under, in tons fine:

Years..	1884.	1885.	1886.	1887.	1888.	1889.
Tons....	20,604	19,797	18,150	14,587	14,841	12,680

The exports of nitrate were as follows for the first two months (January and February) of each year:

Years.	1887.	1888.	1889.
Quintals	1,561,132	1,908,327	3,606,086

During the entire years 1886, 1887 and 1888 the shipments were as follows:

Years	1886.	1887.	1888.
Quintals	9,805,238	15,851,567	16,741,019

Nitrate production increases so rapidly because it is so very profitable. During the eight years from 1880 to 1887 inclusive the exports aggregated 66,532,152 quintals, netting \$26,612,861 paper-money profit to the refiners. The quintal equals 101½ pounds American. The bulk of this industry is in English hands. Chili's wheat exportation has ranged between \$4,000,000 and \$6,000,000 annually during late years, the flour selling well on the Pacific Coast. Almost the sole importation from Chili into the United States is nitrate, of which we usually receive about 1,800,000 quintals annually. The exchange of commodities with Chili is shown in the following table:

Calendar year.	Imports from Chili.	Exports to Chili.
1886	\$2,497,325	\$2,188,259
1887	1,531,140	2,376,611

As the proposed lowering of the Chilean duties would favor our goods particularly, we have fair chances for a decided increase in trade in that direction.

The American Institute of Mining Engineers are holding their fifty-fourth meeting this week in Colorado, the session having begun at Denver on the 18th inst. The annual convention for 1889 of the American Society of Civil Engineers began its session at Seabright, N. J., to-day. Many of the most active and prominent members of these engineering societies are at present in Europe.

**The American Exchange Bank Loses.**—An important decision was handed down by the Court of Appeals in the case of Marshall Cutler and others against the American Exchange National Bank, in which they affirmed the judgment of the Superior Court of New York in favor of the plaintiffs. The action was brought to recover \$500 from the bank upon a letter of advice. The plaintiffs, on July 20, 1888, deposited with the defendant bank \$500 for the purpose of having it transmitted to Leadville, Col., and received for that purpose the letter of advice, which represented on its face that \$500 had been deposited with the defendant bank to the credit of the bank in Leadville for the use of J. Seymour Hall. The plaintiffs took the paper, and before it could be presented to the bank of Leadville it failed. The failure took place on July 26. A receiver was appointed who refused to pay the \$500 deposited. Suit was then brought by the plaintiffs to recover the amount in suit from the defendants, who refused on demand to return the money. The bank's defense was that as the plaintiffs had accepted the letter of advice, which said that the money was deposited to the credit of the bank of Leadville, they were estopped from denying that the money had actually come into the possession of that bank. The Court of Appeals has now affirmed the decision of Judges Sedgwick and O'Gorman in favor of the plaintiffs.

During the month of May the two stacks of the Isabella Furnace Company, at Etna, Pa., produced 13,070 tons of 2268 pounds of No. 1 foundry pig-iron. This is the largest production for the same length of time in the history of the furnaces.

## Our Production of Gold and Silver.

The report of Dr. James P. Kimball, Director of the Mint, has just been issued. From it we take the following statements relative to the production of gold and silver in this country in recent years:

The produce of gold from mines in the United States during the calendar year 1888 is estimated to have been 1,604,841 fine ounces (49,917 kg.), of the value of \$33,175,000.

Messrs. Wells, Fargo & Co., in their annual statement, estimate the gold produce of the States and Territories of the United States west of the Missouri River as \$29,987,702 in 1888, which is considerably less than the estimate of this bureau. Their estimate for 1887, of \$32,500,067, agreed substantially with that of this bureau, the latter being, for the whole country, \$33,000,000.

The value of the gold produced in the United States annually since 1880, according to the estimates of this bureau, is exhibited in the following table:

Years.	Weight, fine ounces.	Value.
1880	1,741,500	\$36,000,000
1881	1,678,612	34,700,000
1882	1,572,187	32,500,000
1883	1,451,250	30,000,000
1884	1,489,950	30,800,000
1885	1,538,325	31,800,000
1886	1,693,125	35,000,000
1887	1,596,375	33,000,000
1888	1,604,841	33,175,000

The produce of silver from mines in the United States during the calendar year 1888 is estimated to have been 45,783,632 fine ounces (1,424,826 kg.), of the coining value of \$59,195,000.

This is an increase of 4,515,327 fine ounces over the estimated production for 1887.

The elimination from an estimate of the produce of our own mines of the value of foreign material, consisting principally of refined silver obtained from crude silver, base bullion, and miscellaneous smelting ores imported from Mexico, has been attended, as in the last few years, with no little trouble.

The influx into the United States of such silver products in considerable quantities for reduction and refining, beginning in 1885, has since steadily increased, owing to the extension of railways into Mexico, and very largely to the fact that most of the silver-bearing ores are rich in lead, which, under rulings of the Treasury Department, is free of duty when contained in ores in which the precious metals constitute the predominant value.

So important has it become to identify and eliminate for statistical purposes this foreign product from the produce of our own mines that custom-house officers on the Mexican frontier and on the Gulf have been required to furnish this bureau with monthly statements showing in detail the class of material imported and the names of consignees.

According to custom-house returns the value of silver bullion imported into the United States during the last calendar year was \$5,977,036. This value of silver bullion is understood to be the commercial or market value, in which terms silver imports are manifested.

Of this foreign silver bullion \$5,054,402 was from Mexico, and most of the remainder from the United States of Colombia, with a small value from Honduras, and a smaller value from the British possessions in North America, and from Cuba.

In addition to the imports of foreign silver bullion, silver ores were imported of the declared commercial value, according to custom-house returns, of \$5,684,098. Most of these ores were imported through the ports of entry of the customs district of Paso del Norte. The collector of cus-

toms at El Paso informs the bureau that of the declared value of silver ores imported in his district during the year the value of the gold contained was \$16,313 of the lead \$332,944, and of copper \$1870.

These figures are the more useful as measures have been adopted in the customs district of Paso del Norte to verify by assay the important mineral and metallic products from Mexico entered at the several custom-houses.

Deducting the value of the gold, lead and copper contained in silver ores, the commercial value of the silver contained in ores imported was \$4,832,966.

Of the silver ores imported the value of \$4,450,363 was from Mexico, \$1,208,190 from the British possessions in North America, the remainder being small lots from various countries.

The total commercial value of foreign silver bullion and of silver contained in foreign ores imported into the United States during the calendar year 1888 was therefore, according to custom-house reports, \$1,810,002. The average price of silver during the year, based upon daily cable dispatches from London to the bureau of the Mint, was 42.869d per ounce British standard, equivalent, at the par of exchange, to \$0.93,974 per ounce fine. For the purposes of this report the average price is taken as \$0.93 per fine ounce. At this value the silver imports contained 11,500,000 fine ounces, worth at coining rate in silver dollars \$14,868,686.

The production of silver in the United States since 1880 is exhibited in the following table:

Years.	Fine ounces.	Coinage value.
1880	30,318,750	\$39,200,000
1881	33,257,812	43,000,000
1882	36,196,875	46,800,000
1883	35,732,812	46,200,000
1884	37,743,750	48,800,000
1885	39,909,375	51,600,000
1886	39,445,312	51,000,000
1887	41,268,505	53,357,000
1888	45,783,632	59,195,000

Dr. Kimball has made the following estimate of the world's production of gold and silver in 1887, gathering the information from a great variety of sources. A kilogram of gold is equal to \$664.60; of silver, \$41.56. The coining rate of silver is in United States silver dollars:

Countries.	1887.			
	Gold.		Silver.	
	Kilos.	Dollars.	Kilos.	Dollars.
Unit'd States	49,654	33,000,000	1,368,855	56,857,000
Australasia.	41,119	27,327,500	6,422	268,900
Mexico	1,240	824,000	904,000	37,570,000
European countries:				
Russia	30,232	20,092,000	13,522	562,000
Germany	2,251	1,460,000	23,929	984,500
Austria				
Hungary	1,877	1,247,450	53,391	2,218,900
Sweden	84	55,550	5,823	242,250
Norway			7,200	299,000
Italy	195	129,800	33,859	1,408,350
Spain			54,335	2,258,000
Turkey	10	7,000	3,323	55,000
France			46,789	1,944,550
Great Britain	2	1,000	9,964	414,100
Dominion of Canada	2,061	1,369,700	10,865	451,550
South American countries:				
Argentina Republic	45	30,000	722	30,000
Colombia	4,514	3,000,000	24,061	1,000,000
Bolivia	109	72,000	240,616	10,000,000
Chili	2,365	1,591,400	205,432	8,537,350
Brazil	1,532	998,000	141	5,350

Ch'ia (Amoor district)	5,098	3,368,500		
India (British)	481	320,000		
Total	151,712	100,826,800	3,016,044	125,346,310

### Business Courtesy.

If it were possible to determine the money value of business courtesy the majority of people would be wonderfully surprised to find at how high a figure it was rated; and stranger yet, if this same quality could be gathered up or manufactured into a marketable form, we believe that it would find very few purchasers. In other words, courtesy is a something the worth of which is little appreciated, and most people would not care to take it even as a gift. How important a factor it is in the general affairs of life is not a question to be discussed in a trade paper, but on the other hand, it is eminently proper to point out the influence of this personal ingredient in the business world. Furthermore, the subject is especially pertinent just now, when the celebration of the centennial anniversary of General Washington's inauguration is turning men's thoughts back to the customs of the last century. To be sure, the chief attention is given to the military ways of our ancestors, but along with this there is a good deal of investigating into the every-day habits a hundred years, more or less, ago. Whoever looks up the history of business and reads old correspondence and papers relating to past methods of trading cannot but be struck by the more dignified and courteous tone that pervaded the dealings of the merchants then, and if the written records they have left are marked by an old-fashioned courtesy we can depend upon it that the manners of the day possessed the same charm. Is there no excuse to say that business men of the present are subject to such fierce competition and are so driven in their work that they have no time to waste in being courteous, for a gentlemanly manner will facilitate rather than delay a trade, even if it is but swapping jack-knives. Furthermore, as there is little prospect of the hurry of business life abating yet awhile, we should be all the more careful to guard against the consequences that come from fret and worry, lest our future behavior become intolerably rough.

Looking at the matter simply from a mercenary stand-point, it will require but little reflection on the part of sensible people to discover that courtesy in business brings an actual money reward. There is no one but can recall instances in his experience where the manner of a salesman had as much to do with a bargain as the quality of the goods. It would seem to be true, however, that this personal element enters with greater force in small transactions than in large ones, for where considerable money is involved we are less influenced by our feelings in the matter. A pleasant address will win a fortune for a book agent, while the president of a big corporation can be as crotchety as he pleases without coming to bankruptcy. Nevertheless, the amount of business lost through the offensive behavior of a company's agents is an indeterminate factor, and very likely it is the difficulty of estimating the losses from this cause that makes us undervalue it. If, as not infrequently happens, we are kept from purchasing a lot of goods or from awarding a contract by a disagreeable manner, we are not apt to tell the person the reason why we do not trade with him, and such people are seldom modest enough to divine our motives. But if it is the price of the work or quality of the goods that deter us, we have no hesitation in letting our reasons be known. In the first instance, the man injures his interests without knowing how, and we will likely repeat the folly many times over, while in the second case we have cited the obstacle to the trade is understood and can readily

be removed. As we intimated above, the influence of courtesy increases as we approach the last division in the distributing trade, and is greatest with the retail salesman, but in every department of business it is too important a factor to be ignored. It is extremely difficult to write about this subject in a general way, and it would require an infinite number of practical illustrations to cover the whole field. The best we can hope to do is to direct attention to it, and let each one reason out for himself the money value of business courtesy. After all, courtesy is much like advertising; we know that it is a good thing, but cannot tell exactly how many dollars it is worth to us.

### The Wrecked Pennsylvania Bridges.

Iron structures will replace the wrecked bridges of the Pennsylvania Railroad on the Juniata River. The principal bridges are the Granville Bridge, near Lewistown Junction. It is 640 feet long, iron, and of 5 spans, four of which were completely washed away. May's Bridge, two miles west of the Granville Bridge, 5 spans and 640 feet long, was completely wrecked and a new bridge will have to be built. The Manayunk Bridge, two miles west of McVeytown, was wrecked, and a new one of iron will be erected in its place. It is 640 feet long and has 5 spans. Besides these there are a number of one and two span bridges which have been more or less injured, and in all cases they will be repaired by the substitution of iron ones. Petersburg Bridge, near Shafer's Station, is a complete wreck. It is only 156 feet long, and was supposed to be strong enough to withstand the heaviest kind of a freshet. The Montgomery Bridge, which crosses the North Branch of the Susquehanna 22 miles from Sunbury, has just been repaired after nine days of hard work, but a new iron bridge will be erected. Shuman's Bridge, near Tyrone, is 310 feet long. A new iron bridge will be erected in its place. The Viaduct Bridge was a magnificent one-arch stone structure 80 feet long, about eight miles east of Johnstown. It was built by the State in 1832 and has stood many an uprising of the waters. It was considered a fine work of mechanism, but the last rise in the waters around Johnstown was too much for it and it succumbed with the weaker bridges. A new bridge of stone will be erected in its place. Little Conemaugh Bridge No. 6, just east of Johnstown, an iron bridge of 2 spans, was totally washed away. A new one of stone will be erected in its place. South Fork Bridge, which crosses the Conemaugh River near South Fork, was an iron bridge of 2 spans. It was washed away and a new stone bridge will take its place. An official of the company said: "It has been our policy for the last few years to erect stone bridges wherever practicable, and as we have the chance to do so we will carry out our intention. Wherever the ground will permit we will hereafter erect a stone bridge."

### The Chain and Nail Trades.

The condition of the chain and nail trade workers, says the *London Engineer*, is an illustration of the terrible effects of unlimited and misguided competition for work among wholly uneducated work-people. Individual has conflicted against individual, until the work of each chain and nail maker is the work of a slave in a slavery of his own making and in a den of his own defilement. Publicity is creating a disposition to remedy this deplorable state of things. That the statements which have hitherto been made have in no way overdrawn the picture is evident from the annual report of

the chief inspector of factories. With reference to the operative chain-makers, the inspector states that while, after the prolonged strike of 1887, the chain-makers returned to work at the 4/ list—i. e., 4/ for making 1 cwt. of  $\frac{1}{4}$ -inch chain—at which price a steady man could earn 25/ a week, yet, to get iron out of the warehouse, too many would undertake to do it for less, and had gone so far as to undertake making it at as low a figure as 1/9 per cwt. This, it is easy to calculate, would reduce wages to below 12/ a week. With reference to the nail-makers, the report is fully confirmatory of all that has previously been said upon this subject. As instances of low wages, a case is quoted where a woman made 5000 hob-nails in a week, for which she got 2/7 $\frac{1}{2}$ , and this was a good week's work, considering that house and children had to be looked after. In another instance a worker gets 2/6 a bundle for making rivets, and can in a full week earn 4/. Another gets 3 $\frac{1}{2}$ d for making 12 dozen "tangs," and has to work hard to make 5/ a week. A man making  $\frac{1}{4}$ -inch chain, working about 67 hours a week in front of a hot fire, can clear 12/ a week. It has been suggested that the chain shops should be closed by act of Parliament at 6 p. m., to prevent excessive labor and also competition from colliers and other outsiders. As to the nail trade, that is undoubtedly a declining industry; but there seems to be no reason why a more speedy termination should not be put to hand labor by the more extensive and rapid introduction of machinery.

A large section of the manufacturing district of lower Jersey City was wiped out by fire Tuesday night. The fire originated in a small structure in the rear of N. B. Cushing's machine works, a five-story brick building, near the piers and yards of the Red Star and Inman steamships, and all were burnt. William Brown's boiler works, a two-story frame building, was next destroyed. At the same time Tooker & Sayre's syrup refinery was burned. The Wallis Iron Works, a two-story frame building opposite Cushing's, were ignited. Cushing's building cost \$55,000. The machinery and stock were worth fully \$100,000 more. The loss on the refinery building and stock is estimated at \$125,000. Brown's boiler shop was damaged about \$10,000 and the Wallis Iron Works about \$3000.

The annual meetings of the Duluth and Iron Range Railway and Minnesota Iron companies were recently held at Duluth, Minn. In the railroad company the only changes were the election of M. J. Carpenter as vice-president and director, in place of R. H. Lee, and D. H. Bacon director, in place of Samuel P. Ely. In the iron company the only change was the election of R. H. Lee as director and member of the Executive Committee, in place of C. Tower, Jr. The surplus for the year, \$1,300,000, was voted to be used at the discretion of the Executive Committee for the improvement of the property. It is learned, though not officially, that this means no less than the building by the company of a line of vessels to carry their ore.

Judge Advocate General Rogers, of the Johnstown Bureau of Information, now estimates that not over 4000 lives were lost in the flood. He bases his calculation on the census returns and the reports which have been made to his office. He thinks that the number given will certainly cover the loss, and that it may be as low as 8000. This varies widely from the estimates made a week ago, that the total number of lives lost would be from 12,000 to 15,000.

# TRADE REPORT.

## Philadelphia.

Office of *The Iron Age*, 220 South Fourth St.,  
PHILADELPHIA, Pa., June 18, 1889.

**Fig-Iron.**—The market has been very active during the past week, and a great many lots are believed to have been arranged for on private terms. A considerable business has been done at prices fractionally higher than last week's quotations, while in other instances the quantity called for was cut down about one-half before the sellers would agree to close the contract. From this it will be seen that the change of feature intimated in our recent reports has become more pronounced, so much so, in fact, that the market may be called strong, with an advancing tendency, and that without any qualification whatever. Of course it is not expected that there will be any great boom in Iron, but the advance which now averages 50¢ per ton may easily be increased to \$1 within a few days, and for some brands possibly a trifle more than that. But in many cases prices were ruinously low, and as the cost of production is said to be a full 50¢ more than it was a month ago, sellers have not reaped much benefit from the advance so far. The more hopeful feeling, however, is due to the fact that there is no difficulty in finding buyers at current rates and in the belief that the period of extreme depression has been passed, and that still further improvement in values is only a question of time. The great difficulty to-day would be to find some one willing to quote on anything like large lots. Regular customers are favored with their usual quantities for prompt delivery at, say, \$14.75 @ \$15 for good Gray Forge; \$16 @ \$16.50 for No. 2, and \$17 @ \$17.50 for No. 1. It would have to be a very good buyer or a brand of secondary character at the inside quotation, while large orders would not be accepted at the outside figure unless for very early deliveries. Southern Irons have been largely sold presumably at about \$14, ex-ship, for No. 1 Mill, said to correspond with Pennsylvania Gray Forge. Foundry grades are held at figures nearly approaching to those asked for local Irons, but some of the largest concerns have withdrawn from the market, so that prices are more or less nominal.

**Blooms.**—The market is unsettled and prices hard to quote, as some of the leading sellers are out of the market. Others ask an advance of 50¢ @ \$1 per ton, while still others profess to accept orders from their customers at the old prices. Several large sales are reported, but prices have not been made public. We repeat last week's quotations, although in the present condition of the market the outside figures would probably be required in the majority of cases, viz: \$28 @ \$28.50, at mill, for Nail Slabs; \$30 @ \$31 for Tank Slabs; \$32.50 @ \$33.50 for Shell Slabs; \$36 @ \$37 for Flange, and \$38 @ \$40 for Fire-Box; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite, \$41 @ \$42.50; Scrap Blooms, \$32 @ \$33 per "Bloom" ton of 2464 lb.

**Muck-Bars.**—The same unsettled feeling may be noticed in this department. Sales have been made as high as \$28, delivered, some holders now quoting \$28.50. There is a good deal of inquiry, but very few sellers, hence the feeling is one of much firmness, although the advance is thought to be somewhat extreme compared with that in other specialties.

**Bar-Iron.**—While there is a much firmer feeling in Bars prices have not advanced, as might have been expected, considering the movement in other depart-

ments. Some of the best brands are held at 1.85¢ @ 1.90¢, but others are still hanging around 1.75¢ @ 1.80¢, with certain Western makes available at still lower figures. There is a gradual increase in the volume of business, however, and as soon as the many little country mills get filled up with work more uniformity in prices is expected. Skelp Iron shows some improvement in demand, but prices remain at about 1.75¢ for Grooved and 1.95¢ @ 2¢ for Sheared. The actual change in prices since last week is very trifling, but the increase in demand is considered a strong feature, and will doubtless develop into higher prices before long.

**Plate and Tank Material.**—The demand has been largely in excess of the supply, so that prices have shown a steadily-hardening tendency. All descriptions have been called for, and mills are now full of work for some weeks to come. Prices are higher, but vary according to circumstances and according to the way certain mills are situated for making deliveries. In a general way the following inside quotations represent prices f.o.b. cars at mills, and the outside figures are for deliveries in consumers' yards: 2¢ @ 2.2¢ for Ordinary Plates and Tank Plates; 2¢ @ 2.25¢ for Universal Plates; Shell, 2.4¢ @ 2.5¢; Flange, 3.25¢; Fire-Box, 3.7¢ @ 4¢; Steel Plates, Tank and Ship Plate, 2.2¢ @ 2.30¢; Shell, 2.5¢ @ 2.7¢; Flange, 2½¢ @ 3¢; Fire-Box, 3½¢ @ 4¢.

**Structural Material.**—Business has been very active in this department, mills all full of work, with prices firm and advancing. Beyond that there is nothing more to be said, except that prospects are decidedly favorable and that work during the summer is likely to be abundant. Quotations are about as follows: Bridge Plate, 2.05¢ @ 2.15¢; Angles, 2.1¢ @ 2.2¢; Tees, 2.5¢ @ 2.6¢; Beams and Channels, 2.8¢ for Iron or Steel.

**Sheet-Iron.**—There is all the business that mills are inclined to accept at present prices. The feeling is firm, and it is believed that some advance will be made soon, but in the meantime prices are about as follows for carload lots:

Best Refined, Nos. 14 to 20.....	3¢
Best Refined, Nos. 21 to 24.....	3.20¢
Best Refined, Nos. 25 to 26.....	3.40¢
Best Refined, No. 27.....	3.50¢
Best Refined, No. 28.....	3.60¢
Common, ¼¢ less than the above.	
Best Soft Steel, Nos. 14 to 20.....	8½¢
Best Soft Steel, Nos. 21 to 24.....	3½¢
Best Soft Steel, Nos. 25 to 26.....	3½¢
Best Soft Steel, No. 27.....	4¢
Best Bloom Sheets, ¼¢ extra over the above prices.	
Best Bloom, Galvanized, discount.....	65 %
Common, discount.....	67½ %

**Steel Rails.**—The market is dull but firm at \$27.50 @ \$28 at mill. Sales during the week have not been important, but there is plenty of work on hand for the present, so that there is no disposition to shade quoted rates. Prospects are considered to be favorable for a further stiffening in prices, as there is a considerable amount of business to be placed during the summer months.

**Old Rails.**—Prices are entirely nominal at about \$22.50, spot, Philadelphia, or \$23 @ \$23.50 delivered in the interior. There is but little inquiry, and an equally light supply.

**Scrap-Iron.**—Prices are firm and the supply of good Scrap decidedly scarce, but no quotable change can be made at present, although sales are chiefly at outside figures, as follows: \$20.50 @ \$21 for cargo lots; \$21 @ \$21.50 for carload lots, delivered, or for choice, \$22; No. 2 do., \$14 @ \$15; Turnings, \$14 @ \$15; Old Steel Rails, \$16.50 @ \$17.50; Cast Scrap, \$15 @ \$16; do. Borings, \$9 @ \$10; Old Fish-Plates, \$23 @ \$24; Old Car-Wheels, nominal, \$17 @ \$18, Philadelphia.

**Wrought-Iron Pipe.**—The demand is very active and prices are firm, with an advancing tendency, although discounts for the present remain as before, viz.: Butt-Welded Black, 52½ ¢; Lap-Welded Black, 65 ¢; Butt-Welded Galvanized, 45 ¢; Lap-Welded Galvanized, 52½ ¢; Boiler Tubes, 60 ¢.

**Nails.**—There is a pretty good demand from the building trade and a very active one from speculators. Mills limit sales to their regular customers and claim \$1.90 to be an outside price for carload lots. Store prices are about \$2.

Mr. Wm. H. McElroy, for the past 12 years with the Phoenix Iron Company, at their works, Phoenixville, Pa., has resigned his position to enter into the Iron and Steel commission business with R. E. Anthony, Jr., of Brooklyn, N. Y., and has secured offices at 328 Chestnut street, Philadelphia.

## Chicago.

Office of *The Iron Age*, 50 Dearborn street,  
CHICAGO, June 17, 1889.

**Fig-Iron.**—The only change in the condition of the market as described a week ago is in Southern and Ohio Irons. Local furnaces have been selling at figures that made it absolutely impossible to sell outside Coke and Charcoal Irons here at a profit. Manufacturers recognized this fact, and nearly every sales-agent handling Southern grades has been notified that the furnaces are "sold up"—better prices being obtained in other markets. In many instances extra concessions on immediate shipments were offered them by their local branch roads, which it was hoped, with the new freight rate, would help the maker in placing some of the surplus stock, but local furnace men have the advantage under all circumstances, and they intend keeping it so long as they have a ton of Iron to sell. In Soft Irons, Gray Forge and Mottled used in mixtures there is no local competition, and manufacturers were free to take in a good many orders. The demand was very free and prices consequently advanced from 25¢ to 50¢ per ton. On this grade of Iron we change quotations accordingly, but on Saturday it was rumored that railroads fighting for business had made a cut of 35¢ per ton from Birmingham, making the rate \$3.65, as against \$4. If this rumor proves correct our prices will be that much above the market. Transactions in Coke and Charcoal Irons were frequent and no concessions made for quantity. Long-time deliveries are not accepted so ravingly as some weeks ago and command the top price. Car-Wheel Irons have been in better request, but sales were not augmented to the extent anticipated. A very small proportion of the cars contracted for came to this vicinity, hence no extra amount of Iron was required for Wheel purposes. We make the following quotations, cash, f.o.b. Chicago: Lake Superior Charcoal, \$18.50 @ \$19; Local Coke, No. 1, \$15.50; No. 2, \$14.50; No. 3, \$13.50; Chicago and Bay View Scotch, \$15.50 @ \$16; American Scotch (Blackband), \$18; Southern Coke, No. 1 Foundry, \$15.75; No. 2 Foundry and No. 1 Soft, \$15.25; No. 3 Foundry, \$14; No. 2 Soft, \$14.25; Gray Forge, \$13.00; Mottled, \$13.25; Hanging Rock, No. 1, \$18.25; Jackson County Silvery, No. 1, \$18; Tennessee Charcoal, No. 1, \$18.75; Alabama Car-Wheel, \$24 @ \$25.

**Bar-Iron.**—As the end of the month approaches manufacturers are becoming more chary about taking orders at any price. Some of the mills East and West have declined to bid on specifications for July, August and September deliveries, and all those who do name prices all the way from \$1 to \$2 per ton higher at mill. Prices are nevertheless irregular and vary

according to quality and uses. On Common Bars, \$1.60, and on Single Refined, \$1.75, including half extras, f.o.b., Chicago, is a general quotation made by the lowest sellers. Mills having begun to show a little firmness, buyers are placing their orders more rapidly and inquiries are not falling off. Best Refined is not getting its share of attention. There are a good many consumers who hesitate about placing their full orders with the cheap makers and only one mill. Out of store jobbers quote Common and Single Refined at \$1.65 @ \$1.75, and the better grades at \$1.80 @ \$1.90.

**Structural Iron.**—It now looks as though there would be a very fair trade in Builders' Shapes during the summer and early fall. Foundries are all pressed for estimates and quite a lot of little contracts are made every week. Several large structures—one 10, another 12 and another 14 stories—are under negotiation, and operations are to begin soon. Bridge Material for new and repair work is in good request. On these prices may be a shade firmer, but unchanged in quotations, as follows, f.o.b. Chicago: Angles, 2.10¢ @ 2.12½¢; Universal Plates, 2.15¢; Sheared Plates, 2.20¢; Tees, 2.55¢; Beams and Channels, 2.90¢. Small lots from store are quoted at 2.20¢ @ 2.30¢ for Angles, 2.65¢ @ 2.70¢ for Tees and 3.40¢ for Beams.

**Plates, Tubes, &c.**—Jobbers report no change in the general condition of the market. Consumption is confined to small-lot buyers. Large orders for new work are talked of but not placed. Prices remain quite steady on Iron and Steel Plates and advanced on Tubes. The following quotations from store are made: Nos. 10 to 14 Iron Sheets, 2.50¢ @ 2.60¢; Nos. 10 to 14 Steel Sheets, 2.75¢ @ 3¢; Tank Iron, 2.40¢ @ 2.50¢; Tank Steel, 2.50¢ @ 2.60¢; Shell Iron or Steel, 3¢; Flange Iron, 4¢; Flange Steel, 3.50¢; Fire-Box Steel, 4.75¢ @ 5.50¢; Ulster Iron, 3.75¢; Boiler Rivets, 3.75¢ @ 4.25¢; Boiler Tubes, 55 % off for 1½-inch and less and 60 % off for 2-inch and larger.

**Sheet-Iron.**—Because manufacturers do not want additional orders the impression prevails that there will be some labor trouble in the Sheet mills next month. Jobbers who have stock under contract are pressing for deliveries and holding prices firm. From store they quote on a basis of 2.20¢ for No. 27, and mills quote on the same basis and number 2.90¢ @ 2.95¢, f.o.b. Chicago.

**Galvanized Iron.**—The market continues to be in about the same condition as a week ago. Orders are quite numerous in small lots, but heavy buyers are not placing their orders. Stocks in all sizes are in good supply and prices pretty closely adhered to. On Juniata jobbers quote 65 % off and on Charcoal 65 % and 5 % off.

**Merchant Steel.**—Low-grade Steels continue to have the call. Consumers begin to realize that the chances for lower prices are very slim. While that class of manufacturers who do not make stock goods are not inclined to buy heavily, they nevertheless are stocking up gradually and accumulating from time to time a little more material than their immediate wants require. A good many of the agricultural implement men have placed their orders for the next year's supply, but there are still many who are waiting for further indications that prices have reached bottom. The Chicago office of the Gautier Steel Department have issued a circular in which they say: "We shall be prepared in 30 to 45 days to fill any orders you may favor us with for Tire, Machinery, Toe-Calk and Spring Steel; also for Finger-Bars, Rake-Tooth Steel and Finished Rake Teeth, Bundle-Carrier Teeth, &c." If they can do this, it will have a

tendency to divert some of the orders on which inquiries have been made in this market recently. Manufacturers quote f.o.b. Chicago on round lots of Open-Hearth Spring Steel, 2.25¢; Open-Hearth Machinery, 2.10¢; Tire Steel, 2.15¢; Toe Calk, 2.30¢, flat; Soft Bessemer Steels, 1.90¢ rates. The following quotations are from store: Mixed Machinery Steel, 2.10¢ @ 2.20¢; Tool Steel, 7.75¢ @ 8.50¢; Specials, 12¢ @ 25¢; Crucible Spring Steel, 3.50¢ @ 3.60¢; Open-Hearth Spring, 2.50¢; Open-Hearth Machinery, 2.50¢ @ 3¢; Bessemer Machinery, 2.30¢ @ 2.40¢; Sheet-Steel, 7¢ @ 10¢; Tire Steel, 2.20¢ @ 2.25¢.

**Track Supplies.**—The demand for this class of shapes has not run into large orders. Prices on Fish-Plates vary with the quantity and time of delivery from 1.70¢ to 1.90¢. Bolts with Square Nuts are quoted at 2.50¢; with Hexagon Nuts, 2.60¢ @ 2.70¢; Spikes, 1.85¢ @ 1.90¢; Hot-Pressed Square Nuts, 5.85¢ discount; Hexagon Nuts, 6.35¢ discount.

**Steel Rails.**—The demand for Steel Rails in the past week has been very slow. Railroad companies that were greatly in need of Rails got into the market early in the month. The mills here are consequently filled up entirely for June and July. The C., R. I. & P. R. R. Co., it is said, will build a line of 100 miles through the Oklahoma Territory, for which they will need a quantity of new Rails. There are several other new branches spoken of, but so far as known none are ready to contract for the necessary supplies. On Heavy Sections mills continue to quote \$29 @ \$30. There has been considerable demand for Light Iron Rails for street car purposes. On 12-lb Rails manufacturers are asking \$34 @ \$36; on 30-lb Rails, \$38. This is a slight advance over prices of several weeks ago; \$32 was refused on a 100-ton lot within the last week.

**Old Rails and Wheels.**—The demand for Old Rails has been quite brisk, but sales very limited. In the first place stocks are scarce in this market and those who have Rails to sell are inclined to hold them for higher prices. On small lots \$20.25 has been offered. Sellers are asking from \$20.50 to \$23. The demand for Old Steel Rails is not urgent and prices are nominally quoted at \$17 @ \$18 for long lengths and \$14 @ \$15 for short pieces. Old Car-Wheels are in pretty good demand, but the exalted idea of their value on the part of sellers has thus far prevented any large sales. Offers of \$17 @ \$17.50 have been made by buyers, but the asking price ranges from \$18 to \$19.

**Scrap.**—There appears to be a little more activity in the Scrap market. Sales of 1000 to 1500 tons Wrought Scrap are reported. Railroad companies are offering only small lots, and dealers are holding their prices a trifle stronger than several weeks ago. Manufacturers do not take hold in very large quantities and are inclined to discredit the probability of prices advancing. Dealers' quotations on 2000 lb are as follows: No. 1 Wrought, \$17.50; Fish-Plates, \$18; Axles, \$21; Horse-shoes, \$17; No. 1 Mill, \$13; Cast Machinery, \$11; Stove Plate, \$9; Cast Borings, \$8; Wrought Turnings, \$10; Coil Steel, \$13; Leaf Steel, \$14.50; Locomotive Tires, \$14.50; Track Scrap, \$16; Mixed Country Wrought, \$12.

**General Hardware.**—Nothing of importance has transpired since our last report. The leading jobbers of this city are doing a very nice trade in Shelf Goods and other staple articles. The demand for Heavy Hardware is lighter. No new prices were announced during the week and all the advances heretofore made are being well sustained.

**Nails.**—This market is so unsettled that it is difficult to express an opinion which will give a definite idea of the situation. The manufacturers who are selling Nails at the ruinous prices of a week ago have withdrawn from the market, but in their stead we find another set of men who have taken offence at the action of their brethren, and are now preparing to (if not already doing so) discount the price at which Nails have been sold. As they recognize that most of the jobbers have obtained pretty large supplies, and that they cannot do much in a jobbing way, they intend going direct to the large retailers throughout the country soliciting carload orders. The unprecedentedly low freight rates from Pittsburgh, Wheeling and Ohio Valley to St. Paul and Missouri River points makes it possible for goods to be shipped into those sections at nearly the same prices for which they can be laid down in Chicago. Should they proceed in their undertaking they will through this means be able to stock up all the principal dealers in the West. This will result in arousing the jobbers, who undoubtedly will meet whatever prices are made by the manufacturers. Under the disturbed condition of the market the majority of dealers would not feel inclined to take full carloads, which would exclude the manufacturers and leave the jobbers an opportunity of selling small lots or mixed cars at the same price the manufacturer had named, and in a measure deprive him of some trade. From stock jobbers are quoting \$1.85 for Cut Nails and \$2.80 for Wire Nails. Mixed carloads in small lots Cut Steel Nails are quoted at \$1.90 and Wire Nails at \$2.35. It is not surprising that Wire Nails are suffering from the demoralized condition of the Cut-Nail trade. Manufacturers readily see that in order to compete with the Cut Nail it will be necessary for them to reduce their prices. This has not yet been done, but there is a probability that lower prices will be made before the close of the week. Manufacturers of Wire Nails are making an effort to have the jobbers adopt their last price-list on small goods. The jobbers are making serious objections to it, and it is not likely that it will come into operation.

**Barb-Wire.**—The conditions of the market remain precisely the same as heretofore. Manufacturers in the West are running their mills full on orders and not accumulating any stock. Jobbers' price in small lots from store is 2.75¢ on Painted and 3.85¢ on Galvanized. Some of the Eastern mills evidently are not so well situated, as we hear of orders of carload lots delivered on the Mississippi River at about the same figures that jobbers are asking here in carloads. Here also comes into play the discrimination in favor of Eastern manufacturers on through freight rates, which enables them to lay down Wire in Duluth as cheaply as they could in Chicago.

**Pig-Lead.**—There was no activity in the market last week, buyers apparently waiting for a change in the situation. Consumers are pretty well supplied for June and July, and there is no hurry in placing orders for August. Sales amount to about 200 tons at 3.80¢ @ 3.85¢, which was the ruling price at the close of the week.

## Chattanooga.

Office of *The Iron Age*, Carter and 9th Sts., CHATTANOOGA, June 17, 1889.

**Pig-Iron.**—There appears to be an improvement all along the line in the tone of the market. No concessions are now being asked by buyers, and sales are being made on a basis of previous prices to an advance of 25¢ @ 50¢, so that upon the whole there is really an advance in the condition of the market. Anything like making a purchase of a round lot for future

delivery—that is to say, for a stated amount per month during the year—is now out of the question; it would take an advance of at least \$1 @ \$2 per ton to secure such a contract. None of the furnaces are suffering for orders, and it is safe to say that at prices that have ruled during the past few weeks there is not a furnace South but what could close out its entire output for the balance of the year. The above describes about the situation with the Southern Iron makers, and the future is being watched with much interest. A reduction in rates to some points North has been made, but how many points are affected is not yet known.

## Pittsburgh.

Office of *The Iron Age*, 77 Fourth Ave.,  
Pittsburgh, June 18, 1889.

In regard to the hitch between the Iron manufacturers and the Amalgamated Association there has been nothing of a decisive character developed as yet. The manufacturers have no organization, and the wage-scale agreed upon by the Amalgamated Association, which it is believed will be substantially the same as that of 1888-89, will be presented to each firm by the Mill Committee, and the indications at the present time are that the manufacturers generally will sign, and consequently there is not much probability of a strike. Our manufacturers say they cannot compete with Eastern manufacturers, who have a great advantage in the matter of wages. It is generally admitted that in regard to the wage-scale the Amalgamated Association display a good deal better generalship than the manufacturers, who for a year or more have had virtually no organization, and, of course, without organization there could be no co-operation; on the other hand, the Amalgamated Association are well organized, and consequently they have a decided advantage.

Our communication with the East via the Pennsylvania Railroad is again opened up, so far at least as relates to passengers and mail, but it will be some days yet before freight trains will be put on; in the course of another week, however, it is expected that the road will be in pretty good condition for business, but it will be a long time before the damage in the Conemaugh Valley is fully repaired. The railroad officials, it is understood, estimate the actual loss to the road at \$1,500,000, but this does not include the loss of business while the road is in its disabled condition, which will also be very heavy. However, while it is bad for the company it will make a largely increased demand for all kinds of Railway Supplies, Rails, &c. Bridge-builders also will come in for some pretty good-sized contracts. Moreover, the rebuilding of Johnstown and suburbs, both as to dwellings and manufacturing establishments, has already been commenced, which will require large quantities of Iron and Steel, to say nothing of machinery.

**Pig-Iron.**—There has been more activity the past week, with more buyers and fewer sellers, and while prices are not quotably higher, the market is firmer. The feeling generally obtains that hard pan has been reached, and furnacemen are refusing to make contracts for future delivery at present rates. While sales of Bessemer have been reported for immediate or near-by delivery at \$15.75 and even \$15.50, furnacemen are asking from 50c. to \$1 more for delivery during July or August. We quote prices as follows:

Neutral Gray Forge.....	\$13.85 @ \$14.00, cash
No. 2 Neutral Gray Forge.....	\$13.50 @ \$13.75, "
All-Ore Mill.....	14.50 @ 15.00, "
No. 1 Foundry.....	16.00 @ 16.25, "
No. 2 Foundry.....	15.00 @ 15.25, "
No. 3 Foundry.....	14.50 @ 14.75, "
White and Mottled.....	13.00 @ 13.50, "
No. 2 Charcoal Foundry.....	21.00 @ 22.00, "
Cold Blast Charcoal, No. 1.....	24.00 @ 27.00, "
Bessemer Iron.....	15.75 @ 16.00, "

**Muck-Bar.**—There is more inquiry and the market is firmer. We now quote at \$26 @ \$26.25, cash, with a sale of 1000 tons reported at \$26.25, cash. Manufacturers say there is nothing in it at present prices, and some of them are indifferent about selling.

**Manufactured Iron.**—The mills generally are pretty well employed, but there is no rush and no improvement in prices. First-quality Iron is still quoted upon a basis of 1.60¢ @ 1.70¢ for Bars, 60 days, 2 % off for cash, but Old Rail Iron can be had for from  $\frac{1}{10}$ ¢ to  $\frac{1}{8}$ ¢ less. There is a continued good demand for Skelp Iron, and prices are steady at 1.60¢ @ 1.65¢ for Grooved and 1.90¢ @ 1.95¢ for Sheared.

**Nails.**—The Nail trade continues unsettled and somewhat demoralized. What has been known as the Western Association has collapsed, and each firm is now free to do as it pleases. There are no regularly established prices, although makers continue to quote at \$1.80 @ \$1.90, 60 days, 2 % off for cash. Manufacturers, it is said, succeeded in unloading from 15,000 to 20,000 kegs at Chicago last week at very low prices. A firm having over 100 machines who wanted to go out of business offered to sell the whole lot at \$20 for each machine. Wire Nails are still quoted at \$2.25, 60 days, 2 % off for cash.

**Wrought-Iron Pipe.**—The meeting of the Pipe manufacturers in this city last week was largely attended, nearly all the mills in the country having been represented; business was very generally reported good; mills all busy, with every prospect of a continuance of the same until the advent of the winter season. Prices on Boiler Tubes and Line-Pipe were advanced, the rest of the list remaining unchanged. Discounts on Black Butt-Welded Pipe, 52½ %; on Galvanized do., 45 %; on Black Lap-Welded, 65 %; on Galvanized do., 52½ %; Boiler Tubes, 1½ inches and smaller, 55 %; 2 inches and larger, 60 %; Casing, 5½ inches, 62½ %; other sizes, 60 %; 2-inch Tubing, 18¢ per foot, net; Line-Pipe, 2-inch, 10½¢ per foot, net; 2½-inch, 16¢; 3-inch, 21¢; 3½-inch, 25¢; 4-inch, 30¢; 4½-inch, 36¢; 5-inch, 42¢; 6-inch, 58¢; 7-inch, 70¢; 8-inch, 95¢; 9-inch, \$1.20; 10-inch, \$1.25; 12-inch, \$1.60.

**Old Rails.**—Continue in demand, with but few offerings, but prices remain about as last quoted, \$22 @ \$22.50, cash; sale of 500 tons at \$22.50. A large consumer here says he can get all he wants at \$20 at Chicago, which with freight added, \$2.20, would make them cost \$22.20 here. Old Steel Rails are still quoted at \$16 @ \$17 for short lengths and \$19 @ \$20 for long lengths.

**Steel Rails.**—Are still quoted at \$26 @ \$27, cash, at mill, and as mills are all pretty well sold out the market is firmer.

**Billets, Blooms, &c.**—Sales of Bessemer-Steel Billets reported at \$26.75 @ \$27.25, according to size, quality and delivery. Sales of Bessemer Nail Slabs at \$26.50. No recent sales of Bloom Ends or Rail Crops reported, in the absence of which it is difficult to give reliable quotations.

**Railway-Track Supplies.**—Railway Spikes have been reduced to 1.95¢, 30 days, free on cars at works; Splice Bars unchanged at 1.60¢ @ 1.70¢, and Track Bolts at \$2.75 with Square and \$2.85 with Hexagon Nuts.

**Old Material.**—Is in rather better demand and firmer, but prices remain unchanged. No. 1 Wrought Scrap, \$18, net ton; Old Car Axles, \$23.50 @ \$24; No. 1 Wrought Turnings, \$13 @ \$14; Cast Scrap, \$13.50 @ \$14, gross; Old Car-Wheels, nominal at \$18.

## Detroit.

**WILLIAM F. JARVIS & Co.,** under date of June 17, 1889, report as follows: While for several weeks past we have been able to report a large number of inquiries, we have been unable to report any large sales. However, during the week just past several large orders for Lake Superior Charcoal have been placed, and also enough small sales of 50 to 200 tons to make a large quantity in the aggregate. The demand for Coke Irons has not been as great as for Lake Superior Charcoal, but a considerable number of small orders for Ohio and Southern Irons have been booked. While prices remain about the same, there are very few furnaces willing to make concessions to obtain orders, and some have decided to make no further sales for delivery after September, unless at higher quotations than at present are ruling. We report an active market and quoted as follows:

Lake Superior Charcoal, all numbers.....	\$19.00 @ \$19.50
Lake Superior Coke, all ore.....	18.00 @ 18.50
Lake Superior Coke, cinder mixed.....	17.50 @ 18.00
Standard Ohio Black Band.....	18.00 @ 18.50
Southern No. 1.....	18.50 @ 19.00
Southern Gray Forge.....	18.00 @ 18.50
Southern Silvery.....	18.00 @ 18.50
Jackson County (Ohio) Silvery.....	18.00 @ 18.50
Old Wheels.....	18.50 @ 19.00

## St. Louis.

Office of *The Iron Age*, 214 N. Sixth st.,  
St. Louis, June 15, 1889.

**Pig Iron.**—The improved condition of trade noted in last week's report continues. Prices show more strength, and there is a gradual movement toward somewhat higher figures, although as yet there is no quotable advance. Offers for good round lots at prices that would have been accepted two weeks ago are now refused, and in some instances slight advances have been asked, these, however, for brands of superior excellence. There have been a number of sales made during the past week, to be delivered as per ordered, which indicates a legitimate demand, and shows an absence of buying for speculative purposes. Standard brands are scarce and firm, and cannot be bought at the low prices at which some Irons were recently offered. For ordinary-sized lots we quote as follows, for cash, f.o.b. St. Louis:

Southern Coke, No. 1 Foundry.....	\$15.25 @ \$15.75
Southern Coke, No. 2 Foundry.....	14.75 @ 15.25
Southern Coke, No. 3 Foundry.....	14.25 @ 14.50
Gray Forge.....	13.25 @ 13.75
Ohio Softeners.....	17.00 @ 19.00
Lake Superior Charcoal.....	19.75 @ 21.50

Missouri.	
Charcoal Foundry, No. 1.....	16.00 @ 16.50
Charcoal Foundry, No. 2.....	15.00 @ 15.50

Tennessee.	
Charcoal Foundry, No. 1.....	17.00 @ 18.00
Charcoal Foundry, No. 2.....	16.50 @ 17.00

Connellsville Coke, f.o.b. East St. Louis, \$4.40; St. Louis, \$4.55.

**Bar Iron.**—Trade shows signs of improvement daily, and mills are kept fairly well employed. Jobbers are heavy buyers, as are also the Car-works, and some little demand emanates from the railroads; this latter, however, is not as heavy as was anticipated, but taking everything into consideration, the outlook is more promising than for some months past. Small lots from store are quoted at \$1.80; carload lots from \$1.60 to \$1.70, according to circumstances.

**Barb Wire.**—Trade is dull and prices remain as last quoted. Mills have enjoyed a good trade since the first of the year, but now the farming industry has little or no time to give to fence building, hence the dullness. Mills quote from \$2.80 to \$2.85 for Painted and from \$3.40 to \$3.45 for Galvanized; carload lots at from \$2.70 to \$2.75 for Painted and \$3.30 to \$3.35 for Galvanized, f.o.b. St. Louis.

## Louisville.

LOUISVILLE, KY., June 17, 1889.

**Pig-Iron.**—The market this week has shown increased stiffness, though some offerings have been made at very low prices. One or two of the prominent Southern furnaces have felt it wise not to offer their iron at present price and have withdrawn, and their views are about 50¢ a ton higher than Saturday. A few furnaces continue to sell at old prices, but we think the tendency of the market is upward and that prices will advance probably 50¢ @ 75¢ a ton. There has not been much Iron sold here during the past week, as buyers have not generally decided what action to take, but the disposition is to purchase for future delivery what Iron they desire during the year. Furnaces are meeting buyers' views to a certain extent where they are willing to pay 25¢ @ 50¢ over last week's prices. We quote as follows:

Southern Coke, No. 1 Foundry.	\$14.25 @ \$14.75
Southern Coke, No. 2 Foundry.	13.75 @ 14.25
Southern Coke, No. 8 Foundry.	13.00 @ 13.50
Gray Forge	12.50 @ 13.00
White and Mottled, different grades	12.00 @ 12.50
Silver Gray, different grades	12.50 @ 13.50
Southern Charcoal, No. 1 Foundry	16.00 @ 16.50
" " No. 1 Mill.	14.50 @ 15.00
Southern Car-Wheel, standard brands	21.75 @ 22.75
Southern Car-Wheel, other brands	18.00 @ 19.50
Hanging Rock Coke, No. 1 Foundry	15.50 @ 16.00
Hanging Rock Charcoal, No. 1 Foundry	19.50 @ 21.00
Hanging Rock, Cold Blast	20.75 @ 22.75

## Cleveland.

CLEVELAND, June 17, 1889.

**Iron Ore.**—The market retains its activity. Ores of all grades are selling freely at prices slightly below the quotations established at the beginning of the season. Good Gogebic Ores that then commanded \$5 are now to be had for \$4.75 and the very best Ores from this range are selling for \$5, instead of \$5.25. Menominee Bessemer are bringing \$4.50 at present and are in fair demand at that figure. Few non-Bessemer Ores from any of the ranges can now be purchased, nearly the entire output of the mines having been previously contracted for. For the scattering lots occasionally reported sold about \$3.80 per ton is paid. Despite the energetic efforts of the vessel men to increase Lake freights plenty of tonnage can still be secured at 90¢ from Escanaba, \$1.10 from Marquette and \$1.25 from Ashland. Indications are not wanting of an 80¢ rate from Escanaba before August. Ore is being pushed down from the Lake Superior district at a tremendous rate and the shipments are already nearly 1,000,000 tons ahead of those at a corresponding period last year. It is believed that 4,125,000 tons of Ore have already been sold.

**Pig-Iron.**—All the Iron now in stock could be easily disposed of at present prices. The demand is astonishing and the general tone of the market has considerably improved over last week. The advance in prices is, of course, purely speculative, but the extremely healthy condition of the Pig-Iron market seems to justify the belief that rock bottom has been reached and that future sales of Iron will be at prices slightly in advance of prevailing quotations. Nearly all the dealers in the city unite in the belief that better prices will come early in June.

**Scrap-Iron.**—Scattering sales of Old American Rails at \$21 are reported, but the market lacks activity. There is but small demand for Old Wheels, even at \$19. Old Axles are, however, selling freely.

**Nails.**—There is no material change in the situation. Steel Wire Nails at \$2.30 are in fair demand, and Steel Cut Nails at \$1.90 from store are selling with considerable freedom.

## Cincinnati.

Office of The Iron Age, Fourth and Main Sts. }  
CINCINNATI, June 17, 1889. }

**Pig-Iron.**—The low prices current for Pig-Iron have not only attracted larger buyers for various deliveries, but inquiries have been numerous from consumers of all kinds of metal anxious to test the temper of the market rather than to make purchases. Speculators, too, have entered the market for no small amounts, but have failed to secure the full quantity desired at inside prices. With one or two exceptions, there is less pressure to sell at the close, Forge Iron, especially, being held more firmly. In some instances buyers have made direct purchases from furnaces, profiting by the omission of the commission. Although production continues on a liberal scale, the report of stocks at furnaces shows a steady decline, and the conviction that the market has reached its lowest level is strengthened. There has been more demand for Car-Wheel Iron, and 3000 tons Southern sold at \$23, for delivery during the next three or four months. Among the other larger sales were 900 tons No. 3 Southern Coke Foundry at \$13.25; 1000 tons do. No. 2 at \$13.75; 600 tons No. 1 at \$14.35; 1000 tons do. at \$14.75, cash basis; 2000 tons Gray Forge at \$12.75, and 1500 tons Mottled at \$11.75, cash. Sales of carload lots to 200 tons have been numerous at proportionate prices. There is more general activity than has been the case for several months. Business affairs aside from Pig-Iron are improving, and so far as these matters have a bearing the prospect is decidedly improved, but a more active money market may modify the tendency toward better prices. The following are the approximate prices current here at the close for cash, f.o.b.:

<b>Foundry.</b>	
Southern Coke, No. 1	\$14.25 @ \$14.75
Southern Coke, No. 2	13.75 @ 14.25
Southern Coke, No. 3	13.25 @ 13.75
Ohio Soft Stone Coal, No. 1	15.50 @ 16.00
Ohio Soft Stone Coal, No. 2	14.50 @ 15.25
Mahoning and Shenango Valley	16.00 @ 16.50
Hanging Rock Charcoal, No. 1	20.00 @ 22.00
Hanging Rock Charcoal, No. 2	19.00 @ 21.00
Tennessee and Alabama Charcoal, No. 1	17.50 @ 18.00
Tennessee and Alabama Charcoal, No. 2	16.50 @ 17.00
<b>Forge.</b>	
Strong Neutral Coke	12.75 @ 13.00
Mottled Neutral Coke	11.75 @ 12.00
Gray Forge	12.75 @ 13.00

<b>Car-Wheel and Malleable Irons.</b>	
Southern Car-Wheel	20.00 @ 23.00
Hanging Rock, Cold Blast	22.00 @ 23.00
Lake Superior Car-Wheel and Malleable	20.00 @ 21.00

**Manufactured Iron.**—There has been some little increase in the orders placed, and mills and foundries are fairly busy on old contracts, but while there is a better feeling, there is no tendency toward higher prices.

**Nails.**—There has been a fair jobbing demand, but an easy tone has prevailed, without essential change in prices. Steel Nails, 12d and 40d, sell at \$1.80 @ \$1.90 per keg, with 10¢ rebate in carload lots at the mills, and Steel Wire Nails at \$2.40 @ \$2.50 per keg.

**Old Material.**—The demand for Rails has continued moderate, but the offerings have not been large and the market is fairly quotable at \$20, spot. There has been some inquiry for Old Wheels at \$16, cash, but offerings have been small.

## New York.

Office of The Iron Age, 65 and 68 Duane street, }  
New York, June 19, 1889. }

**Pig-Iron.**—Very decided activity has prevailed among those who are in a position to furnish Iron promptly. Sales are reported of numerous lots ranging from 50 tons to 2000 tons. A number of dealers have disposed of 1500 to 2000 tons each

during the past week, and one house reports transactions aggregating 6000 tons. The heavy purchases of material of all kinds by the railroads have undoubtedly stimulated the Pig-Iron market, and it is hoped that the impetus thus given may not be merely temporary. The buying movement now in progress has clearly demonstrated that both consumers and furnace companies were carrying light stocks. Some of the furnace companies have notified their agents to take no more orders at present, as their capacity is well covered for several months. Outstanding options have been withdrawn, and manufacturers are evidently getting themselves in readiness to take advantage of an upward movement in prices if the demand continues. Some dealers, however, take a conservative view of the situation, believing that consumers have pretty well covered their requirements for the time being and that there will not be sufficient activity to cause much of an advance. Here and there prices on various brands have been marked up 25¢ @ 50¢ per ton, but the general range continues about as previously quoted, namely: Northern Irons at tidewater, \$16.50 @ \$18 for No. 1, according to brand; \$15.50 @ \$17 for No. 2; \$14.50 @ \$15.25 for Gray Forge. Southern brands sell at \$16.25 @ \$17 for No. 1; \$15.50 @ \$16 for No. 2; \$14.75 @ \$15 for No. 3; \$14.25 @ \$14.50 for Gray Forge, all delivered at New York.

**Scotch Pig.**—Larger transactions are reported, with orders entered for future delivery, which is a feature of trade that has been wanting for some time. Quotations are as follows: Eglinton, \$19 @ \$19.50; Dalmellington, \$19.50 @ \$20; Summerlee, \$21.50; Langloan, \$21; Coltness, \$21.50 @ \$21.75.

**Spiegeleisen.**—Several thousand tons of 20 % were sold at about \$28. Small transactions in Ferro are reported at \$58 @ \$60 for 80 %.

**Wire-Rods.**—Quotations are nominal at \$48, ex-ship. No transactions are possible at this price.

**Structural Iron and Steel.**—The market is very active and strong. Quotations for delivery on dock are as follows: Sheared Plates, 2.05¢ @ 2.1¢; Universal Mill Plates, 2.1¢ @ 2.15¢; Angles, 2.05¢ @ 2.1¢; Tees, 2.5¢ @ 2.6¢; Beams and Channels, 2.8¢.

**Plates.**—An excellent business is reported, with an upward tendency in prices still existing. Quotations are as follows for delivery on dock: Tank Iron, 2.05¢ @ 2.1¢; Shell, 2.4¢ @ 2.5¢; Steel Tank, 2.25¢ @ 2.3¢; Shell, 2.4¢ @ 2.5¢; Flange, 2.7¢ @ 2.8¢; Fire-box, 3.25¢ @ 4¢.

**Bar-Iron.**—The demand is not so heavy as for other classes of material, yet some good orders have been entered. Quotations for dock deliveries are as follows: Common, 1.6¢ @ 1.65¢; Medium, 1.7¢; Refined, 1.75¢ @ 1.9¢. Some mills are refusing to sell at less than 2¢.

**Merchant Steel.**—Business has been rather quiet, but orders are being received for shipment after the 1st of July, so as to throw them into the new fiscal year of manufacturing consumers. Some complaint is heard of slow collections. Tool Steel, good brands, in large lots, is still quoted at 7¢ @ 7½¢; specials, 12½¢ @ 20¢; Crucible Spring, 8½¢ @ 4¢; good Open-Hearth Machinery, 2.30¢ @ 2.5¢; common ditto, 2¢ @ 2.25¢; Open-Hearth Spring, 2½¢ @ 2.5¢; Sheet, 6½¢, 8½¢ and 10½¢.

**Steel Rails.**—The mills are now so well supplied with work that railroad companies are finding some difficulty in arranging for early deliveries. The sales of the week have been confined to small lots, the largest reported consisting of 8000 tons. A good movement in light-weight Rails is

in progress. They are being placed on the basis of \$28 at mill for heavy sections, which is the rate now quoted on small orders. Quotations on large contracts are firm at \$27.50 at mill. Speculative lots, taken some time since, are being pressed on the market, but the holders of such contracts are finding it very difficult to dispose of them for some reason.

**Track Supplies.**—A much better feeling obtains among sellers. A heavy volume of business is reported, with quite a number of negotiations pending. Some mills are now filled up on Fish-Plates to August, and prices are naturally firmer with their withdrawal from the market for the time being. Quotations for Fish-Plates of Iron or Steel range from 1.80¢ to 1.90¢; Track Bolts, Square Nuts, 2.70¢ @ 2.75¢; Hexagon Nuts, 2.90¢, Common Iron, and 3¢, Refined; Spikes, 1.95¢ @ 2¢.

**Old Material.**—Old Iron Rails are in good demand, while the supply is very limited. About 2000 tons were secured by a prominent consumer, who claims to have paid only \$22, but other parties bid the same figures and were unable to consummate a purchase, so that this price hardly represents the market at present. Holders are decidedly firm in their views and are looking for considerably higher prices. Inquiries are being received for Old Steel Rails, but no sales are reported. Buyers offer \$17.50. No. 1 Wrought Scrap has been sold along railroad line at \$20 in quite considerable quantities. Among city yards there is less inquiry for No. 1 and little business is being transacted. Buyers offer \$19.50 @ \$20, delivery on cars, and have declined an offer of \$20 to boat. Cast Scrap is dull at \$14.50 @ \$15, while Turnings and Cast Borings are unchanged.

## Financial.

There are some favorable features in the commercial situation, but there is little buoyancy outside of a few special lines. In New York the aggregate of transactions as per clearing-house returns, shows an increase for the week of 20.5 % compared with the same time last year, largely due to speculative activity, not only on the Stock Exchange, but in wheat, coffee and some other commodities, sales of coffee on a single day reaching the colossal aggregate of 124,000 bags under the stimulus of a heavy decline, equal to 2¢  $\frac{1}{2}$  within the last two days. The depression and the excitement incident to it were attributed to a sharp decline of 3½ francs in coffee at Havre, which was influenced by the increased crop estimates for Brazil and the unwillingness of big holders here to carry their load. Wheat dealers, too, were full of business, with prices varying widely. On Monday there was a sharp advance, succeeded by a heavy break, with enormous trading, the largest since last autumn, comprising 24,600,000 bushels. Among dry goods jobbers the only feature of the week is in the return of money buyers from Europe, who report business in all manufacturing centers good, and all seemingly independent of the American market, with higher prices all along the line. The character of the fall trade is not yet determined. Exports of manufactured cottons since January 1 are less than \$4,000,000 in value, against upward of \$5,600,000 for the same time last year. Provisions are easier. Sugar is strong. In the dairy line there are enormous receipts, favored by an exceptionally fine grass season. Crop prospects as a whole are not perceptibly affected by bad weather, and collections are fair.

In the Stock Exchange markets the freight rate troubles in the West, more particularly news that the Chicago and Alton had given notice of an intention to with-

draw from the Interstate Railway Association July 15, were a fruitful source of disturbance. Nevertheless, several of the leading specialties were higher. New England was influenced favorably by prospects of the near completion of the Peekskill bridge, as it is believed that considerable shipments of coal will take the new route, via Lehigh & Hudson to Eastern points. On Friday stocks were dull and lower, the sharpest declines occurring in St. Paul and Burlington and Quincy. New England was again the feature, and closed weak. Saturday brought a dull market, with the coalers firmest on the list, on account of the supposed better prices for anthracite. On Monday the market varied with conflicting reports from the West, but Lead Trust and Sugar Trust attracted much attention, and there was a stronger tone at the close.

On Tuesday there was a little more hopeful feeling at Chicago, it being believed that the Chicago and Alton Railroad cannot substantiate their charges against the St. Paul, and that they will before July 15 take back their notice of withdrawal. The tone of the market was firm to strong. At the annual election of the Oregon Transcontinental and of the Oregon Railway and Navigation companies Mr. Villard carried the Oregon Transcontinental, and a compromise was effected whereby the Oregon Railway and Navigation Company will be managed as part of the Union Pacific system, the Northern Pacific to have nothing to do with it. The new board decided to abandon the proposition to issue \$10,000,000 of preferred stock.

United States bonds were firm. Quotations as follows:

U. S. 4½, 1891, registered.....	106½
U. S. 4½, 1891, coupon.....	106½
U. S. 4, 1907, registered.....	128½
U. S. 4, 1907, coupon.....	129½
U. S. currency 6s.....	118

The weekly statement of the Associated Banks was unexpectedly favorable in showing a decrease in surplus reserves of only \$42,950, due entirely to an increase of \$2,339,800 in net deposits. In loans there was an expansion of \$2,384,400, which was thought to have resulted from the increased activity at the Stock Exchange. The changes indicate receipts of about \$5,000,000 from the interior. In other words, the movement of currency to this center exceeded the outward flow of gold to Europe. The banks still hold \$10,603,225 above legal requirements, against \$28,563,700 a year ago and only \$4,616,625 in the same week of 1887. According to the Custom-House report, the exports of specie from this port during the week amounted to \$4,675,498, making a total since January 1 of \$41,784,818, as compared with \$19,790,000 for the corresponding period last year, and larger than for the same time for any year in the last decade. Imports of specie since January 1 are about \$4,000,000. On Saturday \$4,004,857 was shipped, chiefly to Paris, there being a profit in such transactions owing to the firm tone for Continental exchange. Notwithstanding the heavy gold exports, the monetary situation continued easy and rates were 3 @ 4 % for time loans and 4 @ 5½ % for prime mercantile paper, but the general tone was firmer.

As the season is at hand for the usual semi-annual interest and dividend disbursements, amounting to at least \$65,000,000, the continuance of easy money is looked for with confidence.

The market for sterling was quiet, with posted rates closing at \$4.88 @ \$4.89½. Gold continues to flow into the Bank of England, and the situation, so far as bullion is concerned, promises easy money. A further drain to South America is not improbable.

A phase in Canadian banking that is likely to attract more attention hereafter, namely, the smallness of the cash reserves in proportion to the liabilities, brings out

a cautionary signal in the *Montreal Gazette*, as follows: "The Dominion Government debt payable in London has increased since 1883 from \$130,000,000 to \$196,000,000, or by no less than \$66,000,000, every dollar of which increase was available ultimately through the Canadian banks for the liquidation of mercantile indebtedness in Great Britain, for sinking fund purchases and for the payment of interest on the debt. The annual interest the Dominion has to pay on its debt held in London is now nearly \$2,000,000 more than it was in 1883. It is well known that in imports and exports of merchandise the balance of trade runs against Canada, though not to a large extent, but when to this trade-balance is added the interest upon Government, municipal, railway and other indebtedness, the sum becomes a very formidable one, and only fresh borrowing from time to time has averted a crisis which would expose how much dependency we have upon new drafts of capital for the settlement of foreign indebtedness."

The imports of merchandise at this port during the week were \$8,012,000. Since January 1 the total valuation is \$233,050,000, against \$222,909,000 for the same time in 1888. Exports from this port for the week were valued at \$6,556,000.

Exports of breadstuffs, provisions, cotton and petroleum during May were in value \$32,239,869, against \$28,643,471 in May, 1888. For 11 months ending May 31 the exports of the above-mentioned articles were \$478,703,815, against \$454,543,884. This is a large increase, but the imports have increased to a greater amount. The exports of oils for 11 months of the present fiscal year, as shown by the Treasury report, foot up 554,873,474 gallons, at a value of \$45,158,554, against 530,407,778 gallons, valued at \$42,849,967, for the corresponding period of the year preceding.

A new bank, to be called the Knickerbocker, is soon to be opened on Broadway, near Twenty-eighth street.

## Metal Market.

**Copper.**—At the time of our last report spot Copper stood in London £41. 7/6; it came last night £41. 5/, while futures gave way from £41. 5/ to £41. The statistics of the middle of the month show the visible supply in England and France to have been at the time 114,320 tons, the decrease being 3000 tons for the fortnight, and chiefly in Chili Bars, indicating that consumers over there extend their purchases for the moment to the lower grades. The total sales for the week over there were only 800 tons, however. Here the situation and prices have undergone no change; the mining companies declare themselves satisfied with the deliveries going on to actual consumers, while these insist they are only buying from hand to mouth. There is no change in the quotations, 12¢ being the rule from the producers of Lake direct; in a jobbing way the figure is 12½¢ @ 12¾¢, and casting brands fetch 11¢ @ 11½¢. On the exchange to-day there were no bids; 12¢ was asked.

**Tin.**—On Wednesday of last week London still quoted £90. 17/6 for spot, which dropped to £89. 15/ yesterday. Futures in the meantime declined from £91. 12/6 to £90. 16/. The fact is that the late relatively-high ruling caused a larger output in the producing countries, and the London operators now let the market slide in order to put, if possible, a slight check on the manifest tendency toward overproduction. They may keep prices low for a couple of months, and if then the output relaxes the screws may be put on again. At least this is given out as the programme for the time being. The week's sales in London aggregated 600 tons. Here some

110 tons were first sold on the exchange at 20.20¢, spot and June, and at 20.25¢, September and October; subsequently trading was arrested, the bids not exceeding 20.25¢ for near and 20.15¢ for distant deliveries, the quotation for spot this forenoon being 20½¢ @ 20¼¢. Messrs. Gilfillan, Wood & Co., Singapore, write under date May 9: "Stocks are not large, nor are large supplies expected to arrive in the near future, so that any further decline there may be must take its origin in the consuming markets." Tin closed on the exchange at 19.95¢ bid, and 20.05¢ asked. **Tin Plates.**—Our dealers, who have been holding back their "future" orders are, now that Pig Tin is lower, in hopes of gaining their point, and buying 3d box cheaper than what makers on the other side demand. Meanwhile our market has been dull and unchanged. We quote large lines, ordinary brands, 3d box: Siemens-Martin Steel, Charcoal finish, \$4.75 @ \$5.50; Coke finish, \$4.55 @ \$4.65; Ternes, \$4.12 @ \$4.30; Coke Tins, \$4.22½ @ \$4.32½, and Wasters \$4.12½ @ \$4.15.

**Lead.**—The week has been an excessively dull one, sales in the open market to consumers being restricted to 400 tons at 8.95¢ @ 4¢, the market winding up quite firmly at 8.97½¢ @ 4¢, while St. Louis is strong at 8.80¢ @ 8.85¢ and Chicago at 8.90¢. Closing prices on the exchange today were 8.97½¢ bid and 4.02½¢ asked.

**Spelter.**—There has been a lull, so that we cannot quote Common Domestic on the spot over 5¢, nor Silesian any better than 5½¢. There are no new features, the demand being slack for the moment, but the position of the metal is apparently quite sound.

**Antimony.**—We repeat our quotation of 14¢ for Hallett's and 15½¢ Cookson's, at which there continues to be a steady, moderate consumptive demand.

#### New York Metal Exchange.

The following sales are reported:

THURSDAY, June 13.	
10 tons Tin, spot	20.20¢
20 tons Tin, June	20.20¢
80 tons Lead, August	8.97½¢
FRIDAY, June 14.	
20 tons Tin, October	20.25¢
10 tons Tin, September	20.25¢
10 tons Tin, spot	20.20¢
10 tons Tin, June	20.20¢
50 tons Lead, spot	8.95¢
WEDNESDAY, June 19.	
16 tons Lead, spot	8.97½¢

### Coal Market.

The Anthracite Coal trade is gradually recovering from the effects of the great flood. All but eight of the drowned Reading collieries are again in operation, but the Beech Creek line is not yet restored and several of the laterals of the main lines of railway to the sources of supply are still closed to shipments. The New York market suffers from dullness in the bulk of demand rather than from any shortness of supply, stocks at shipping ports being ample, despite the temporary enforced check in production. Operators profess to believe in renewed activity early in July, and remarks are freely made about another advance in prices, but it is said that the large consumers are not uneasy concerning the prospects. Touching on this subject the Philadelphia Record says that Coal can be bought in that city at concessions from the March circular, and it can be said on authority that the Reading Company have not received one order for Coal this month at the advance made last month. In the Pottsville region at last accounts there was no increase of business and much of the Coal was going into stock. Quotations remain unchanged, viz.: Free Burning,

f.o.b., Broken, \$3.85; Egg Chestnut, \$4; Stove, \$4.80. Reading last week reported 140,000 tons production, of which 80,000 was shipped to Port Richmond and 20,000 to Port Liberty. The Pennsylvania Railroad's Coal tonnage for the year is 4,489,000 tons, a decrease of 691,000 tons compared with 1888.

Bituminous Coal shipments are reported to be more active and the placing of several good mill contracts is referred to. Coal shipments from the Clearfield region were resumed last Sunday, and the daily shipments are from 200 to 300 cars. The Reading Railroad have finished the survey of a branch road from Lofty to Drifton, following the Lehigh Valley most of the way. This road is to carry the Coal from Coxe Bros. & Co.'s collieries at Drifton. Another movement is the organization of the Pennsylvania, Lehigh and Eastern Railroad at Wilkesbarre, with Samuel F. Pierson as president, to run a line from Tomhicken, Pa., to Port Jervis, N. Y., offering a short outlet for hard coal to New England via the Poughkeepsie bridge. The route, as surveyed, will go in close proximity to nearly 50 collieries and through the cream of the Anthracite Coal regions in Luzerne, Carbon, Monroe and Pike counties.

### British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]

LONDON, WEDNESDAY, June 19, 1889.

Copper has ruled very irregular, having dropped 20/ and recovered 10/ during the week. Rumors of continued negotiations between the mining officials serve a purpose in supporting the market. The offerings of Merchant-Bar warrants have been larger the past week, and consumers are freely supplied. Dealers have appeared little disposed to purchase. Transactions in furnace material have been on a quite extensive scale, and at somewhat better prices. James Lewis & Sons' record for the first half of the month includes 900 tons Anaconda matte at 8/6, 100 tons Montana at 8/6, 700 tons Montana at 8/3 and 470 tons Montana, private terms, all to arrive, Liverpool delivery. The visible supply of Copper has decreased the past fortnight 4500 tons, and the new supply was 4100 tons less than during the preceding two weeks.

Block Tin receded in price to £89. 15/ on Tuesday under the pressure of heavy selling movement, due to expected large shipments from the Straits. The immediate future of the market depends chiefly upon the extent of those shipments. The current consumption absorbs fully the late average of the supply. To-day prices were very irregular, with sales of prompts at £89. 10/ and £90.

There was a lull in the Tin-Plate market early in the week, but the demand since became quite active and good sales were made of specials. Ternes have been selling quite freely on the basis of 24/ for double boxes. Inquiries are favorable for a continued good business.

Scotch warrants weakened on Wednesday and Thursday last, owing to a pause in the demand that frightened weak holders and encouraged "bear" selling. Since then there has been a recovery, but only a moderate business. Reports from the makers indicate a healthy trade in named brands, but prices are hardly steady. Middlesborough Pig is offered a fraction lower by makers, whose prices are still undersold by merchants. Hematites have ruled very steady, but Spiegeleisen is rather easier.

Common Staffordshire and Welsh Bars are held higher, being in very good demand, but there is no change on other Manufactured Iron. In the Steel trade there is some irregularity, with higher prices asked for Billets, Slabs and Wire-Rods, but some concession made on Steel Rails. A Chilean order for 10,000 tons of Rails, on which British makers competed, was secured by a German firm.

A further improvement in the demand for Old Material and increased purchases of the same are reported.

**Scotch Pig.**—There has been only a fair business and prices show little change. Ocean freights from Glasgow to New York are a shade higher.

No. 1 Coltness, f.o.b. Glasgow	54/6
No. 1 Summerlee, " "	54/
No. 1 Gartsherrie, " "	51/6
No. 1 Langloan, " "	58/
No. 1 Carrbroe, " "	46/6
No. 1 Shotts, " at Leith	52/
No. 1 Glengarnock, " Ardrossan	51/6
No. 1 Dalmellington, " "	45/
No. 1 Eglinton, " "	42/6

Steamer freights, Glasgow to New York, 2/6; Liverpool to New York, 10/.

**Cleveland Pig.**—Business has been moderate and prices are rather weaker. No. 3 Middlesborough quoted 38/ @ 38/6, prompt.

**Bessemer Pig.**—A fairly active business reported at steady prices. West Coast brands, mixed numbers, 49/6, f.o.b. shipping point.

**Spiegeleisen.**—A moderately active trade at somewhat modified prices. English 20 % quoted 80/, f.o.b. at N. W. England shipping point.

**Steel Rails.**—There has been a very good business, but prices are not so strong. Heavy sections quoted at £4. 10/, and light sections £4. 17/6 @ £5. f.o.b. at N. W. England shipping point.

**Steel Blooms.**—A fair demand and the market steady. We quote £4. 5/ for 7 x 7, f.o.b. at N. W. England shipping point.

**Steel Billets.**—Makers ask higher prices and there is a fair business. Bessemer, 2½ x 2½ inch, £4. 12/6, f.o.b. at N. W. England shipping point.

**Steel Slabs.**—Not much doing, but makers very firm on prices. Bessemer, £4. 12/6, f.o.b. at N. W. England shipping point.

**Old Rails.**—More business doing and the market firmer, without, however, any positive advance. Tees quoted at £3. 5/ @ £3. 7/6, and Double Heads, £3. 12/6 @ £3. 15/, c.i.f., New York.

**Scrap-Iron.**—The market quite firm, and more active. Heavy Wrought quoted at £2. 2/6 @ £2. 5/, f.o.b.

**Crop Ends.**—There is more doing, at firm prices. Bessemer quoted £2. 10/ @ £2. 12/6, f.o.b.

**Tin-Plate.**—A fairly active business, with little change in prices. We quote, f.o.b. Liverpool:

IC Charcoal, Alloway grade.....	15/3 @ 15/6
IC Bessemer Steel, Coke finish.....	13/6 @ .....
IC Siemens.....	13/9 @ .....
IC Coke, B. V. grade.....	13/ @ .....
Charcoal Terne, Dean grade.....	12/ @ 12/3

**Manufactured Iron.**—The general demand good, and prices firm. We quote, f. o. b. Liverpool:

Staff. Marked Bars.....	£ s. d. @ 8 2 6
Common.....	@ 6 0 0
Staff. Bl'k Sheet, singles.....	7 12 6 @ 7 15 0
Welsh Bars (f.o.b. Wales).....	5 7 6 @ 5 10 0

**Copper.**—The market has been unsettled, but more active than last week. To-day's prices for Bars were £41. 10/; spot; £41 three months' futures. Best Selected, £47.

**Tin.**—Trading has been smaller than last week and the market unsettled. Straits quoted to-day at £89. /10 @ £90, spot, and £90. 2/6 @ £90. /5 for three months' futures.

**Lead.**—The market very quiet but steady. Quoted £12. 10/ for Soft Spanish.

**Spelter.**—A moderate business at unchanged prices. Quoted at £18 for ordinary Silesian.

### EAST INDIES.

**MANILA, June 10, 1889.**—*Hemp.*—The price is nominal at \$15.75 per picul, against \$8 same date last year, equaling \$7 ton, cost and freight, £50, against £27 7/8. Clearances for the United States since last cable amounted to 9000 Bales, against 7000 in 1888. Since January 1 to 118,000, against 88,000; loading for ditto, 13,000, against 11,000; cleared for England since January 1, 120,000, against 144,000; loading for ditto, 8000, against 81,000; cleared for other countries, 19,000, against 38,000; receipts at all ports since last cable, 9000, against 15,000, and since January 1, 267,000 bales, against 273,000 in 1888 and 212,000 in 1887. *Freights.*—\$7.50, against \$5.50. *Exchange.*—Six months' sight, on London, 8/5, against 8/5 1/4. *Kor & Co., per cable direct to their agent in New York, Mr. Charles Nordhaus, 80 Water street.*

**COLOMBO, Ceylon, May 2, 1889.**—*Plumbago.*—The market has remained firm at ensuing quotations, in rupees, per ton: Large Lump, 145 @ 170; Ordinary Lump, 125 @ 160; Chips, 80 @ 95, and Dust, 40 @ 65. Following are the shipments made since October 1: To England, 94,157 cwt.; to Hamburg, 6206; to Antwerp, 6007; to Bremen, 659; to Holland, 487; to India, 95; to Australia, 203, and to the United States, 85,951; together, 193,906 cwt., against 148,880 in 1888, 120,123 in 1887 and 110,074 in 1886. *Cot Yarn.*—Nos. 1 @ 4 has been selling at 7 @ 13 rupees per cwt. *Exchange.*—Six months' sight, 1/4 1/4. *Volkart Bros., Ceylon and Malabar Coast, to their agent in New York, Mr. John W. Greens 82 Wall street.*

**PENANG, April 30, 1889.** *Tin.*—Of the fortnight's receipts of 7500 piculs Europeans took 2100 and Chinese 4000. Opening at \$35.00 per picul, the price gave way to \$34.00, at which it closes. The stock demand has caused the stock in bazar to reach 5500 piculs. *Schmidt, Kuster-mann & Co.*

**SINGAPORE, April 30, 1889.** *Tin.*—Some 165 tons have been sold from \$35.75 per picul down to \$35.15 the market closing weak at \$34.80 @ \$34.55. The export hence to England since January 1 amounts to 67,667 piculs, to the United States to 37,202, and to 10,120 to the Continent. *Gum Damar.*—A sale of 30 piculs Palembang was made at \$17.50. *Gum Copal.*—Some 100 to 120 piculs were taken at \$7 @ \$10.75, as to quality. There has been more doing in *Gum Benjamin*, 60 cases fair Padang bringing \$45 @ \$54.50. *Gutta Percha.*—There is no change, but the better sorts are in less request at \$130 @ \$155, while medium fetches \$85 @ \$100. *India Rubber.*—Has been selling at \$45, and Borneo at \$45.50 @ \$46. *Exchange in London, four months' Bank, 3/10 1/4 @ 3/1.*—*Guthrie, Wood & Co.*

### HOLLAND.

**ROTTERDAM, June 6, 1889.** *Tin.*—The production of Billiton for 1888-89—from May 1, 1888, to April 30, 1889—amounts to 73,194 piculs, against

77,840 in 1887-88, 89,122 in 1886-87, 81,032 in 1885-86, 81,367 in 1884-85, 70,974 in 1883-84, 70,061 in 1882-83. The average production during the last ten years is about 76,000 piculs. A public sale of about 12,000 piculs will be held at Batavia on June 27 next. The following statement shows the position of Banca Tin in Holland on May 31, from the official returns published by the Dutch Trading Company:

Import in May, slabs.....	1889. 22,287	1888. 17,797
Total, five months, slabs.....	83,260	108,938
Deliveries in May, slabs.....	9,900	13,146
Total, five months, slabs.....	61,088	89,746
Stock, second hand, slabs.....	38,051	50,809
Unsold stock, slabs.....	149,382	107,223
Total stock, slabs.....	187,433	158,049
Afloat, piculs.....	3,200	.....

To other countries.....	45	12	300

—De Monchy & Havelaar.

### GERMANY.

**HAMBURG, June 8, 1889.**—*Iron.*—Matters in the iron trade have not yet returned to their normal condition. The demand for Pig has increased somewhat; most of the blast-furnaces have, it is true, resumed work, but some only work with half their force. Luxembourg may be quoted 36 @ 38 marks per ton; Westphalian, 40 1/2 @ 42 1/2 for finished iron. A good demand still prevails for Hoops, Beams and Boiler-Plates. Thin Sheets sell swimmingly at the advance established of 15 marks per ton. Machine-shops, foundries and car-shops have been getting on steadily. Wire-Rods are unaltered; they quote them 110 @ 120, and Steel-Rails 120 @ 125. *Metals.*—Have on the whole been well sustained; Lead at 13 @ 13.30 marks per 50 kg.; Spelter at 18 @ 18.50. *Borsenhalles.*

### BELGIUM.

**BRUSSELS, June 8, 1889.**—*Iron.*—Our market has remained very active and firm, with an upward tendency in Merchant Iron, for which there is an increased demand, also for Beams. There is a good run of orders for Structural Iron; only foundries working for the export trade complain of a lack of work. Following are the closing quotations: Pig, Foundry, 5.20 @ 6.50 francs per 100 kg.; Forge, 4.80 @ 5.50; Merchant, No. 1, 12 @ 12.50; Beams, 11.75 @ 12; Sheet Iron, 16 @ 25; Steel, ditto, 18.50 @ 19.50. *Monteur des Interets Matériels.*

Samuel Untermyer, the agent for the English syndicate which is purchasing American breweries, said to a reporter in this city on Tuesday: "This syndicate, which, by the way, is not a syndicate, but merely a number of English capitalists, is going to invest in flour-mills and rolling-mills. We are already negotiating for the purchase of different mills, and propose to manufacture steel rails in this country. I am not at liberty now, however, to state where these manufactories and mills are."

The latest estimate of the railroad mileage of the world is given in a German periodical. The conclusion is that there are 324,400 miles of railroad in existence, in which \$26,500,000,000 is invested. The capital in Europe is \$118,000 per mile and in other countries \$59,000. Nearly one-fourth of the mileage of the railroads of the world has been constructed during the last four years. This country leads all others in the amount of mileage, which is placed at 150,700, a low estimate. Of the European countries Germany leads with 24,900 miles and France, England, Austria and Russia come next in the order named, the latter reporting 18,000 miles. In British India there are 14,200 miles of road; in Cape Colony, 1700 miles; in Brazil, 5000 miles; in the Argentine Republic, 4000 miles; and in all the Australian provinces 9500 miles. Railroad-building is going on very fast in South and Central America, Australia, Japan and in Natal and Mauritius in Africa.

### Bituminous Coal Production.

The Seaboard Steam Coal Association of bituminous coal producers, organized to maintain pool prices, has met with but indifferent success from its inability to enforce its own rules and regulations. At scarcely any time have the prices officially announced more than approximated the prices actually ruling. The Philadelphia *Record* predicts that this year will witness the disruption of the whole concern. "There is no longer any doubt of that among soft-coal shippers by reason of its utter worthlessness and weakness. At the beginning of this year iron-bound articles were signed, to which all the larger operators were induced to subscribe. The prices were fixed for coal shipped to the East from each of the Atlantic ports, and stringent regulations provided for a deposit by each shipper for every ton shipped as a guarantee that he would live up to the terms of the agreement. There is not one of the provisions but has been utterly disregarded. Prices have been slashed by the larger operators, and the smaller men have followed as best they could. The deposit of 20 cents on each ton mined has proved a manifest absurdity, as was prophesied at the start, and the Steam Coal Association has no excuse for existence." The reasons given for this situation are that "there is too much soft coal seeking a market to make any agreement for restriction possible. There is hardly one of the bituminous districts but can largely increase its output if occasion demands or if the smallest profit can be derived. At the Western part of the Clearfield region there are new developments of considerable size, but in the Southern regions almost an indefinite amount of coal can be mined. In the Pocahontas region of Virginia and West Virginia and in the Elk Garden region of West Virginia there are immense deposits of coal not yet touched. With conditions such as these, with an innumerable number of competitors trying to increase their tonnage, the effort at restriction is absurd and has signally failed."

**A Simple Boring Test.**—The question of simple methods of investigating the ground underlying foundations has been lately discussed in *Engineering News*. The latest method suggested for borings of moderate depths comes from a correspondent signing himself "Buckeye." He says he has frequently used for this purpose the following simple method: Take a worn-out locomotive boiler flue, and cut slots about 1/4 x 6 inches in a spiral winding around the flue. Then sharpen one end of the flue to a cutting-edge and put a heavy screw-cap on the other end. This cap should be not less than 3 inches long and solid for 2 inches of its length. In using this testing apparatus drive the flue down with a heavy sledge and at the same time turn the pipe with a large chain-tongs. The pipe can be lifted again by a lever or a derrick of portable form. When the tube is withdrawn the character of the material penetrated can be examined through the slots in the sides. A locomotive boiler-flue is generally about 11 feet long, but this is usually sufficient to test the foundations of small bridges and other light structures.

A fleet of small twin-screw boats, propelled by electricity, will run on the Thames River, England, this summer. They will transport passengers from place to place over short distances. The electricity is to be generated from accumulators carried on the boats and recharged when necessary at any of the river stations. The boats are 65 feet long, 22-inch draft and carry 80 passengers.

## Hardware.

While in some respects the business of the half-year now closing has not come up to expectations, a review of the trade shows that on the whole it has been reasonably satisfactory. Many manufacturers have been fully occupied on orders, and the volume of business has been large. The margins of profit have in many lines been narrow, and there has been some disposition on the part of some to sell goods at a positive loss. There are, however, indications that manufacturers are recognizing the necessity of refusing unremunerative business, and if this were generally done it would greatly improve the situation.

### Cut Nails.

The sales of the past week have been quite large in the aggregate, much of the business having been unsolicited. Inquiries are evidently being stimulated by the disposition of dealers to advance prices. The market is in quite a feverish and unsettled condition. Some of the leading houses have already pushed their quotations up a notch or two, and the others are selling very cautiously, with a watchful eye on their stocks. Shipments of Nails from the factories in the recently flooded districts of Pennsylvania are still being interfered with, so that it is difficult to arrange definitely for the future. Dealers are quoting on inquiries for immediate acceptance only. The Oxford Iron and Nail Company's price is now \$2, but the other houses are still naming \$1.80 @ \$1.90, with sales at about \$1.85 on an average. Cheap stocks seem to have been pretty well cleaned up by this time, and the market is in much better shape for an advance than for a long while.

The regular monthly meeting of the Western Cut Nail Manufacturers' Association was held in Wheeling, W. Va., on Wednesday, the 12th inst. No agreement whatever was reached looking either to a curtailment of production or a change in selling price. The Jefferson Iron Works, of Steubenville, Ohio, gave notice of their withdrawal from the organization. An effort was made to reduce the so-called extras on the list and reduce them all along the line, with a view of checking the demoralization caused by what are known as the "averages," which are calculated by each mill for itself. Pending a discussion on the subject a motion to adjourn was carried. The impression prevails that the association has been practically dissolved and will not hold another meeting.

From Chicago we have the following advices from a most reliable source: "The failure of the members of the Western Cut Nail Association to reach an amicable settlement in regard to prices and product at their meeting on the 12th inst. is likely to result in a demoralized market for some time to come. The prices at which some of the manufacturers unloaded large blocks of Nails into the hands of leading Western jobbers within the last few weeks is regarded by many as having placed the jobbers in control of the market price for several months. The manufacturer who did not sell at the extreme prices then prevailing now finds himself with a stock on hand which he cannot well dispose of to the jobbers, and he must find other purchasers or stop his factory. In endeavoring to release himself from this predicament, the only avenue of escape appears to be through the retailers. Under these circumstances, from what has already developed, it will not be surprising to hear that certain manufacturers are soliciting carload orders from the retailers through the West at figures scarcely higher than those at which

the jobber purchased in large lots of 3000 to 5000 kegs. Competing railroad lines are fighting for business, and Nails are apparently made leaders in the cut rate. June 8 the rate from Wheeling and Pittsburgh to Chicago was fixed at 11 cents per keg. On the 11th this rate was reduced to 9½ cents, and on shipments through to St. Paul 17½ cents. It may be argued that this will help the manufacturers out on the low prices previously made, but at the same time it will place in the hands of the mills the power to stock up the Western retailer, so that the jobber will be forced to sacrifice the advantages of his low prices or carry his stock. The Chicago jobber does not often allow anybody to get away with him, and in the conflict between the manufacturer and the middleman the retailer may reap the harvest."

### Wire Nails.

Some opposition to the new card, June 1, is still manifested, and the Tack manufacturers are still using their former lists, and some other concerns—as, for example, the Wire Goods Company, Worcester, Mass.; American Screw Company, Providence, R. I., and Russell & Irwin Mfg. Company, New York—have not adopted the part relating to the papered goods, though it is not unlikely that they may decide to do so. There is also some opposition to the new list on the part of some of the jobbers, who regard it as impracticable to apply the card to such goods. The irregularity which results from the use of different lists is annoying to both buyer and seller, as the former will naturally closely scrutinize the prices of the different manufacturers, and buy the goods from the card or the list according as will be to his advantage, in many cases perhaps dividing the orders. The difficulty which is experienced in regard to special Nails which are not covered by the new card is also referred to. On the whole, however, the new card seems to be generally received with favor, and if it continues to be adhered to by the principal manufacturers will probably in time be adopted by most of the others, and its tendency will be to diminish the number of sizes which will be called for by the trade. It may, however, be some time before the papered goods are generally sold on the new system.

Comparatively little business has been done since the announcement of the new card, and manufacturers generally are busy filling orders at the old prices. The indications are that a base price of \$2.25 to \$2.30 for carload lots at factory about represents the market, with comparatively slight advances for less than carloads.

### How It Looks in the Country.

Scene—Hardware store. Time—June 10, 1889.

Dramatis Personæ—Hardware Man and Average Customer.

H. M.—Good-morning, sir.

A. C.—Howdy. What can you sell me Wire Nails for, Mr. Hardware Man? I shall build a house and barn this season—have the foundations already laid—and shall want a good bit of Hardware. Now, make the figures low.

H. M.—Well, Average, you have always been inclined to favor me in the way of patronage, and I will make the price \$2.50, base, provided you give me all of your trade in Hardware for these buildings.

A. C.—Two dollars and fifty cents, base! I suppose that means 2½ cents per pound for what Wire Nails I want.

H. M.—No, sir. That would average less than cost. We can't do that; shall be obliged to charge you the regular mill extras.

A. C.—Well, how much will that make Shingle Nails cost me?

H. M.—Three dollars and forty cents per keg.

A. C.—That ain't bad. I shall want mostly 10d and 12d.

H. M.—The list of extras has just been changed. We shall have to charge you 40 cents extra for 10d and 35 cents for 12d.

A. C.—You don't say! Well, I suppose I shall have to stand it. I shall want some 30d and 40d for the rafters and frame and a part of a keg of Lath Nails.

H. M.—According to the new list I shall have to charge you 20 cents extra for 30d and 40d Nails.

A. C.—What do you mean? What is the base, anyway?

H. M.—Sixty-pennys.

A. C.—Thunderation! I don't want any 60d. What are you giving us, anyway? Do you claim to sell me Wire Nails for \$2.50 per keg and then charge me \$2.70 for the cheapest size that I want? What do you take me for? I always supposed that you were an honest man for a Hardware dealer, but this is the most bare-faced swindle I have ever heard of in this country.

(Exit A. C.—Enter Carpenter Builder.)

C. B.—How are you, Mr. Hardware Man? How is the Wire Nail market?

H. M.—So-so. Have you heard of the change in extras?

C. B.—Change! Have they changed it again so quick, and what for?

H. M.—Oh, the base is now 60d, with 10 cents extra for 50d, and so on, to 50 cents for 8d and 9d; then only 65 cents for 6d and 90 cents for 4s. They say that this change is necessary to make the list symmetrical, and that as at present arranged they can accept an order for any size without requiring a customer to take a certain number of kegs of small sizes to increase the average price. But here is the new card, together with the manufacturer's circular. Look them over.

C. B. (after a few moments' study)—Now, what are we to expect? We were told last year that it was necessary, in order to accept orders of the kind you name, that 60d should be sold for 35 cents more than 12d. They changed the list to obviate this difficulty and to make the list "symmetrical." Eleven months later, in order to harmonize that list, we are told that it is necessary to charge 35 cents per keg more for 12d than for 60d. This strikes me to be very like "Young America" or else there is a "nigger in the bushes." Of the two I am inclined to think that it is the "nigger." Next year they will discover that kegs cost money and charge 10 cents extra for them. In 1891 it will be found necessary to charge 2 per cent. extra on the whole card to cover insurance, and in 1892, it being the national election, they must add 5 per cent. for political "soap." If they want a "base" to reckon from, why not make it \$1 per keg? Then you can sell Wire Nails cheap (until you add the extras). We are told that these goods are being sold "very close; very close, sir;" "losing money every day, sir." Why don't they charge 10 cents extra for 60d and make a profit, instead of staggering along in this way? It must be that these Wire-Nail maker will all be in the poor-house very soon. But, Mr. Hardware, think of it a moments! Why, man alive! it is worse than European hotels, where tourists are charged extra for soap and candles.

H. M.—Don't be too hasty, friend Builder! By this arrangement you not only buy penny nails on this base, but also all Wire Nails, either in boxes or in pound papers. Don't you see the beauty of it?

C. B. (after a moment's thought)—Why, yes; to be sure! Don't know but I shall like that, friend Hardware Man. You will hang up a list of extras for your clerks to sell by, and when I come in to buy, say, 10 pounds ¼ No. 19 finishing, your

clerk will look up the list, and seeing that size down for \$6 I shall get my 10 pounds for 60 cents and save my "base." That's good! I have no more to say. I take it all back. The manufacturers were wise beyond their years. Good-day, sir.

MASSACHUSETTS.

### Export Trade.

The demand for all classes of American merchandise continues good from the Argentine Republic, and there is every prospect of a continuance for some time. The few houses here doing that business report heavy shipments and large orders are yet in hand not placed. As long as the extraordinary immigration to that country continues and no internal trouble occurs business will be good. The west-coast trade remains very dull and is in the hands of a few large houses who have secured the cream of the business. Latest reports from South Africa show good business, notwithstanding the fact that buyers have undoubtedly been overloading, extraordinarily heavy shipments being made of Carriages and Manufactured Wood Goods, as well as all kinds of general merchandise.

The Australian mail, which arrived in installments on Saturday, we regret to say does not seem to be up to the standard, and freighters will continue to fill their vessels at probably a loss. A few of the representative merchants from the colonies are here, but are doing little or nothing in the way of making purchases; all complain of excessive freight charges and are holding back their purchases on this account. We learn that a new line of vessels to the colonies will be established when a favorable time arrives, as the capital has been subscribed; managers are only waiting for the time to arrive when money can be made or a fight instituted that in the end will be successful. There are rumors of trust combinations, &c., by some of the manufacturers engaged in the export business for the purpose of realizing a profit on their goods, but nothing definite has come of it yet.

More attention should be given by our manufacturers to packing goods for export. This is a very serious question. We should bear in mind that the freight is a very important item and importers will not pay freight on rubbish. Cases should be made to exactly take in the goods without leaving spare room. Another feature which needs attention is the packing of polished-steel goods, such as Shovels, Axes, Hammers, Agricultural Implements, &c. The vessels to South Africa, New Zealand and portions of Australia are small and apt to be wet; if goods arrive out rusty dealers lose money and will place orders with firms who pack in waterproof paper, or who use some preventive against rust. We are on the eve of a very large export trade, and manufacturers now engaged with the business should give careful attention to these points in order to hold what they have and be in a position to reap the reward which awaits them in the future.

### Miscellaneous Prices.

The regular monthly meeting of the Wrought-Iron Pipe and Boiler Tube Manufacturers' Association was held in the Monongahela House, Pittsburgh, on Thursday, the 13th inst. Campbell B. Herron, chairman of the association, presided and J. B. Murdoch acted as secretary. The following named firms were represented in person:

National Tube Works Company, Pittsburgh.  
Pennsylvania Tube Company, Pittsburgh.  
Spang, Chalfant & Co., Pittsburgh.  
A. M. Byers & Co., Pittsburgh.  
Duquesne Tube Company, Pittsburgh.  
Morris, Tasker & Co., Philadelphia.  
Conshohocken Tube Co., Conshohocken, Pa.  
Am. Tube and Iron Co., Middletown, Pa.  
Oil City Tube Company, Oil City, Pa.  
Riverside Iron Works, Wheeling, W. Va.

After a long discussion on the condition of trade and the advisability of advancing prices it was decided to make a slight advance only on 8, 4, 6 and 8 inch Line-Pipe. The following discounts and prices were agreed on and went into effect on Saturday, the 15th inst.

	Discount.
Butt-Welded Pipe	52 1/2 %
Lap-Welded Pipe	50 %
Butt-Welded Pipe (Galvanized)	48 %
Lap-Welded Pipe (Galvanized)	52 1/2 %
Casing, 5 1/2 inches	52 1/2 %
All other sizes	50 %
Boiler Tubes, 1 1/2 inches and smaller	58 %
Boiler Tubes, 2 inches and larger	60 %
2 1/2-inch Line-Pipe, per foot, net	\$0.18
3-inch Line-Pipe, per foot, net	0.21
3 1/2-inch Line-Pipe, per foot, net	25
4-inch Line-Pipe, per foot, net	30
5-inch Line-Pipe, per foot, net	48
6-inch Line-Pipe, per foot, net	58
7-inch Line-Pipe, per foot, net	70
8-inch Line-Pipe, per foot, net	85
9-inch Line-Pipe, per foot, net	1.20
10-inch Line-Pipe, per foot, net	1.25
12-inch Line-Pipe, per foot, net	1.60

The next meeting of the association will be held at Long Branch about the middle of July.

The Tack market has not recently experienced much change in its general features. Prices are very irregular, and there is little reason to doubt that a good many goods are sold without profit. The more conservative houses are declining to meet the extreme quotations, preferring to lose orders rather than accept them at unprofitable figures, but the margin of profit even with the most conservative management is conceded to be small. There is also a good deal of irregularity in regard to the weights of Tacks, and the many new forms in which the goods are put on the market add to the general confusion, so that unless one carefully scrutinizes the goods he cannot be sure of what he is getting. There is also a lamentable laxity in regard to the quantity of goods in given packages, and buyers will be wise to examine carefully the weight, number, &c., of all goods they are buying.

The prices of Strap and T Hinges do not improve, and there has been recently a further decline in quotations made, especially by the Western manufacturers. Some of the Eastern manufacturers are pursuing a more conservative policy, but their quotations also show a downward tendency. Wrought Butts are in similar condition, but the demoralization has not proceeded quite so far.

Boxwood Rules do not show evidences of improvement, but there has been recently a further slight decline in prices.

The Pick and Mattock Makers' Association held their semi-annual meeting in Pittsburgh on June 6. The meeting was very harmonious and satisfactory, the only changes made being a moderate advance in price of Picks, Mattocks and Grub-Hoes, the trade prices being established at 50, 10 and 5 to 60 per cent. off list. We are advised that all the manufacturers of these goods in the country are members of this association.

The following discounts are named by the Cincinnati Tool Company, Cincinnati, Ohio, relating to the line of good they are offering to the trade:

	Discount.
Sets of Taps and Dies	15 & 10
Bench Stops	25 & 10
Washer-Cutters	25 & 10
Spoke-Shaves	25 & 10
Combination Drawer Locks	25 & 10
Screw-Drivers	20 & 10
Brace Screw-Drivers	25 & 10
New Pattern Folding Screw-Driver, 6-inch, \$3; 7-inch, \$4	net
Adjustable Bench-Clamps	20 & 10
Machinists' Clamps	15 & 10
Adjustable Screw-Clamps	15 & 10
Adjustable Boat and Ship Clamps	15 & 10
Quilt-Clamps	25 & 10
Cabinet-Clamps	25 & 10
Carpenters' Clamps	25
Extra-Heavy Carpenter's Clamps	25
Standard Clamps	15 & 10
Cabinet-Maker's Clamps	15 & 10
Adjustable Ship and Bridge Builders' Clamps	15 & 10

Cooper's Shaves	20
Box-Scrappers	25
Band-Setters	25
Gimlets	25
Brad-Awls	20
Brace-Wrenches	15 & 10
Monkey-Wrenches	15 & 10
Countersinks	25
Plug-Cutters	20
Spoke-Pointers	25
Bit-Gauge	25
Dowel-Pointer	25
Door-Hangers Nos. 3 and 4, Improved	25 & 10
Brace-Drills	30 & 5
Brace-Drills for Metal	40 & 10
Cutting-Nippers	25 & 10
Screw and Plug Bit	25
Saw-Vises, Nos. 3 and 4	20 & 10
Standard Hollow Auger	25 & 10
Adjustable Hollow Auger, No. 1	30 & 30 & 5

### Items.

Buffalo Hammer Company, Buffalo, N. Y., have issued a new illustrated price-list and catalogue of their extensive line of solid-steel Tools. It represents an exceptionally complete assortment of Handled and other Hammers, Picks, Hot and Cold Chisels, Swages, Punches, Hardie's Flat-ters, &c., as well as a line of Hatchets. The company call attention to the fact that they are now located in their new works, with largely increased facilities, and are prepared to manufacture a high grade of tools. For the convenience of the trade they have adopted a new system of numbers on Hammers, doing away with all duplication, so that Hammers and Sledges can hereafter be ordered by number only, no further description being necessary. The association list and numbers are used on Hatchets. The catalogue is fully illustrated and finely printed.

The new catalogue of Hubbard & Co., Pittsburgh and Beaver Falls, Pa., is a beautiful specimen of artistic printing, and shows very satisfactorily the extensive line of goods represented in it. It is the work of Gies & Co., engravers and printers, Buffalo, N. Y., whose taste and skill are exhibited on every page. The catalogue is divided into the following departments: Axes, Saws, Shovels, Spades, Scoops and Drain Tools, Railroad Supplies and Eye Hoes. It is copiously illustrated with cuts exceptionally fine, and the different patterns of Axes are shown in *fac-simile*, colors of labels, &c., being accurately reproduced. Side and edge views of the different Axes are given. In some of the cuts the edge and poll are given, also the swell or ridge on the center of the blade, thus showing not only the exact shape but the thickness of the head or poll of each Axe. The effect produced by the gold bronze and the striking colors is very attractive and the brilliant corner-piece on each page adds materially to the beauty of the book. In the different departments there are copious illustrations showing the patterns of the different goods. It is worthy of notice that each of the divisions of the book is preceded by a sheet for quotations on the line of goods in the division which follows, so that the prices are thus given in close connection with the goods to which they relate, instead of being, as usual, at the beginning or ending of the book, or in a separate sheet. It is also suggested to the customers of the house that the book as sent be not mutilated, and it is stated that loose pages printed on one side only for the use of salesmen will be furnished on application. This catalogue, which has been not inappropriately referred to as the finest catalogue in the trade, will be valued by those who receive it, and bears evidence of the enterprise of the house that issues it.

Walter W. Woodruff & Sons, Mount Carmel, Conn., have issued a new catalogue illustrating their line of Carriage Hardware and other manufactures, their Mount Carmel Ox Shoes being prominently represented. The catalogue is excellently printed on fine paper. Special attention is directed to the large assortment of special band patterns. They also allude

to their new special process of electroplating, combining the use of nickel as a base with a heavy coating of silver. This catalogue will be received with interest as covering a desirable line of goods and evidencing the progress and enterprise of the house.

Announcement is made under date June 1 that the copartnership heretofore existing between A. E. La Tour, Emil Jetter and Edward Jetter, Buffalo, N. Y., under the firm name of the Jetter Mfg. Company, has been dissolved by mutual consent. The business will be carried on under the same firm name by Emil Jetter and Edward Jetter, A. E. La Tour having retired from the firm.

The Henry Sears Company, 75 and 77 Wabash avenue, Chicago, Ill., issue a comprehensive 50-page price-current illustrating an extensive line of Cutlery, including Table and Pocket Scissors and some specialties. A great many illustrations are given, with list prices.

De Grauw, Aymar & Co., 84 and 85 South street, New York, are issuing a handsome illustrated catalogue and price-list which relates to Cordage, Oakum, Wire Rope, Chains, Anchors, Oars, Blocks and Cotton and Flax Ducks, Russia Bolt Rope, Bunting, Flags, Marine Hardware and Ship-Chandlers' Goods generally. It is neatly printed and well arranged.

Sargent & Co., New Haven, Conn., and New York, issue a number of new pages for insertion in their 1888 catalogue. They refer to their line of Locks, Knobs, Door Furniture, &c., and include also some new Hooks, Sash-Lifts, Transom-Lifters, Scandinavian Padlocks and the present Screw list.

The Hollow Cable Mfg. Company, Hornellsville, N. Y., report that they are enjoying a good trade in their line of goods, namely: Preston's Patent Hollow-Cable Clothes-Lines, Braided Barbliss Fence Wire and Braided Box Bands. Their Fence-Wire trade is alluded to as active and increasing, the Wire being regarded with especial favor by breeders of fine stock, making as it does a strong, light and cheap fence which is not liable to break in cold weather from contraction.

### Obituary.

J. B. Shannon, well known to the Hardware trade as senior member of the firm of J. B. Shannon & Sons, Philadelphia, Pa., died in that city on June 9 at the advanced age of 71 years. Mr. Shannon was among the early Hardware men, being in the store of Peter Rodgers, and in 1846 became a member of the then new firm of Little, Hatrick & Shannon, all former employees of Peter Rodgers, this firm being shortly afterward succeeded by Little & Shannon, and again in 1854 by J. B. Shannon. From 1858 to 1884 he was located at 1009 Market street, and then moved to the present site, a large five-story building, 1020 Market street, and on July 1, 1878, took into the firm three of his sons—Alfred P., Edwin H. and David W.—under the present style of J. B. Shannon & Sons. Mr. Shannon was always of an inventive turn of mind, and has devised many useful articles for the hardware and building trades, but realized nothing from his inventions, as none were ever patented. He was the first in the United States to use electrical annunciators in hotels, and among the first to make gas-burners in this country. The sliding-roller door originated with him, which, by the way, was an accident, not an invention. As a business man Mr. Shannon stood high in the estimation of the community and was sincere and devoted to many interests in his city, and was one of the most active and energetic men of his time.

### Relief for the Johnstown District.

The following is a further list of contributors to the relief fund for the sufferers by the flood in the Conemaugh Valley, the contributions below being secured by Geo. V. Smith, sales agent Cambria Iron Company (Gautier Steel Department,) 104 Reade street, New York:

Dunham, Carrigan & Hayden Co. and employees, New York.....	\$162.00
S. Otis Livingston, New York.....	100.00
David Williams, New York.....	100.00
Vought & Williams, New York.....	100.00
Huntington, Hopkins Co., New York.....	100.00
Wm. Jessop & Sons, Ltd., New York.....	100.00
W. H. Wallace & Co., New York.....	100.00
D. G. Gautier & Co., New York.....	100.00

**Total.....\$10,407.88**

### Hardware Interests at Williamsport, Pa.

While the well-nigh unparalleled disaster in the Conemaugh Valley has to a large degree engrossed public attention, the destruction of life and property at Williamsport, Pa., has not received the appreciation that it would otherwise have had; but its merchants as well as others

have been overtaken by a calamity which, besides the destruction of life and property, disturbs the regular order of business and may call for indulgence on the part of their creditors. Having 7½ or 8 feet of water on the floor of a Hardware store, while logs by the million feet and houses by the dozen are swept by the door, has a disquieting and damaging effect upon trade. In view of the unsettled condition of things and the disturbance of business, the Hardware merchants of the city have been conferring; and while efforts are being made as quickly as possible to return things to their normal course, and to carry on trade as before, the following circular letter has been addressed to wholesale dealers and manufacturers of Hardware and all other goods sold by the Hardware trade. The reasonableness of this appeal will be recognized, and will, we doubt not, have a hearty response from those to whom it is addressed:

WILLIAMSPORT, PA., June 12, 1889.

We, the undersigned Hardware dealers of Williamsport, Pa., desire to call your attention to the condition of the Hardware trade in this section. By the omnipotent power of an all-wise God, we are sufferers by the late overwhelming floods, which devastated our city and submerged in most cases our entire stock of merchandise. The loss among the Hardware dealers is larger than in any other line of merchandise. For us the labor of years has been swept away. Our loss is great, but our grit and nerve are still with us, and we desire to have our affairs adjusted so that we can continue business and make a success of the future, as we have of the past. Our trade being mostly among lumber men and house-builders, who, of course, are great sufferers, a danger still greater than the actual loss of our goods stares us in the face, from the fact that many of those to whom we have been selling goods are from the very same cause rendered incapable of paying what is due us. We cannot force collections even if we desired, because in hundreds of cases their houses and property have been swept away, and those who were in good circumstances a month ago are insolvent to-day. Public sentiment here would decry legal proceedings of any kind; and inasmuch as some of us may need your assistance in this hour of our adversity, we hope, should any of us seek an extension of time on goods purchased before June 1, 1889, that you will grant such an extension as may be deemed necessary.

Respectfully,

KLINE & Co.  
LEWIS & Co.  
WILLIAMSPORT HARDWARE AND  
STOVE COMPANY, LIMITED.

BECK BROS. & Co.

#### Trade Topics.

Our readers will remember that a few weeks ago we published an extract from an article in the *Commercial Bulletin* of Los Angeles, Cal., relating to the appointment of Pacific Coast agencies, with headquarters at San Francisco, in which the point was made that such agencies are not satisfactory to the business men of Los Angeles, while reference at the same time was made to the growing importance of that city as a trade center. From a prominent Hardware house of that city we have received a letter bearing upon this subject, in which it is pointed out that the position of the newspaper from which we quoted is untenable, inasmuch as Los Angeles agencies are pretty well established and the commission business well represented in that city. Our correspondents say:

The writer of the article in the *Commercial Bulletin* evidently is not acquainted with the trade of Los Angeles. To one who has been in business here for any length of time it would seem rather strange that there are no commission agents in the Southern country. The fact is there are a great many of them, and a majority handle goods directly from the East, receive orders and transmit them to manufacturers without being in any way connected with San Francisco houses. Almost all lines of goods are represented in that way, and there are so many firms who are doing a commission business that we doubt if more than one or two of them are making any money.

The majority of the business houses here either have their representative buyers in the East who are purchasing for them and taking advantage of the market, or else they are such small dealers that they are unable to buy any quantity large enough to ship from the East. In this way it makes the success of the commission houses rather doubtful. The same rules which would govern the commission houses in the East will not control the business here, because the distance from the market and the quantity of goods which must be ordered to obtain advantage of the lowest freight will allow but comparatively few houses that are now doing business here to order through these agents. Another reason is that most of these commission merchants have opened up business since trade here has decreased, and at a time when the majority of the houses were overstocked. In time undoubtedly there will be a good opening for them here, but we must differ with the account in the *Commercial Bulletin*, that they are subservient to San Francisco houses and have no headquarters here dealing direct with the manufacturers.

We have also the following advices bearing upon the same question, in which our correspondents refer to the mistakes sometimes made in regard to Pacific Coast agencies, and referring also to the importance of Los Angeles as a trade center:

The Eastern manufacturers make a mistake in establishing agencies for the Pacific Coast with headquarters at San Francisco, and a greater mistake when they give the exclusive sale of their goods for the Pacific Coast to San Francisco jobbers. A fair example is in the Granite-Ware manufacture. Because San Francisco sold Granite-Ware when Southern California, you may say, was a wilderness, Los Angeles merchants in a city of nearly 100,000 inhabitants must buy their supply in San Francisco! As well ask the jobbers of Chicago to get their supply from Buffalo. San Francisco has lost its grip on this part of the State. Goods in the Hardware line are sold at better figures here than in San Francisco. When the Interstate Commissioners give us the benefit of the short-haul clause of the law San Francisco cannot compete with us. Why should she, being over 500 miles further from the Eastern markets? Los Angeles will be in the future as it is now the metropolis of Southern California. Notwithstanding the business depression, as a consequence of the great real-estate excitement, the city is advancing rapidly in population, as well as all Southern California. The costly and permanent improvements going forward in this city and part of the State show the confidence that the people that know this section of our country best have in its future. It is a section that the Eastern manufacturer of Hardware cannot overlook.

The freight question in Iowa continues to attract much attention and there is a good deal of feeling in regard to it. The roads running through the State have, we are advised, taken off many of their passenger trains on north and south lines and lessened their other trains, and are changing their time-tables needlessly in order to coerce the acceptance of their freight rates. With a view to getting at the merits of the case and to obtain information the Governor is sending out printed circulars to the shippers of the State propounding these questions:

1. How do the local freight rates of the railroads patronized by you compare with the rates in force two years ago?
2. Are the present rates satisfactory to the shippers of your locality?
3. If they are not satisfactory, state in what respect the present tariffs are deemed deficient or unjust.
4. Has the passenger service in your locality deteriorated, and if so, to what extent?
5. Are you in favor of State control of railroads?
6. What railroad legislation, if any, would you recommend for the future?

The controversy is evidently waxing warm, and it remains to be seen what the outcome will be.

The proper organization of a business house with a view to economy and efficiency of administration in the different departments is an important matter which is touched upon by a Western correspondent, who says:

I find many firms made up of a practical Hardware man and tinner who have their different departments in charge. In many cases in addition to these a third has been associated with the other two, who takes charge

of the books and collections. Having one partner, each acquainted with a particular kind of work, doing the buying for that department, puts the business on an excellent basis, as each is responsible for a certain part of the results.

We have the following advices from Louisville, Ky., under date June 8:

The Hardware trade of Louisville, Ky., is remarkably good for this season of the year. It is a source of wonder where the enormous volumes of goods go to, as the spring trade was remarkably large, and now that the farmers are busy in the fields, it is hard to say who buys the goods from the retailer, for he is patronizing the jobber very liberally. For some time a continued drought made dealers hold back in the tobacco and cotton sections, but now plentiful rains insure the crops to be fair anyhow. More agricultural machinery than usual has been bought this season than formerly. Bar-Iron and Merchant Steel are in fair demand, and many inquiries coming from Southern quarters show that the Birmingham mills must be full, as the Southern mills have latterly supplied the trade. Sheet-Iron is quite stiff, few mills being able to take new orders. The extreme low prices of Cut and Wire Nails are having the effect of some heavy buying, many mills refusing orders at lower figures; so now the buyers believe the manufacturers cannot go much lower and run. The approaching season for the low water in the river and annual labor troubles compel the mills to call somewhat of a halt. From the amount of Nails and Wire going out one might suppose that all the barns and fences in the Central and Southern States were down, if it were not for the fact that this vast country is fast opening up and being improved, new railroads going out in all directions, and cheap goods are aiding the good work of progress. The Barb-Wire mills are remarkably busy for this season, as many cases are reported of delayed shipments and refusals of large orders. The unlicensed Wire manufacturers are making strenuous efforts through their Cincinnati office to induce dealers to fearlessly take hold of their Wire, and of course it has a depressing effect on other makes, as it is sold 5 cents below ordinary quotations. Builders' Hardware is rapidly going out, and Wagon and Carriage goods show a lively trade. In fact, the jobbers report extraordinarily large sales during May, and trial-balances show satisfactory figures for the closing six months.

## REVIEW OF THE WHOLESALE MARKET IN PAINTS AND OILS.

*It should be understood that the prices quoted in this column are strictly those current in the wholesale market, and that higher prices are paid for retail lots. The quality of goods frequently necessitates a considerable range of prices.*

### Oils.

There have been no striking features in the market for animal and vegetable Oils. Outside of the ordinary jobbing movement there is little going on at the moment, and surface appearances suggest a conservative disposition on the part of buyers generally. Prices have undergone comparatively unimportant variation.

*Linseed Oil.*—The position is practically the same as described last week. Seed continues high, with only moderate supplies on the spot, very little "outside" Oil comes this way, and city crushers are disposing of the bulk of their current output. Prices remain very firm on the basis of 60 cents for city brands of Raw.

*Cotton-Seed Oil.*—In the local market business has been of rather small volume and the demand moderate. Supplies here consist mainly of "off" grades, and while these may be had at some modification of

### American Water-Gauge Reflector.

It is a conceded fact that the reflecting feature found in the French red-line reflecting gauge glasses is a very decided advantage over the well-known Scotch gauge tubes. The former have upon them a narrow red line which is greatly magnified by the water in the tube, so that the height of the water is made remarkably distinct, as it is indicated by a very broad red line. This desirable end has now been accomplished by Pancoast & Maule, of Philadelphia, Pa., who by means of a very simple addition provide an ordinary tube with all the advantages of the French. As shown by cuts, the reflector consists simply of a narrow concave strip of light copper, coated all over with white enamel, having a longitudinal red stripe, similar to that on the French glass. This strip fits neatly against the glass, and is held in its proper position by two small steel clasps, and as a result an optical illusion,

American Water-Gauge Reflector.

precisely similar to that produced by the French red-line glass, is obtained on any water-gauge to which the reflector is attached. In gauges fitted with the American reflector the water with which the tube is partially filled appears to be of a brilliant red in color, and the height of it can be noted in an instant at a distance of 50 feet or more. On boilers which are located in basements, cellars or other places where the light is poor, such as steamers, mines, &c., the American reflector will be found a very valuable assistant to the engineer or stoker.

### The Fox Adjustable Try and Bevel Square.

This article is manufactured under a recent patent by the Bridgeport Steel Cutting Company, Bridgeport, Conn. It is represented in the illustration herewith. From this it will be seen that it consists of a try-square with an attachment on the back of the handle by means of which it is readily converted into a bevel, which is easily given a variety of adjustments, by means of which it can be set for any pitch or angle. The bevel attachment is a sliding bar on the back of the handle, and on it are marks for pitches from 7 to 16 inches, and another mark on the back of the square blade, which is used in giving

the adjustment desired. For example, in order to obtain a 7-inch pitch the sliding bar is placed in such a position that the mark 7 is in an exact line with the notch cut in the back of the square blade, and it is fastened in that position by means of the thumb-screw, when by placing the top of the slide and the rounding corner of the handle against the work the line of the blade will indicate the correct

The Fox Adjustable Try and Bevel Square.

of other tools, and combines in convenient form the try, bevel and miter square, and is thus adapted to a wide variety of uses. It is also to be borne in mind that when set for any pitch or angle the try-square can also be used. The quality of the workmanship and the accuracy of the tool are other points to which the company directs attention. Its price, 8-inch, is \$15 per dozen, with a discount to the trade.

### The Gem Lathe.

The lathe here illustrated was designed by the Seneca Falls Mfg. Company, of Seneca Falls, N. Y., to meet the demand for a light, substantial and practical working lathe at a low price. It is provided with a patent foot-power by which the greatest power is produced with little fatigue. This consists of double treadles

The Gem Lathe.

bevel or pitch desired. In the same manner it may be adjusted for a pitch of either 8, 9, 10, 11, 12, 13, 14, 15 or 16 inches. The marks for octagon or pitches of 5 and 6 inches are on the top of the slide, there being a corresponding notch in the top of the blade. It will thus be seen that this ingenious and well-made tool can be set instantly to any pitch or rise from 5 to 16 inches without the aid

having a walking motion and which are movable and work independently of each other. They are connected to the opposite ends of the driving-wheel shaft in such a manner as to produce a strong, positive and continuous power. The lathe may be driven by either treadle standing or both treadles sitting. The head-stock has a two-speed cone for a 1-inch flat belt, hollow steel spindle having a  $\frac{1}{4}$ -inch hole and anti-friction metal-lined boxes, which are adjustable to take up wear. The tail-stock has a steel spindle with self-discharging center. A slide-rest and a counter-shaft can be furnished with the lathe when desired. The lathe weighs 110 pounds.

### The Colby Wringer.

One of the points emphasized by the Colby Wringer Company, Montpelier, Vt., in regard to the Colby Wringer, of which we gave a description last week, is the fact that when removed from the tub the rolls are relieved from pressure. By an erroneous substitution of *can* for *cannot* a contrary statement was made in the article, where it was asserted that the wringer *can* be removed from the tub without at the same time taking the pressure off the rolls. This point is an important one in the machine, as it will be perceived that the wringer is thus given greater durability, inasmuch as when not on the tub its rolls are entirely free from the injury that results from continued pressure, which robs them after a time of their elasticity.

**Galvanized Tea-Kettle.**

The accompanying illustration represents a new galvanized sheet-metal tea-kettle which has recently been placed on the market by Sidney Shepard & Co., Buffalo, N. Y., who refer to it as a novelty of merit, it being light, serviceable and reasonable in price. It is galvanized

*Galvanized Tea-Kettle.*

after being put together, thus soldering all the seams and coating the entire surface so as to prevent rusting. Apart from the objections that exist to the use of galvanized metal for cooking purposes, or in connection with water which is to be drunk, this article would appear to be possessed of advantages which will commend it to the trade.

**The Double-Case World Type-Writer.**

This type-writer is put on the market by the Pope Mfg. Company, Boston, Mass., and is represented in the accompanying illustration. The single-case World type-writer has been on the market for two years, but the double-case machine, which writes both capitals and small letters, has only recently been offered to the trade. The illustration pretty clearly indicates its construction. It writes 76 characters, including capitals and small letters, numerals and punctuation points. With the exception of being  $\frac{1}{4}$  inch wider, it occupies the same space as the single case and its operation is the same. The compactness of this machine is referred to as giving advantages: It is 12 inches in length, 6 inches wide,  $2\frac{1}{4}$  inches high and weighs a little less than 4 pounds. Consequently it can easily be placed in a convenient position on the desk or in the drawer, not necessitating a table or a change of position when a letter is to be written. The principle of indicating with one hand and printing with the other

*The Double-Case World Type-Writer.*

is referred to as giving this machine a speed which is not attained in others of its class, which are operated with only one hand. The direct printing of the types on the paper is also alluded to as giving a better impression than it is possible to obtain where a ribbon is used. It is also pointed out that no amount of use can change the alignment and the cost of repairs is trivial. The construction is such that the friction is reduced to a minimum. A neat walnut

case fitted with a handle is made for the machine and is convenient for carrying it about. It has less than 40 parts and employs but one active spring. It is light and strong and seldom needs repairing and is practically indestructible. The following additional particulars in regard to this machine, with some reference to type-writers in general, are furnished us by the company:

It does not get out of order easily, the alignment is perfect, the parts are all interchangeable, it employs no ribbons to dirty the fingers, writes on paper of any width or thickness, will address envelopes, postal-cards or tags more easily than any other type-writer. For filling in blanks it cannot be excelled. Its writing will copy-press better than a letter written with copying-ink. It can be used in connection with hektograph and a large number of perfect copies taken. It is easy to carry, and many traveling men who for years have wrestled with a hotel pen claim that they cannot get along without it. It takes very little practice to learn to work the machine rapidly. Its action is positive and it cannot lap or skip. Simplicity is one of the points of the machine. In 15 minutes an ordinarily intelligent person can write almost as rapidly with this type-writer as with the pen. With an hour's practice a day for a week one can write 50 per cent. more rapidly than with the pen.

The single case machine writing 44 characters is sold for \$10, and the double case, writing 76 characters, as above mentioned, is sold for \$15.

**Giant-Saw Tool.**

E. C. Atkins & Co., manufacturers of saws, tools and mill specialties at Indianapolis, Ind., with branches at Memphis, Tenn., and Minneapolis, Minn., have re-

*Giant-Saw Tool.*

cently brought out a new tool to be used in the care of cross-cut saws. It is called the Giant-saw Tool and is a combined jointer, raker, tooth gauge, side file and set-tooth gauge, all comprised in one tool, and is described as a most perfect tool for the purpose made. It is represented in

**Ice-Making Machines.**

The accompanying illustrations represent portable ice-making machines of foreign manufacture which are being introduced by the Francis T. Witte Hardware Company, 106 Chambers street, New York.

*Ice-Making Machine—Regular Pattern.*

Fig. 1 represents the usual pattern of the smaller sizes, Fig. 2 being a larger machine for restaurants and confectioners. From these illustrations, which show the inside arrangement of the machines, it will be seen that the receptacle which holds the water is turned by a crank similarly to an ice-cream freezer, there being around it a packing of special salts. The operation

of freezing is said to occupy 10 or 15 minutes. The smallest machine, No. 0, is for the production of  $\frac{1}{4}$  pound of ice, the larger ones making 1 pound,  $1\frac{1}{2}$ , 2, 4, 6, 9 or 18 pounds each. The salts, we are

*Ice-Making Machine for Restaurants, &c.*

advised, can be used over and over again by ebullition—that is, by putting the used and wet salts on a stove and allowing the water to evaporate. It will thus be seen that the ice is not produced by this ma-

chine in large quantities, but the machines are alluded to as valuable adjuncts to the kitchen outfits of yachts, camping parties, or in countries where ice cannot be obtained.

## NEW PUBLICATIONS.

**ELECTRICAL RULES, TABLES AND FORMULÆ.** Illustrated; Andrew Jamieson; Industrial Publication Company, New York, publishers. Price 75 cents.

This book gives what has long been needed—a clear and concise explanation of the rules and formulæ relating to electricity, together with tables on the same subject. The book will be appreciated by the electrical engineer, and also by the many users of electrical appliances, since the definitions it contains are so clearly explained as to be readily understood, even by those who are not electricians.

**PRACTICAL IRON FOUNDRY.** By the author of "Pattern Making," "Lockwood's Dictionary of Mechanical Engineering Terms," &c.; illustrated; Whittaker & Co., London; D. Van Nostrand Company, New York, publishers.

In a condensed and clear style an admirable definition of the principles and practice of iron-founding, aided by well-selected drawings showing the practice, is given in this work. The book begins with a discussion of the principles underlying iron-founding. Then follows a description of sands, tools, green-sand molding, machine-molding, cupolas and blast, &c. The work will be a valuable aid to those studying foundry-work, and will be of much assistance to any one who is interested in the subject. The appendix contains many useful tables relating to founding.

**THE ART OF SPECULATION.** By Roderick H. Smith, 6 Wall street, New York. 48 pages flexible cloth cover.

This is an ingenious work, intended as a guide to speculation in Wall street. The mode of procedure laid down is founded upon the rule of averages, the speculator buying a lot at every 1 per cent. decline and selling a lot at every 1 per cent. advance. The mathematical demonstration of the success attending the adoption of this rule appeals to the reason of the reader, but the author very decidedly proves also that capital is required, and that small operators are shut out.

**MANUAL OF AMERICAN WATER-WORKS.** M. N. Baker, editor *Engineering News*, New York, publisher.

For several years past our contemporary *Engineering News* has issued in book form a condensed history of the water-works of the United States and Canada. The new edition brings the classification down to date, and contains accounts of all those water-works which have been erected since the appearance of the former edition. This work is received as an authority upon water-works history, and is of great value to all those interested in the subject, because of the vast amount of reliable information it contains relating to all sources of water supply.

**A HISTORY OF THE PLANING MILL.** By C. R. Tompkins, M.E.; John Wiley & Sons, New York, publishers. Price, \$1.50.

The writer of this book, having been for 40 years or more identified with planing-mill machinery, speaks with confidence of the designs now well known and also of the needs of this important branch of mechanics. Opening his work with an early history of the planing-mill and the early inventions in England, he follows with descriptions showing the gradual advances and improvements made up to the present time. He then deals with the

practical operation of wood-working machinery and the adjusting and working of these appliances. Although the book is headed "A History of the Planing Mill," it is really a discussion of the construction, care and management of wood-working machinery in general, the subjects treated including the various kinds of wood-working machinery, lubrication, hints about molding-machines, responsibilities of foremen, advice to operators, artistic wood-work, shafting, belting, &c.

**HOT-WATER HEATING AND FITTING OR WARMING BUILDINGS BY HOT-WATER HEATING APPARATUS, THE METHODS OF THEIR CONSTRUCTION AND THE PRINCIPLES INVOLVED.** By William J. Baldwin; 385 pages; over 200 illustrations and diagrams, and 15 tables. Published by the *Engineering and Building Record*. Price, \$4.

The subject of warming buildings by hot water is attracting so much attention upon the part of the public at large at the present time, and is having such special study upon the part of all who are engaged in any branch whatsoever of the business of heating and ventilation, that the appearance of a manual or compendium devoted to it is of great importance. That the book should come from the pen of a writer so well known to steam engineers and to the readers of the technical press in general as William J. Baldwin gives it still further claims to examination, and demands for it careful scrutiny and intelligent criticism. The work has been prepared not alone for purely professional readers, but rather for the mechanic and hot-water heating fitter, as the amount of new matter which it contains relates chiefly to fittings rather than to the principles of heating. The greater portion of the matter contained in this book first appeared in the pages of the *Engineering and Building Record* in a series of articles. Since their appearance in that periodical they have been revised, and considerable new matter has been added pertaining to the subject above indicated.

Considering the work as a whole, it can only be regarded as a small original contribution to hot-water heating literature. The greater part of it is taken up with reiteration of experiments of some of the earlier investigators. Much time has been given to the calculations based on the accepted hydraulic formulas, but the space occupied in the explanation of how these calculations were made is of small importance to the practical reader. The results of this figuring are of use, and the methods proposed for proportioning and grading the sizes and areas of pipes might, with great advantage, receive more elaboration. Tables, in addition to the diagrams, giving the actual sizes of pipes and surfaces would have been very desirable. The information regarding the proportions of pipes is of benefit to the practical man, and for this alone the book becomes a useful addition to the engineer's library. The effort is more the work of a student of engineering authors than that of a practical mind, as an illustration of which we would cite the assumption of the temperature of the water in the radiators when calculating the heating surface. In the radiators in the greater number of buildings it is not common to get the temperature of the water entering the radiators to 210° F., the outside atmosphere being zero or 10° below zero. If, however, this high temperature is practicable, it is to be regretted that no case was shown where it occurs, and that no idea of the relative size and proportion of boiler and heating surface was given to attain such results. In the only practical experiment made by the author, and referred to on page 166, he states that the highest temperatures attained in two tests of the water entering coils were 195° and 206° F., while the outside air was 85° and 78°. Here was a case of one boiler sup-

plying 122 square feet of surface so that 210° might, if possible, be attained. It being the first literary contribution to hot-water heating in the United States, it is worthy of all the attention it will attract, and it is surely the precursor of many practical American additions to the library of hot-water heating literature.

## THE LOCOMOTIVE.

We have received volume IX, covering the year 1888, of our valuable contemporary the *Locomotive*. We always look forward with interest to the advent of the monthly edition of our contemporary, and since the numbers are used extensively in abstracting we are always pleased to receive the bound volume at the end of the year, which we can keep in complete form for reference.

The Customs Department of the Dominion of Canada promulgated the following decisions in regard to duties on the 1st inst.: Lemon-squeezers, made wholly of glass, 20 per cent.; Paris white, dry, 20 per cent.; patent carbon enamel (composed of fusel-oil, &c.), \$1.90 per gallon; wire ferrules, iron, steel or brass, 80 per cent.

# CURRENT HARDWARE PRICES.

JUNE 19, 1889.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers' prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers, at the figures named.

# THE IRON AGE

THURSDAY, JUNE 27, 1889.

## Pipe-Cutting and Threading Machine.

A new pipe-cutting and threading machine, of which we present an engraving, has just been placed on the market by Curtis & Curtis, of Bridgeport, Conn. It is arranged to cut off and thread all sizes of wrought-iron pipe, from 2½ to 12 inches inclusive—a very unusual range. On ac-

In operating the machine the pipe is placed through the self-centering vise attached to the back of the shell, with the end against the back of the dies, and clamped securely by turning the hand-wheel shown on the top of the machine. The dies are all opening and adjustable to any variation of the fitting by means of cams behind the dies on an annular ring, and they are set for the size of pipe to be

cheaper than any other 12-inch power pipe machine in the market. The floor-space is 47 x 65 inches and the shipping weight 5800 pounds.

The example of the Cumberland Valley Railroad in using a car fitted with a dynamo and the necessary apparatus for electric lighting seems likely to be followed

NEW PIPE-CUTTING AND THREADING MACHINE, BUILT BY CURTIS & CURTIS.

count of the small amount of floor-space required long length of pipe can be handled in a much smaller room than is usually required. The general principle is the same as in the smaller sizes of pipe-machines for hand or power made by this firm. The die-carrying gear is supported in a casing with the pinion imbedded in its side. On the back of the gear is placed a lead-screw of the same number of threads to the inch as the pipe to be cut, which engages with the brass lead blocks shown on the side of the shell, and which work out or in by excentrics. Thus as the gear revolves in the shell it is drawn into the shell by the lead-screw and the dies are brought on to the pipe.

cut by simply revolving the ring to the graduation. The difficulties attending so great a range are overcome by using two die gearing rings which fit into the large gear. The larger one is shown in the machine and contains six dies for threading all sizes, from 7 to 12 inch inclusive. The smaller fixture is shown by the side of the machine and contains four dies for threading all sizes, from 2½ to 6 inches inclusive. A change from 2½ to 12 inch pipe is made in a few moments by changing the fixture and the jaw steels. The advantages claimed for this machine are that it has the largest range, requires less floor-room, takes less power to run it, is more simple in construction and is far

in the near future by other roads throughout the country. The car in question demonstrated its great usefulness recently in the work of repairing tracks and bridges. It was used by the Pennsylvania Railroad in building the temporary bridge at Montgomery and at other points along the line. It is 38 feet long, 9 feet wide and 13½ feet from the rails to the top of the roof. The boiler and engine are at one end and the dynamos at the other. The lamps and tools for erecting the line are carried under the car. The boiler is 40 horse-power and the engine is a 35 horse-power vertical automatic. The dynamos are of 25 and 15 arc-light capacity respectively, each lamp being of 2000 candle-power.

## Use of Softeners in Foundry Practice.

(Concluded from page 916, June 20.)

### SILICON.

Silicon is a softener of cast-iron. It promotes the production of graphitic carbon by replacing the carbon combined with the iron. By the proper use of silicon any proportion of combined carbon can be obtained that is required by the founder. It increases the fluidity of cast-iron. It prevents shrinkage by lessening the amount of combined carbon. Silicon prevents the formation of chilled castings in the same manner, it being difficult to get iron to chill deeply with silicon as high as 1.25 per cent.

Mr. A. E. Hammer has stated that "the carbon in iron containing less than 1.25 per cent. of silicon is surprisingly sensitive to the least increase or diminution of the silicon, even 0.02 per cent. making, under favorable conditions, an appreciable difference." In certain cases, he says, "the cast-iron may not have contained quite enough silicon to coax or force the combined carbon into the graphitic or semi-graphitic state, and the addition, under these circumstances, of 0.077 per cent. or even less of silicon would be expected to have altered very decidedly all the mechanical and many of the chemical conditions of the iron." Professor Turner finds that the percentage of silicon should be, for the greatest tensile strength, 1.80 per cent.; for softness and working qualities, 2.50 per cent., when the percentage of lowest combined carbon is under 5 per cent.

### SULPHUR.

Sulphur hardens the metal. It is very powerful in its action and acts in almost the contrary direction to silicon, as it promotes the formation of combined carbon, 1 part of sulphur neutralizing probably the effect of from 5 to 10 parts of silicon. Riley thinks that the "slight differences in the amount of sulphur would explain the differences in the number and quality of the iron, as the percentage of sulphur increases as the number of the pig passes from 1 to 6. No. 1 contains silicon, 2.619 per cent.; sulphur, 0.54 per cent.; No. 4 contains silicon, 2.234 per cent.; sulphur, 0.115 per cent.; white contains silicon, 0.27 per cent.; sulphur, 0.54 per cent.

It is observed that as silicon increases in pig-iron the sulphur decreases. In foundry irons the percentage of sulphur should not exceed for soft foundry irons 0.18 per cent., nor for hard and mottled irons 0.20 per cent., nor for white irons 0.25 per cent.

### PHOSPHORUS.

Phosphorus causes hardness and brittleness and increases fluidity. Professor Turner finds that 0.3 per cent. of phosphorus is a good figure for strong castings.

### MANGANESE.

Manganese tends to the formation of combined carbon in cast-iron and reduces the tensile strength. Manganiferous irons are brittle. As the manganese is increased the hardening properties are increased, since it acts in a contrary direction to silicon, and more powerfully in keeping the carbon in the combined state. M. Al. Pourcel, Terrenoire, states that silicon is neutralized by manganese when for each chemical equivalent of silicon there is a little more than an equivalent of manganese present. Silicon when neutralized by manganese does not diminish the hardening properties of the metal. M. Gautier found that the presence of manganese prevented mottled iron from becoming gray when scrap, burnt iron, ferro-silicon and No. 1 Scotch irons were melted together in a mixture.

Manganese is considered to make iron fluid, to take out the shrinkage of certain

irons, and to make clean castings. It protects the silicon during remelting from oxidation, and should therefore always be present to some extent, so that the iron by retaining its silicon may continue to be graphitic.

Professor Turner finds 0.58 per cent. manganese to be the best figure for strong castings. Dr. Dudley stated to me that as manganese hardens both foundry and car-wheel metal it increases the cost of boring and machining the castings; he therefore recommends that manganese be kept below 0.50 per cent. in foundry pig-iron.

### MIXTURES OF IRONS.

In the cupola practice of the Bessemer steel process for a given grade of steel, the proportions of phosphorus, sulphur and manganese being prescribed and constant in the materials used, the mixtures of irons are based almost entirely upon calculations made from analyses of the percentages of silicon contained in the pig-irons and scrap employed. To maintain the required temperature in the converter silicon is necessary, it being the principal heat-producer, as will be seen from the following table, taken from calculations by Professors Ledebur, Favre and Silbermann: From the combustion of 1 per cent. of manganese a temperature of 69° C. is produced; carbon, 8° C.; silicon, 300° C. From calculations made from analyses the proportion of silicon required to give the temperature necessary for the success of the operation is very exactly maintained.

In the foundry the problem is not to attain a certain amount of heat in the molten metal, but to have the right proportions of combined and graphitic carbon in the resulting casting; this is done, as we have seen, by getting the proper proportion of silicon. The variations in the proportions of silicon afford a reliable and inexpensive means of producing a cast-iron of any required mechanical character which is possible with the material employed. In this way, by mixing suitable irons in the right proportions, a required grade of casting can be made more cheaply than by using irons in which the necessary proportions are already found.

If a strong machine casting were required, it would be necessary to keep the phosphorus, sulphur and manganese within certain limits. Professor Turner found from a most elaborate and careful series of experiments that cast-iron which possessed the maximum of the desired qualities contained of graphite, 2.59 per cent.; silicon, 1.42 per cent.; phosphorus, 0.89 per cent.; sulphur, 0.06 per cent.; manganese, 0.58 per cent.

Irons containing different percentages of the last three elements could not be used without changing the proportions of the other two and complicating the calculations necessary for making a mixture that would produce a strong casting. A strong casting could not be made if there was much increase in the amount of phosphorus, sulphur or manganese. Irons of the above percentages of phosphorus, sulphur and manganese would be most suitable for this purpose, but they could be of different grades, having different percentages of silicon, combined and graphitic carbon. Thus hard irons, mottled and white irons, and even steel scrap, all containing low percentages of silicon and high percentages of combined carbon, could be employed if an iron having a large amount of silicon were mixed with them in sufficient amount. This would bring the silicon to the proper proportion and would cause the combined carbon to be forced into the graphitic state, and the resulting casting would be soft. High-silicon irons which are used in this way are called "softeners."

### HIGH-SILICON IRONS.

Mr. Keep gives the following analyses of high-silicon irons:

#### Ferro-Silicon.

	Foreign. Per cent.	Foreign. Per cent.	Foreign. Per cent.	American. Per cent.	American. Per cent.

Mr. Meissner gives the following analyses of Scotch irons:

	Silicon.	Phosphorus.	Manganese.	Sulphur.	Graphite.	Combined Carbon.
Summerlee No. 1.....	2.70	0.545	1.80	0.01	3.00	0.25
Summerlee No. 1.....	2.47	0.780	2.51	0.015	...	...
Summerlee No. 1.....	3.44	1.00	1.70	0.015	...	...
Summerlee No. 2.....	2.70	0.81	2.90	0.020	3.00	0.80
Eglinton No. 1.....	2.15	0.618	2.80	0.025	3.76	0.21
Cottbus No. 1.....	2.59	0.845	1.70	0.010	...	3.75(?)
Glengarnock No. 1.....	3.08	1.20	2.85	...	...	...
Glengarnock No. 2.....	4.00	0.90	3.40	0.01	1.78	0.90

I add the analysis of the Bellefonte soft irons as follows: Silicon, 3 to 6 per cent.; phosphorus, 0.845 per cent.; manganese, 0.58 per cent.; sulphur, 0.03 per cent.; graphite, 3 per cent.; combined carbon, 0.25 per cent.; total carbon, 3.25 per cent.

It will be seen that ferro-silicons contain a low percentage of total carbon and a high percentage of combined carbon. It has been stated that carbon is the most important constituent of cast-iron, and that there should be about 3.4 per cent. total carbon present. By adding ferro-silicon which contains only 2 per cent. of carbon the amount of carbon in the resulting mixture is lessened.

Mr. Keep found that more silicon is lost during the remelting of pig of over 10 per cent. silicon than in remelting pig-iron of lower percentages of silicon. He also points out the possible disadvantage of using ferro-silicons containing as high a percentage of combined carbon as 0.70 per cent. to overcome the bad effects of combined carbon in other irons. Professor Turner finds that the lowest percentages of combined carbon are met within iron containing from 4 to 7 per cent. of silicon, being from a trace to 2 per cent.

The Scotch irons generally contain much more phosphorus than is desired in irons to be employed in making the strongest castings. It is a mistake to mix with strong low-phosphorus irons an iron that would increase the amount of phosphorus for the sake of adding softening qualities, when softness can be produced by mixing irons of the same low phosphorus.

Bauermann states that the highly-graphitic Scotch pig-irons, while useless in themselves for producing castings, have a great use in bringing up lower qualities of metal to the proper degree of grayness in the cupola.

M. Gautier says that the high percentage of manganese in Scotch softeners makes them inferior to ferro-silicons; therefore,

he says, Scotch irons might be improved by keeping down the manganese to 0.50 per cent. and raising the silicon to 3 per cent.

Tensile strength is important in the best castings; manganese reduces the tensile strength and increases the capacity of iron for combining carbon with itself; therefore a reduction of manganese in Scotch irons will increase the strength of the metal and enable it to carry more scrap. He found that the presence of manganese prevented mottled iron from becoming gray when a mixture was made of scrap, burnt iron, ferro-silicon and No. 1 Scotch; hence, he says, if ferro-silicon had not been discovered a new variety of Scotch pig, with less manganese and more silicon, could easily be provided for, and would afford a new field to that renowned product; but he was afraid that ferro-silicon, which was the essence of the good qualities of Scotch pig without any of the bad ones, must come to the front in the future.

From the analyses of the Bellefonte softener it is seen that it contains all the

#### Portable Coal Elevators.

The accompanying illustration is that of a portable coal elevator constructed according to the methods employed by the Clark-Howard Excavator and Conveyor Company in coal-handling machinery, and is now in daily use at the coal wharves of the Philadelphia and Reading Railroad Company at Port Richmond, Philadelphia. The machine has a lift of 80 feet, an adjustment of 16 feet and a capacity of 300 tons per hour. It is built on an ordinary flat gondola car, with a simple hoisting engine and boiler of about 15 horse-power attached, and consists of an arrangement of 30 buckets attached to an endless chain at stated intervals, which passes around a system of wheels. Each bucket holds about 250 pounds of coal. The entering edge of the bucket, where it passes into the coal pile, is fitted with prongs which project ahead, so that instead of crushing into the coal and breaking its way, it gently loosens the coal and scoops it up. The manner in

force of manual labor which is unreliable and expensive. The breakage is reduced to a minimum and is less than that caused by handling by hand. The theory employed in this machine is to handle a large amount of coal at a slow rate of speed, thereby gathering and depositing the coal so slowly and carefully that it becomes impossible to break it; and instead of flinging the coal out at a great height upon a pile beneath, the door of each bucket opens from the back and the coal slides gently out, the motion being that of drawing the bucket away from the coal. This machine has proved to the satisfaction of those in charge of the Philadelphia and Reading coal-yards that it handles coal cheaper, quicker and more securely than ever before. This machine is made by the Clark-Howard Excavator and Conveyor Company, of 135 Broadway, New York, and Third and Walnut streets, Philadelphia, Pa.

#### The Cooper Union.

The thirteenth annual report of the trustees of the Cooper Union for the Advancement of Science and Art, New York, has just been issued. It comprises a pamphlet of 68 pages. We extract the following interesting statement:

The trustees have heretofore made known to the public the necessities of the institution, and they can now only repeat that additions to the endowment fund will be most acceptable, and, indeed, are absolutely necessary, in order to meet the constantly increasing pressure for admission to the various privileges of the institution. The applications to the art school are more than a year in advance of the possibilities of admission. If the school were double in size it would promptly be filled by the applicants for admission. The other departments of the institution, especially the night classes, are crowded to their full capacity and require enlargement. The space exists in the building, but the funds are deficient for the necessary expenses. To bring the institution up to the full measure of its capacity an endowment of \$1,000,000 will not be too much. In the meantime the trustees will henceforth be compelled to keep the expenditures within the income which can be got from the rented portions of the institution and the annual interest of the endowment of \$300,000 provided by the heirs of Mr. Cooper. During the past year the number of pupils has been:

	Students.
In the woman's art school.....	310
In the phonography and type-writing class.....	50
In the telegraphy class.....	84

Total female day scholars.....394

In the night school of science.....	980
In the night school of art.....	2,147

Total male night scholars.....3,127

The average daily attendance at the reading-room amounts to 1500 readers. The free lectures on Saturday evening have attracted very large audiences, often exceeding the capacity of the great hall. These figures serve to give an idea of the magnitude of the educational work carried on by the Cooper Union.

We have received a copy of the proceedings of the first session of the National Convention of the Representatives of Commercial Bodies to formulate an equitable uniform bankrupt law, held pursuant to call of the Associated Wholesale Grocers of St. Louis, February 28 and March 1, 1889, at St. Louis. The proceedings are published in a broad-paged pamphlet of 100 pages. The last page of the cover contains a full list of the officers of the convention, headed by Jay L. Torrey, of St. Louis, president.

PORTABLE COAL ELEVATOR.

good qualities of both ferro-silicon and Scotch pig, without any of the bad ones of either. Silicious ores from the Barrens group of Centre County (the section from which the Bellefonte Furnace Company's ores come), containing as high as 40 per cent. of silica, have been shipped in large quantities to furnaces in Ohio making a specialty of softeners.

Desiring what many furnace men have expressed themselves in favor of, that iron should be bought and sold on analyses, I have undertaken to furnish the analysis of all shipments of iron made when asked for, and to furnish iron of the above proportions of phosphorus, sulphur and manganese, and of any percentage of silicon asked for below 6 per cent. I have even met the foundry men more than half way, undertaking to analyze their irons and scrap on hand, and to furnish an iron that would carry the amount of scrap and hard iron that they desire to use.

WALTER GRAHAM,  
Chemist of the Bellefonte Furnace Company and Member of the American Institute of Mining Engineers and of the Verein Deutscher Eisenhüttenleute.  
BELLEFONTE, PA., May 31, 1889.

which the machine performs its work is this: It is placed upon trestles over coal piled beneath, an engineer and two attendants being all the manual labor necessary to operate the machine. The boot with the chain of buckets is lowered into the hatch between the trestles. The endless chain begins to move, when the bucket nearest the coal enters gently and slowly into the mass, preceded by the prongs, which loosen and scoop it up. The chain revolving draws bucket after bucket through the coal at the slow speed of 75 feet per minute. The chain passes the buckets up the perpendicular to the top wheel, at which point a trip-wheel is also located, which strikes a latch in the back of the bucket, the door opens and the coal slides gently into a chute situated a little below the course taken by the buckets and thence on into cars drawn up on either side on the adjacent tracks. The bucket continues now empty until it reaches another wheel, where it is similarly closed and proceeds downward, to be refilled and emptied as before.

The advantages derived from handling coal in this manner are all primary and important. It does away with that large

### The Puritan.

The Puritan, which is without doubt the grandest river steamboat in the world, has taken her place in the fleet of the Fall River Line and will, in the future, ply between New York and Fall River. Her most important dimensions are: Length over all, 420 feet; length on water-line, 404 feet; width, 52 feet; depth, 21½ feet; gross tonnage, 4650 tons. The steel hull is double and is divided into 59 water-tight compartments; the decks are also of steel, covered with wood. The masts are hollow and will serve as ventilators. The engine is of the compound vertical beam surface condensing type, and develops 7500 horsepower. The high-pressure cylinder is 75 inches in diameter and 9 feet stroke, and the low pressure is 110 inches diameter and 14 feet stroke. The shaft is 27 inches in diameter in the main bearing and 30 inches in the gunwale bearings. There are eight return tubular steel boilers, carrying a pressure of 110 pounds. The boilers have 850 square feet of grate surface and 26,000 square feet of heating surface. The fire-room is 78 x 12½ feet. The vessel is steered by steam, a two-cylinder engine being provided for this purpose. The extreme upper deck has a promenade entirely around it; this walk is over 600 feet long and 42 feet above the water. On the saloon deck is a second promenade entirely around the boat. The cabins are all extremely large and richly decorated and furnished. The main saloon is 128 x 28 feet and the dining-room 108½ x 30 feet. The steamer is lighted by electricity and every known precaution has been taken to guard against fire.

### Universal Hand-Lathe.

The Brown & Sharpe Mfg. Company, of Providence, R. I., have just issued a pamphlet on the construction and use of the universal hand-lathe made by them. The pamphlet describes and illustrates

fastened to the bed by a clamp-screw, and can be easily shifted or taken from the bed; its spindle moves in a steel bushing and is operated by a hand-lever which has its fulcrum on an adjustable stud back of the spindle. This spindle may be clamped

to ¼ inch in diameter. The tapering portion of the hole is ground. A thread to receive a face-plate or lathe-chuck is cut on the front end of the spindle, and when not in use is protected by a guard-nut. The spindle-boxes are fitted into taper

UNIVERSAL HAND-LATHE.

Fig. 3.—Method of Centering Bars and Shafts.

many new attachments designed for work not usually done on the hand-lathe.

As here shown, the lathe rests upon a table, but it is frequently used as a bench-lathe. The top of the bed is flat and is scraped to surface-plate, as are also the bearing surfaces of the foot-stock and the slide or other rests. The foot-stock is

in any position and has a movable stop, *r*, Fig. 1, which serves to limit the forward motion when brought against the adjustable stop-screw *s*. The head-stock, spindle and boxes are steel, hardened and fitted by grinding. The hole through the spindle is ¼ inch in diameter the greater part of its length and tapers at the front

holes in the head-stock and held in place by nuts. On one side they are cut open and, when adjusted, are drawn forward by nuts and practically closed from all sides. The alignment of the spindle is thus preserved. The spindle bearings are thoroughly protected from grit and dust and are lubricated from beneath. Shell-chucks

are provided for holding small work. These chucks are made in a great variety of forms, as required by the shape of the work. The tool-holder guides *j j* on the head and foot stock, Fig. 1, may be set in or out and enable the lathe to be used for turning small shafts, studs, screws, &c.,

cap, C, which is slipped over the end of the tool-holder. The pin D, in the drill-holder B, serves as a stop in connection with the end of the shaft, and determines the depth of the hole.

In finishing a pin, I, Figs. 4 and 5, a special chuck is used, which grips the

is removed by the tool T, and the edge S is rounded with a bead tool, J. The pin U is a stop to regulate the depth of the cap by coming in contact with the inside surface V. The tools and pin are held in the tool-holder shown in Fig. 3, the tools being at right angles to each other. These caps are also bitted and countersunk in the hand-lathe, and when riveted to a stem the burr is turned off with a hand-tool.

The ends of a great many odd-shaped pins are rounded as at M, Fig. 7. This cannot be done with the arrangement of tools before described on account of the projecting part; accordingly the tool is held in a collet, which is inserted in the foot-stock spindle. The work is held on

Figs. 4 and 5.—Finishing a Pin.

Fig. 6.—Finishing Small Caps.

Fig. 7.—Rounding Ends.

either straight or taper. The lathe swings 9 inches over bed and receives 14 inches between centers. The bed is 36 inches long. The table or stand on which the bed rests is 12 x 40 inches, measured over all. Height of table from floor, 34½ inches; height of centers from floor, 44½ inches; floor-space, measured over extreme points of movement of lever on foot-stock, 25 x 58 inches. The weight of the lathe complete ready for shipment is about 500 pounds.

The tool-rest shown in plan in Fig. 2 can be clamped to the bed at any angle and can also be adjusted vertically.

Fig. 3 shows a method of centering needle-bars, foot-bars, shafts, &c. The drill A is fastened in the drill-holder B, which is secured in the tool-holder k. The tool-holder slides on the guides *j j*, and the outer end of the drill-holder slides upon the tool-rest *p*. The shaft X, to be centered, is held in a shell-chuck, *m*, while the drill is pressed against it by hand, the palm bearing on a wooden

body and closes about the thread of the pin just enough to steady and hold it in line. The pin could not be held by the thread alone without damage, and the body is too short to admit of its being held by that alone. To use an ordinary chuck for such work would be comparatively slow and costly.

A method of finishing small caps is shown by Fig. 6. These caps come to the hand-lathe from the punch press in the form shown at R. The superfluous stock

Fig. 2.—Tool-Rest.

a face-plate, and the end located centrally by a clamp and stop-pins. The length is regulated by adjusting the stop and stop-screw, which limit the forward movement of the foot-stock spindle. The four screws are used to adjust the tool when it is worn or ground. Sometimes it is more convenient that the tool should be held in the live spindle and the work secured to the dead spindle, as in turning the shoulders R and S, Fig. 8. The piece is held by the clamp W in a groove on a special fixture, U, and is moved to a hollow mill by the hand-lever.

C. P. Huntington, of American railway celebrity, has become interested in the Congo railway, 230 miles in length, to be built around the falls of the Congo River,

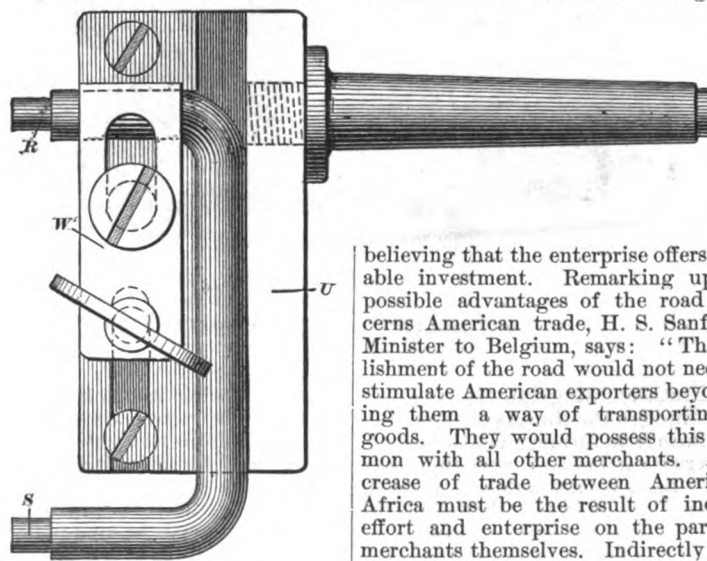

Fig. 8.—Rounding Ends.

believing that the enterprise offers a profitable investment. Remarking upon the possible advantages of the road as concerns American trade, H. S. Sanford, ex-Minister to Belgium, says: "The establishment of the road would not necessarily stimulate American exporters beyond giving them a way of transporting their goods. They would possess this in common with all other merchants. Any increase of trade between America and Africa must be the result of individual effort and enterprise on the part of the merchants themselves. Indirectly the fact that American capital was interested, were this the case, might direct the attention of Americans to the field and in this way increase the commerce of this country. It is quite within the range of probability that if the road were finished some of our manufacturers would endeavor to take advantage of it and try to find a market for their goods along the Upper Congo and its tributaries. Apart from this, however, I do not see why the road should not pay on the freights it would secure. The articles we get from Africa now are sufficiently valuable to stand heavy freight charges."

**Automatic Testing-Machine.**

The illustrations represent the latest form of automatic testing-machines built by Tinius Olsen & Co., of Philadelphia, Pa. One end of the sample of material of which it is desired to ascertain the tensile strength is secured by proper tools to the extreme upper plate of the machine, while the other end is secured to the plate below, thereby exposing that part of the specimen between the plates on which the strain is exerted. The lower plate or cross-head is secured to four straining-screws which pass through holes at the carriers of the weighing platform of the machine, through openings in the levers and bed-plate, and enter the driving-nuts situated below the

portant on cast-iron and plate specimens of wrought-iron or steel.

The weighing apparatus consists of the main levers upon which the platform rests, three in number, and so constructed as to act as a single lever, and supporting the platform upon which rest the columns which carry the upper plate or cross-head. As one end of the specimen is secured in the upper cross-head any stress imparted to the specimen by the lower straining-head will be communicated through the columns and platform to the levers. The stress on the main lever is through an intermediate lever connected to the beam, where the amount is balanced and thus registered. The stresses are in this machine automatically balanced on the

after his calculations or measuring while the specimen is being pulled apart, thus saving much time. The wheel at the end of the screw besides operating the screw also serves as a dial vernier for reading the smaller fraction of the stresses.

The machine is also provided with means by which it graphically records the result of the test. In order to do this the distortion of the specimen under test must not only be observed but transferred to a piece of paper which is mounted on a drum on the beam, in front of which is seen the pencil for marking the diagram. The pencil is moved axially along the drum by the same screw that moves the poise on the beam, and thus this motion indicates the stress on the specimen. The

AUTOMATIC TESTING-MACHINE, MADE BY TINIUS OLSEN & CO.

latter. Feathers fitting into longitudinal slots cut through the threads of the screws prevent them from turning, and they therefore either rise or fall and carry the lower plate with them as the nuts are rotated. These nuts are operated through bevel gearing by outside spur gearing and counter-shaft, which is shown in the lower right of the cut. The counter-shaft is provided with double cone and friction pulleys, admitting of six downward or pulling speeds and two upward speeds.

For tensile tests the ends of the specimen are secured to the plates by steel wedges which enter rectangular openings cut through the centers of the plates. Interposed in the space between the wedges proper and the plate are spherical surface bearings by which the wedges are adjusted to the specimen, and the specimen is adjusted centrally and on a parallel line to the line of greatest stress, and a straight pull secured. This item is especially im-

portant on cast-iron and plate specimens of wrought-iron or steel. The weighing apparatus consists of the main levers upon which the platform rests, three in number, and so constructed as to act as a single lever, and supporting the platform upon which rest the columns which carry the upper plate or cross-head. As one end of the specimen is secured in the upper cross-head any stress imparted to the specimen by the lower straining-head will be communicated through the columns and platform to the levers. The stress on the main lever is through an intermediate lever connected to the beam, where the amount is balanced and thus registered. The stresses are in this machine automatically balanced on the

after his calculations or measuring while the specimen is being pulled apart, thus saving much time. The wheel at the end of the screw besides operating the screw also serves as a dial vernier for reading the smaller fraction of the stresses. The machine is also provided with means by which it graphically records the result of the test. In order to do this the distortion of the specimen under test must not only be observed but transferred to a piece of paper which is mounted on a drum on the beam, in front of which is seen the pencil for marking the diagram. The pencil is moved axially along the drum by the same screw that moves the poise on the beam, and thus this motion indicates the stress on the specimen. The

rotary motion of the drum is reserved to show the distortion of the specimen. On the specimen are secured small heads a certain distance apart, say 6, 8 or 10 inches, the distance in which the distortion, or, in case of tensile tests, the elongation, is to be observed. Between the heads are placed small cylinders partly filled with water, a similar cylinder being placed on the beam in front of the drum. These cylinders are then connected through a collector and reservoir shown at the top of the illustration, and by the help of which the arrangement is controlled and operated. The drum carrying the paper can be connected directly with the cylinder in front of it, and when all is properly adjusted any expansion of the cylinders and their pistons on the specimen caused by its elongation will cause corresponding contraction of cylinder and piston in front of the drum, and this motion is transferred to the drum on which the line is drawn.

This line is drawn on properly-lined paper, so that the results of the test, tensile strength, limit of elasticity and elongation may be observed at a glance.

#### Verbatim Copy of Texas Trust Law.

We have received a copy of the act of the Texas Legislature which was adopted for the purpose of crushing out all trusts and combinations seeking to do business in that State. The act was approved by the Governor on March 30. It reads as follows:

[S. H. Ba. Nos. 9, 117, 136, 192 and 313.] An Act to define trusts, and to provide for penalties and punishment of corporations, persons, firms and associations of persons connected with them, and to promote free competition in the State of Texas.

Section 1. Be it enacted by the Legislature of the State of Texas: That a trust

or transportation at a fixed or graduated figure, or by which they shall in any manner establish or settle the price of any article or commodity or transportation between them or themselves and others to preclude a free and unrestricted competition among themselves or others in the sale or transportation of any such article or commodity, or by which they shall agree to pool, combine, or unite any interest they may have in connection with the sale or transportation of any such article or commodity that its price might in any manner be affected.

Sec. 2. That any corporation holding a charter under the laws of the State of Texas which shall violate any of the provisions of this act shall thereby forfeit its charter and franchise, and its corporate existence shall cease and determine.

Sec. 3. For a violation of any of the provisions of this act by any corporation mentioned herein it shall be the duty of

Sec. 6. Any violation of either or all the provisions of this act shall be and is hereby declared a conspiracy against trade, and any person who may be or may become engaged in any such conspiracy or take part therein, or aid or advise in its commission, or who shall, as principal, manager, director, agent, servant, or employee, or in any other capacity, knowingly carry out any of the stipulations, purposes, prices, rates, or orders thereunder or in pursuance thereof, shall be punished by fine not less than \$50 nor more than \$5000, and by imprisonment in the penitentiary not less than one nor more than ten years, or by either such fine or imprisonment. Each day during a violation of this provision shall constitute a separate offense.

Sec. 7. In any indictment for an offense named in this act it is sufficient to state the purposes or effects of the trust or combination, and that the accused was a member of, acted with or in pursuance of it, without giving its name or description, or how, when, or where it was created.

Sec. 8. In prosecutions under this act it shall be sufficient to prove that a trust or combination as defined herein exists, and that the defendant belonged to it or acted for or in connection with it, without proving all the members belonging to it, or proving or producing any article of agreement or any written instrument on which it may have been based, or that it was evidenced by any written instrument at all. The character of the trust or combination alleged may be established by proof of its general reputation as such.

Sec. 9. Persons out of the State may commit and be liable to indictment and conviction for committing any of the offenses enumerated in this act which do not in their commission necessarily require a personal presence in this State, the object being to reach and to punish all persons offending against its provisions whether within or without the State.

Sec. 10. Each and every person, corporation, or association of persons who shall in any manner violate any of the provisions of this act shall for each and every day that such violation shall be committed or continued forfeit and pay the sum of \$50, which may be recovered in the name of State in any county where the offense is committed or where either of the offenders reside, or in Travis County, and it shall be the duty of the Attorney-General or the District or County Attorney to prosecute for and recover the same.

Sec. 11. That any contract or agreement in violation of the provisions of this act shall be absolutely void and not enforceable either in law or equity.

Sec. 12. That the provisions hereof shall be held cumulative of each other and of all other laws in any way affecting them now in force in this State.

Sec. 13. The provisions of this act shall not apply to agricultural products or livestock while in the hands of the producer or raiser.

Sec. 14. Whereas the people of this State are without a remedy against trusts, therefore an emergency and imperative public necessity exists requiring that the constitutional rule which requires that all bills shall be read on three several days be suspended, and that this act take effect from and after its passage, and it is so enacted.

VERTICAL SECTION THROUGH AUTOMATIC TESTING-MACHINE.

is a combination of capital, skill, or acts by two or more persons, firms, corporations, or association of persons, or of either two or more of them for either, any, or all of the following purposes: First—To create or carry out restrictions in trade. Second—To limit or reduce the production, or increase or reduce the price of merchandise or commodities. Third—To prevent competition in manufacture, making, transportation, sale, or purchase of merchandise, produce, or commodities. Fourth—To fix at any standard or figure, whereby its price to the public shall be in any manner controlled or established, any article or commodity of merchandise, produce, or commerce intended for sale, use, or consumption in this State. Fifth—To make or enter into, or execute or carry out any contract, obligation, or agreement of any kind or description by which they shall bind or have bound themselves not to sell, dispose of, or transport any article or commodity, or article of trade, use, merchandise, commerce, or consumption below a common standard figure, or by which they shall agree in any manner to keep the price of such article, commodity,

the Attorney-General or District or County Attorney, or either of them, upon his own motion, and without leave or order of any court or judge, to institute suit or *quo warranto* proceedings in Travis County, at Austin, or at the county seat of any county in the State, where such corporation exists, does business, or may have a domicile, for the forfeiture of its charter rights and franchise, and the dissolution of its corporate existence.

Sec. 4. Every foreign corporation violating any of the provisions of this act is hereby denied the right and prohibited from doing any business within this State, and it shall be the duty of the Attorney-General to enforce this provision by injunction or other proper proceedings in the District Court of Travis County, in the name of the State of Texas.

Sec. 5. That the provision of Chapter 48, General Laws of this State, approved July 9, 1879, to prescribe the remedy and regulate the proceedings *quo warranto*, &c., shall, except in so far as they may conflict herewith, govern and control the proceedings when instituted to forfeit any charter under this act.

The new buildings for the New York Central Railroad, to replace those recently destroyed in the \$1,000,000 fire at the foot of Sixtieth street, in this city, will have many valuable improvements. An elevator of 1,500,000 bushels capacity that will cost \$400,000 will be built upon the old timber foundations. Piers B and D will be rebuilt, each with a two-story iron shed. A large storage warehouse, 200 feet square, will also be erected. The improvements will cost nearly \$1,000,000.

## THE AMERICAN ENGINEERS IN ENGLAND.

(Editorial Correspondence.)

After a delightful run from Queenstown to the Mersey the good ship City of Richmond reached Liverpool. With the tender came the Reception Committee of the Liverpool Engineering Society and representatives of the Council of the City. Their first graceful act of hospitality, after a brief address of welcome had been pronounced and responded to, was to present magnificent bouquets to the two leading ladies of the party. Embarking on the tender, three vigorous cheers were given to Capt. E. Barff, of the City of Richmond, a proceeding which Liverpool people pronounced unprecedented, but which it was subsequently learned was highly appreciated as a spontaneous and cordial acknowledgment of the efforts made to render the trip across the Atlantic comfortable. After the customary search for spirits and cigars at the customs, a glaringly perfunctory proceeding so far as the ladies' "luggage" was concerned, the rest of the day was spent in wondering why the floor was so solid, while the night was, according to the confession of the majority, largely employed in watching the antics of the four bed-posts and enjoying the luxury of freedom of movement. On the whole, the process of getting off one's sea-legs was less distressing than getting on them.

The engineers had arrived a day earlier than expected. English hospitality was, however, equal to the occasion, so that for Wednesday afternoon (the 5th) two impromptu excursions were planned. The morning was filled by your correspondent by a call on the Mayor, in company with Henry R. Towne. Special permission was granted to inspect the magnificent Town Hall and to attend a meeting of the Town Council. It happened that bills of the Finance Committee were up for debate. One young Radical made it a point to attack those of his fellow-councilors who had gone on little junketing trips to London, especially during Derby Day, and had pocketed allowances of 5 guineas a day each for the services thus rendered. Human nature appears to be very much the same in swaying the hayseed legislator or the English town councilor. Your correspondent was particularly interested in listening to the famous "hear, hear" (pronounced he-ah, he-ah) with which English parliamentary speeches are so liberally sprinkled as evidences of approval.

In the afternoon the majority of the party split up into two bodies, one being carried off to see the Liverpool end of the Manchester ship canal works, while the other, in which were included most of the ladies, proceeded to Knowsley, the seat of the Earl of Derby.

During the course of the day invitations to visit points in the vicinity of Liverpool began to pour in upon the committee. They were pressed with such hospitable persistency that their acceptance became a duty. The embarrassments of those who represented the organization of the guests were increased very seriously through the fact that the City of New York, among whose passengers were about 100 engineers and their ladies, had not yet been telegraphed. It was impossible under the circumstances to supply our hosts with any definite information concerning the number for whom they were to make preparations. Rival attractions, too, appeared to have an unsettling effect upon the minds of the engineers themselves, so that it was apparently impossible to state at any given moment who

and how many would accept invitations to any one point of interest. That this confusion should have failed to lead to any discomfort to the visiting engineers is entirely due to the Herculean efforts of the Liverpool local committee, whose chairman was Alfred Holt, the treasurer being George Heaton Dalish, and the secretary Henry R. West. Their efforts were seconded by C. H. Darbishire, president, and J. J. Potts, vice-president of the Liverpool Engineering Society. It is the pleasant privilege of a journalist to express in behalf of his associates, in a manner less formal than can be done in resolutions, a thorough appreciation of the overwhelming hospitality shown under circumstances peculiarly calculated to increase its burdens. It is often said that a characteristic of Americans is their constant habit of comparing their own aims and their own work with that of others, with the ultimate object of excelling. If such an idea lingered in the minds of many, with reference to the reception of the Iron and Steel Institute, and, it is hoped, other kindred societies in America in the fall of 1890, its realization must now appear far remote.

On Thursday, June 6, two alternate excursions were offered to the visitors, the first being over

### THE MERSEY DOCKS AND HARBOR ESTATE.

The party was driven from the hotels to the Hercules Dock, whose main feature is the range of 60 "casements," tunneled into the rock for warehousing petroleum in barrels. The front wall is Portland cement concrete; and it and the doors are so arranged that in case of fire they could contain in bulk all the oil in that particular department. The aggregate storage capacity is 60,000 barrels. Passing along the Harrington Dock, adjoining, the party reached the Toxteth Dock and then went by special omnibus to the Coburg Dock Pumping Station. The group of docks surrounding the pumping station, of about 50 acres in extent, was built many years since and therefore has not the depth of water required for modern vessels. As it cannot be obtained by structural alterations, the Coburg Pumping Station has been provided to raise the water in the docks to a minimum depth of 22 feet during all variations of high-water level. The pumping plant includes three Gwynne centrifugal pumps, whose fans are 7.5 feet in diameter with 54-inch suction and delivery pipes capable of discharging in the aggregate 800 tons of water per minute. They are driven by inverted compound condensing engines of 1500 indicated horse-power. At low neap-tides access is gained to the docks by way of the modern deep-water docks to the southward, locks being provided in the Union Dock. Thence the party proceeded to the Waterloo Dock grain warehouses, built about 20 years since after the ordinary system of "floor" warehouses, as it was necessary that they should be available either for grain or for ordinary goods. The aggregate area of the floors is about 12 acres, and they have an aggregate storage capacity of about 57,000 tons of grain. Five buckets, each capable of elevating 60 tons per hour, are situated in towers disposed around the dock. They elevate the grain to the top of the warehouse from receiving hoppers placed below the quay level. The grain is passed through hoppers to the weighing-machines, whence it falls into distributing hoppers. From there it is received on endless traveling belts which convey it to any part of the upper floor. From this floor the grain is delivered through shutters to any part of the building. Screening machinery and hydraulic lifts are also provided. All this machinery is worked by hydraulic power with an accumulator pressure of 700 pounds per square inch.

The party then proceeded to the Sandon Graving Docks, where pumps have been at work for some years for increasing the depth of water within the dock and over the graving dock sills on low neap-tides, so as to render the latter available at such times for vessels of deeper draft than would otherwise be possible. The pumping plant consists of five Gwynne invincible centrifugal pumps. Four of them have fans 60 inches in diameter and 36-inch suction-pipes. They are driven direct by four independent high-pressure engines. On trial it was found that the maximum combined discharge of the pumps was 513 tons per minute.

The Alexandra Dock and Langton Graving Docks, next visited, were completed in recent years specially for the accommodation of the large steamers employed in the Atlantic trade. The arrangement provides for an exceptionally large amount of quay and shed space in proportion to the total area of ground occupied. The graving docks are divided by gates in the center, so that in the event of one vessel requiring dry-dock accommodation for a long time it does not interfere with the use of the lower portion of the dock.

The visitors were then conducted to the steamer Lancashire, and while crossing the river were entertained on board at luncheon at the invitation of the Liverpool Reception Committee. The Birkenhead Docks were then entered and inspected. Afterward the party steamed up the river and returned to Liverpool. A neat compliment, highly appreciated by the visitors, was the dressing of all the ships in the harbor along the route, a courtesy which your correspondent was informed by friends is very unusual.

The second party started at the same time for

LAIRD BROS.' BIRKENHEAD IRON-WORKS, at Birkenhead, opposite Liverpool. The firm is an old one, having been founded in 1824 by William Laird, and since its establishment has built, including those now in hand, 576 vessels, having an aggregate tonnage of over 350,000 tons and an aggregate indicated horse-power of 304,000, a large proportion of the work having been done for the British Government. Special attention has been given to the design and construction of steamers for river navigation, some of which have been pioneers in opening up rivers which are now important channels of commerce. Among them was the John Randolph, which, it is claimed, was the first iron steamer ever seen on American waters.

Passing through the model-room the party entered the old armor-plate shop, at present used for general work, and reached the frame-bending shop and furnace building. Near them were the slips for building two very fast torpedo gun-boats of an improved Rattlesnake type. Their dimensions are 230 x 27.5 x 14.75 feet. They have 4500 horse-power engines, and are designed for a speed of 21 knots per hour. Here, also, the Gazelle, for the Great Western Railway Company, was building. Next followed No. 5 Graving Dock, where the Argentine battle-ship Almirante Brown was being prepared for overhaul and refitting. Next was No. 4 Graving Dock, in which two twin-screw steamers, Lynx and Antelope, were being completed. They are for the Great Western Railway Company. Each is 285 feet long, 27.5 feet beam and draws 13 feet 2 inches. Their engines are 1600 horse-power, and their speed is estimated at 16 knots. In the engine-shops the machinery for the Antelope and Gazelle and the 3300 horse-power engines for the Russia were in course of construction. Near No. 4 Graving Dock is a 50-ton crane for masting and boiling vessels, and near it the Russia, a 373-foot steamer for the Hamburg and American Steam Packet Com-

pany, was building. No. 3 Graving Dock, in which the man-of-war Agincourt and other large vessels were built, is permanently covered over, having overhead power-driven traveling cranes, which traverse in two directions. After seeing the smith's shop, Nos. 1 and 2 Graving Docks, sawmills, joiners' shops and mold lofts, the party was driven to the new boiler-works of the firm, which were completed in September last. They have already turned out boilers of about 30,000 horse-power, many of them of an exceptional size, two of the largest having weighed about 95 tons each. The ground covered by buildings is nearly 6000 square yards, the factory consisting of four principal spans parallel to one another. The largest of these is reserved for the erecting work, being 286 feet long, 58 feet wide and 58 feet high. An annex is the shop for receiving and preparing the material ready for erecting. Another annex is devoted to lighter work, and a third is used as the smith-shop. At the quay adjoining the boiler-works the Hamburg and American Steam Packet Company's steamer Columbia is now nearing completion. Her dimensions are 463 x 56 x 36.8. She is propelled by twin screws, with triple-expansion engines of 12,500 indicated horse-power, supplied with steam at 150 pounds pressure from nine cylindrical boilers.

From the Columbia the party was driven through Claughton and the Birkenhead Park to the Town Hall, where they were received by the Mayor and were shown through the building. They then proceeded to the residence of William Laird, where they were hospitably entertained, and after luncheon and speech-making were photographed in a group. The next visit on the programme was to

#### THE MERSEY TUNNEL RAILWAY,

which connects Liverpool with Birkenhead and the Wirral Peninsula of Cheshire, the width of the Mersey at that point being 1320 yards. The road is constructed almost entirely in tunnel, of double-line width, and is lined throughout with brick in cement. Under the river the tunnel is in sand-stone rock, with an average cover of 30 to 35 feet, the lowest rail-level being 145 feet below mean-level water mark. The gradients are therefore somewhat severe for English practice, being on the Liverpool side 1 in 27. The drainage of the tunnel is dealt with by two pumping-shafts, one on each side of the Mersey, the water draining to the shafts through drainage headings beneath the tunnel. On each side of the river there are three pumping-engines of 200 horse-power, of the compound walking-beam and compound horizontal type. The steam-cylinders are 36 and 55 inches in diameter, the pump-rams being 40 inches in diameter by 15-foot stroke. The tunnel is ventilated by four 40-foot Guibal fans 12 feet wide, driven by 120-horse-power compound condensing engines running at 45 revolutions. They exhaust about 200,000 cubic feet of air per minute from a gallery 7 feet 2 inches in diameter, running parallel with the tunnel, into which there are frequent openings, with sliding doors, so that the exhausting action of the fans can be distributed or concentrated at pleasure. On each side of the Mersey are hydraulic lifts, or elevators, for raising passengers from the under-ground station platforms to the street level 100 feet above. The elevator rams are 18-inch steel tubes in 12-foot lengths, secured together. The pressure is 90 to 100 pounds per square inch, being supplied from tanks placed in lofty water-towers, which form striking architectural features of the river-side stations. These tanks are kept full by small pumping-engines. The cars accommodate 100 passengers at a time.

In the evening the American engineers

were entertained in a sumptuous manner at a reception in the beautiful Town Hall by E. H. Cookson, Mayor of Liverpool, a very large number of the leading citizens being invited to meet them. The affair was exceedingly brilliant, the series of wonderful reception-rooms of the Town Hall being thronged.

#### TOUR THROUGH NORTH WALES.

One of the parties started on the 7th, under the auspices of the London and Northwestern Railway, on a tour through North Wales, visiting first the ancient city of Chester, famous for its Roman wall, castle, cathedral and rows, and driving to Eaton Hall, the seat of the Duke of Westminster, reaching Llandudno, the greatest of Welsh watering-places, in the evening. Favored by glorious weather, a drive was taken around the Great Orme's Head in the morning. In the afternoon a visit was paid to Conway Castle, built in 1284 by Edward I; Bettwys-y-Coed, a charming spot, being reached in the evening. There Sunday was spent quietly. Monday again found the party on its travels, Blaenau-Ffestiniog, with its great slate quarries and its quaint railway, being visited in the morning. From Port Madoc coaches conveyed the engineers through Tremadoc, Aberglaslyn, Beddgelert and through the pass to Llanberis. Tuesday morning, June 11, was spent in a visit to the Llanberis lake and fall and the ruins of Dolbadarn Castle, a short run by rail then taking the tourists first to Carnarvon, with its ruins, and to Menai Bridge. Wednesday morning was given over to a drive to Anglesea to visit the Suspension Bridge and Stephenson's famous Britannia Tubular Bridge. In the afternoon the party left for Bangor, passing through Llanfairfechan, Penmaenmawr, Conway and Colwyn Bay. Crewe is to be reached in the evening, and at 10 o'clock at night the party expects to roll into Euston Station, in the great metropolis.

A second party started from Liverpool to Crewe on Friday morning (7th) to visit THE CREWE SHOPS OF THE LONDON AND NORTHWESTERN RAILWAY,

where they were received by F. W. Webb, the well-known mechanical engineer, who has during the past few years done so much to develop the compound locomotive. The party were received at the offices of the company by a band playing national airs, while one of the latest of Mr. Webb's engines moved along the track before the assembled engineers. Side-tracked near by was a long array of the different types of engines built at the Crewe shops. Our hosts at once conducted the visitors into the great drawing-office, where an elaborate lunch was provided. Speeches followed, J. P. Bickersteth, vice-chairman of the London and Northwestern Railway Company, being in the chair. In responding to a toast by W. H. Wiley, Mr. Webb gave some data relating to the company of whose service he is so distinguished a member. The railroad has a capital of \$528,000,000, its annual gross revenue being \$51,500,000 and its annual expenditure \$26,500,000. It operates 2500 miles of road and carries 57,000,000 passengers, whose tickets call for the consumption of 50 tons of paper. Its tonnage of freight is 36,000,000 tons annually, the engine mileage last year having been 55,525,384. Last month, with a mileage of 4,750,000, only one engine in the passenger service was slightly out of order, so that Mr. Webb undertook to say that he could, barring accidents due to the permanent way, go twice around the world with one of his engines without making the slightest repairs. During the last year, besides the ordinary service, the road ran 41,314 special passenger trains, 47,223 special freight trains and 78,285 special cattle and mineral trains. The company own 53,000

freight-cars, 5600 passenger-cars, 2500 engines and 20 steamships. The Crewe locomotive works are a part of the manufacturing establishment of the railroad company. They occupy 116 acres of ground, the covered area being 36 acres. The plant consists of four 5-ton Bessemer converters, in groups of two, placed opposite one another on either side of the deep pit. Following it, in the same line are the open-hearth furnaces, one of them, a 20-ton furnace, being just completed. The rail department contains a rather old-fashioned three-high rail-train, driven by a fine horizontal engine with Corliss gear. The route then lay through the points and crossing department into the boiler-shop, where, among other matters of interest, the new Webb corrugated boiler was inspected. To the majority of the engineers the most interesting sight was the flanging-presses, one being a 75-ton press for flanging boiler-fronts, and the second, over 200-ton, for punching out and simultaneously flanging the fire-door. The works have a very large plate mill, and they also roll angles and shapes. They are fitted with 8-ton, 30-ton and 10-ton hammers, and have a tire mill, steel foundry and iron forge. Thence the visitors went to the signal-shop and paint-shop, after which they returned to the train and were conveyed to the millwright's, joiner's shops, the sawmills and through the smithy into the locomotive-erecting, wheel and fitting shops. In the meantime the ladies had been entertained at tea at the fine residence of Mr. Webb.

The majority started by special train to Manchester, where they were joined by another body, who in the interval had paid a visit to the

#### HORWICH SHOPS OF THE LANCASHIRE AND YORKSHIRE RAILWAY.

These works are of particular interest, since they embody the latest practice in English engineering work. Starting with a clean sheet of paper, the entire disposition of the plant could be made with special reference to requirements, building having begun in 1886. They were erected for the purpose of repairing and renewing the whole of the locomotive stock and carrying out the mechanical engineering work of the Lancashire and Yorkshire Railway Company. The land inclosed includes 85 acres, located between the Chorley New Road and Horwich and Red Moss, the covered area of the work-shops being 13½ acres. The first point of interest aside from the offices, laboratory, test-room (with a 100-ton machine) and general stores is the boiler-shop, 364 x 111 feet. It is fitted with a pair of hydraulic pumps and accumulator, two large fixed hydraulic riveters for boiler work, each having a hydraulic overhead crane for lifting boilers when riveting, three portable hydraulic riveters on swing cranes bolted to walls and columns and three overhead traveling cranes.

The smith's shop is provided with 12 double and 31 single hearths, a reheating furnace, bolt and nut making plant, hammers, &c. The forge, 362 x 111 feet, has a 14-inch merchant mill and an 8½-inch guide mill, with Siemens regenerative furnaces for reheating. The steel-works are equipped with two open-hearth furnaces, having a high level tramway for carrying the ladle and a narrow-gauge track, which connects with the forge and rolling-mill, for the mold trollers. The whole of the furnaces in the steel-works and the rolling-mill are heated by gas, made from a series of Wilson gas-producers. Then follows the foundry, 212 x 111, equipped with two cupolas, supplied with blast by a Root blower. Hydraulic power is used for working the cranes, in addition to which there are two overhead rope power traveling cranes. A second foundry, 62 x 128, with two cupo-

las, is used for casting the chairs used for the permanent way. A staging is provided for "fettling" the chairs, which are then placed on an endless chain, which conveys them to the railway cars for shipment. Special large shops are provided also for a brass foundry, tinsmith's and copper-smith's shop, for testing, repairing and renewing the electrical instruments used, for wood-working, and for the manufacture of signals, springs, points and crossings. The fitting-shop, 400 x 111 feet, is provided with a large number of special tools for dealing with locomotive work, including a large milling tool for cutting out crank-axle webs, crank-axle lathes, milling, planing and slotting machines. These are driven by two wall engines, placed at the end of the shop, giving motion by means of bevel gearing to four ranges of shafting, running longitudinally, and to four 5-ton high-speed rope-jib traveling cranes, which control the principal heavy machines. By far the showiest of the buildings is, however, the erecting-shop, which is not less than 1520 x 118 feet. It has been arranged for the repairs of existing and the building of new engines and tenders. It is supplied with 20 30-ton overhead power-cranes, driven by wall engines. Their handling great engines in so large a building was an impressive sight. A chain shop, 110 x 27, and a chain smithy, 64 x 28 feet, are provided with a large hydraulic testing-machine for testing all chains before they are sent out for use. The company have their own gas-works, and have built for the convenience of their employees a dining-room, to accommodate 1000 men, and a *café* and reading-rooms.

The party was hospitably entertained at luncheon by the company, its chief engineer, J. A. F. Aspinall, acting as host. A series of speeches followed the usual toasts to the Queen, the royal family and the President of the United States, which apparently are a feature of all such gatherings. The party was then conveyed by special train to Manchester.

Reaching Manchester in the afternoon, the party visited Owens College, the Lancashire and Yorkshire Company's car-works, at Newton Heath, the Salford Corporation sewage works, and a number of other establishments thrown open to them. In the evening they were joined by the party from Crewe, and after a reception by the Mayor of Manchester sat down to a most elaborate banquet as the guests of the Manchester Engineers' Reception Committee, of which William Bradford was the president and Thomas Ashway the secretary. Leaving Manchester, after having spent the morning visiting the Manchester Ship Canal Works and a number of engineering and manufacturing establishments, the members of this division rode to Chester, where Sunday was spent. Monday brought them to Rugby, Leamington and Warwick, whose famous castle they visited. Tuesday morning they reached Stratford-on-Avon, and driving thence to Kenilworth a visit was paid to the castle, Oxford being reached in the evening. Wednesday was to be spent visiting the colleges, London being reached in the evening.

#### FUTURE MOVEMENTS OF THE ENGINEERS.

The tours through some of the most picturesque parts of England were arranged in order to pass the Whitsuntide holidays. To judge from the programme settled upon by the London engineers, the serious business of sight-seeing is then to begin. On Thursday, June 13, there will be a special choral service at Westminster Abbey, followed by an address by the Dean, Dr. Bradley, on the sacred and historical associations of the Abbey. At noon the Houses of Parliament are to be visited. In the afternoon there is to be a formal reception at the Institution of

Civil Engineers, followed later by the presentation of an address by the president, Sir John Coode, K.C.M.G. In the evening there will be a dinner at Guild Hall "by the express sanction of the Lord Mayor, Aldermen and Court of Common Council of the City of London."

Friday two parties are arranged to go down the Thames to visit docks, drainage and sewerage works, ship-building and torpedo yards, the afternoon being given to a visit to Lambeth Palace and the Doulton Potteries and art studios.

Saturday one party goes to Windsor to be entertained at the Albert Memorial Hall, to be followed by a drive through Windsor Great Park to Virginia Water. Another group is given an opportunity to attend a performance of the "Midsummer Night's Dream" at Copped Hall, Totteridge. In the evening a reception will be given by Lord Brassey. Monday St. James' Palace, Buckingham Palace and the Royal Mews will be visited, the evening being reserved for a garden party at Holly Lodge, Highgate, by the invitation of the Baroness Burdett-Coutts and Mr. Burdett-Coutts, M.P.

Tuesday, June 18 and 19, and Wednesday are given over to visits to works, to Hampton Court Palace and the Royal Botanic Society's Flower Show in the Regent's Park. Thursday a special train and boat will take the engineers to Paris.

The German engineers have evidently been seized by the same eager desire to entertain their American brethren. At a meeting of the Verein Deutscher Eisenhüttenleute and other organizations at Dusseldorf it was resolved to extend a cordial invitation to them. Herr Schroeder, the secretary of the society, traveled specially to Liverpool as its bearer, and it is possible that at least a small number of American engineers will avail themselves of an exceptional opportunity to visit the centers of industry of Westphalia and the Rhine provinces. It is now intimated that the iron masters of Lorraine are organizing to capture some of the Americans as their guests.

#### Open-Hearth Furnace with Detached Melting-Chamber.

The accompanying illustrations, furnished by L. G. Laureau, of Philadelphia, show a modification of the Siemens furnace, embodying features which, after a trial of several years' duration, have proved

Fig. 1.

worthy of consideration. The furnace belongs to the type, now rapidly becoming common, where the melting-chamber is completely detached from the regenerators and the gas and air ducts. The melting-chamber is oval instead of round (as in some furnaces of the same type), so as to give a greater travel to the flame from port to port, thus allowing it to spend its energy in the furnace itself and

reducing its cutting action on the outgoing ports. The gas and air ports are made to open into the melting-chamber, side by side. This arrangement causes the flame to spread well across the entire furnace from front to back, melting as fast at the doors as in the center. It

Fig. 2.

allows a long line of contact between the air and gas and furthermore makes the ports easily accessible for repairs. The cover bricks to the horizontal gas and air ducts outside of the furnace can be readily removed and the ports can be repaired rapidly from the outside without cooling

Fig. 3.

the entire furnace and regenerators. The roof is held in a wrought-iron band and rests upon the melting-chamber walls without being bound into them. It is made high so as to allow free play for the radiating effects of the flames. In furnaces of not over 12 tons capacity five ports (two large air and three small gas) have proved ample and efficient. In furnaces of 15 tons capacity and over seven ports should be used.

The three cuts illustrate how this type of furnace can be modified according to circumstances. Fig. 1 shows the normal furnace; Fig. 2 a furnace suited to a location where water is found close to the general level; while Fig. 3 shows the same furnace where space lengthwise of the structure is limited. The same arrangement of parts has been used in heating furnaces with marked success.

The area of the Territories of North and South Dakota, Montana and Washington is equal to the combined area of the German Empire, Great Britain and Ireland, the Netherlands and Switzerland, the former being 361,588 square miles and the latter 361,500 square miles. The European area contains a population of over 90,000,000; the American area has a present population of less than 1,000,000.

## THE WEEK.

An 8-inch pipe line from the Ohio oil fields to Detroit will be completed by September 1.

The Interstate Commerce Commission have issued a new and revised edition of the rules of practice before that body, adding several new ones that have been found necessary by experience, and containing also concise and complete forms for complaints and other proceedings before the commission. Care has been taken to make these rules as simple as possible, to enable business men, if they desire, to prepare their papers themselves. The commission desire to have the rules distributed, and copies may be procured without charge upon application to the secretary.

New York City is able to boast of having within its boundaries 294 individuals or firms each good for \$1,000,000 or upward.

An eight-story brick building, fire-proof throughout, is soon to be erected for the New Jersey Central Railroad Company on the corner of Liberty and West streets. The ground dimensions will be 200 feet on Liberty street and 100 feet each on West and Washington streets. The intention is to lease a considerable portion of the building to firms in the coal trade. The architects are Peabody & Stearns and the cost of the structure will not be less than \$500,000. The building will be finished May 1, 1890.

The Castle Garden Emigration Commissioners urge upon Secretary Windom the necessity of making their position a Federal office.

A maritime exhibition of a novel character is to be given in Madison Square Garden this coming fall, under the direction of C. S. Hill, secretary of the American Shipping and Industrial League. It is proposed to bring together samples of the products of 200 distinct industries which are either directly or remotely connected with the shipping interests of the country, and to contrast American machinery, models of vessels and appliances of various kinds with those of foreign origin. Machinery Hall will be devoted to machinery in motion. The peculiar feature will be a canal 25 feet wide and one-eighth of a mile long, to be navigated by steam launches and craft of various descriptions, and a central stage will serve as an arena for naval maneuvers.

The Minneapolis industrial exhibition opens August 21 for one month.

Two lads of a mechanical turn of mind were experimenting in Philadelphia on Saturday with an old kitchen boiler, pieces of gas-pipe and a miniature steam-engine almost 18 inches in length, which they proposed to connect with an ice-cream freezer. From some cause unknown the boiler burst, killing them both.

Howard, who was so successful in buying machinery for the bogus electric sugar process, was rewarded for his enterprise with a sentence of nearly nine years in the New York State prison.

The new city of Guthrie, in Oklahoma, was struck by a cyclone on the 20th inst., and scores of houses, of which there are several hundred in course of erection, were thrown down.

The manual-training school of St. Louis, which has a membership roll numbering 241, had its annual exhibition last week, and 40 graduates received their diplomas. The class forging iron and steel, 24 in number, attracted much general interest. Professor Woodward stated that the applications for membership were far in excess of the present capacity of the school, and he predicted that ten years hence would witness a greater number of manual-training schools in this country than was dreamed of in the philosophy of those who were to-day encouraging the belief that the idea and theory of such institutions were not in keeping with successful mental strength and development.

The new Hamburg line of steamships to Philadelphia will receive no outward cargo from that port, but load in Baltimore for the homeward trip. Philadelphia merchants protest against the so-called "boycott," but without success. The steamship and railroad companies are too closely allied.

Under the new law of Pennsylvania, already in force, children under 12 years of age cannot be employed in manufacturing establishments, and over that age and under 16 their employment is limited to six hours a day.

Montreal papers complain that Canada is "knocked out" of the export business in wheat and corn by the competition of American ports.

The Jay Gould stockholders still control the Pacific Mail Steamship Company.

The announcement is made that the last spike has been driven in the Georgia Pacific Railway. This is a leased line of the Richmond and Danville, and has been extended to a connection with the Missouri Pacific and the Mississippi River, in furtherance of the plan agreed upon when George Gould was made a director in the Richmond Terminal Company, who own the Richmond and Danville. This makes another through trunk line by which the traffic from the Southwest can be carried to the Atlantic sea-board.

A Shanghai dispatch says Li Hung Chang has accepted the control of railways in the north of China, and that tenders will soon be invited for the construction of a railway from Peking to Hankow, indicating the final triumph in that country of the progressive element as against the ultra-conservative.

The new Brooklyn city directory contains 195,220 names, a gain of 6254 over last year. The entire population is estimated at 880,000 to 900,000.

The Third Avenue Railroad Company, New York, having obtained authority from the Legislature to substitute cable-power for horses, and two-thirds of the property owners on the route having already given their consent, it is probable that the final step preparatory to making the change will be taken by asking the sanction of the Railroad Commission.

The New York Commissioner of Public Works, Mr. Gilroy, has recommended to the Board of Estimate and Apportionment the kind of pavement that should be laid down in the principal streets in this city, in accordance with the purposes of a special act of the Legislature authorizing the expenditure of \$3,000,000 during the next three years for street improvement. "From the experience of the past 15 years with pavements laid during that time," the Commissioner says, "it is found that the most suitable and durable pavement for the streets of the first class, the great avenues of trade and commerce, is a pavement of granite blocks, according to specifications now in use, with tarred joints and concrete foundation. No other pavement is known which will present equal resistance to the heavy wagon traffic in those streets and at the same time retain an even surface and give equally good foot-hold to horses. The tarring of the joints is useful in preventing the percolation of water through the pavement into the soil, which frequently causes settlement of the soil under the pavement

and corresponding depressions on the surface. For streets of the second class the stone blocks may be laid on the ordinary sand foundation or bed. In the purely residential streets a good asphalt pavement, laid on substantial foundation, is the more suitable. It should not be laid, however, where the grade is steep, because in such cases it would not afford a safe foot-hold to horses."

The opening of the Tennessee River to Chattanooga next September, into the heart of the mineral region in the South, will have an important effect on transportation rates throughout that section of country. Steamboats will be able to reach Chattanooga from New Orleans, Pittsburgh or the head of navigation on the Mississippi. A prominent railway-traffic manager says that boats at Chattanooga, otherwise returning empty, can carry pig-iron at a very low rate; they can carry it with profit to St. Louis for \$1.25 a ton, whereas the present rate is \$2.25 per ton to Cincinnati and \$3 to St. Louis. The opening of the Tennessee River, it is affirmed, will give the pig-iron producers on or near it an increased profit of \$1.75 per ton and enable them to compete with Pennsylvania pig to even better advantage in the Western markets.

The foundation walls are being laid in Duluth of the Chamber of Commerce building, to cost \$250,000.

The Wood-Acid Trust organized in Binghamton, N. Y., last April are complacent in the fact that the price of crude wood alcohol has advanced from 47 to 57 cents a gallon, or over 20 per cent., and there is a liberal advance also in the prices of the accompanying products of the factories—acetate of lime and naphtha. Wood alcohol offers itself as a cheap substitute for grain and fruit alcohols in mechanics, manufactures and the arts, and it is upon these branches of industry that the burden of the heavy increase of prices chiefly falls.

The old copper mine near Bristol, Conn., has been opened and is being worked by a large force of men with improved machinery and implements for mining. The managers of the new company are confident of fair returns.

The ten thousandth locomotive built at the Baldwin Locomotive Works, Philadelphia, was shipped from that establishment last week to the Northern Pacific Railroad for service on the mountain division of that road. This engine is remarkable, not only in bearing so high a consecutive number among engines turned out from a single establishment, but in marking a distinct advance in the progress of locomotive construction, which, among other causes, has made the cost of rail transportation in the United States less than in any other country in the world. It has a weight one-fourth greater than the largest freight locomotives of the Pennsylvania Railroad, and can haul, it is said, on a grade of 116 feet per mile, combined with reversed curves of 10°, a train weighing 535 tons, of 2240 pounds, of cars and load, or 20 loaded cars. On easier grades, of say 52½ feet per mile, or 1 foot per 100, its power is estimated at 1000 tons, exclusive of its own weight. Its actual weight in working order, exclusive of tender, is 150,000 pounds; cylinders, 22 x 27 inches; driving-wheels, four pair coupled, 50 inches. The Baldwin Locomotive Works were established in 1833, and 28 years, or until 1861, were required for the completion of the first thousand locomotives. But nine years, or until 1870, were required for the second thousand. The third thousand was completed in 1872, the fourth in 1876 during the Centennial, and the fifth in 1880. Five thousand more were constructed during the nine years since.

## MANUFACTURING.

### Iron and Steel.

The two new furnaces, &c., of the Nashville Iron, Steel and Charcoal Company, at West Nashville, Tenn., are to be sold on July 2. The sale is made necessary from lack of capital, the original subscribers failing to pay subscriptions to stock.

The laboratory at the Homestead Steel Works of Carnegie, Phipps & Co., Limited, at Homestead, Pa., was destroyed by fire last week, causing a loss of about \$2000.

We are advised that the report that the Emma Furnace, of the Union Rolling Mill Company, of Cleveland, Ohio, had been sold to the Cleveland Rolling Mill Company is without foundation. The furnace named was blown in recently and is producing about 140 tons of Bessemer pig-iron per day.

One of the Himrod furnaces of the Brier Hill Iron and Coal Company, at Youngstown, Ohio, is out of blast at present, undergoing repairs.

Notice has been posted by the Glasgow Iron Company, of Pottstown, Pa., of an advance of puddlers' wages from \$3 to \$3.25 per ton. This will go into effect on and after the 1st of July, and will affect all the men in the puddling department of the iron-works.

The Pennsylvania Construction Company, of Pittsburgh, have been awarded the contract for the iron roof for the post-office building, now in course of erection in that city. The contract price for the work is \$50,740.

A number of the molders in the employ of the Pittsburgh Steel Casting Company, at Pittsburgh, went out on a strike last week on account of a disagreement in regard to wages. The trouble was afterward settled and the works are now in full operation.

At Pittsburgh last week Frank S. Layng filed a bill in equity against the A. French Spring Company, Limited. The capital stock of the company is \$500,000, of which Mr. Layng claims that he owns \$31,250. He states that in 1888 Aaron French, chairman of the spring company, without the knowledge or consent of the plaintiff or the Board of Managers of the company, purchased stock of the Bolton Steel Company, of Canton, Ohio, to the amount of \$87,500, a controlling interest. In payment, Mr. French gave three notes for \$25,000 each and the balance in cash. The purchase was professed to have been made on behalf of the spring company and was charged up to them. The Board of Managers afterward ratified the purchase. As a result, the regular dividends of the spring company have been suspended. Mr. Layng desires the court to enjoin the payment of the three notes out of the partnership funds, and that the Board of Managers be required to indemnify the company for any loss by reason of the purchase; also that the court decree that the purchase of the Bolton Steel Company's stock was not within the scope of the business of the partnership, and the purchasers be declared to have made the purchase on their own account.

The National Tube Works Company, of McKeesport, Pa., have recently purchased a large hotel building at that place, and will convert it into an immense sample-room for displaying all sizes and grades of pipe.

The rolling-mill of the Wheatland Iron Company, at Wheatland, Mercer County, Pa., which has been idle for some years, has been put in operation under the management of Henry Friend, of Pittsburgh. John Tomlins, formerly with Cartwright,

McCurdy & Co., of Youngstown, will have charge of the rolls. They will roll iron for 6-inch pipe, 32 inches wide and  $\frac{1}{4}$  inch thick.

Ella Furnace, at West Middlesex, Pa., operated under lease by the Wheeler Furnace Company, of Sharon, Pa., is out of blast at present, undergoing repairs. As soon as these are completed it will be put in operation again, as the firm have some large orders on hand for pig-iron.

From the Norristown, Pa., *Register* of the 19th inst. we take the following: "The work of rebuilding the McHose Furnace began this morning. The *débris* caused by the furnace being chilled some time ago has been cleaned out. The work of rebuilding was delayed a few days pending the arrival of a large iron cylinder which will encircle the bottom of the furnace, the idea being to render it less liable to chill. The device is a new feature to furnaces in this part of the State."

Two of the blast-furnaces of the Cambria Iron Works, at Johnstown, Pa., are in blast, and the other furnaces, the Bessemer Steel Works and the mill department will soon be running. The plant of the Gautier Steel Works was totally destroyed, but will be rebuilt and put in operation as soon as possible.

The Lehigh Valley Railroad Company have made a reduction of from 4 to 7 cents per ton in the freight on furnace coal to the blast-furnaces along their line, which places these establishments, so far as the coal supply is concerned, on about the same basis as the furnaces along the Philadelphia and Reading Railroad.

A San Francisco telegram, dated June 19, states that H. W. Hammond, representing an English syndicate, has selected a site at Vallejo, directly opposite the Mare Island Navy Yard, for extensive iron and steel works, and that \$10,000,000 has been subscribed for the purpose by English capitalists.

The Secretary of State of Illinois has issued a license to the East Chicago Tin-Plate Company, at Chicago, to manufacture iron, steel, tin-plate and all products of steel and iron; capital, \$250,000; incorporators, Edward L. Lamb, Zenas Bruno, William H. Smith.

The Paige Tube Company have been organized at Warren, Ohio, to succeed the Warren Tube Company, of that place. The new concern is composed of D. R. Paige, Albert Paige and O. C. Barber, of Akron, Ohio, and several other gentlemen. Arrangements are now being made to put the works in operation and it is expected they will be operated full time in the future. T. S. Bray, formerly manager of the tube department of the Riverside Iron Works, at Wheeling, W. Va., has been secured as superintendent.

McClure & Schuler, engineers and contractors, of Pittsburgh, have just closed a contract with the Riverside Iron Works, of Wheeling, W. Va., for the erection of a new blast-furnace in place of the one they now have at that place. It will be fitted up with three Massick & Crooke's hot-blast fire-brick stoves, of which McClure & Schuler have the exclusive control in this country. In October of last year there were but three of these stoves in operation in this country, those erected by Shoenberger, Speer & Co. at their No. 2 Furnace, at Pittsburgh, Pa. Since that time the following list of stoves have been put in operation: Three for the Williamson Iron Company, at Birmingham, Ala., 16 feet 6 inches x 62 feet; three for the North Chicago Rolling Mill Company, at Bay View, Wis., 18 x 65 feet; three for the Brier Hill Iron and Coal Company, at Youngstown, Ohio, 16 feet 6 inches x 62 feet; three for the Thomas Iron Company,

at Niles, Ohio, 16 feet 6 inches x 62 feet. In addition to the above the following list of stoves are in course of erection and will soon be completed: Three for Shoenberger, Speer & Co., at Pittsburgh, 16 feet 6 inches x 62 feet; two for the Paducah Iron Company, at Paducah, Ky., 16 feet 6 inches x 62 feet; three for the Bellaire Nail Works, at Bellaire, Ohio, 18 x 65 feet; three for the Brier Hill Iron and Coal Company, at Youngstown, Ohio, 19 feet 6 inches x 70 feet; one for the Chicago Furnace Company, at Chicago, 20 x 60 feet, to supplement their present fire-brick stoves, and four for the Carrie Furnace Company, of Pittsburgh, 19 feet 6 inches x 70 feet. The last named are about completed and the new furnace will be blown in not later than July 15. From the rapid manner in which these stoves have been adopted it is evident that they have given satisfaction wherever introduced.

We are informed that the report that Jones & Laughlins, Limited, proprietors of the American Iron and Steel Works, at Pittsburgh, had signed the Amalgamated scale for the coming year is without foundation. Up to Monday, the 24th inst., the scale had not been presented to the firm, and for that reason they were unable to say whether they would sign it or not when presented.

The Oxanna Nail Factory, at Oxanna, Ala., has begun the manufacture of cut nails.

Furnace No. 1 will blow in at Talladega Ala., the last part of July, and the city will have a great celebration.

The American Association, Limited, whose general offices are at Knoxville, Ky., inform us, under date of the 18th inst., that the statement going the rounds of the papers as to the contract made with that company by a Northern syndicate for the erection of iron and steel works in Middlesborough, Ky., is in the main correct. But, pending certain negotiations now current in England between the association's board of directors and the representative of the syndicate, they are not at liberty to publish details. The matter now in negotiation is a question of royalty and area.

### Machinery.

The Columbus Machine Company, of Columbus, Ohio, are at work on an order for three blowing-engines on order of James Leffel & Co., Springfield, Ohio, for the use of the Bookwalter Iron and Steel Company in the new Bookwalter process of steel-making. The engines are of 40-inch diameter and 2-foot stroke. An order is also booked for a similar engine of still larger size.

The large works of the Westinghouse Air Brake Company, at Allegheny City, Pa., are being operated only half time at present, owing to a lack of orders.

Last week notices were sent out by the Westinghouse Electric Company, of Pittsburgh, that a special meeting of the stockholders of the company will be held June 27 to consider a proposed agreement between the company and the Westinghouse Electric and Mfg. Company, by which certain stocks, claims and accounts of the former company will be transferred to the Westinghouse Electric and Mfg. Company. This is regarded as a move to consolidate under one charter the present electric company and all their branches or controlled and leased corporations with one name and one set of officials, thus economizing greatly in the matter of running expenses.

Chaplin, Fulton & Co., Limited, of Pittsburgh, manufacturers of syphon pumps, injectors and a general line of machinery, report that they have recently secured orders for the entire systems of

gas regulators from the Dayton Natural Gas Company, of Dayton, Ohio; the Wayne Natural Gas Company, of Fort Wayne, Ind., and the Indiana Piping and Construction Company, of Logansport, Ind. They have already shipped to Dayton 2 12-inch high-pressure regulators and 3 8-inch low-pressure regulators, which are now in operation and which will be followed by 12 6-inch low-pressure regulators to complete the system. Their order from Fort Wayne calls for 2 12-inch high-pressure regulators and 12 6-inch low-pressure regulators. At Logansport they have 2 8-inch low-pressure regulators and 5 6-inch low-pressure in operation.

Burnham, Parry, Williams & Co., of the Baldwin Locomotive Works, are about to add still further to their already extensive plant by the erection, at Fifteenth and Spring Garden streets, Philadelphia, of two large buildings for the more convenient prosecution of their business. One of the buildings will be six stories high, with a front on Spring Garden street of 80 feet and depth of 80 feet. This is called the pattern-storage building. Connected with this, on Fifteenth street, and running south 188 feet, with a width of 34 feet, is to be a one-story sand and oil house. Both buildings will contain vaults and cellars, the roofs of which are to be covered with asphalt paving blocks, and the floors concrete. All the inside doors are to be made fire-proof. The cost is about \$75,000.

Freeman Wire Company, St. Louis, Mo., are filled with orders, so much so that they have been compelled to increase their working force. Among orders lately received by them they mention wire and iron cemetery railings, an elevator front for a large manufacturing establishment in St. Louis, and a number of orders for office railing, &c., for local points.

A contract for two large duplex gas compressors and boilers for the Kentucky Rock Gas Company was placed with the Clayton Air Compressor Works, No. 43 Dey street, New York. The compressors have a capacity of 2,000,000 cubic feet per day and are to compress the natural gas at the wells to a pressure of 200 pounds per square inch and force it a distance of 82 miles to Louisville, for light and power purposes. That the Clayton air compressors are eminently suitable for this purpose has been demonstrated by their performance at the natural gas fields of Bradford and Wellsville.

The Thomson Electric Welding Company have removed their offices from the Mason Building to the new Fiske Building, 89 State street, Boston, where they have more commodious rooms. At the works in Lynn, Mass., 80,000 square feet of floor-space have been recently added and a large quantity of new machinery has been put in.

Among the recent purchasers of the patent friction covering for pulleys now being manufactured by the National Pulley Covering Company, of Baltimore, are the following: Eagle Lock Company, Terryville, Conn.; W. H. Hyde & Son, Newark, N. J.; J. E. Clarke, Columbia City, Ind.; James Clarke, Warren, Pa.; A. E. Spink & Co., Washington, Ind.; J. G. Hoffman & Sons, Wheeling, W. Va.; Smelting Works, Salt Lake City, Utah; G. W. Campbell & Sons, Kane, Pa.; Eagle Pencil Company, New York; Schultz Bros., Philadelphia, Pa. The company have recently appointed S. C. Nightingale & Childs, 134 Pearl street, Boston, their agents for New England.

#### Hardware.

The Gulf Wire Mill Company have commenced operations at New Orleans, manufacturing barb wire for the Southern market. Hitherto all the wire of this kind used in the Southwest—and very

large quantities of it are consumed in Texas—has been brought from the Eastern mills by way of New York, or from St. Louis. A short time ago the company were organized for the manufacture of barb wire. Ground was purchased on the corner of St. Joseph and Peter's streets, and works erected. The factory has a capacity of 40,000 pounds of wire per day, to be increased if the business is found to be profitable. Max Herman is president of the new company, I. M. Wiemann vice-president and Fred. Peters secretary. They claim that the wire can be manufactured at New Orleans at from 10 to 15 per cent. cheaper than in the East.

The plant of the Braddock Wire Company, at Rankin Station, Pa., will close down on the 29th inst. for the purpose of making repairs. We are advised that the company have had under consideration for some time the advisability of erecting a small steel plant for the purpose of making their own steel. The question will probably be decided in the course of a few weeks.

On the 6th inst. the Freeman Wire Company, of St. Louis, filed notice of incorporation, the capital stock being \$750,000. The stockholders are John W. Harrison, John M. Harrison, David L. Field, C. S. Freeman, Thos. W. Freeman and Thomas Drennan.

#### Miscellaneous.

The Wayne Works, of Richmond, Ind., have recently been reorganized under the name of the Creamer & Scott Company, of which Thomas Creamer is president and Thomas D. Scott secretary and treasurer, with a paid-up capital stock of \$50,000. The company have removed their plant from Richmond to Indianapolis, where they have complete facilities for the manufacture of their specialties—namely, road-carts, stick-wagons, piano-box buggies, &c. The new works are located on the corner of Eighth street and Lake Erie and Western Railroad.

The McElroy Car Heating Company, of Detroit, and the Sewell Car Heating Company, of Portland, have amalgamated, with a capital of \$2,500,000. Robert C. Penger, of Albany, is president, and S. Hatch, of New York, is vice-president.

The following recent orders have been received at the Philadelphia Scale and Testing Machine Works of Riehle Bros.: One 60-ton self-adjusting railroad-track scale for the Thomas Iron Company, Hokendauqua, Pa.; one 500-pound wire-tester for Blasius & Sons, Philadelphia; one 10-ton wagon-scale for Johnson Foundry, Johnstown, Pa.; two extra-heavy furnace charging scales for Tennessee Coal, Iron and Railroad Company, Chattanooga, Tenn.; one extra-heavy furnace charging scale for Woodstock Iron Company, Aniston, Ala.; one Weighmaster frame and standard, made to Turkish standard, for Algeria; United States standard weights for R. & A. Hecksher, Swedenland, Pa.

The Louisville and Nashville Railroad Company have just given out a contract for 500 refrigerator cars, 300 going to the Missouri Car and Foundry Company, of St. Louis, and 200 to the Ohio Falls Car Company, of Jeffersonville, Ind. The company have placed orders for their season's wants of spikes with the Tredegar Iron Works, for splice-bars with the Springfield Iron Works and for bolts with the Upson Nut Company. The company are double-tracking their short line to Cincinnati for a distance of about 30 miles and the main stem south for about 20 miles.

The people of Oxford, Chenango County, N. Y., are anxious to have a foundry established there, and set forth the numerous advantages presented by the locality.

#### PERSONAL.

Thomas W. Fitch, who has been superintendent of the Braddock Wire Company, Rankin Station, Pa., since their organization, has tendered his resignation, to take effect on July 1.

Henry Phipps, Jr., of the well-known firm of Carnegie, Phipps & Co., Limited, at Pittsburgh, has offered to erect an aquatic plant department to be located adjoining the greenhouses in the parks of Allegheny City. The offer has been accepted and work on the building will be commenced at an early date.

The Birmingham Rolling Mill Company, of Birmingham, Ala., held their annual meeting recently, electing the following officers: G. W. Norton, president; W. B. Caldwell, vice-president; B. du Pont, treasurer. Directors: John B. McFerrer, W. W. Hite, W. P. Harney and J. G. Caldwell, all of Louisville, Ky. Thomas Ward is general manager of the mill, and John D. Dwyer is superintendent in charge of the mill departments.

Dexter Brackett, of Boston, was elected president of the New England Water-Works Association.

S. T. Wellman, formerly superintendent of the plant of the Otis Iron and Steel Company, at Cleveland, Ohio, has accepted the position of consulting engineer for the Illinois Steel Company, of Chicago, comprising the consolidated Chicago mills.

E. L. Harper, who wrecked the Fidelity Bank, of Cincinnati, is said to be directing a large iron business from his prison.

Thos. W. Wetherald, for a number of years manager of the nail factory of the Bellaire Nail Works, at Bellaire, Ohio, died at his residence in that place on the 17th inst. William Sharp has been appointed his successor.

The Master Mechanics' Association, whose sessions were held at Niagara Falls last week, elected officers as follows: President, R. H. Briggs, Memphis, Tenn.; first vice-president, John Mackenzie, Cleveland, Ohio; second vice-president, Albert Griggs, Providence; secretary, Angus Sinclair, New York; treasurer, O. Stewart, Charlestown, Mass.

J. K. Taggart, for a number of years superintendent of the coke plant of the Connellsville Coke and Iron Company, situated in the Connellsville region, has resigned his position to engage in the iron business with his father in Philadelphia. He has been succeeded by J. H. Paddock, chief engineer of the H. C. Frick Coke Company.

J. Adachi, an officer of the Japanese Government, who has been in this country three years under instruction, has attained conspicuous proficiency in engineering and geology and now returns home to make practical use of his knowledge.

Theodore Sturges, president of the Oxford Iron and Nail Company, sailed for Europe yesterday, to be absent until September. Samuel Sloan will act as president *pro tempore*.

The annual meeting of the stockholders of the Bethlehem Iron Company was held at Bethlehem, Pa., on Tuesday. The meeting was a large one, and nearly all stock was voted. The following board of directors was chosen: John Knecht, R. H. Sayre, Sr., Joseph Wharton, E. P. Wilbur, W. W. Thurston, R. P. Linderman and George H. Myers. Subsequently the new board organized, with the following officers: President, W. W. Thurston; vice-president, R. P. Linderman; treasurer, C. O. Brunner; secretary, Abraham S. Schropp. There has been no change made in the management of the works, all of the officers remaining the same.

## The Texas Trust Law.

In another part of this issue will be found the exact text of the law against trusts and combinations which is now in full force and effect in the State of Texas. This law has been alluded to in the daily press, and in some cases commented upon at length, but its provisions have very seldom been stated explicitly. With the law itself before them, our readers will be able to perceive to their own satisfaction how the Texas law-makers have proposed to deal with trusts. The question has undoubtedly been handled most vigorously and with a very earnest determination to settle it thoroughly and completely. The members of the Legislature realized that a gigantic evil was threatening the business interests of the State, and they proceeded, metaphorically speaking, to "pound the life out of it." For fear that the evil might not be recognized in some of the numerous shapes it had been known to assume, they first laid down a definition of a trust, which is so broad and sweeping that it includes all kinds of agreements covering manufacturing, transportation, selling or purchasing any article or commodity whatever. This definition is well worthy of careful study. It is an aggregation of the popular but often misinformed theories regarding trade associations. No trade association whatever can exist in Texas if the provisions of this definition are strictly applied. All such associations can be construed to affect the price, production or transportation of merchandise in some way, because they may "increase or reduce the price of merchandise or commodities," both of which they are forbidden to do by this act.

Corporations chartered by the State of Texas violating the provisions of the law forfeit their charters, and foreign corporations thus acting are prohibited from doing any business in the State. Principals, managers, directors, agents, servants or employees who carry out the purposes of trusts or combinations are punishable by a fine of \$50 to \$5000 and an imprisonment of one to ten years, each day in which the act is violated constituting a separate offense. Anything more sweeping than these clauses of the act could hardly be devised, and he would be a reckless man indeed who would subject himself to such penalties, if the law is really being carried out in its strict construction.

But the most remarkable feature of this law is the declaration as to the evidence required to prove the existence of a combination or trust. "The character of the trust or combination alleged may be established by proof of its general reputation as such." It is not necessary to prove or produce any article of agreement or any written instrument, "or that it was evi-

denced by any written instrument at all." This would cover even such cases as the Steel Rail Association, which everybody in the trade knows has no control whatever over prices, but concerning which there is a popular belief in outside circles that it is a full-fledged combination. Agents for steel-rail manufacturers and for manufacturers of iron and steel in numerous other forms have need to exercise much caution in making sales in Texas, as they are all popularly believed to be members of trade organizations of some kind, and such belief is sufficient evidence to lead to conviction by Texas juries. The manufacturers themselves, though they may never visit the State, are equally liable to punishment with their agents, the object of the act "being to reach and punish all persons offending against its provisions, whether within or without the State." But this view of the law carries with it so many palpable absurdities that it seems almost unreasonable to suppose that attempts will be made to enforce the penalties prescribed.

While contracts or agreements made in violation of this act are pronounced by it "void and not enforceable," a singular oversight on the part of its framers is to be observed. No penalties are specified against those who purchase commodities from the trusts or combinations. A stringent, hit-all-around measure like this should have taken cognizance of the misguided people who will insist on patronizing concerns bound together by compact "to increase or reduce the price" of merchandise. Such people are equally at fault with the sellers, and a provision should have been specially incorporated in the law for their punishment.

A peculiarity of the law is its non-application to the farmer. One section specifically declares that "the provisions of this act shall not apply to agricultural products or live-stock while in the hands of the producer or raiser." Farmers are free to combine and refuse to take less than a certain price for wheat, corn, cotton, hogs, milk, &c., and if they do so they are held blameless. But woe betide the wheat, corn or cotton merchant, the pork-packer or the milk vender who effects an understanding with others in his line of trade to sell at a certain price! For every day during which such an understanding prevails he is liable to a fine of \$50 to \$5000 and an imprisonment of one to ten years. This seems to be such a flagrant discrimination between occupations as to bring the constitutionality of the act in serious question. At all events, it arrays the agricultural interests against all the other industrial interests of the State, combining with the latter the commercial and transportation interests.

The appearance of the Texas law at this juncture forms a most interesting chapter in the history of the trust and combination era which is now on us. It represents very forcibly the dominant sentiment in a large section of the country that the farming interest is at the mercy of the commercial, manufacturing and railroad interests, and that a remedy for this state of affairs must be found. But it is a striking display of crude legislation; its very wide application, threatening severity and most forbidding harshness being well calculated to defeat the very objects for which it was framed.

## Northwest Freight Rates.

The week has been an exciting one in railroad matters. The rate situation in the Northwest is one which has great interest for merchants in the East, in Chicago and in the territory named. In spite of the great increase in local manufacturing, a large part of the articles used in the Northwest comes from the States east of Chicago. If the freight rates to St. Paul are all made up by adding the Chicago local to the rate from the factory or seaboard to Chicago, and if the through rates by any route conform to this standard, then all jobbers, those in Chicago included, can sell in Dakota and Minnesota on even terms. This has been the theory on which tariffs have for years been made up, so that it seems a pity that anything should occur to throw so nicely an adjusted balance into confusion. But freight rates, like channels of trade, find at last ways of breaking bounds and yielding to natural laws. As the presence of ore and coal determines the successful furnace, so cheap water routes must fix the basis for freight tariffs.

In the beginning of the season the lake rate first class from New York to St. Paul was fixed at 89 cents, while to Chicago it was 51 cents on traffic for St. Paul. This left the roads north of Chicago an opportunity to secure St. Paul traffic at a rate of 38 cents. This they were glad to do. Since to cut these Chicago roads off from all the flour down and merchandise up was no part of the programme, the owners of the Lake Superior boats were easily induced to make this higher rate from New York to St. Paul or Duluth than to Chicago, thus leaving the margin spoken of north from Chicago. This higher rate to St. Paul than to Chicago also allowed the Chicago jobbers to sell the Northern trade as usual. There was one defect at least in this plan. By water Duluth is as near to Buffalo as Chicago is, and although the amount of traffic on the upper lakes is not so great as on Lake Michigan, yet an increase in the rates much less than 35 cents per cwt. would have served to balance this lighter trade so as to have allowed the Superior boats an equal profit. Thirty-five cents per 100 was, however, the difference agreed upon on first class, because of the trouble to the Chicago-St. Paul roads if any less amount of difference was made.

Geographical considerations asserted themselves and the claims of St. Paul and Minneapolis for tariffs fixed on water distances from the sea-board were made. One road said that the rates to St. Paul should be fixed on a fair profit to the carriers without regard to the Chicago lines at all. This road figured this at 69 cents, and the lines which had early in the season named 89 cents now offered 54 cents in a spirit of protest against any offer under their original figures. Meanwhile the Chicago roads were getting roundly denounced by the jobbers of that city because the locals were so much higher than the proportion of the through. This was getting to be a serious matter; for if St. Paul should by any means get an independent tariff by any route, the effect in time would be a loss to Chicago of nearly all the jobbing trade of that important section. It may be that the end of the present war will be the restoration of the old high rates, but if so the con-

ditions of the case are such that it seems hardly possible that those high rates will be permanent.

If we understand the matter, it seems only a question of time when St. Paul, by its water transportation, will have tariffs to and from the sea-board as low or nearly as low as those ruling east of Chicago. This would mean trouble for the jobbers of Chicago, and as far as they are concerned is to be regretted. But what is a loss to Chicago would be a gain to St. Paul, Minneapolis and the whole Northwest. But Chicago will not easily let the trade of the Northwest go if she can help it. The roads can rely upon it that every means will be tried, every legal point taken which will avoid such a loss. And some way may yet be devised by which the difficulties will be smoothed over and the old tariff basis be retained.

### Our Increased Domestic Export to Australia.

The Australian colonies have imported unusually large amounts of foreign merchandise of late years, considerably in excess of their exports, and it is gratifying to note that the United States has had a goodly share in the increase. Following are the latest official statistics showing the foreign trade of those colonies, taking two years together and comparing them with the previous equal period:

#### Import and Export in 1886 and 1888.

	Import.	Export.	Excess of Import.
Victoria...	\$26,575,179	\$27,947,079	\$2,228,100
New South Wales...	44,338,744	32,007,958	12,240,786
Queensland...	12,525,717	10,177,374	2,348,343
South Australia...	10,401,153	10,125,263	275,890
West Australia...	1,406,804	1,077,085	331,769
Tasmania...	3,514,053	2,645,253	867,800
New Zealand...	14,238,994	13,492,730	746,264
Totals...	\$123,001,584	\$96,982,572	\$26,019,012

#### Import and Export in 1887 and 1888.

	Import.	Export.	Excess of Import.
Victoria...	\$42,994,235	\$25,304,906	\$17,789,327
New South Wales...	30,691,793	30,354,682	336,111
Queensland...	12,385,743	11,078,325	707,418
West Australia...	1,332,690	1,209,310	123,380
Tasmania...	3,307,480	2,783,236	524,244
			\$19,379,535
South Australia...	10,509,911	12,314,878	1,804,967*
New Zealand...	12,197,415	14,683,494	2,486,079*
Totals...	\$122,250,222	\$107,180,783	\$15,069,439
Net excess of import...			\$15,073,739

\*Excess of export.

The excess of import, which, for example, in Victoria was very large in 1887 and 1888, has, of course, chiefly arisen from the rapid extension of railroads and telegraphs. On January 1, 1887, 8881 miles of railway were in running order and 1992 miles building; the telegraphs measured in length at the same date 37,099 miles of line, with 71,859 miles of wire, there being 1921 officers and 9,021,610 telegrams forwarded in 1886. Simultaneously the mail department handled in 5236 offices 150,435,626 letters and postal cards and 82,363,194 newspapers. American trade presents the following figures:

Calendar year.	Import into the United States.	Domestic exports to Australasia.
1887...	\$4,898,232	\$12,608,701
1888...	4,613,218	9,442,150
Increase .....	\$285,014	\$3,166,551

The increase of exportation in a single year has been 33 per cent., and this in the face of the comparatively small amount of

goods we import from Australasia. The ports of New York, Boston and Philadelphia received during the fiscal year ended June 30, 1888, only 15,738,510 pounds of Australian clothing wool—and of these only 5,046,245 pounds direct—out of a total import of 111,982,093 pounds. What little we consume of Australian tin for the most part reaches us via London. Our goods, whether they be hardware or manufactures of wood and leather, including carriages, have fortunately been gaining in popularity in Australia year after year, and the remarkable increase in the amount taken in 1888 abundantly proves that this trade, properly conducted, is capable of as great expansion as to any other non-European country, small as the population is, for it barely reaches 4,000,000 at present. What has astonished the world most is this very circumstance of a comparatively small population being able to produce such enormous amounts of goods and taking in return even greater amounts. The only way to explain it is that the Australasians are very active and enterprising; that what they produce is very valuable, as, for example, wool and the metals; that their resources are great and manifold and their methods of production the best suited to the locality; and finally that at least in the cities modern civilization is carried to as high a degree of refinement and rests on as solid a basis as anywhere in the United States or Europe. They have long learned to buy the best even if it be a little dearer.

There is only one serious drawback in Australia so far as wool and cereal production are concerned—namely, the frequent prolonged droughts, leading at times to a fearful degree of mortality among sheep, and this explains the fluctuating amounts of wool yearly turned out. But, on the whole, production of the latter has been steadily on the increase, and in 1886 Australasia exported 478,998,092 pounds, toward which New Zealand contributed 90,858,744 pounds, the amounts leaving the latter colony having been as follows during 1883-87:

Year.	Pounds.	
1883 .....	68,149,430	\$3,014,311
1884 .....	81,190,028	3,597,527
1885 .....	89,507,431	3,205,275
1886 .....	90,858,744	3,672,971
1887 .....	83,125,322	3,231,074

#### The number of sheep was as follows:

Year.	Number of sheep.	Year.	Number of sheep.
1883 .....	13,300,329	1886 .....	14,774,330
1884 .....	13,973,530	1887 .....	15,155,638
1885 .....	14,546,801		

The average production of wool per sheep in all 1886 throughout Australia was 4½ pounds. The rise in wool three years ago, since maintained, has, of course, contributed greatly toward improving Australian affairs and finances, 1d per pound making a difference of \$10,000,000 per annum. The exportation to England of wheat and mutton, the latter in refrigerator steamers, is at times important, although in the latter item the Argentines are becoming competitors not to be despised. New Zealand exports to the United States many cargoes of Rauri gum annually, a fossil rosin used for varnish manufacture, supposed to be a very profitable trade. Australia is, from a commercial point of view, one of the most promising countries we deal with. It is reported per cable from Sydney, June 21, that the New South Wales Government have decided to continue for a year from next November the contract for carrying

the mails between that port and San Francisco. This is important at a time when, as we have shown, the Australian trade we are carrying on is taking a fresh start.

### British Statistics for 1888.

The annual statistical report of J. S. Jeans, secretary of the British Iron Trade Association, has just been received. It contains a mass of valuable statistics relative to the British iron trade, as well as much information concerning the iron trade of other countries, the whole comprising a volume of 128 pages. An epitome of the British statistics of production, exports and imports is given in the following table, in which the figures for 1888 are compared with those for 1887:

Description.	1888.	1887.
	Tons.	Tons.
Production:		
Total pig-iron.....	7,893,834	7,441,927
Bessemer pig-iron.....	3,245,555	3,054,573
Basic pig-iron.....	475,540	471,510
Spiegelisen and ferro..	205,184	223,190
Puddled bar.....	2,061,473	1,701,312
Bessemer steel ingots.....	2,012,784	2,064,406
Bessemer steel rails.....	979,085	1,021,547
Basic steel.....	408,594	364,526
Open-hearth steel ingots	1,222,743	981,104
Iron ore .....	14,168,000	13,068,041
Coal.....	169,935,219	162,119,812
Stocks pig-iron Dec. 31..	2,566,708	2,773,684
Ship-building tonnage launched.....	904,329	577,327
Exports:		
Total iron and steel.....	3,966,934	4,145,907
Pig-iron.....	1,038,177	1,159,500
Railroad iron and steel..	1,020,324	1,013,631
Tin-plates.....	181,391	254,773
Coal.....	26,935,492	24,454,607
Imports:		
Iron ore .....	3,562,071	3,765,738
Beams, &c.....	69,312	69,306
Bars, angles, &c.....	113,263	112,379
Steel, unwrought.....	12,058	14,757
Unenumerated iron, &c..	157,799	129,680

These figures show how satisfactory was the business of 1888 as compared with 1887. In nearly every instance the figures of production show an increase, which is in some cases very heavy, while the branches in which there was no increase have been holding their own very well. The export trade has also been sustained very satisfactorily. Stocks of pig-iron decreased to some extent during the year.

The most remarkable increase in production shown in this table was in open-hearth steel, which is mainly due to the larger employment of steel in ship-building, although no inconsiderable part of the enlarged output was worked into tin-plates. The increased production of pig-iron is not so notable, as Great Britain surpassed the figures for 1888 in that line in both 1882 and 1883 by 600,000 tons. Never before was the production of open-hearth steel so large, the output of 1886 having been almost doubled, while there was a gain of nearly one-third on the figures for 1887. The only statistics available regarding tin-plates are those relating to exports, as the makers seem to withhold their figures of production. With reference to this branch of trade, Secretary Jeans says: "The position and prospects of the industry at the present time are very uncertain. There is a probability of a year of good trade, and the quantity produced is increasing, but much will depend upon how far the movement which is in progress in the United States for the establishment of a home tin-plate industry is successful." Of the total British exports of tin-plates, no less than five-sevenths are sent to this country.

For the purpose of comparison with this country we present below the leading statistics of iron and steel production in the United States in 1888 and 1887:

	1888.	1887.
Pig-iron.....	Gross tons. 6,499,738	Gross tons. 6,417,148
Bessemer steel ingots.....	2,511,161	2,936,033
O. H. steel ingots.....	314,318	322,069
Bessemer steel rails.....	1,388,277	2,101,904
All forms rolled iron.....	2,153,263	2,311,161

#### Manufacturing in Canada.

Stimulated by favorable legislation and favored by long credits, which the plethoric condition of the banks enabled them to extend, through the floating abroad of Government loans, manufacturing establishments in Canada seem to have been multiplied far beyond the demands for consumption. This is true of manufacturers of cotton, agricultural machinery, flour, sugar and some other lines, until this year it is true that only the strongest survive. Numerous facts touching this subject are given in the recent reports of bank managers just issued, in which discussion respecting the general interests of the Dominion is given a wide range. For example, Henry Yates, manager of the Merchants' Bank of Canada, says:

We have largely increased the productive power of our manufactories of textiles, and apparently have outbuilt the requirements of the country. Manufacturers have found an outlet by shipping large quantities of cotton goods to China, realizing no profit from the venture so far, but giving employment to workmen, keeping looms running and factories open. This, after all, is no unusual condition of things in manufacturing. . . . It does, however, teach us that if we build factories we must submit to the conditions under which factories are run, and take bad times and good times together. And we may certainly conclude that when times are good dividends should be moderate, and money set aside for a rainy day. And it teaches further that when a country has factories enough it is folly to build more. When our population is double what it is at present, or even half as much again, we can then enlarge our looms and spindles with some reason. No matter what kind of manufacture a man is engaged in, whether the raw material be cotton, wool, iron or leather, these remarks are pertinent to it. No money can, as a rule, be made out of mere staples or out of articles that everybody can make and that everybody understands. Any manufactory or mill that is built without close calculation and is carried on in a humdrum, careless manner will undoubtedly drift into loss.

To the same effect is the report of Manager Walker, of the Canadian Bank of Commerce, in reference to the manufacture of agricultural implements. Of harvesting machinery the output during the present season will be probably 10 to 15 per cent. in excess of last year, but at reduced profits, owing to the competition of large and perfectly-equipped establishments. Within four years prices have fallen, say, 20 per cent., and at the present time only 15 establishments survive of the 22 formerly in existence. Of the successful ones, moreover, four manufacture three-fourths of the entire product. In hardware, groceries, &c., the same general statements hold true. The margin of profits is growing smaller, the expenses of conducting business greater, and as a consequence the tendency is in the direction of the large firms, whose proportion of expenses to sales can be kept within reasonable limits, gradually absorbing the trade.

In other words, the leading lines of general business in Canada seem to have been overdone, with the inevitable consequence

of many bad debts, and thus it comes about that Canadian manufacturing interests, which have been so enormously developed of late, realized during the past year a poor return on their capital. A part of the difficulty is attributed to the impolicy of granting long credits by banking institutions, and bank managers are unanimous in suggesting a gradual change in this respect. It should be observed, however, that in contemplating the future a more hopeful feeling is expressed, the general situation being improved by the weeding out of weak traders, as well as by sounder methods that follow where the evils of expansion have been felt. Moreover, the lumbering industry is active and profitable and crop prospects are excellent.

#### OBITUARY.

SILAS H. WITHERBEE.

Silas H. Witherbee, of the well-known iron-ore firm of Witherbees, Sherman & Co., died of pneumonia at his home in New York, on Saturday, June 8, at the age of 74 years. He had been seriously ill for several days, but his death was unexpected. We take the following statements concerning his life and achievements from a biographical sketch furnished the *Engineering and Mining Journal* by William Allen Smith:

Mr. Witherbee was born in Bridport, Vt., January 27, 1815. Losing his father when he was only five years old, he early became self-reliant. As a boy he showed the same kind heart and genial temperament which marked his later life; he excelled in feats of skill and strength, and was a noted wrestler. He had no schooling after the age of 13, at which time he left home and lived with a brother in Vermont. When 19 years old he went to Port Henry, on Lake Champlain, then almost in the wilderness, and became a store clerk with a salary of \$50 per year and board. Later he was a clerk at the blast-furnace at Port Henry, then owned by Horace Gray, of Boston. This was the opening of his career in the iron business. While here he was married in 1842 to Sophia C. Goff, the sister of the superintendent, George W. Goff. About 1846 he went to Westport, where he became superintendent of the furnace, under the management of Frank Jackson, of Boston. In 1848 he returned to Port Henry, and formed a partnership with his nephew, Jonathan G. Witherbee. This firm of S. H. & J. G. Witherbee did a large business in transporting ore, iron and other products from Lake Champlain to New York. In 1849 the firm acquired from A. G. Rousseau, of Troy, an interest in the iron-ore property adjoining the ore property of John A. Lee and George Sherman, known as the "Old Bed." In 1852 they joined with Kinsley Sherman in establishing the firm of Sherman & Witherbee, at Cleveland, for the sale of the ore in the West; and for many years before the large development of the Lake Superior mines this firm supplied the Western market with the only iron ore brought to mix with local ores. The iron-ore interests of John A. Lee, Geo. Sherman and S. H. & J. G. Witherbee were consolidated in 1856 under the firm name of Lee, Sherman & Witherbees; in 1861 the firm of Witherbees, Sherman & Co. was established, the other three partners buying out the interest of Mr. Lee. The firm have continued to the present time under the same title and rank among the largest ore producers of the country.

In 1863 the Witherbees with F. P. Fletcher erected a charcoal blast-furnace near Mineville (the name given by them

to the town which grew up around their ore beds) and from "New Bed" ore produced some of the first Bessemer pig-iron made in this country. In 1864 the firm acquired an interest in the adjoining property of the Port Henry Iron Ore Company. From that time the two concerns have been closely associated, with Witherbees, Sherman & Co. as sales agents. Their sales of ore have in some years reached nearly 500,000 tons. Mr. Witherbee was the first president of the Cedar Point Iron Company, whose furnace, built in 1873, was subsequently purchased by Witherbees, Sherman & Co., and was the first in the country to use Whitwell's hot-blast stoves.

In 1879 Mr. Witherbee was a director in the Bay State Iron Company, at Port Henry, and upon its later reorganization became president of the same furnace company with which he had started years before as clerk. At the time of Mr. Witherbee's death he was the senior member of the firm of Witherbees, Sherman & Co., vice-president of the Port Henry Iron Ore Company, vice-president of the First National Bank of Port Henry, president of the Port Henry Furnace Company, director of the Lake Champlain and Moriah Railroad Company and of several other corporations in different parts of the country. The business life of Mr. Witherbee was characterized from beginning to end by energy, sagacity and fidelity. Starting as an industrious and faithful subordinate, he advanced gradually and surely to a position of honored leadership. The nature and extent of his business made him among the best-known of our iron men. He was, in the best sense, a self-made man, but conspicuously free from egotism or ostentation. Through his whole life he preserved a winning simplicity of manner, which, with his kindly shrewdness, gave him the faculty of attaching warmly to himself all who had near relations to him. His patience and large charity were well known, and his naturally even temper was hardly ever disturbed. Mr. Witherbee's family life was singularly happy. The wife of his youth survives him, and he leaves three children, two daughters and one son, Walter C., a member of his firm, residing at Port Henry.

JAMES S. MARSH.

James S. Marsh died on June 16 at his residence, in Philadelphia, in the 68th year of his age. Mr. Marsh was born in Cayuga County, N. Y., November 11, 1821. When 20 years of age he removed to Lewisburg, Pa., where he introduced the manufacture of cooking stoves, being one of the first to engage in that business in Pennsylvania. There he established the Lewisburg Foundry. In 1851 Mr. Marsh became one of the firm of Beaver, Marsh & Co., manufacturers of pig-iron, at Winfield, Union County. Later he became interested in the manufacture of agricultural implements and was the original patentee of the revolving self-raking reaping machine. Mr. Marsh continued in that business until 1878, when his works were destroyed by fire, since which time he had not been engaged in any business. He leaves six sons and one daughter, all adults.

WILLIAM H. SCRANTON.

William H. Scranton, for many years general manager of the Oxford Iron and Nail Company, of Oxford, N. J., died on the 19th inst. from heart failure, having been taken ill with pneumonia three days before. He was general manager of the Fall River Iron Works up to the time of the sale of their plant, and then became interested in the Wenstrom ore-separator, with Robert A. Cook. He was but 49 years old at the time of his death.

## The Homestead Wages Scale.

In our issue of May 23 we made mention of the fact that Carnegie, Phipps & Co., Limited, of Pittsburgh, had decided to put in operation at their Homestead Steel Works a sliding scale of wages, to go into effect on the 1st day of July. In the early part of this month William Weihe, the president of the Amalgamated Association, requested that the firm furnish him a copy of the proposed scale, which was done. A portion of this scale was printed in the *National Labor Tribune*, and also circulated among the delegates in attendance at the Convention of the Amalgamated Association of Iron and Steel Workers. This led W. L. Abbott, chairman of Carnegie, Phipps & Co., Limited, on the 12th inst., to address a letter to Mr. Weihe, which we publish in part as follows:

"DEAR SIR: When, on Tuesday last, you asked for and were given a copy of the scale of wages submitted to our employees of the Homestead Steel Works, you were told that the same caused an average reduction in the rates at present paid of, approximately, 20 to 25 per cent. It was explained to you that the greater part of this cut was taken from the wages of those men whose earnings are abnormally high under existing Amalgamated rates, made so in part by reason of the exceptional facilities we possess and the special character of the product of the Homestead Works. My attention has to-day been called to the fact that the men at Homestead are circulating printed copies of the scale that was given you. In a parallel column is published the present tonnage rates, but the estimated tonnage of each turn contained in our copy has been omitted from that the men have had printed. A perfectly correct understanding of our proposition is impossible if all features of the scheme are not exhibited. Permit me to submit some figures for your consideration. They show the wages that would have been earned under the new scale, based upon the actual output of the Homestead Steel Works for the month of May, 1889:

## Converting Mill.

Position.	Number of men.	Rate per 100 tons.	Daily earnings as estimated on basis of May tonnage.	Earnings for May of each man.	Actual daily earnings, basis of May tonnage.
Cupola man.....	1	\$1.70	\$3.75	\$126.00	\$5.04
Vessel man.....	1	1.70	3.75	126.00	5.04
Pourer.....	1	1.60	3.50	117.80	4.71
Blower.....	1	1.48	3.25	109.65	4.39
Spiegel man.....	1	1.38	3.00	100.75	4.03
Pit men.....	10	1.36	3.00	100.75	4.03
Stopper-setter...	1	1.25	2.75	92.60	3.70
Ladle man.....	1	1.18	2.50	87.40	3.49
Cupola helpers...	2	1.14	2.50	84.45	3.38
Bottom-makers...	1	1.14	2.50	84.45	3.38
First regulator...	1	1.09	2.40	80.75	3.23
Crane shifters...	3	1.09	2.40	80.75	3.23
Vessel man's first helper.....	1	1.09	2.40	80.75	3.23
Cinder men.....	3	1.09	2.40	80.75	3.23
Vessel man's second helper.....	1	1.02	2.25	75.55	3.02
Bot.-m'k'r's helpers.....	2	1.00	2.20	74.10	2.96

Stopper-maker...	1	.95	2.10	70.40	2.81
Metal-wheelers...	8	.91	2.00	67.40	2.70
Cinder-snappers...	2	.91	2.00	67.40	2.70
Ladle man's helper.....	1	.91	2.00	67.40	2.70
Ingot-extractor's helper.....	1	.91	2.00	67.40	2.70
Coke-wheelers...	2	.88	1.90	63.70	2.55
Second regulators.....	3	.86	1.90	63.70	2.55
Mold washer.....	1	.86	1.90	63.70	2.55
Steel-crane man...	1	.86	1.90	63.70	2.55

Total tonnage, 14,818 tons; tonnage per turn, 7409 tons.

## 28-Inch Blooming Mill.

Screw man.....	1	\$3.10	\$6.00	\$150.00	\$6.00
Heater.....	1	3.10	4.50	118.00	4.72
Rougher.....	1	2.59	3.75	98.50	3.94
Point-in-hook...	1	1.90	2.75	72.25	2.89
Shear man.....	1	1.90	2.75	72.25	2.89
Turn-up-book...	1	1.90	2.75	72.25	2.89
Bottom men.....	2	1.79	2.60	68.10	2.72
Hookers.....	3	1.72	2.50	65.40	2.62
Furnace men.....	6	1.55	2.25	58.95	2.36
Tong man.....	1	1.55	2.25	58.95	2.36
Shear man's help.	1	1.52	2.20	57.80	2.31
Dragout.....	1	1.52	2.20	57.80	2.31
Butt-wheeler...	1	1.38	2.00	52.50	2.10
Pull-around.....	1	1.38	2.00	52.50	2.10
Shear pulpit.....	1	1.21	1.75	46.00	1.84
Pulpit man.....	1	1.21	1.75	46.00	1.84
Cover men.....	2	1.14	1.65	43.35	1.73

Total tonnage, 7808 tons; tonnage per turn, 3804 tons.

## 28-Inch Mill.

Roller.....	1	*	\$6.00	\$140.00	\$5.60
Heater.....	3	\$6.92	4.50	89.25	3.57
Catcher.....	1	5.77	3.75	74.43	2.98
Rougher-down...	1	5.38	3.50	69.40	2.78
Rougher-up.....	1	4.62	3.00	54.60	2.38
Sticker-in.....	1	4.23	2.75	54.60	2.18
Straightener.....	1	4.23	2.75	54.60	2.18
Heater's first helpers.....	3	4.00	2.60	51.60	2.06
Hookers.....	6	5.69	2.40	47.60	1.90
Hot -straighten- ers.....	2	3.46	2.25	44.60	1.78
Buggy man.....	1	3.46	2.25	44.60	1.78
Heater's second helpers.....	3	3.23	2.10	41.65	1.67
Chargers and drawers.....	8	3.23	2.10	41.65	1.67

Day turn, 1290 tons.  
In addition to the above, wages of 13 men, making \$14.50, changing rolls, which is not included in earnings.  
\* \$1 per month and 3 1-10.

## 38-Inch Beam Mill.

Roller.....	1	\$ *	\$5.80	\$166.20	\$5.65
Heaters.....	3	\$11.00	4.50	132.40	7.20
Catcher.....	1	8.99	4.00	147.40	5.90
Rougher-down.....	1	7.78	3.50	129.00	5.16
Rougher-up.....	1	7.22	3.25	119.70	4.79
Straighteners.....	2	6.67	3.00	110.60	4.42
Hookers (front).....	4	6.11	2.75	101.30	4.05
Sticker-in.....	1	6.11	2.75	101.30	4.05
Heater's 1st help- ers.....	3	5.78	2.60	95.80	3.83
Chargers.....	4	5.55	2.50	92.00	3.68
Hookers (back).....	3	5.55	2.50	92.00	3.68
Buggy man.....	1	5.00	2.25	82.90	3.31
Heaters 2d help- ers.....	3	4.67	2.10	77.40	3.09
Buggy man's helper.....	1	4.67	2.10	77.40	3.09
Hot-bed men.....	4	4.67	2.10	77.40	3.09
Saw man.....	1	4.67	2.10	77.40	3.09
Rack man.....	2	4.44	2.00	73.60	2.94
Straightener's helpers.....	12	4.44	2.00	73.60	2.94
Hydraulic tele- graph.....	1	3.78	1.70	62.65	2.50

Total tonnage, 3317 tons; tonnage, one turn, 1658 tons.  
\* \$100 per month and \$4.

## 119-Inch Plate Mill.

Rollers.....	1	*	\$6.80	\$181.50	\$7.26
Screw man.....	1	\$6.03	5.00	145.65	5.83
Shear man.....	1	8.93	5.00	145.65	5.83
Table man.....	1	8.04	4.50	131.10	5.24
Heaters.....	2	8.04	4.50	131.10	5.24
Second shear man	1	5.80	3.25	94.60	3.78
Hooks.....	2	5.38	3.00	87.40	3.50
Heater's helpers..	2	4.64	2.60	75.70	3.03
Sweepers.....	2	4.02	2.25	65.60	2.62
First leader.....	1	4.02	2.25	65.60	2.62
Second leader.....	1	3.98	2.20	64.10	2.56
Shear man's help- ers.....	10	3.75	2.10	61.20	2.45
Crane man.....	1	5.36	3.00	87.40	3.50
Crane man's help- ers.....	1	4.02	2.25	65.60	2.62

Product on each turn, 1631.  
\* \$100 per month and \$5.

"It will be noted that the estimated product per turn was in many instances exceeded, while in others, the 28-inch mill, for instance, the reverse is the case. It is due to ourselves and to our workmen that our position and our aim in the action that has been taken be clearly defined. As the official head of a great and influential organization, to which so many of these men acknowledge allegiance, I briefly summarize the statement made to you orally:

"1. The Homestead Steel Works cannot longer be operated successfully under a scale of wages established to apply to iron products, nor under conditions that have radically changed, and which did not contemplate the use of appliances and methods admitting of a largely-increased output without corresponding increase of labor. These improved facilities were acquired only through the outlay of large sums of money, on which capital we must have a reasonable return.

"2. To place ourselves upon an equality with our leading competitors an average

reduction of wages of, approximately, 25 per cent. is imperative.

"3. As a cure for the annual recurrence of wrangles and the dissatisfaction inevitably following the yearly agitation of the wage question, and in the interest of our men quite as much as of ourselves, a sliding scale shall be established.

"4. The scale adopted shall be operative for not less than two and one-half years.

"This action is not taken in antagonism to organized labor, but it has been forced upon us by the unreasonable and short-sighted demands of that power which, like all power not carefully controlled, is apt to be used to destroy itself. We recognize the right of every man to get for his services the highest market price. Whether, as employers, we purchase such service from the individual or from an organization which controls him is immaterial to us."

During last week several conferences were held between the firm and a committee from the Amalgamated Association, but no settlement was reached. The first conference was held on Wednesday, the 19th inst., and before any business was done the Amalgamated committee was given to understand that there were three essentials that would be insisted on by the firm: First, a reduction and a material one; second, a sliding scale; third, that whatever agreement should be reached it was to continue in force at least two and one-half years. The workers did not make any serious objection to the second question, the only objection being that they did not understand its workings and were in doubt as to its effect. They objected to the base of the scale, the firm demanding \$25 and the Amalgamated Association asking for \$27.50. The firm stated that they were willing to leave it to one man to establish the average selling price and they would allow the Amalgamated Association to name the man, only providing that he be a strictly honest man. They named President Weihe, Secretary Martin and Vice-President Roberts. Another conference was to have been held on Thursday, the 20th inst., but for some reason the Amalgamated committee did not put in an appearance and thus the matter stands. From present indications a strike is inevitable unless a settlement is reached during the present week. The entire plant of the firm will close down on the 29th inst., for the purpose of making the annual repairs. If a full complement of men can be secured the plant will be put in operation as soon as repairs are completed; if not it will remain idle until men are secured.

At a meeting of the Pittsburgh Committee of freight agents of the railroads running east of Pittsburgh, held in that city on the 22d inst., it was decided to make a reduction in the rates on iron and steel of about 3 cents per 100 pounds. The reduction was made to agree with the reduced rates put in force by the railroads from the Mahoning and Shenango valleys. The new figures go into effect on the 27th inst. and are as follows, the first named for carload lots and the last for freight in less quantities, in cents: To New York, 12 and 15; Boston, 15 and 18; Albany, 12 and 15; Utica, 12 and 15; Syracuse and Rochester, 10 and 13; Philadelphia, 10 and 13; Baltimore, 9 and 12; Washington, D. C., 9 and 12; Richmond and Norfolk, Va., 12 and 15; Portland, Maine, 19 and 22½.

Several large bridge contracts have been awarded by the Pennsylvania Railroad Company—viz., the Lewiston Bridge across the Juniata to M. P. Roberts; the Granville Bridge to the New Jersey Steel and Iron Company; May's Bridge and the Manayunk Bridge to Cofrode & Saylor. The new South Fork and Conemaugh bridges will be of stone.

# TRADE REPORT.

## Chicago.

Office of *The Iron Age*, 59 Dearborn street,  
CHICAGO, June 24, 1889.

**Pig-Iron.**—The syndicate of Malleable Iron manufacturers placed their order for the year's supply of Charcoal Iron last week. This is about the largest contract that is placed every year and many individual buyers never place their order for Charcoal Iron until that purchase is made. The sale was well spread out among buyers and brought out quite an active demand for this class of Iron from all sections of the West. Manufacturers of Malleables seldom contract until late in July or August, but the recent heavy purchases of Coke Iron, which firmed up the price, and the better prospects in all lines of Iron manufacture, induced them to buy earlier this year. The statement made three months ago that Charcoal would be short is again revived and to some benefit in getting orders. The furnaces that were out of blast are not taking orders at present prices because they say later, when the shortage is realized, they will have their Charcoal to make higher-priced and more profitable Iron. It matters not how much truth there is in the Charcoal shortage statement, it has had and is having its effect upon the consumers of Iron and making buyers who usually buy small lots take larger quantities. In local Coke Irons trade was very good, but nearly all the largest buyers have contracted. Ohio and Southern furnaces worked hard to sell Soft Irons and found a good many orders which they could accept under the advantage of the \$3.65 freight rate. On Lake Superior Charcoal, cash, f.o.b. Chicago, we reduce quotations 50¢ per ton, and give \$18 as the bottom price by the cheapest sellers on carloads. There are but two or three standard Irons that can be bought at these figures; other makers refuse orders at less than \$18.50 @ \$19. The balance of the changes are made on account of the reduction in freight rates from the South. We quote Local Coke, No. 1, \$15.50; No. 2, \$14.50; No. 3, \$13.50; Chicago and Bay View Scotch, \$15.50 @ \$16; American Scotch (Blackband), \$17.50; Southern Coke, No. 1 Foundry, \$15.50; No. 2, \$15; No. 3, \$14; No. 1 Soft, \$14.75; No. 2, \$14.25; Gray Forge, \$13.25; Mottled, \$18; Hanging Rock, No. 1, \$18; Jackson County, No. 1, \$17.50, immediate delivery; Southern Ohio Silvery, No. 1, \$17; No. 2, \$16; Tennessee Charcoal, No. 1, \$17.75; Alabama Car-Wheel, \$24 @ \$25.

**Bar-Iron.**—In lots ranging from 25 to 50 tons business was quite active. Merchants and manufacturers were disposed to fill up broken stocks, and wanted shipments before the close of the month. For these orders mills were enabled to get better figures than prevailed several weeks ago. Mills that accept orders for delivery later in the season do not appear quite so firm as last week. Makers' prices range from \$1.55 to \$1.60, half extras, f.o.b. Chicago, on Common, and on Single Refined, \$1.75. On Car specifications \$1.60, flat, is asked. On account of freight reductions these figures net the manufacturer better margins at mill. Store quotations are \$1.65 on Common, \$1.80 on Single Refined and \$1.90 for better grades in small lots full card.

**Structural Iron.**—Actual business is gradually improving. Each week some long-talked-of building project matures and new ones are started. The Beams (about 150 tons) for the foundation of the Rand & McNally building were let to Carnegie

last week. Other orders of a similar nature are pending. As foundries get in work prices improve, and competition is more generous. The quick demand for stock shapes has depleted the supply, and mills are beginning to hear some vigorous calls on unfilled contracts. Quotations are as follows, f.o.b. Chicago: Angles, 2.10¢ @ 2.12½¢; Universal Plates, 2.15¢; Sheared Plates, 2.20¢; Tees, 2.55¢; Beams and Channels, 2.90¢. Small lots from store: Angles, 2.20¢ @ 2.30¢; Tees 2.65¢ @ 2.70¢; Beams, 3.40¢.

**Plates, Tubes, &c.**—Buyers continue to take only small lots, which keeps sellers pretty busy, but does not make much inroad on the large stocks they have on hand. A good many inquiries have been made lately for round lots Iron and Steel Plates for July and later delivery. Quotations from store are as follows: Nos. 10 to 14 Iron Sheets, 2.50¢ @ 2.60¢; Nos. 10 to 14 Steel Sheets, 2.75¢ @ 3¢; Tank Iron, 2.40¢ @ 2.50¢; Tank Steel, 2.50¢ @ 2.60¢; Shell Iron or Steel, 3¢; Flange Iron, 4¢; Flange Steel, 3.50¢; Fire-Box Steel, 4.75¢ @ 5.50¢; Ulster Iron, 3.75¢; Boiler Rivets, 3.75¢ @ 4.25¢; Boiler Tubes, 55 ¢ off for 1½-inch and less and 60 ¢ off for 2-inch and larger. The Pipe trade are not buying heavily, but frequently. The last advance was unexpected by consumers, but so far as we can hear very well maintained by sales agents.

**Sheet-Iron.**—The demand for Sheets continues good. Mills are full of orders and very independent about taking further work for either July or August delivery. They quote on No. 27, f.o.b. Chicago, 2.90¢ @ 2.95¢. Jobbers quote from store, No. 24, 3¢; Nos. 25 and 26, 3.10¢; No. 27, 3.20¢.

**Galvanized Iron.**—In small lots trade has been quite active, but in large orders there is less doing than there was in the early part of the month. Jobbers' assortments are still in good shape, though mills are slow to accept further contracts. The heavy consumption of Black Sheets makes it difficult for galvanizers to secure stock in all numbers. Jobbers continue to quote 65 ¢ off on Juniata and 65 ¢ and 5 ¢ off on Charcoal.

**Merchant Steel.**—Business is in about the same condition as a week ago. Country merchants and manufacturers with an established consumption have lately been filling up their stocks with lots sufficient to carry them over the time that mills will be closed during the early part of July, for the purpose of repairs, &c. Some go even further and take in stock enough to carry them over the entire month in case there should be labor trouble. Light-grade Steels have been in better demand than other qualities. On Soft Bars, round lots, f.o.b. Chicago, manufacturers quote 1.90¢ rates; Open-Hearth Spring Steel, 2.25¢; Open-Hearth Machinery, 2.10¢; Tire Steel, 2.15¢; Toe Calk, 2.30¢, flat. From store jobbers quote as follows: Mixed Machinery Steel, 2.10¢ @ 2.30¢; Tire Steel, 7.75¢ @ 8.50¢; Specials, 12¢ @ 25¢; Crucible Spring Steel, 3.50¢ @ 3.60¢; Open-Hearth Spring, 2.50¢; Open-Hearth Machinery, 2.50¢ @ 3¢; Bessemer Machinery, 2.30¢ @ 2.40¢; Sheet-Steel, 7¢ @ 10¢; Tire Steel, 2.20¢ @ 2.25¢.

**Track Supplies.**—Sales agents report a dearth of orders. Splice Bars are quoted at 1.55¢ @ 1.60¢; Bolts with Square Nuts, 2.50¢ @ 2.55¢; Hexagon Nuts, 2.60 @ 2.70¢; Spikes, 1.85¢ @ 1.90¢; Hot-Pressed Square Nuts, 5.85¢ discount; Hexagon Nuts, 6.85¢ discount.

**Steel Rails.**—There is no perceptible change in the condition of the market. The Illinois Steel Company have all the work they can do in their three mills for July delivery, and it may be stated, too,

that railroads apparently have all they want for the same period, as orders are scarce and not as urgent as they were the early part of the month. On Heavy Sections \$29 @ \$30 is quoted, according to time of delivery and quantity. For Light Iron Rails manufacturers are asking \$24 @ \$26 for 12-lb and \$33 for 30-lb. The demand for these continues rather active for immediate delivery, while there are a great many inquiries for Rails to be delivered later in the fall.

**Old Rails and Wheels.**—There have been but very few transactions in Old Rails for the reason that stocks are scarce and high-priced. Sellers are asking \$21 as bottom, and keeping themselves in position to decline selling should they receive an offer. Several lots are offered at \$23. Sales have been made on a basis which would be equivalent to \$20.50, f.o.b. Chicago, but it is doubtful whether the purchase could be duplicated. Old Steel Rails are quoted at \$17.25 for long lengths and \$14.50 for short pieces. Old Car-Wheels are in fairly good demand and held at \$17.50 @ \$18 by those who have any quantity of stock; \$17 has been offered without effecting sales. Sellers are not quite so firm as they were two weeks ago.

**Scrap.**—The quantity of old material offering is not so great as several weeks ago. Railroad companies are withholding their Wheels, Rails and better grades of Forge because they think that prices will advance next month. Dealers' quotations on 2000 lb are as follows: No. 1 Wrought, \$17 @ \$17.50; Fish-Plates, \$18; Car-Axles, \$21.50; Horseshoes, \$17; No. 1 Mill, \$13.50 @ \$14; No. 2 Mill, \$8.50 @ \$9; Cast Machinery, \$11; Stove Plate, \$8.50 @ \$9; Cast Borings, \$8; Wrought Turnings, \$10; Coil Steel, \$13.50; Leaf Steel, \$14.50; Locomotive Tires, \$15; Track Scrap, \$16; Mixed Country Wrought, \$12.

**General Hardware.**—Jobbers report an excellent trade on all lines of goods. It is something unusual to have their traveling salesmen send in larger orders at the close of this month than were general in May. It shows that goods are being rapidly consumed in the country, and the outlook for the balance of the year very flattering. Mail orders are also unusually large and numerous. There are no recent changes in prices on the part of manufacturers, and between jobbers they remain fairly steady on close margins.

**Nails.**—To outline the market would be to duplicate our last week's report. The only new feature in connection with the situation is another reduction in freight rates by the Canadian Pacific road from Boston to St. Paul, which goes into effect to-day. This reduction will be made by lines via Chicago to Missouri River points, and will enable manufacturers east of here to dispose of their product to jobbers and dealers in all sections at a lower price than was named last week without reducing their prices at mill. There is a wide difference of opinion on the future of the Nail market. Some manufacturers are becoming more independent, and refuse to meet prices. Jobbers who are desirous of buying continue to hammer the higher-priced makers with the price of the weaker ones for the purpose of getting a better article, and not infrequently gain their object. On carloads all Cut or all Wire or mixed jobbers quote \$1.85 rates for Cut Nails and \$2.30 for Wire Nails. In small lots Cut Nails are quoted at \$1.90 and Wire Nails at \$2.35. The demand for Wire Nails is quite active in small lots and the stocks of jobbers are much lighter than they usually carry, but the demoralized condition of the Cut-Nail trade prevents them from placing orders, as they believe that it will have a damaging effect on the price of

Wire Nails before long. In fact, several of the Wire-Nail manufacturers have in the last few days offered to take orders from jobbers for July and August delivery at 5¢ per keg less than what they were able to get last month.

**Barb-Wire.**—The manufacturers of Barb-Wire are to hold their consolidation meeting this week. The place selected is not positively known, but indications point to Cleveland or Cincinnati. The demand for Wire continues very active in small lots, on which jobbers quote \$2.75 for Painted and \$3.35 for Galvanized.

**Pig-Lead.**—Some 400 tons changed hands last week at about 3.85¢. Offerings were quite plentiful and near deliveries were the weakest options. Much uncertainty attaches to the probable decision of the Treasury Department in the Silver-Lead Ores, as for or against a duty will determine the near-future condition of the market.

## Philadelphia.

Office of *The Iron Age*, 220 South Fourth St., PHILADELPHIA, Pa., June 23, 1889.

The Iron trade is just in that condition which makes it hard to report correctly. The feeling is nervous and unsettled, with a general tendency towards higher prices, but the difficulty is to find what the ruling prices are. There are a good many that are "not quoting" at all, others don't seem to know what to quote, while a few are meeting the legitimate requirements of their customers at a trifling advance over last week's prices. The position is not without its difficulties—cost of production has already advanced considerably, and any further movement in the direction of higher prices would be certain to be met with a demand for higher wages. If an advance in prices was sure to be maintained manufacturers would probably not object to some advance in wages, but suppose the market reacts? This is the contingency which has to be met one way or other. Manufacturers are inclined to wait before committing themselves either way. The outlook is certainly encouraging, but after all a great deal depends on the action of the Western trade. If prices advance there the East is in a position to keep pace, but to secure permanency the movement must be instantaneous.

**Pig-Iron.**—The market has developed an improving tendency, and as regards Mill Irons, prices are a shade dearer. Foundry Irons are steady, but not notably higher than they were a week ago, although good brands are scarce and could not be bought for late delivery unless at some advance over the figures quoted for spot lots. Mill Irons are easily 25¢ dearer, the general asking price being 50¢ advance. There is a great deal of inquiry for Iron, and sellers express much confidence in the outlook, although the attitude of the Southern companies is not yet clearly defined. The difficulty with this class of Iron is its varied quality as well as its variety of prices. Some of the more prominent companies are sold up, and are therefore not quoting on new business. Others offer at \$14.50, \$16 and \$16.50 ex-ship, with intimations that these prices can be shaded on bids from the right kind of buyers. Quality may be as satisfactory as other Southern Irons, but as the brands have not been used to any extent in this vicinity consumers are not inclined to make offers while they can get approved brands at a trifle more money. Hence while the quotations seem low, the Iron does not attract much attention. Local brands are held at from \$17 to \$18 at tide, for No. Foundry, \$16 @ \$16.50 for No. 2 and \$15 @ \$15.50 for Gray Forge. There is not much good Iron for sale at less than \$17.50, and while \$15 has been

shaded in one or two instances for Gray Forge, the feeling is very firm, with several sales of good-sized lots at \$15.25. The market, therefore, may be called firmer all around, with the average of transactions at probably 25¢ per ton higher than the week previous.

**Blooms.**—It is a most difficult matter to quote Steel Blooms correctly. As we said last week, some of the leading makers are out of the market, others claim to be getting 50¢ @ \$1 per ton advance, while others are accepting business of a desirable character at the figures herewith quoted, viz.: \$28 @ 28.50, delivered, for Nail Slabs; \$30 @ \$31 for Tank Slabs; \$32.50 @ \$33.50 for Shell Slabs; \$36 @ \$37 for Flange, and \$38 @ \$40 for Fire-Box; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite, \$41 @ \$42.50; Scrap Blooms, \$32 @ \$33 per "Bloom" ton of 2464 lb.

**Muck-Bars.**—The market is bare of stock, so that prices are irregular and unsettled. Sales have been made at \$28.50, delivered, with a further demand at same price, but holders ask \$28.75 @ \$29. Probably \$27.50 @ \$28, at mill, might be accepted, although higher prices are confidently predicted.

**Bar-Iron.**—There is not the improvement in this department which the trade seemed to expect. The demand is better and prices are nominally higher, but the amount of business forthcoming at the advance is not important. At last week's prices some large orders could be had, but as the cost is considerably more than it was, manufacturers need some advance to let them out. The general feeling is that 1.85¢ base should be a minimum for first-class Bars, and those making such quality obtain that figure or let the business go elsewhere. Some outside mills accept 1.75¢, and still lower figures are mentioned for Western Iron, but in spite of the disparity in prices it is felt that the general tendency is toward improvement. Skelp Iron is inactive, but firm, at 1.75¢ for Grooved; Sheared at from 1.95 to 2¢. A much better demand is expected for Skelp Iron, as some large contracts for Pipe are under negotiation.

**Plate and Tank Material.**—The mills are very full of work, and large orders would be hard to place without causing a further advance in prices. There is a great deal of business to come on the market during the next 60 days, but as the most urgent requirements have been provided for there is a disposition on both sides to await developments before entering into further engagements. The feeling is very firm, nevertheless, and the chances seem to be ultimately in favor of higher rather than lower prices. Meanwhile quotations are about as follows (although some mills ask more, while others might shade a little, according to the condition of their order-books): 2¢ @ 2.2¢ for Ordinary Plates and Tank Plates; 2.10¢ @ 2.25¢ for Universal Plates; Shell, 2.4¢ @ 2.5¢; Flange, 3.25¢; Fire-Box, 3.7¢ @ 4¢; Steel Plates, Tank and Ship Plate, 2.2¢ @ 2.30¢; Shell, 2.5¢ @ 2.7¢; Flange, 2.4¢ @ 3¢; Fire-Box, 3.4¢ @ 4¢.

**Structural Material.**—There is very little change in this department. The mills have all the work they can handle for the present and all they care to take at current prices. The outlook for the summer months is unusually favorable, as there is a great deal of work that must be done promptly. Prices are firm but somewhat irregular, some asking an advance, others accepting last week's prices, viz.: Bridge Plate, 2.05¢ @ 2.15¢; Angles, 2.1¢ @ 2.2¢; Tees, 2.6¢ @ 2.7¢; Beams and Channels, 2.8¢ for Iron or Steel.

**Sheet Iron.**—The demand is of a very satisfactory character, coming as it does

from all classes of consumers. Mills have plenty of orders, and have no difficulty in obtaining full quoted rates for all they can deliver within a reasonable time. Prices for carload lots are about as follows:

Best Refined, Nos. 14 to 20.....	3¢
Best Refined, Nos. 21 to 24.....	3.20¢
Best Refined, Nos. 25 to 28.....	3.40¢
Best Refined, No. 27.....	3.50¢
Best Refined, No. 28.....	3.60¢
Common, ¼¢ less than the above.	
Best Soft Steel, Nos. 14 to 20.....	3½¢
Best Soft Steel, Nos. 21 to 24.....	3½¢
Best Soft Steel, Nos. 25 to 28.....	3½¢
Best Soft Steel, No. 27.....	4¢
Best Bloom Sheets, ¼¢ extra over the above prices.	
Best Bloom, Galvanized, discount.....	.65 %
Common, discount.....	.87½ %

**Steel Rails.**—Business is not active, but prices are very firm. Mills are fairly supplied with work for the next 60 days, and are not disposed to accept orders for later deliveries unless at about \$28 at mill. There is a good deal of inquiry, and it is expected that there will be a demand large enough to keep the mills fully employed at current rates or higher.

**Old Rails.**—There are so few Rails here, and so few wanted, that they are hardly worth quoting. Holders ask \$28 and upward for Philadelphia delivery, but consumers are quite indifferent unless they can get them at about that price delivered, and in most cases they get them on the terms named from roads in the interior, although \$28.50 @ \$24 has been paid for American Rails.

**Scrap-Iron.**—Good Scrap is scarce on the sea-board, but relatively in good supply in the interior. The result is a light business, but firm prices about as follows: \$20.50 @ \$21 for cargo lots; \$21 @ \$21.50 for carload lots, delivered, or for choice, \$22; No. 2 do., \$14 @ \$15; Turnings, \$14 @ \$15; Old Steel Rails, \$16.50 @ \$17.50; Cast Scrap, \$15 @ \$16; do. Borings, \$9 @ \$10; Old Fish-Plates, \$23 @ \$24; Old Car-Wheels, nominal, \$17 @ \$18, Philadelphia.

**Wrought-Iron Pipe.**—The demand is very satisfactory and prices firmly maintained. Mills are full of work, and it is said that some important contracts are on the point of being closed. Discounts unchanged, as follows: Butt-Welded Black, 52½ %; Lap-Welded Black, 65 %; Butt-Welded Galvanized, 45 %; Lap-Welded Galvanized, 52½ %; Boiler Tubes, 60 %.

**Nails.**—The demand is improving and the general feeling as to prices is better, but low sellers can still be found. For first-class Nails \$1.90 is quoted for carload lots and \$2 from store, but some brands are available at pretty near to the old figures. A general advance, however, is not improbable, and in fact is rather confidently predicted by some well-informed parties.

Messrs. John L. Hogan & Co. have removed their offices to the Bullitt Building (second story), 135 to 141 South Fourth street.

The partnership heretofore existing between E. M. Valentine and Ogden Armstrong, under the firm name of Valentine & Armstrong, has been dissolved by mutual consent. The business will be continued as heretofore by E. M. Valentine & Co.

Mr. Samuel D. Hopkins, who had charge of the warehouse and store of the Reading Iron Works, in Philadelphia, has resigned that position and formed a partnership with Mr. Charles E. Small, under the firm name of Hopkins & Small. The firm will act as manufacturers' agents for the sale of Wrought-Iron Pipe and Boiler Tubes, Engineers' and Machinists' Supplies, &c., at No. 206 South Fifth street, Philadelphia.

## Pittsburgh.

Office of *The Iron Age*, 77 Fourth Ave.,  
Pittsburgh, June 26, 1889.

There has been nothing especially important developed in the general Iron business during the past week. The mills are all in operation and many of them are working up to their full capacity, and the outlook is favorable. The most important event of the week in labor circles was the rejection by the men employed at the Homestead Steel Works of the new scale submitted by the firm, so that a strike appears inevitable. So far as known, none of the manufacturers have as yet signed the scale.

Freight rates on Iron and Steel from here eastward have been reduced about 3¢ per 100 lb. The new rates are elsewhere published.

**Pig-Iron.**—We have to record a more active and firmer market, and there are now but few, if any, sellers for future delivery at present prices. And even for immediate near-by delivery buyers are more numerous and sellers are indifferent about making additional sales, and the most of the furnaces in this district are pretty well sold up. We quote prices as follows:

No. 1 Gray Forge.....	\$13.80 @ \$14.00, cash
No. 2 Gray Forge.....	\$13.50 @ \$13.75, "
All-Ore Mill.....	14.50 @ 15.00, "
White and Mottled.....	13.00 @ 13.50, "
No. 1 Foundry.....	16.00 @ 16.25, "
No. 2 Foundry.....	15.00 @ 15.25, "
No. 3 Foundry.....	14.50 @ 14.75, "
No. 2 Charcoal Foundry....	21.00 @ 21.50, "
Cold Blast Charcoal.....	26.00 @ 26.80, "
Bessemer Iron.....	15.75 @ 16.00, "

In regard to Bessemer Iron, while but few sales were reported, the market is firmer. We now quote at \$15.75 @ \$16, cash, for immediate delivery, but furnacemen are demanding considerably more for future delivery.

**Muck-Bar.**—Is in better demand and firmer, and while we are advised of a sale of 2500 tons at \$26, cash, there are but few sellers now under \$26.50, cash, and it is doubtful whether contracts could be made for August delivery under \$27, cash, as the feeling generally obtains that Pig-Iron is likely to advance within the next few weeks.

**Spiegel.**—Is still quoted at \$30 to \$30.50, cash, for 20 % and Ferro-manganese at \$59.50 @ \$60, cash, for 80 %.

**Manufactured Iron.**—There is a fair business; mills generally are pretty well employed, but prices have not improved. Of course manufacturers want to keep their mills in operation and hold their trade, which many of them have realized is easier to lose than regain, but many claim that it is difficult to get a new dollar for an old one in the present condition of the market. We continue to quote good Iron upon a basis of 1.60¢ @ 1.70¢ for Bars, 60 days, 2 % off for cash. Plate-Iron is quoted at 2.10¢ @ 2.15¢, and No. 24 Sheet at 2.70¢ @ 2.75¢. Skelp Iron, 1.60¢ @ 1.65¢ for Grooved and 1.90¢ @ 1.95¢ for Sheared.

**Nails.**—The Western Nail Association having dissolved, there are no regular prices, and it is difficult to give reliable quotations in consequence. Manufacturers here continue to quote at \$1.80 @ \$1.90, 60 days, 2 % off for cash. Wire Nails are quoted at \$2.20 @ \$2.25, 60 days, 2 % off for cash; car lots can be bought at the inside quotation.

**Wrought-Iron Pipe.**—The activity noted for some time past continues, and the combination prices are being faithfully adhered to; it is said that never since the association was formed have prices been so honestly maintained as the present year. There has been entire absence of cutting ever since the reorganization of the association. Discounts on Black Butt-Welded Pipe, 52½ %; on Galvanized do., 45 %; on Black Lap-Welded, 65 %; on Galvanized do., 52½ %; Casing, 5½ inches,

62½ % off; other sizes, 60 % off; Boiler Tubes, 1½ inches and smaller, 55 % off; 2 inches and larger, 60 % off; 2-inch Tubing, 13¢ per foot, net; Line-Pipe, 2-inch, 10½¢ per foot, 2½-inch, 16¢; 3-inch, 25¢; 4-inch, 30¢; 4½-inch, 36¢; 5-inch, 42¢; 6-inch, 58¢; 7-inch, 70¢; 8-inch, 95¢; 9-inch, \$1.20; 10-inch, \$1.25; 12-inch, \$1.60.

**Old Rails.**—Old Iron Rails are still quoted at \$22.25 @ \$22.50. Some of the brokers report that while the offerings are light, the demand is chiefly for small lots, indicating that consumers are not disposed to buy beyond immediate actual wants. Old Steel Rails are still quoted at \$16.50 @ \$17 for short and \$19 @ \$20 for long pieces.

**Steel Rails.**—Heavy sections are still quoted at \$26 @ \$27, cash, at mill, according to character of order and delivery. The market is firmer, with an increasing demand. It is said that some of the orders of the Cambria Company have been transferred to other mills, the former, owing to its disablement, not being able to fill the same according to contract. Both mills, the one at Braddock and the other at Duquesne, are running up to their full capacity.

**Blooms, Billets, &c.**—Sales of Bessemer-Steel Billets reported at \$26.75 @ \$27.25, and Bessemer-Steel Nail Slabs at \$26.50. There have been no sales of Bloom Ends or Rail Crops recently, in the absence of which it is difficult to give reliable quotations.

**Railway-Track Supplies.**—There is an improved demand, but no change in prices. Spikes, 1.95¢, 30 days, free on cars at works in Pittsburgh; Splice Bars, 1.65¢ @ 1.75¢; Track Bolts, \$2.75 with Square and \$2.85 with Hexagon Nuts.

**Old Material.**—There is more inquiry, and the market is firmer, but prices remain about as last quoted. Sales of No. 1 Wrought Scrap, \$18, net ton; No. 1 Wrought Turnings, \$13 @ \$14; Old Car-Axles, \$23 @ \$24.50; Cast Scrap, \$13.50 @ \$14, gross; Cast Borings, \$11.50 @ \$12, gross; Old Car-Wheels, nominally \$18; sale of Beam Ends at \$17.25, gross. The indications are that there will be a materially improved demand for everything in this line next month, and if so the market will stiffen.

## Chattanooga.

Office of *The Iron Age*, Carter and 9th Sts.,  
CHATTANOOGA, June 24, 1889.

**Pig-Iron.**—The indications for the past week have been very encouraging to producers, and the outlook for the future, so far as prices are concerned, is much improved. The inquiry has been more active and the endeavors to contract for round lots for monthly deliveries in the future have been more numerous than formerly. Quite a number of furnaces have withdrawn from the market and others are asking an advance of 50¢ per ton, and instances are not wanting when large orders have been declined at that. So far as can be ascertained there has been but very little accumulation of stocks in the yards of any of the furnaces; nearly all on hand has been held some time by furnaces that are able to hold against any financial pressure. Large consumers are, as a general thing, confining themselves to grades and makes that they have been using in the past and with which they appear to be satisfied, and with good customers the furnaces are dealing liberally, so far as prices are concerned. Some three or four of the large Pipe-makers took in the situation and have contracted within the past month for large round lots of Pipe Iron, aggregating probably some 50,000 tons, which will put them out of the market for a while; but the increased

demand that has come forward from other sources would more than cover the capacity of the furnaces even if all were willing to sell.

The freight rates on Pig Iron from Birmingham have been decreased to \$3.65 to Chicago, Pullman, Grand Crossing and Hegewisch, formerly \$4.

The Attalla Furnace, recently blown in so successfully at Attalla, Ala., is now about up to her capacity. The Ore that is being used is from what is known as the Dirt Seller Vein, with some little Brown Hematite. This Ore is called the Red Fossil, and the vein runs from 3½ to 5 feet, continuing through the Coosa Valley with very little variation. It was partially from this Ore that the Confederate Government made their celebrated Brooks guns at Selma. Some two or three small furnaces were formerly run on this ore, and the product was made into Car-Wheels, which gained a wide celebrity through the South.

## Detroit.

WILLIAM F. JARVIS & Co., under date of June 24, 1889, says: There has been a large amount of buying during the past week, and the Lake Superior Charcoal trade has been very active. Several large buyers have made their purchases for from six months to a year's delivery, and there are several buyers willing to contract if they can secure long deliveries at present price, or even at a slight advance. The demand for Coke Irons has also been better than for some time past, but Silvery Irons are most called for, and some large sales have been made at low figures. We cannot report any advance, but furnaces are refusing orders for long deliveries at present quotations, unless in special cases. We report an active market and quote as follows:

Lake Superior Charcoal, all numbers.....	\$19.00 @ \$19.50
Lake Superior Coke, all ore.....	18.00 @ 18.50
Lake Superior Coke, cinder mixed.....	17.50 @ 18.00
Standard Ohio Black Band.....	17.50 @ 18.50
Southern No. 1.....	18.50 @ 17.00
Southern Gray Forge.....	15.00 @ 15.50
Southern Silvery.....	18.00 @ 18.50
Jackson County (Ohio) Silvery..	18.00 @ 18.50
Old Wheels.....	18.50 @ 19.00

## New York.

Office of *The Iron Age*, 66 and 68 Duane street,  
New York, June 26, 1889.

**Pig-Iron.**—The tone of the market continues firm, the advanced rates recently made on special brands being sustained. Buyers now realize that they no longer control the situation and are inquiring prices in directions which they had for some time neglected. The Thomas Iron Company, who are still the largest makers of Foundry Iron in the country, report that they will have no more Iron to sell this year except to their own recognized customers. Their output is now 3600 tons per week, which is being shipped as rapidly as it is produced. The condition of this company well represents the change which has come over the Iron trade. At this time last year they had a stock of 12,000 tons of Nos. 1 and 2 Foundry, but they now have only 1200 tons on hand, all of which will be shipped to customers before the 1st of July, thus leaving them with no stock. In almost equally good condition is the Tennessee Coal, Iron and Railroad Company, represented in this market by Naylor & Co. Their capacity is well sold up for months ahead and they are making large shipments. While ready to take small orders, they are not forcing the market, but can afford to await developments. These are representative concerns, North and South, and their condition shows very plainly the satis-

factory shape into which the Iron trade has gradually worked. The advance of 50¢ by the Thomas Iron Company goes into effect next Monday, but does not apply to their regular customers. The demand for Iron was quite good during the week, but the volume of business was not as large as in the preceding week. Quotations are as follows: Northern Irons at tidewater, \$16.50 @ \$18 for No. 1, according to brand; \$15.50 @ \$17 for No. 2; \$14.50 @ \$15.25 for Gray Forge. Southern brands sell at \$16.25 @ \$17 for No. 1; \$15.50 @ \$16 for No. 2; \$14.75 @ \$15 for No. 3; \$4.25 @ \$14.50 for Gray Forge, all delivered at New York.

**Scotch Pig.**—Consumers are still ordering for future delivery, but the entire quantity of Iron sold on this account will not reach very large figures. Stetson & Co. have cable advices from abroad that prices are slowly advancing, but quotations here are not affected, being as follows: Eglinton, \$19; Dalmellington, \$19.50; Langloan, \$21.25; Summerlee, \$21.50; Coltness, \$21.50.

**Spiegeleisen.**—Twenty per cent. is quoted at \$28 @ \$28.50, and 80 % Ferro at \$59 @ \$60, with very small transactions.

**Wire Rods.**—The quotation ex-ship is still \$43, with no sales.

**Structural Iron and Steel.**—A very satisfactory business is in progress, but the demand is not so heavy as it was during the previous week. Buyers are realizing that there is not any danger just at present of a decided scarcity of material. Still, quotations are firmly held at the higher rates recently made, and it seems likely that they can be maintained. Prices are about as follows for delivery on dock: Sheared Plates, 2.05¢ @ 2.1¢; Universal Mill Plates, 2.1¢ @ 2.15¢; Angles, 2.05¢ @ 2.1¢; Tees, 2.5¢ @ 2.6¢; Beams and Channels, 2.8¢.

**Plates.**—The mills represented in this market are very full of work, and it is somewhat difficult to place orders with those whose products have the highest reputation. For delivery on dock quotations are as follows: Tank Iron, 2.05¢ @ 2.1¢; Shell, 2.4¢ @ 2.5¢; Steel Tank, 2.25¢ @ 2.3¢; Shell, 2.4¢ @ 2.5¢; Flange, 2.7¢ @ 2.8¢; Fire-box, 3.25¢ @ 4¢.

**Bar-Iron.**—Work is fairly abundant, with prices for dock delivery as follows: Common, 1.6¢ @ 1.65¢; Medium, 1.7¢; Refined, 1.75¢ @ 1.9¢.

**Merchant Steel.**—The week has been very quiet in this line, with quotations unchanged, as follows: Tool Steel, good brands, in large lots, 7¢ @ 7½¢; specials, 12½¢ @ 20¢; Crucible Spring, 8½¢ @ 4¢; good Open-Hearth Machinery, 2.30¢ @ 2.5¢; common ditto, 2¢ @ 2.25¢; Open-Hearth Spring, 2½¢ @ 2.5¢; Sheet, 6½¢, 8½¢ and 10½¢.

**Steel Rails.**—Inquiries are still coming forward but not for large quantities, except in the case of railroad projects involving some financing as a preliminary to business. The sales of the past week have therefore amounted to but a few thousand tons. The manufacturers, however, appear to be well supplied with orders for some time to come and are disposed to let matters shape themselves. They quote on small lots, such as are now being placed, \$28 @ \$28.25, at mill.

**Track Supplies.**—A fair volume of business is reported, but in Fish-Plates there is an unsettled feeling caused by the competition for orders on the part of mills making Steel. The usual quotations are 1.85¢ @ 2¢ at mill, but Steel Fish-Plates can be purchased at perhaps ½¢ lower. Track Bolts, with Square Nuts, are firm at 2.70¢ @ 2.75¢; Hexagon Nuts, 2.90¢, of Common Iron, and 3¢, Refined Iron.

Spikes are quoted at 2¢, with an upward tendency.

**Old Material.**—Old Iron Rails are in good request. A sale of 800 tons is reported at \$22, on cars, New York, equivalent to \$22.50 on the other side of the North River. Consumers are offering \$22.50 @ \$22.75, but are unable to secure Rails held here in store, for which \$24 is asked. Old Steel Fish-Plates have been sold at \$22, on cars, New York; Iron Fish-Plates at \$23, also on cars, New York. Wrought Scrap is firmer, with more business doing, and is now quoted at \$21 for No. 1 of good quality.

## Financial.

There was much speculative activity during the past week, "industrial stocks" having become more than ever a special feature, the aggregate transactions in these latter on 'Change being considerably in excess of the total of all other descriptions. Oil trading also became exciting after a long period of inertia. Wheat, corn and oats advanced a little, with a moderate inquiry from shippers, chiefly for Europe, though partly for South America, but scarcity of freight room checked European business. Spot corn at the close was easier. Hog products steadily tend to lower prices. The break in coffee is still felt in the market. In dry goods there is a firm tone, so that opportunities for buyers are less favorable than a month ago. A pleasing feature is the good harvest reports. In California wheat is being gathered all over the State with the best results. A St. Paul dispatch says: "Conservative estimates made on 'Change place the wheat crop for Minnesota and Dakota at from 70,000,000 to 100,000,000 bushels." The wheat harvest is in progress as far north as central portions of Ohio, Indiana and Illinois. The Illinois State Board estimate the crop at 26,670,000 bushels. In Kansas the crop is gathered and President Cable, of the Rock Island, says the yield is a good one. The report of damage is contradicted. The business situation as a whole is generally construed as favorable, despite the export of gold and speculative tendencies, though the continued agitation respecting costs of transportation operates as a drawback. There is a belief, however, that rates will be maintained in prospect of heavy traffic in wool, grain, &c. Flying rumors in regard to trusts in coal, rubber, castor oil, plug tobacco and other descriptions of merchandise have not materialized. The decision of Judge Rightor, of New Orleans, making permanent the writ of injunction issued previously against the Cotton-Seed Oil Trust, forbidding the trust to exercise any privileges or franchises in the State of Louisiana, and declaring it to be an illegal and invalid association, is in harmony with Judge Barrett's Sugar-Trust decision in this city.

The Stock Exchange markets were active, with sales of trust stocks the leading feature, notably Sugar Refineries, Cotton Oil and Lead trusts. The buying of Sugar Trust was accompanied by a rumor of an extra dividend to be paid out of the enormous surplus which the trust claims to have in its treasury. On Monday transactions were enormous. The advance in Lead Trust was said to have been caused by a report that the Atlantic Lead Company, of Brooklyn, had been absorbed, and the rise in Pipe Line certificates was represented to be due to an increased export demand for oil. The boom in petroleum was not less marked, sales aggregating 5,000,000 barrels and prices touching 89¢. American cotton-oil certificates were sold on Judge Rightor's decision enjoining the trust from doing business in the State of Louisiana, but the price declined only ¼, to 58, and rallied to 58½. On Tuesday

Sugar Trusts fluctuated widely and lost all Monday's advance, closing at 117½. Lead certificates were again lively with large transactions, but conservative investors fight shy. Railway shares received more attention, and were well sustained. The Standard Oil is credited with having inspired the entire deal.

United States bonds are quoted as follows:

U. S. 4½%, 1891, registered.....	108½
U. S. 4½%, 1891, coupon.....	108½
U. S. 4%, 1907, registered.....	128½
U. S. 4%, 1907, coupon.....	129½
U. S. currency 6s.....	118

The money market was a shade firmer, owing to the reluctance of capitalists to accept Trust certificates as collateral for loans on as favorable terms as railway shares. Time money on first-class collateral is quoted at 3 % for 90 days; 3½ % @ 4 % to end of the year. The supply of commercial paper is better, and is quoted 60 to 90 days at 3½ % @ 4½ %; good single names, four to six months, 4½ % @ 5½ %.

The weekly statement of the Associated Banks shows a loss in surplus reserve of \$1,882,725, which reduces the amount held above legal requirements to \$9,220,500. The exports of nearly \$6,000,000 gold and the absorption of money by the Treasury operated against the banks. The gain from the interior currency movement was less than usual. The loss in specie and legal tenders combined was \$1,496,500. Loans were increased \$615,600 and deposits decreased \$455,100. According to the custom-house report the exports of specie from New York for the week were \$5,894,839, making a total since January 1 of \$47,679,659, which is the largest amount recorded for the same period within the last decade. Director of the Mint Kimball, when questioned with regard to gold exports, said that they were caused by demands from France. "About the 1st of June," said the director, "the Bank of England raised by half a penny an ounce the price at which it would sell French gold coins, and recourse has been had to the United States." Another explanation is that shipments of gold result from sales of securities on French account by those who have suffered in copper speculations. Again, foreign capitalists are dissatisfied with the present aspect of the silver question. The commercial and crop situation indicate that the flow of gold will soon be in the opposite direction.

The total clearings of 37 cities last week show an increase of 30.6 %. New York gained 11.2 %; Boston, 37.7 %; Philadelphia, 11.4 %; St. Louis, 30 %; San Francisco, 25 %; Cincinnati, 20.7 %; Louisville, 36.9 %; New Orleans, 21.6 %; Omaha, 32.4 %; Denver 29.7 %; Cleveland, 27.2 %; Indianapolis, 20.2 %.

The importations of merchandise at this port during the week were valued at \$9,908,000. Since January 1 the total is \$242,958,000, as compared with \$231,142,000 for the same time last year. The exports were \$4,950,000.

The Bureau of Statistics statement of imports and exports for May, just issued, shows a considerable increase in the value of both exports and imports over May, 1888. Exports of merchandise during the past month aggregated in value \$52,169,197, against \$47,087,190 in May, 1888; while imports of merchandise in May past were valued at \$68,754,994, against \$60,482,698 in May a year ago.

The total merchandise and coin and bullion exports during May aggregated \$70,103,756, while imports amounted to \$71,415,617, an excess of imports over exports amounting to \$1,311,861. For the 11 months of the current fiscal year exports of merchandise, coin and bullion aggregated in value \$769,412,975, an excess of \$58,597,509 over imports for the same period.

## Metal Market.

**Copper.**—The London market declined on spot Copper from £41. 10/ last Wednesday to £41. 2/8 yesterday, and futures from £41. 5/ to £40. 15/, with sales of 900 tons. Pending the renewal of a pool sale by the Lake companies to our manufacturers, to date from the 1st prox., the price to large consumers has remained 12¢. There is a diversity of opinion as to whether or not this figure will be fixed for the next contract. Some consumers think it may be reduced, while others are inclined to believe there will be no change, as consumption seems to readily absorb Lake Copper at 12¢. It has been jobbing at 12½¢ @ 12½¢, and casting brands have moved off at 10½¢ @ 11½¢, as to brand. During the first quarter of this year Spain exported 928,667 tons of Pyrites, against 270,754 in 1888 and 266,679 in 1887; of Precipitate the shipments were 8781 tons, against 10,164 and 9823.

**Tin.**—London gave way since our last report from £89. 10/, spot, to £88 last night, and futures from £90. 2/6 to £88. 15/. Sales were 800 tons. As we have followed suit, consumers have taken hold more readily, buying in the open market at 19.95¢ @ 20¢ some 200 tons, but with the drooping tendency subsequently accelerated, September and October were done on 'Change at 19.80¢, July at 19.70¢ and September at 19.85¢, the spot price winding up at 19½¢ @ 19½¢. At the Metal Exchange on the first call 10 tons July brought 19.85¢, and 10 tons October 20¢. **Tin-Plates.**—Only a moderate business having been done, prices remain without material change; the make continues excessive, and stocks accumulate on the other side, where prices are weak in consequence. The export of Tin-Plates from England to the United States during the past five months has been 150,232 tons, as compared with 117,254 tons same time last year and 109,943 in 1887; to all quarters, America included, it was 187,786 tons, against 153,781 and 145,072. We quote large lines, ordinary brands, ½ box: Siemens-Martin Steel, Charcoal finish, \$4.75 @ \$5.50; Coke finish, \$4.55 @ \$4.65; Terns, \$4.12 @ \$4.30; Coke Tins, \$4.22½ @ \$4.32½, and Wasters \$4.12½ @ \$4.15.

**Lead.**—Sales in the open market were restricted to 400 tons of Common Domestic at 4¢, the market being quiet and closing at this figure, while at St. Louis it has been strong at 3.80¢, and at Chicago at 3.85¢. Nothing has as yet been decided in Washington about the Ore question, the impression in this city being that a duty will be imposed; still, there is nothing positive to base this belief on, the contending interests being equally powerful. Spanish exportation of Pig Lead during the first quarter has been 42,105 tons, against 44,460 tons during the corresponding period of last year and 42,972 in 1887. At the Metal Exchange on first call 50 tons August Lead were sold at 4.05¢, closing at 4¢ bid and 4.07½¢ asked.

**Spelter.**—The floods out West have caused a rise in Ores there of \$1 to \$2 ½ ton, so that Common Domestic cannot be sold for less than 5¢ @ 5.05¢ in this city, at which it remains moderately active, while Silesian, with the rise in London, is held at 5.85¢ @ 5.90¢. Spanish Calamine exportation during the first quarter has been 6773 tons, against 8518 last year and 8287 in 1887.

**Antimony.**—Has been strong, with an active demand, at 15½¢ @ 16¢ Cookson's, and 14¢ @ 14½¢ Hallett's.

### New York Metal Exchange.

The following sales are reported:

FRIDAY, June 21.	
50 tons Lead, spot.....	3.97½¢
16 tons Lead, August.....	4.02½¢
10 tons Tin, August.....	20.10¢

10 tons Tin, spot.....	19.95¢
15 tons Tin, spot.....	20.00¢
10 tons Tin, October.....	20.00¢

### MONDAY, June 24.

10 tons Tin, September.....	19.80¢
10 tons Tin, October.....	19.80¢
50 tons Lead, spot.....	4.00¢

### TUESDAY, June 25.

16 tons Lead, September.....	4.10¢
20 tons Tin, July.....	19.70¢
10 tons Tin, September.....	19.85¢
22 tons Lead, August.....	4.07½¢

### WEDNESDAY, June 26.

50 tons Lead, August.....	4.05¢
10 tons Tin, July.....	19.85¢
10 tons Tin, October.....	20.00¢
30 tons Tin, July.....	19.95¢

### Old Metals.

The following are the prices paid for Old Metals in New York:

Heavy Copper.....	\$ 10 9¢
Light Copper.....	\$ 10 8¢
Heavy Brass.....	\$ 10 7¢
Light Brass.....	\$ 10 6¢
Lead.....	\$ 10 3¢
Tea Lead.....	\$ 10 2½¢
Zinc.....	\$ 10 2½¢
No. 1 Pewter.....	\$ 10 14¢
No. 2 Pewter.....	\$ 10 7¢
Wrought Scrap Iron.....	\$ gross ton, \$17.00
Heavy Cast Scrap.....	\$ gross ton, 12.00
Stove Plate Scrap.....	\$ gross ton, 8.00
Burnt Iron.....	\$ gross ton, 6.00

## Coal Market.

The Hard-Coal trade is dull and weak, supplies from the mines being in excess of requirements, while the demand is of the character usual at this season. A report comes from Philadelphia that it is generally believed that no advance in prices can be secured in the schedule for July, "though an attempt to that end will be made." It is natural to reason that agitation on this subject would at least have a bracing effect, but it is remarked that "the raising of prices ahead of the market does not work as well this year as it did last." Producers are confident of an active period near at hand, although just now sales are heard of as low as \$4 ½ ton for Stove and \$3.75 for Chestnut, alongside. The reported total production last week is 807,600 tons, as compared with 580,000 tons a fortnight ago, and since January 1 the figures are 14,323,000—a decrease of 1,315,000 tons compared with the same time in 1888. The Reading Company contributed during the week 142,000 tons, indicating a rapid recovery from their loss by the flood. Anthracite has been helped by the cutting off of supplies of Bituminous Coal via the Beech Creek route and other heavy feeders. Further relief will come from the reopening of communication with the West about the beginning of July. From an official of one of the Anthracite Coal roads it is learned that the production in May was 3,016,581 tons, against 2,851,470 tons in May of last year. The stock at tide-water June 1 was 962,066 tons, against 964,628 tons on June 1, 1888. For five months the output is as follows:

Region.	1889.	1888	Difference.
Wyoming.....	6,307,812	8,541,891	Dec. 2,184,079
Lehigh.....	2,280,628	1,890,580	Inc. 969,048
Schuylkill.....	3,496,544	3,906,384	Inc. 161,169
Total.....	12,113,986	13,177,906	Dec. 1,063,821

Bituminous Coal is in full supply and prices are cut. Cumberland shipped for the week ending June 15 60,850 tons and since January 1 1,319,792 tons. On the Pennsylvania Railroad cars are scarce both for Bituminous and Anthracite, on account of the demands in transporting road-bed material for repairs. Grievous complaints are heard from the iron establishments in Eastern Pennsylvania, many of which were threatened with an immediate shut-down on account of the scarcity of fuel, as the Schuylkill Valley is largely supplied from Beech Creek and Clearfield.

At Pottstown the Ellis & Lessig Steel and Iron Company, Cofrode & Saylor's extensive bridge works and the Pottstown Iron Company were nearly out of fuel. At Conshohocken the Jawood Lukens rolling-mill and the Woods mill were nearly exhausted. In most cases there has been timely relief.

A serious strike may follow a failure to settle differences between Clearfield miners and the coal operators about pay for "dead work."

## Imports.

### Hardware, Machinery, &c.

## British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]

LONDON, WEDNESDAY, June 26, 1889.

The trade demand for named brands and Merchant-Bar Copper has been quite large, but it is believed that large holders continue to realize, and prices for Merchant Copper are therefore somewhat irregular, with sales of prompts at £41 the past few days. Few traces are noticeable of demand from French consumers. Nothing new transpires regarding the proposed agreement between producers.

Block Tin has continued to decline under the weight of free selling caused by full supplies from the Straits and comparatively little business. Sales were made at £88 for prompts, but from that price there was a reaction to £88. 10/ late Tuesday and a further 2/6 @ 5/ rise to-day.

Speculation in Pig-Iron warrants has been moderate owing to absence of outside interest in the market and prices are hardly steady. Stocks have been reduced owing to the damping-down of three furnaces on account of disputes with workmen and higher prices for Ores and Coal. A further reduction in the output from the same causes is likely. The demand for makers' brands of Scotch has been rather slow, but Middlesborough is more active and there continues to be a fairly active trade in Hematites.

The Tin-Plate market is in a dragging condition at present and sellers are less pressing with buyers in the matter of prices. No change of importance is quoted.

Bolckow, Vaughan & Co. have booked a large order for Steel Rails for India, and German makers have secured a large one for Australia. The market is quite lively, and a brisk trade is reported also in Billets and Blooms.

The Belgian Iron syndicate agreement has been renewed.

Consumers have been buying old material less freely, but firm prices are maintained by holders.

**Scotch Pig.**—The volume of business is moderate and prices are without material alteration.

No. 1 Coltness, f.o.b. Glasgow	54/6
No. 1 Summerlee, " "	53/6
No. 1 Gartsherrie, " "	51/6
No. 1 Langloan, " "	53/6
No. 1 Carnbroe, " "	49/6
No. 1 Shotts, " at Leith	52/
No. 1 Glengarnock, " Ardrossan	51/6
No. 1 Dalmeilington, " "	45/
No. 1 Eglinton, " "	43/
Steamer freights, Glasgow to New York, 2/;	
Liverpool to New York, 10/.	

**Cleveland Pig.**—More doing in this line and the market firmer. No. 3 Middlesborough quoted 38/6 @ 39/ prompt.

**Bessemer Pig.**—There is a fairly active business at steady prices. West Coast brands, mixed numbers, 49/6, f.o.b. shipping point.

**Spiegel Eisen.**—The movement has continued free and prices are steady. English 20 % quoted 80/, f.o.b. at N. W. England shipping point.

**Steel Rails.**—A large business done at about last week's prices. Heavy sections quoted at £4. 10/, and light sections £4. 17/6 @ £5, f.o.b. at N. W. England shipping point.

**Steel Blooms.**—There has been a fairly active demand and the market is firm. We quote £4. 5/ for 7 x 7, f.o.b. at N. W. England shipping point.

**Steel Billets.**—Sales have been large and the market is strong. Bessemer, 2½ x 2½ inch, £4. 12/6, f.o.b. at N. W. England shipping point.

**Steel Slabs.**—Business moderate, but prices held firmly. Bessemer, £4. 12/6, f.o.b. at N. W. England shipping point.

**Old Rails.**—The demand fair and sellers firm. Tees quoted at £3. 5/ @ £3. 7/6, and Double Heads, £3. 12/6 @ £3. 15/, c.i.f., New York.

**Scrap-Iron.**—A fair business, with prices very steady. Heavy Wrought quoted at £2. 2/6 @ £2. 5/, f.o.b.

**Crop Ends.**—The movement is fair and prices steady. Bessemer quoted £2. 12/6 @ £2. 15/, f.o.b.

**Tin-Plate.**—Business moderate and prices hardly steady. We quote, f.o.b. Liverpool:

IC Charcoal, Alloway grade	15/3 @ 15/6
IC Bessemer Steel, Coke finish	12/6 @ 12/8
IC Siemens	13/9 @ 13/10
IC Coke, B. V. grade	12/ @ 12/6
Charcoal Terne, Dean grade	12/ @ 12/3

**Manufactured Iron.**—There has been more activity in this branch, at generally firm prices. We quote, f.o.b. Liverpool:

Staff, Marked Bars	£ s. d. @ 8 2 6
Common	6 2 6 @ 6 5 0
Staff, Bl'k Sheet, singles	7 15 0 @ 7 17 6
Welsh Bars (f.o.b. Wales)	5 12 6 @ 5 15 0

**Copper.**—A fairly active business, with prices rather lower on Merchant-Bars. Today's prices for Bars were £41. spot; £40. 12/6 @ £40. 15/, three months' futures. Best Selected, £47.

**Tin.**—Quite active trading on the decline. Straits quoted to-day at £88. 10/ @ £88. 15/, spot, and £89. 5/ @ £89. 10/ for three months' futures.

**Lead.**—The market remains very quiet, with prices easy. Quoted £12. 7/6 for Soft Spanish.

**Spelter.**—There has been a large business and the market is stronger. Quoted at £19. 10/ for ordinary Silesian.

## Foreign Markets.

### EQUIVALENTS.

### EAST INDIES.

**COLOMBO, CEYLON, May 16, 1889.**—*Plumbago.*—Prices are firmly sustained, with a good business doing. We quote at the close in rupees: ton: Large lumps, 145 @ 170; ordinary lumps, 125 @ 160; Chips, 80 @ 95, and Dust, 40 @ 65. Following have been the shipments to date since October 1: To England, 95,788 cwt.; to Hamburg, 6206; to Antwerp, 6299; to Bremen, 1060; to Holland, 437; to India, 139; to Australia, 287, and to the United States, 85,951; together, 200,167, against last year 164,003, 184,020 in 1887 and 110,171 in 1886. The market for Coir Yarn is steady and unaltered at 7 @ 13 rupees per cwt., Nos. 1 to 4. *Exchange.*—Six months' sight on London, 1/4%. *Volkart Bros., Ceylon and Malabar Coast, through their agent in New York, Mr. John W. Greene, 82 Wall street.*

**SINGAPORE, May 9, 1889.**—*Tin.*—Following currency of London prices, our market has given way to \$34.37½ per picul, at which there are sellers, but no buyers. Stocks are not large, nor are large supplies expected to arrive in the near future, so that any further decline there may be must take its origin in the consuming markets. The April shipments were: 422 piculs per steamer Kaiser-i-Hind, from Penang; 590 per Prometheus, 253 per Kasgar and 1683 per Preussen, hence all for New York; 169 per Monmiur, hence to San Francisco, and 1682 per Nizam to New York. Total shipments to the end of April from the Straits, 43,894 piculs. *Cum Copal.*—Moderate arrivals have commanded full prices for good quality. *Gum Damar.*—There have been no arrivals. *Tonnage.*—Steamer rates for London are firmer, both for this and next month's shipment, at 40/ for dead-weight, with very little room offering by the regular lines. *New York via Cape.*—The Elise, due in a few days, will occupy this berth, having secured a full complement of dead-weight. For Boston the berth is vacant at the moment. *Exchange.*—Very firm indeed at 3/1½ for six months' sight credit drafts. *Gilfillan, Wood & Co*

**MANILA, June 17, 1889.**—*Hemp.*—The quotation is nominally \$15 per picul, as compared with \$8 same date last year, equaling per ton, cost and freight, £48/5, against £27. 7/6. The clearances for the United States since January 1 amount to 118,000 bales, as against 83,000 last year; loading for do., 13,000, against 17,000; cleared for England since January 1, 120,000, against 150,000; loading for do., 8000, against 30,000; cleared for all other ports, 22,000, against 38,000; receipts at all ports since last cable, 21,000, against 10,000; since January 1, 288,000 bales, against 283,000 in 1888 and 219,000 in 1887. *Freight.*—\$7.50, against \$5.50. *Exchange.*—Six months' sight, 3/5½, against 3/5¼. *Ker & Co., per cable direct to their agent in New York, Mr. Charles Nordhaus, 89 Water street.*

### SPAIN.

**BILBAO, June 1, 1889.**—*Iron Ore.*—An active demand has prevailed during the week; several contracts have been made, some being quite important. Most of the Rubios sold went at 7/ @ 7/3, some bringing as much as 7/6. Campanil being scarce it has not been easy to get any at 8/4 @ 8/6; Superior Campanil, 8/9 has been offered for in vain. A few cargoes of Vena brought 8/3 @ 8/6. Ore freights continue tending downward. Only 67,858 tons were shipped during the week. Total Ore export since January 1, 1,692,103 tons, against 1,598,585 in 1888. *Pig-Iron.*—While 2133 tons were exported during the week, 952 went coastwise. *Bilbao Marítimo y Comercial.*

### BELGIUM.

**BRUSSELS, June 15, 1889.**—*Iron.*—Consumers are not very anxious to subscribe to the advance of 2.50 francs per ton in Merchant Iron agreed upon at the late general meeting of Iron-masters. The quotation for sale at home is at present, for Nos. 1 to 3, 12.75 @ 14.75 francs per 100 kg., and free on board at Antwerp, 12.25 @ 13.75; Angles respectively, 13.75 and 13.25; ditto for vessels, 14.50. Makers of Beams not being members of the syndicate, they have not raised them. On June 1 32 blast-furnaces were in operation in Belgium and 18 blown out. The May product has been 51,685 tons, of which 54,715 Forge Pig; 4185 Foundry ditto, and 22,785 Steel. Steel-Rail orders from South America have been refused, our mills being engaged for months ahead, and they have gone to France. *Moniteur des Intérêts Matériels.*

### GERMANY.

**HAMBURG, June 15, 1889.**—*Iron.*—The Iron trade of Rhenish-Westphalia has pretty much returned to a normal condition. In the Siegen district, while the strikes lasted, the blast-furnaces, with a reduced output, had nevertheless been kept going, and a good demand is now setting in for their product. Although Spiegel has been a little less sought for, it remains firm at 66 marks for 10 @ 12 % Manganese. White Luxembourg Pig improved to 36 @ 38 marks; Gray remains 40 @ 42. Finished Iron has kept uninterruptedly active; Hoop Iron in particular has been in lively request at advancing figures. All other rolling mill products have remained steady, but unaltered. Machine-shops, foundries and car-works have continued doing well. They quote Wire-Rods 110 @ 120; Steel Rails, 125 @ 130; last sale at 127; ditto for mines, 110 @ 115. *Metals.*—Have been looking up, Copper in particular, the general inquiry being brisk for all of them. We quote in this city: German Lead, 13 @ 13.30 marks per 50 kg.; Lake Copper, 64 @ 67; Spelter, 18 @ 18.50; Zinc, White, 21 @ 22, and Zinc, Gray, 20 @ 22. *Borsenhalle.*

We have received from James Butterworth Randol, of San Francisco, the following statement relative to the trade in quicksilver: "The receipts of quicksilver at San Francisco for May and the first five months of the year were as follows:

	For May.	Jan. 1 to May 31.
	Flasks.	Flasks.
1887	2,017	9,955
1888	2,584	15,021
1889	931	6,000

The product this year to date, as indicated by the receipts, is only about 36 per cent. of last year and 46 per cent. of 1887. It is probably owing to the diminished yield that the price rose from \$40.50 per flask at the beginning of May to \$47.50 at the close of that month. The exports by sea from San Francisco last month were the lightest in a long time, consisting of only 76 flasks, including 63 to Mexico, 10 to New Zealand and 3 to British Columbia. The exports for the five months ending May 31, 1889, were as follows:

	Flasks.	Value.
New York	430	\$18,000
Australia	10	425
New Zealand	15	608
Central America	1	41
Mexico	2,012	83,791
British Columbia	10	421
Totals	2,478	\$108,286
In 1888	6,832	273,776

Last year New York took 2020 flasks, Hong-Kong 1010 flasks, Mexico 3388 flasks and Central America 240 flasks. China has drawn all its quicksilver from London this year. Mexico must also be using more foreign quicksilver this year."

Michael P. Grace, of New York, has contracted conditionally with the President of Peru for the repair of the damages on the Oroya Railway occasioned by recent inundations. During 90 years he is to pay to the Government as an annual rental 60,000 soles in silver until the receipts of the line do not exceed 1 per cent. on a nominal capital of £1,500,000. Mr. Grace is obliged to purchase from the Government all the rolling stock now in use on the line for 499,000 soles silver, and he will retain of this 100,000 soles for the payment of the building used as the Desamparados depot in Lima and 88,000 soles to pay off certain claims against the railway for the ground occupied, &c.

A fire in Johnstown on Monday originated from carelessness in burning debris, and 25 houses were destroyed, together with household effects. Previously a woolen factory was destroyed in like manner.

The losses of property by the recent floods in Pennsylvania are estimated by *Bradstreet's* at \$44,250,000.

## Hardware.

With the close of the month and the ending of the half-year there is a falling off in business, which, however, continues fair in a small way. Buyers are naturally holding off until next month and orders are mostly for goods to meet immediate wants or for seasonable specialties, which are in average demand. There is, however, some movement in Southern business and a good many buyers from that section are in town. Prices are without material change, but in some directions there are indications of a better tone.

### Cut Nails.

The effects of the flood in Central Pennsylvania are still being felt in the scarcity of Nails here and in the irregularity in shipments on old contracts. Prices remain about the same as previously reported, although the action of the Philadelphia Nail houses in putting prices up to \$1.90 for carloads and \$2 from store is having an effect on sellers here. The Oxford Iron and Nail Company had anticipated this action, but the others have not yet followed the lead thus established. The market is very sensitive, however, and dealers are insisting on knowing specifications before quoting prices. If everything is favorable they will sell at \$1.80 to \$1.90, but they are watching matters very closely, to be ready to take advantage of any decided change that may favor better prices. Parties who have tested many leading manufacturers both East and West during the past week with orders for considerable quantities of Nails report that a large number of them state that they have all the orders they care to fill for the present; others reply that they have shut down or intend to do so, and very few make quotations. Those who quote the prices ruling of late insist on an average ranging from 25 cents above the base price upward. Buyers willing to make out a specification running from 50 to 75 cents above base can secure favorable terms, but others cannot.

### Miscellaneous Prices.

With a view to preventing the massing of orders by several concerns, some of the manufacturers who are attempting to control prices by combination have adopted a rule prohibiting any of their number from shipping goods to other houses than the one by whom they are ordered. Under this restriction it will be seen that in case the goods finally reach different concerns, it will be at the expense of reshipment.

The Improved Eureka Fruit-Pitter, manufactured by Farnsworth & Co., San Francisco, Cal., for whom John H. Graham & Co. are agents, 113 Chambers street, New York, a description of which is given on page 981, is sold at \$5 each, subject to a discount of 25 per cent. Furnished with both cushions, the list price is \$6.

The following is the discount sheet of the company showing the different goods covered by their catalogue and the prices. Terms, net 30 days or 2 per cent. discount for cash in ten days:

	Discount.
Rapid Vises and Attachments.....	25 %
Giant Vises.....	30 %
Giant Vise and Drill Combined.....	35 %
Eureka Vise.....	50 %
Steam Fitters' Vise.....	30 %
Never-Slip Combination Pipe and Bench Vise.....	25 %
All-Steel Open-Pipe Vise.....	25 %

Both Cast and Wrought Butts continue low, the market being considerably demoralized. Some Western jobbers are offering them at cut prices, which in some cases approximate more nearly than they should the manufacturers' quotations.

The condition of the Sand-paper market is such that it will be worth the while of buyers to look into it carefully before placing considerable orders. It is not unlikely that some retailers purchasing even fair quantities will be able to obtain advantageous figures after careful inquiry.

The condition in the market on Wringers has not in its material features greatly changed, but some prices, even lower than those generally prevailing, are made by some of the prominent jobbing houses, especially in the West.

The prices of Shot were to-day advanced to the following figures, subject to a discount of 2 cents per bag, 25 pounds, for cash within five days from receipt of bill:

Drop, per bag, 25 pounds.....	\$1.25
Drop, per bag, 5 pounds.....	.50
Buck and Chilled, per bag, 25 pounds....	1.50
Buck and Chilled, per bag, 5 pounds.....	.35

There has been for some time some irregularity in the Coffee-Mill market, owing especially to the competition of some Western manufacturers. The Eastern manufacturers have accordingly made a reduction in their prices, and the discount on these goods now ranges from 50 and 10 to 60 per cent.

### Items.

At a meeting of the trustees of the E. D. Clapp Mfg. Company, Auburn, N. Y., D. E. Clapp was elected president in place of E. D. Clapp, to whose death we referred in our last issue. John T. Groves, for several years the manager of the company's Cincinnati agency, was elected secretary, thus filling the vacancy occasioned by the death of Phineas S. Hadger. Mr. Groves is said to be thoroughly familiar with the Carriage Hardware business, having traveled for Hayden & Smith when the latter were sole agents for the sale of the E. D. Clapp Mfg. Company's goods. Until he assumes the duties of his office B. C. Smith will act as secretary *pro tem*. The new president has for a long time held the position of treasurer of the company, and has been prominent in the business affairs of Auburn for years, during which time he has occupied different positions of trust and honor. He is thoroughly familiar with the business of the company, having grown up with it, and it is expected that under his management it will continue to occupy the prominent position it now holds.

John H. Clark has become the proprietor of the Hardware business of Charles H. Nutt, Nashua, N. H., in whose employ Mr. Clark has been for 22 years.

Matthai, Ingram & Co., Baltimore, Md., issue circulars relating to their improved Keyless Fly-Fans, the Royal Child's Tray and Improved Fruit Cans.

Among the special notices on page 48 is one in which the advantages of Des Moines, Iowa, for manufacturing enterprises are referred to. Several lines of railway, low freights, cheap coal, light taxes and other advantages are referred to.

The Erie Specialty Mfg. Company, Erie, Pa., have made still further additions to their line of tools, and they are all seasonable specialties. They are Walker's Double Cutter Ice-Shave and Adjustable Ice-Grip, Handy Ice-Plane and Beverage Mixer, and are fully described in a circular.

E. C. Meacham Arms Company, St. Louis, Mo., have issued their circular No. 410, dated June 19. Its 16 pages are devoted to a varied line of Revolvers, Rifles, Shotguns, &c., with some specialties. Quotations are attached in the usual way.

At the annual meeting of stockholders of the Essex Horse Nail Company, Essex, N. Y., held June 4, 1889, the following Board of Directors were elected: D. F.

Payne, H. H. Noble, W. D. Palmer, E. B. Atkins, W. G. Lyon, C. W. Woodford, A. B. Ross, T. McFarland and C. A. Martin. At the meeting of the Board of Directors the following officers were elected: D. F. Payne, president; H. H. Noble, vice-president; W. D. Palmer, secretary and treasurer. The report of last year's business was very satisfactory and the outlook for the future is referred to as encouraging. W. D. Palmer resumes the office of secretary and treasurer for the eleventh time.

The Bonney Rapid Vise Company, Clinton, Iowa, have issued a new catalogue calling attention to their new line of Vises, of the special features of which a full description is given, the different patterns being illustrated. In addition to emphasizing the merit of their Rapid Vises they call special attention to their Never Slip Pipe and Bench Vise, which embodies several novel features.

Suit has been brought against some Western manufacturers for infringement of Sunken-Hopper Coffee-Mill patents, owned by Logan & Strobridge Iron Company, New Brighton, Pa., and the Chas. Parker Company, Meriden, Conn.

The Reading Hardware Company have just gotten into their new works, a large portion of which was destroyed by fire some time ago. The new buildings are not only among the largest, but the most admirably equipped of the kind in this or any other country. They are believed to be absolutely fire-proof, while for light and air, combined with every possible convenience for their work-people, there appears to be nothing wanting. They employ upward of 700 hands, and are being run to their full capacity. In a recent circular they say:

We are pleased to announce that our new works are now completed and equipped throughout with the latest improved machinery, and have been in operation for some time. In addition to above, we shall continue to operate the Manhattan Works. The producing capacity of our new works is fully one-third more than that of our old plant, and we have no hesitancy in announcing that we are now in a position to fill all orders promptly. We have also been able during the past few months to manufacture and put in our warehouses, at Reading, New York, Chicago and Philadelphia, a well-assorted stock of our entire line of goods. We shall continue to keep all our popular finishes, including Geneva and Albion Bronzed, and Royal, Hecla, and Plain Bronze Metal, up to the high standard they have always had.

Surplus, Dunn & Alder, 97 Chambers street, New York, have been appointed direct representatives of the York Wire Cloth Company for the sale of their Wire Cloth. They have also been appointed by C. Hammond & Son, Philadelphia, as their representatives for the Southern States, export business, and the East and near-by trade.

As something of a curiosity, but at the same time illustrating the manner in which the daily newspapers refer to trade matters, we give the following, which recently appeared in a Cleveland paper. While Cleveland and Philadelphia are known as important points in this as in other branches of the Hardware and Iron trade, they will hardly claim the pre-eminence given them in the following paragraph, in which the writer's lack of familiarity with the matters in question is evident in nearly every line:

Among the latest accessions to the combinations is the Nut and Bolt Trust. Cleveland is known as a great Nut and Bolt manufacturing center, and this city and Philadelphia practically control the trade of the country. The Lamson & Sessions Company are among the largest manufacturers in America. A short time ago one of their representatives went to Youngstown, and as a result of his visit the two Nut and Bolt works there are in the combination. It is thought that the establishments in St. Louis will soon follow suit. The plan

pursued is a heroic one. If a manufacturer refuses to join the combination he is asked his price and his plant is purchased.

The Central Expanded Metal Company, Chess, Cook & Co., Pittsburgh, Pa., have issued a handsome catalogue illustrating their Steel Lathing and Netting, and explaining fully what Expanded Metal is and the uses to which it may be applied. Illustrations are given of the different-sized meshes from 4-inch down, and also of the Fencing-Gates, Window-Guards and other goods which are manufactured of it. Among these a Steel Door-Mat is to be noticed as a novelty. This catalogue is of especial interest, and is deserving the attention of those handling this line of goods.

Notice is given that the copartnership lately existing between L. S. St. John and J. W. St. John under the firm name of L. S. & J. W. St. John, Walton, N. Y., was dissolved on the 19th inst. by mutual consent. L. S. St. John will close up the business of the firm. He has also sold his interest to John P. White, and the business will be continued by the new firm of St. John & White.

R. Nickerson, W. B. Jackson and T. H. Nickerson announce that having purchased W. L. Child's interest in the firm of Childs, Nickerson & Co., Athens, Ga., assuming the liabilities and contracts of that firm, they will continue the business at the old location under the firm name of the Athens Hardware Company.

A recent issue of the Indianapolis *Herald* contains a description of Kokomo and its principal industries. Among these a prominent place is given to the Rockford Bit Company, whose factory is alluded to as one of the most complete in the city, and figures are given indicating the extent of its business. An illustration is given showing the works as originally built, but without the extensive improvements that have recently been added in order to accommodate the company's trade.

The R. Loveland Axe Company, Lamar, Pa., were badly damaged by a recent flood. Both their dams were torn out, embankments injured and in large part destroyed, houses carried away, &c., but they expect to be in operation by the middle of August. They desire to acknowledge the receipt of half a dozen Wheelbarrows from Pugsley & Chapman, 8 Liberty street, New York, which they generously donated them.

#### Obituary.

At a meeting of the National Association of Carriage Hardware Manufacturers of the United States, held on the 19th inst., the following resolutions, with reference to the death of their president, E. D. Clapp, which were reported by the Committee on Resolutions, composed of C. W. Scudder, J. M. Foote, D. F. Southwick and F. L. Cowles, were adopted:

*Whereas*, The National Association of Carriage Hardware Manufacturers of the United States is called upon to mourn the loss of its president, Emerous Donaldson Clapp, who died June 10, 1889;

*Resolved*, That we offer to his relatives and business associates our sincere sympathy, and feel deeply the loss of a presiding officer we all respected and loved, whose counsel and kindly word will long be missed and whose judgment and broad, comprehensive views have made him our leader in fact as well as in name since our organization, and whose loss is felt by each member as the loss of a personal friend.

*Resolved*, That the office of president remain vacant until the next annual election as a further expression of our regard, and that these resolutions be duly engrossed and also published in the several trade journals.

#### The Wire-Nail Card.

The Hardware dialogue which was given in our last issue under the heading of "How It Looks in the Country" has evidently been read by the trade with a good deal of interest. The points made in it have received the attention of the trade and our correspondence indicates that many retailers sympathize with the views there expressed. So radical a change as is attempted in the new card, with its change of base price and extension to the papered goods, would naturally cause some friction; but some of our correspondents, while acknowledging this, anticipate that after a little the trade will find the new card to work satisfactorily. There is, however, naturally some diversity of opinion in regard to the whole matter and our correspondents look at it from different points of view. Referring to the advance on the leading sizes of Standard Nails and the greatly diminished margin on the papered goods we have the following advices from a merchant in Vermont:

I hear some complaint from customers that the advance is quite sharp on the sizes that are used mostly, viz., 8d, 9d and 10d, and I have to try to explain to them that the price has advanced, but they say, "you must put them in at old price," which is rather hard to do. But on shelf goods in this branch I think the new card takes our margin right away. Any customer who has a Nail Card can tell just how much extra he should pay on a 1 pound paper of Brads, and we get only about 1 or 2 cents margin, while before, with the high list and liberal discount, we could get from 3 to 5 cents margin on a paper and the customer was satisfied. This part of the card I should like to see changed back to its former place. It is the dollars we are here for and not for convenience entirely.

Another merchant takes a more favorable view of the card, and finds the objection to it principally because it is another change, a thing for which the trade in general have a dislike:

In my travels over this section I have heard some fault found with the new card of extras. The fault seems to be based on a dislike for a change so soon after the adoption of the card of 1888, but I think it will work all right after the thing gets settled down and customers get a little more used to it. There is no special difficulty; only have to stop and explain to customers, and some of them have got to grumble at something, and the new card is that something at the present time.

Many retailers will doubtless consider it good business policy to say nothing to their customers about the new card, using it simply for convenience in buying, but making their own net prices in selling. This is the course adopted by our correspondent whose letter is given below, who at the same time alludes to the dialogue in our last issue:

We have not encountered the difficulties set forth in the dialogue, "How It Looks in the Country," because we have stopped talking "base price" to our customers, and when the price of Nails is asked we ascertain what size and then quote accordingly. Of course with "C. B." a word or two of explanation is necessary. "C. B." will readily come to see that there is no more reason why he should buy all sizes of Nails from 10d to 60d at the same price per keg than that he should buy all lengths of Screws from 1-inch to 3-inch at the same price per gross.

The following letter refers to the relative merit of Cut and Wire Nails, and suggests that the base on both should be 10d:

The price of Wire Nails has caused many who have been using them to take the Cut Nails. I sell now 100 kegs Cut to 10 Wire. The price is one thing and the holding in wood another that has brought

about the change. The old list with 10d for base on both Wire and Cut Nails would suit all the best.

The same idea is favored by a Massachusetts house, who write:

The idea of "How It Looks in the Country" is very good. The basis on Nails should start at 10d Nails. It saves lots of talk with people that do not understand about these things.

Still another merchant is disposed to take issue with the views expressed by one of our correspondents whose letter is given above, and favors the new card because it diminishes the difference that formerly existed between the price of the miscellaneous and the penny Nails, and also tends to reduce the number of extras to be carried in stock. After alluding favorably to the article in our last issue our correspondent adds:

The difference between keg Nails and those in papers was much too great and should have been equalized, and from our standpoint such a great number of extras would seem to be unnecessary, as they are certainly perplexing.

A Hardware house in this State thus emphatically condemns the new card:

We read with much interest as well as amusement the article in last week's *Iron Age* entitled "How It Looks in the Country." We fully concur with the writer thereof and think the article just "hits the nail on the head." We have been in no hurry to adopt the new Wire-Nail card owing to the fact that we had a fair stock of Wire Nails on hand when the change was made, and we feel that we have only just got the old card-rate working nicely with our customers and so dread making the change, as our trade is largely with the farmers, and it takes a vast amount of talking to convince them that they are not being imposed upon, and in this case we are somewhat of the opinion that such is the case. We would therefore have a poor show of convincing them that this new rate is either just or right. We shall make the change when obliged to and quote Wire Nails each size separate, without using the term base at all. We think these frequent and apparently absurd changes have a tendency to disgust merchants with the Wire-Nail trade, and the tendency will be to push good Steel Cut Nails.

We append a number of extracts from Hardware men in New England, leaving those from other parts of the country until our next issue:

NEW BRITAIN, CONN.—We have read the article entitled "How It Looks in the Country," and can say it is not overdrawn a particle. Many of our customers order Nails from time to time, and when they receive their bills at the end of the month it is hard to satisfy them why we charge 20 to 35 cents more on some sizes and less on others than previous month. However, we have become reconciled to it, and until manufacturers find out what Wire Nails cost them suppose we must submit. It certainly is very annoying to retailers.

RUTLAND, VT.—We find it difficult to introduce the new Wire-Nail card, and we continue as yet to sell on the old base. In my opinion the price should be the same from 10d to 60d.

CAMBRIDGEPORT, MASS.—We have no trouble in selling Wire Nails at the new card rate.

LEBANON, N. H.—The dialogue in last week's *Iron Age*, entitled "How It Looks in the Country," hits our case exactly. We think the manufacturers of Wire Nails would do well to make an average price on say 10's to 60's for a base and proper advance on other sizes. It certainly is very confusing and we think demoralizes trade, changing the card so often.

FALL RIVER, MASS.—We are not finding any such difficulties in the Nail list as our country friend speaks of. The Wire Nails are being taken here now in large quantities and are giving satisfaction.

BRIDGEPORT, CONN.—We think the Wire Nail card all right for the shelf goods, but should prefer to have had the Standard Nails nearer the Iron Cut Nails as to extras—then there would be less confusion.

PROVIDENCE, R. I.—The new Wire-Nail card is not received with any more disfavor than the last change of the Cut-Nail card was.

HARTFORD, CONN.—Our customers have hardly got accustomed to the new list as yet, but as far as we know they seem to like it, as the list is now more uniform.

WESTFIELD, MASS.—We have been very much surprised to read in *The Iron Age* for the last two or three weeks that the card was generally being received with favor. Diligent inquiry of traveling men failed to locate the place, and common sense refused to assign any reason why the public generally should approve of it. Were it not a serious matter and apparently approved by gentlemen worthy of respect, we should consider it simply the hasty work of some "smart Alecks" to be repudiated by their principals upon consideration.

NORWICH, CONN.—We have had very little comment as yet on the change in price of Wire Nails, the contractors to whom we sell the bulk of these goods not having had their attention called directly to it. The change will not be heard from until they get their July invoices.

PORTSMOUTH, N. H.—Our customers never take very kindly to the changes in lists. With us new lists always make more or less talk, and it takes some little time to get people to understand them, but they soon fall into the procession and accept it as a matter of course.

PAWTUCKET, R. I.—The sale of Wire Nails in this section is yet so limited that we don't experience any difficulty from the fact that people are not posted and we don't under present circumstances use the base price. It appears to us to have been an ill-considered change.

BANGOR, ME.—We have read the amusing dialogue. There is more truth than poetry in the story. The farmer wants plain, square dealing, and in order to gain his confidence the A, B, C's must be very plain. We have nine clerks in our retail department, and we figure that each man wastes an hour or two every day figuring the relative value and position of the new Wire-Nail card.

### Meeting of the New York State Association.

The meeting of the New York State Association of Hardware Jobbers, in Buffalo on the 20th inst., was well attended, and with the hearty reception given by the merchants of that city and the attentions which were shown to the members of the association the session is referred to as having been exceptionally enjoyable. The officers of the association are as follows:

President, Robert McCarthy, of McCarthy & Son, Syracuse  
Vice-president, C. E. Walbridge, of Walbridge & Co., Buffalo.  
Secretary and treasurer, James W. Eager, Syracuse.

In addition to the above the following members were present:

Robert Mathews, of Hamilton & Mathews, Rochester.  
Ross R. Spaulding, of Kennedy, Spaulding & Co., Syracuse.  
Mr. Barker, of Barker, Rose & Gray, Elmira.  
I. D. Booth, Elmira.  
Daniel Pratt, of Pratt & Co., Elmira.  
J. M. Goss, of Weaver & Goss Hardware Company, Rochester.  
C. M. Tillinghast, 2d, of J. M. Warren & Co., Troy.  
Mr. Sims, of Howe & Co., Troy.  
Mr. Turner, representing Morris E. Viele, Albany.  
George Dana, of Wright & Co., Utica.  
Mr. Parshall, of Parshall & Searle, Syracuse.

J. W. Black, of Burhans, Black & Co., Syracuse.

Hobart Weed, of Weed & Co., Buffalo.  
James R. Smith, of Weed & Co., Buffalo.  
Harry Walbridge, of Walbridge & Co., Buffalo.

Among the guests present who are not members of the association, we are advised, were the following: Mr. Deming, president of the George Worthington Company, Cleveland; H. S. Blossom, of W. Bingham Company, Cleveland; W. H. Cowles, secretary of the Cleveland Hardware Jobbers' Association, and E. H. Fowler, Buffalo delegate of the National Heavy Hardware Association.

The time of the association was divided between the consideration of matters of trade interest and the enjoyment of receptions and other social attentions. The forenoon session was devoted to social chit-chat with a view to promoting the best interests of the Hardware Jobbing Trade and increasing business by a cordial interchange of ideas and experiences. At 2 o'clock a sumptuous repast was served at the Niagara. At 4 o'clock the association accepted the invitation of Col. A. J. Barnard to go down the river to Falconwood, on Grand Island. Upon their return they were treated to a ride through the Park, and in the evening were banqueted at the Buffalo Club by Gen. E. B. Jewett.

A pleasant feature of the meeting was the receipt of a neatly executed card of invitation from the American Bit-Brace Company to visitors to inspect their works while in the city. It read as follows:

The American Bit-Brace Company extend you a cordial invitation to visit their office and factory while you are in our city. With several new, ingenious and very interesting special machines to exhibit we can promise you a pleasant time, and can show you how we turn out 100 dozen (Pedersen's) Bit-Braces complete daily. We are within two blocks of the depots, at Nos. 122, 124, 126 and 128 Washington street, corner Scott.

A. D. WHITE, Manager.

BUFFALO, June 20, 1889.

Those who attended the day after the meeting felt amply repaid, we are advised, for the time spent, expressing themselves that they had seldom seen so well-ordered and systematic a factory, most of the machinery in which was made especially for the particular requirements of making Bit-Braces. It was designed and made by their superintendent, Mr. Wilcox, and is referred to as exceedingly interesting and ingenious. In this way the American Bit-Brace Company did their share for the entertainment of the wholesale merchants of the State.

### Syndicate Buying.

There has been for a number of years a system by which some of the leading jobbing houses in the country have been represented in some of the principal markets by parties sometimes incorrectly designated as Syndicate Buyers, who by purchasing large quantities of goods and sometimes massing orders are in a position to secure favorable terms.

As bearing upon this question and the influence of such houses in the trade we have the following communication from a well-known manufacturing concern. It will be observed that the disturbing influence which syndicate buyers are supposed to exert upon the trade is especially referred to:

Within the last few years there has grown up a system in connection with the wholesale hardware business which, while it is pretty generally understood among the trade, has never as yet I believe been

recognized in your columns. I refer to what is known as "syndicate buying," the plan of which may be briefly described as follows:

B. & Co. hire an office in New York and hang out a sign designating themselves as "Purchasing and Commission Merchants," or by some other term that may mean much or little. They secure the patronage of a number of wholesale Hardware houses in different parts of the country for whom they arrange to act as New York buyers, each concern paying them a stipulated salary. B. & Co. then open correspondence with various manufacturers of Hardware, representing that they control the trade of so many wholesale men, and asking for the lowest prices that the said manufacturers will make, subject to a commission (generally 5 per cent.), which is to be paid to B. & Co. for securing the business. As a rule they find some smaller manufacturers, who do not keep men on the road, and who, being anxious to extend their trade, are willing to meet the lowest market price and allow the commission stipulated. The goods are generally shipped and billed to the different Hardware jobbers represented by B. & Co., and commissions paid to the latter by the manufacturer at the end of each month or quarter. B. & Co. then turn over to each of their patrons all the commissions they receive from their respective purchases, and whatever the Hardware jobber realizes from the commissions more than the salary he pays B. & Co. is, he figures, to him clear gain.

Such is a brief outline of the plan of the syndicate buyer. There is probably much more to it that could be best explained by the participants themselves, but the main parts have been given. The system is viewed in various ways by those who have had occasion to consider or discuss it. The Hardware jobbers who make up the various "syndicates" must of course think they are benefited or they would not pay their money to the New York buyer. On the other hand, it has been found that the jobbers who do not patronize the system are as a rule very bitter against it, some of them characterizing the buying concerns as "leeches on the Hardware trade," and going so far as to say that they will not purchase from manufacturers who sell any goods through these agencies.

The manufacturers are also divided in their opinions, some of them refusing to have anything to do with the syndicate buyers and others taking such business as they can see any margin in, reasoning that "one man's money is as good as another's." One bad feature in the situation for the manufacturer is that it withdraws from the market a number of buyers in different parts of the country, many of them in large business centers, substituting instead one purchasing agent in New York, through whom all the business must be negotiated. As a manufacturer will naturally figure closer and bid lower for the united trade of a dozen or more houses than he could for one, the result is a constant depression of prices and unsettling of the market. Furthermore, the manufacturer is really at a loss at this time to know who to quote, for reasons which can best be shown by an illustration.

The H. Mfg. Co. have been selling some goods through B. & Co., say at \$1 per dozen for a certain article, allowing 5 per cent. commission, realizing 95 cents net. F. & Co., Hardware jobbers in Chicago, write to the H. Mfg. Co. for "lowest prices, tallest discounts," &c. Supposing that they are bidding on an even plane with their competitors, the H. Mfg. Co. quote F. & Co. 97 cents per dozen for the article referred to above. Do they get the order? No; but shortly afterward

they receive a letter from B. & Co. saying "Our customers in the West are being quoted 97 cents. We expect you to meet this figure, subject to our 5 percent. commission; otherwise we will have to look elsewhere." The H. Mfg. Co. thus discover that they have been duped.

Experiences of this kind soon demonstrate to manufacturers that it avails nothing to quote *bona fide* prices to Hardware concerns who patronize the syndicate system, as the figures are only turned over to the New York agent, who makes it his business to find some one that will meet them and allow him a commission. But the trouble is that the number of the syndicates has so increased that it is not always easy to tell who belongs to them and who not; and in quoting prices to a new correspondent the manufacturer may unwittingly be playing into the hands of the New York purchasing agent, whose patrons use these means to keep him posted.

What, it may be asked, will be the outcome of this system? In the writer's opinion the Hardware concerns who compose the syndicates will in time discover that they are unable to obtain quotations from manufacturers direct, and are thus practically at the mercy of their New York representative, leaving them in a handicapped condition as compared with competitors, who can post themselves from all sources. They will then, I believe, make up their minds that it is best for every tub to stand on its own bottom, and that they can serve themselves best by withdrawing from the syndicate and acting independently. I may not have reasoned correctly in reaching this conclusion, and would be glad to see further discussion of the matter in your valuable columns.

It is proposed by certain parties to extend this system to retail houses, and we have seen a circular in which the plan to be pursued is thus outlined:

There has been established for a number of years among the largest jobbing houses throughout the United States a syndicate system of purchasing goods. They have a resident buyer at a central point to watch the market, secure "specials" and lump all orders, thus obtaining a quantity price on many goods much lower than could be obtained otherwise. We propose to inaugurate a similar system, with offices in New York and Philadelphia, for the benefit of the largest retailers and jobbers throughout the country, the advantages of which will be as follows:

1. All correspondents will have the privilege of having a permanent representative in the center of the Hardware industries, to whom all business matters can be referred, such as freight rates, allowances, freight insurance, &c.
2. A confidential price sheet will be mailed as often as obtainable, specifying any inside prices and special lots which we may be able to obtain.
3. We will lump all orders for staple goods, and thus obtain a price as low as the largest jobber, and in many instances lower, thus: Suppose 100 of our correspondents advise us that they can use, say, ten dozen Coal Hods; in the aggregate this would amount to 1000 dozen. The ability to place such a large order would enable us to secure a special price, which our correspondents will have the entire benefit of. This is merely a single instance of what can be done, as the same scheme will apply to all staple goods.
4. It often occurs that a merchant requires little odds and ends not directly in the Hardware business, and we will on solicitation hunt them up and buy them to the best advantage of our correspondents.

Any business man can see at once the great benefit derived by buying at bottom prices, and it is a proven fact that the plan of co-operative buying is successful,

and we are confident of earning for each of our correspondents an amount much greater than the trifling cost of our system. We will limit the number of our correspondents and will not accept more than one in cities of less than 100,000 population.

We shall be glad to hear further from manufacturers and merchants in regard to this question, which is one of direct and practical interest, as there appears to be at the present time something of a tendency toward the increase of this system.

### Duluth.

The growing commercial importance of this city is generally recognized, the indications pointing to it as destined to be before long one of the largest and most important trade centers of the West. Apart from its development in trade generally, enterprises are on foot looking to giving the city a prominence in the Hardware business which it has not heretofore occupied, and plans are being made for the erection of a Hardware building which will compare well with any in the country, and will have, it is expected, some special advantages in location and construction. The parties interested in this movement are the Wells-Chapin Company, whose building it is expected will be erected on Slip No. 1, Bay Front, on the dock of the Duluth Dock Company. It will be so situated on the harbor front that vessels can unload their cargoes at one side of the building, while railway cars will carry the sold product away from the other side. Thus is avoided the expense of drayage, and a saving is made both in money and time, of no little importance to the wholesaler. In regard to this building and its construction the following particulars are given:

The new building is to be built on plans of Palmer & Hall, architects, of this city, who have taken great pains in its designing. It will rest on 1200 piles, capable of sustaining a weight of 30,000 tons. There will be three rows of continuous piling around the outside, besides a row of sheet piles and nests of four, five and six piles under the whole interior. Its dimensions will be 100 x 100 feet, 5 stories high, reaching 72 feet to the brick cornice. The lower floor, which is designed for holding Flat and Heavy Iron and Steel, will be 19 feet high in the clear, and is calculated to sustain a load of 500 pounds to the square foot. The second floor is 12 feet high, those above it about 10 feet, and all will carry a load of 250 pounds to the foot. Ordinary heavy warehouses never carry more than 250 pounds to the foot, and a dense crowd of people is calculated at 80 pounds. Through the center of the building, sunken below the lower floor, will run a 14-foot drive for teams and delivery wagons for local trade.

The building will be what is known as mill or slow-burning construction and will be of brick, in plain but neat and massive architecture. There will be one large and one small elevator, each run by steam, and the elevator shafts and stair-ways will be inclosed in brick walls. Posts throughout the building will be of wood, and will be 12 feet apart. On these are to be laid built-up girders of 2 x 14 inch stuff spiked together, and on them the floor joist, also 2 x 14. On the lower floor these joists will be only 4 inches apart, making with the bridging and double floor an almost solid floor 18 inches thick. On other floors the joists will be 3 x 14, and 9 inches apart. Between the thicknesses of the floors will be fire-proof asbestos.

All the inside work is so put in that there will not be a single hidden timber in the entire structure, a fact much affected by insurance men. Indeed so closely are the laws of insurance companies carried out by Messrs. Palmer & Hall that it is stated the insurance rate will be only about 0.6 per cent., a rate which will make most of our builders stare in surprise. As it is calculated that a stock of Iron and Hardware averaging between \$200,000 and \$300,000 will be kept on hand, this question of insurance is of no little importance.

There will be an oil-room outside the building and a boiler-room to furnish power for elevators and for heat in one corner. Offices for the company will be on the second floor, and there will be fire-proof vaults on both first and second floors. The entire building will contain a little over an acre of floor space, and

its entire height can be packed full of Shelf and Heavy Hardware without danger of collapse or strain. Contracts will probably be let in a few days, and the work of construction carried out this summer.

### Exports.

PER BARK MARY A. GREENWOOD, MAY 28, 1889, FOR BRISBANE, QUEENSLAND.

By Recknapel & Co.—3 cases Washing-Machines. By Manning, Maxwell & Moore.—180 pounds Rail Saw, 18 pounds Iron Levers.

By Fairbanks & Co.—2331 pounds Scales, 1433 pounds Scales.

By McLean Bros & Rigg.—24 dozen Hatboxes.

By Arnold, Cheney & Co.—745 Wash-Boards, 240 boxes Clothes-Pins.

By Healy & Earl.—13 boxes Slate, 6 boxes Iron Grates, 2 cases Forges.

By W. Warden & Sons.—15 cases Axe Handles.

By A. S. Lascelles & Co.—32 dozen Axes, 16 dozen Axes, 6 dozen Picks, 20 dozen Hatchets,

6 dozen Axes, 48 dozen Hatchets, 8 cases Hardware, 6 cases Scales, 11 dozen Wrenches,

1 bundle Trucks, 1 box Wheels, 17 cases Handles, 6 dozen Lemon-Squeezers, 8 cases

Tacks, 336 dozen Nails, 1 dozen Saws, 14 dozen Braces, 2 dozen Braces, 440 dozen Washita

Stone, 3 cases Hardware, 3 cases Grease, 50 gross Lead-Pencils, 1 case Velocipedes, 7 cases

Cartridges and Shells, 1 case Tobacco-Cutters.

By H. W. Peabody & Co.—11 crates Stoves, 3 packages Lamp-Ware, 1 case Hardware, 16

cases Wind-Mills and Parts, 57 packages Carriage-Ware, 2 cases Agricultural Ma-

chinery, 10 cases Axes, 95 packages Hardware, 27 packages Barrows and Trucks, 1 case Sinks,

36 packages Refrigerators, 440 dozen Handles, 7 cases Hand-Carts, 177 packages Hardware,

54 crates Stoves, 4 cases Trucks, 45 bundles Wash-Boards, 23 cases Lamp-Ware, 2 cases

Freezers, 11 packages Pumps, 13 crates Refrigerators, 4 cases Fire-Arms, 32 cases

Handles, 10 cases Trucks, 10 packages Wagons, 44 packages Carriage-Ware, 8 cases Perambula-

tors, 6 cases Lamp-Ware, 2 cases Castings, 8 packages Agricultural Implements, 68 cases

Hardware, 17 cases Fire-Arms, 72 packages Refrigerators.

By R. W. Forbes & Son.—40 packages Stoves,

40 dozen Picks, 8 packages Fruit Jars, 8 pack-

ages Fruit Jars, 50 dozen Axes, 25 gross Shade-

rollers, 10 packages Hardware, 110 dozen

Picks, 12 packages Corn-Shellers, 40 dozen

Shovel Handles, 108 dozen Tool Handles, 4

cases Hardware, 15 gross Shade-Fasteners,

50 dozen Wash-Boards, 15 packages Hardware,

6 packages Shellers, 1 1/4 gross Shade-Rollers,

2 packages Plated-Ware, 5 packages Meat-

Choppers, 1 package Shade-Fasteners, 4 crates

Rake Handles, 2 dozen Snaths, 3 bundles

Tools, 3 dozen Forks, 3 dozen Rakes, 7 pack-

ages Hardware, 1 gross Shade-Rollers, 6 7-12

gross Fly-Traps, 3 packages Hardware, 3 racks

Churns, 2 gross Sewing-Machine Oil, 12 dozen

Hoes, 22 dozen Hatchets, 18 dozen Hoes, 5

gross Shade-Fasteners, 6 gross Pencils, 2 1/4

dozen Meat-Choppers, 14 packages Stoves,

500 feet Rubber Hose, 30 dozen Axes, 11 cases

Hardware, 9 gross Lead-Pencils, 5 gross Axe

Grease, 3 packages Plated-Ware, 1 box Lamp-

Ware, 1 package Plated-Ware, 1 case Store

Trucks, 248 dozen Axe-Handles, 8 dozen

Mouse-Traps, 10 dozen Axes, 4 dozen Ham-

mers, 27 packages Stoves, 4 gross Sewing-Ma-

chine Oil, 6 cases Meat-Choppers, 2 gross

Shade-Rollers, 6 dozen Wire Wash-Stands, 6

dozen Rakes, 37 dozen Fork Handles, 1 case

Pumps, 1 package Rat-Traps, 2 cases Hard-

ware, 10 dozen Axes, 5 sets Wheels, 30 dozen

Hoe Handles, 4 packages Windmills, 10 pack-

ages Stoves, 2 dozen Axes.

PER SCHOONER GELLERT, JUNE 4, 1889, FOR FREEMANTLE, AUSTRALIA.

By R. W. Cameron & Co.—9 dozen Brooms, 50 boxes Clothes-Pins, 25 dozen Axes and Hatchets, 20 dozen Picks, 386 dozen Handles, 15 packages Carriage-Ware, 12 Churns, 5 dozen Rakes, 3 1/4 dozen Fork and Hoe Handles, 6 dozen Hammers, 7 dozen Hardware, 3 dozen Scales, 24 dozen Perambulators, 2022 pounds Pumps, 186 pounds Guns and Cartridges, 6 cases Carriages, 5 boxes Clocks, 11,246 pounds Wire, 14 Wagons.

### REVIEW OF THE WHOLESALE MARKET IN PAINTS AND OILS.

It should be understood that the prices quoted in this column are strictly those current in the wholesale market, and that higher prices are paid for retail lots. The quality of goods frequently necessitates a considerable range of prices.

#### Paints and Colors.

National Lead Trust affairs continue to engage the attention of the trade, as well as the interest of speculators in "industrial" securities. The trade anxiously awaits the policy of the trust as regards prices, rebates, delivery points, &c., and, incidentally, the successful management of the business so that it may earn dividends upon the highly inflated capital. The

### The Perfection Solid Oil-Box

The oil-box of which we herewith present an engraving is manufactured by Charles H. Bealy & Co., of Chicago, Ill., expressly for the use of their Helmet oil. The box consists of a cap into the center of which is cast a screw fitting into a thread cut in the top of the lower part. The cap is filled with oil, which is forced into the oil groove and spread by the re-

two years, and it is said that they have not been touched during that time. They are as tight now as when first put on. This nut-lock is made by E. R. Procter, of Cincinnati, Ohio.

### New Coat and Hat Hook.

The accompanying illustration represents a new wire coat and hat hook which is put on the market by Sargent & Co.,

*The Perfection Solid Oil-Box.*

volving shaft by screwing the top down upon the lower part. The periphery of the lower part is filled with woven cotton packing, making a tight joint, preventing wear and protecting it from dust. The boxes can be applied in any position—from above, below or at the side, on loose pulleys, connecting-rods, bearings, &c. The box should fit snugly in the bearing, with the end placed about  $\frac{1}{4}$  inch from the shaft.

### Nut-Lock Washer.

This nut-lock consists of a ratchet-formed nut adapted to engage with a toothed washer of crucible steel. The

*Nut-Lock Washer.*

tooth formed by the washer locks squarely against the nut, which is shaped to receive it, so that the nut always remains tight. Screwing the nut down tight locks it. The first tried nut-locks of this pattern have been on the track one and a half and

gross. The illustration, without detailed description, shows the special features and manner of the hook's construction.

A cargo of copper ore from Montana via San Francisco arrived at this port last week, destined to France.

### The Keystone Pipe-Joint.

The makers of this joint, Stanley G. Flagg & Co., of Philadelphia, Pa., claim that it makes a superior joint for radiator work and gives much better satisfaction

*The Keystone Pipe-Joint.*

than anything else yet made for the purpose, as it is not affected by the contraction and expansion to which other unions are liable. The form of the union is shown in the engraving. The seat formed in the head-piece by the concave soft-metal seat and in the tail-piece by the convex-finished surface is not damaged or injured by use, being as good after having been in use, taken down and put up again as when first put in. The soft-metal seat is pressed into an under-cut groove in the head-piece and expanded so that it cannot lose its position, but must remain firmly in place. The seat is made at any possible angle and can be loosened or tightened at pleasure without injury, standing without leaking 200 pounds steam-pressure. It is stated that these unions are used extensively in gas, steam and water pipe connections, and that they have been favorably indorsed by all who have used them.

A letter from a gentleman who stands high in business and official circles in the City of Mexico states that, so far, the Mexican Government has given no intimation that it will appoint commissioners to the Congress of American States in October. President Diaz is doubtless vexed by the dilatoriness of the United States in

*New Coat and Hat Hook.*

promoting reciprocal relations, and may not deem it politic to manifest special anxiety on the subject. The Government has sought, rather, judging from surface indications, to show that the European market is as important to Mexico as any other.

**Schmitt's Sad-Iron Heater.**

By means of the accompanying illustration we present a smoothing and sad iron heater invented by Mr. Anselm Schmitt, of No. 850 Seneca street, Buffalo, N. Y. The object of the invention is the production of a stove particularly adapted for

*Schmitt's Sad-Iron Heater.*

heating flat and smoothing irons for laundry and tailors' use. The feature of construction is the plate on which the irons to be heated are placed. Double walls lined with asbestos are provided, within which are flues and ducts for the passage of the products of combustion. The construction is such that the heated gases are concentrated below the plate on which the irons

*Fig. 1.—Eureka Fruit-Pitter.*

rest and pass from beneath the middle portion through openings with which it is provided. The manufacturer states that in this manner the plate is always kept very hot, while but little heat is allowed to escape into the room. It can also be converted into a heating-stove in winter by removing the inside flues and asbestos lining. It is stated that fire can be kept in this stove without trouble day and night and that it is an easy matter to keep the

stove and surrounding floor free from dirt and ashes. The stove was patented April 30, 1889.

**The Improved Eureka Fruit-Pitter.**

This article, which is manufactured by Farnsworth & Co., San Francisco, Cal., for whom John H. Graham & Co. are agents, 113 Chambers street, New York, is illustrated in the accompanying en-

gravings, Fig. 1 giving a general view of the machine when not in use, and Fig. 2 showing the manner in which the pit is extracted from the fruit. It will thus be seen that this machine is attached to a table or other support in convenient position for use. The peach or other fruit is placed upon a rubber cushion, in which it rests, which has a hole in it through which the pit is forced. Connected with this cushion there is a knife which at the same time cuts the bottom of the peach and holds it in position until the cutter and extractor, which is operated by a handle, comes down upon it, simultaneously expelling the pit and cutting the fruit in

*Fig. 2.—Extraction of the Pit.*

two. The points made in regard to this tool are that it does not bruise the fruit and does its work perfectly and much more expeditiously than it can be done by hand. It is also stated that it can readily be adapted to work by foot-power if desired. It is intended for use with peaches, plums, apricots, nectarines, &c., and parties in ordering should specify what kind of fruit it is intended for. Unless ordered a plum-fitting cushion is not sent.

**The Chic Screen-Door Check.**

The use of door-checks has become so common that a door having a spring to shut it and without one of the several devices to prevent its slamming is a rare exception. So general has the spring and check been brought into use that the old "Shut the Door" signs, formerly so familiar on store doors, are now seen only as relics of former annoyances, and the

*The Chic Screen-Door Check.*

pictorial artists are devoting their leisure to more pleasing objects. Doing away with the slamming of ordinary doors has directed attention to the slamming of wire-screen doors as they are shut by the spring hinges so generally used. The door checks heretofore made have not usually been suitable for screen doors, and are too expensive if they were otherwise practicable, but the Chic Screen-Door Check illustrated herewith has been made especially for this purpose. Sargent & Co., the manufacturers, describe it as follows: The new patent Chic Screen-Door Check is suitable for either right or left hand without changing any of the parts; it is easily applied, and can be used with any screen-door spring or spring hinge. The pressure acts toward the hinges and holds the door firmly in position. The piston is inclosed within the cylinder to prevent the summer dust from interfering with its free working. It effectually prevents slamming and can be placed on any screen door. By screwing the cap at the end of cylinder the check can be instantly varied to suit the tension of the door-spring or spring hinges that may be used.

An extraordinary instance of long hours of labor was related recently before the Sweating Committee of the British House of Lords. A Roumanian Jew stated that at Manchester he works from 5 o'clock in the morning until 12 at night, and sometimes until 1 or 2 in the morning, making an average of 20 hours a day for six days in the week, leaving only four hours for sleep. He earned three shillings a day in the busy time, lasting about ten weeks, and from six shillings to eight shillings per week in the slack season, and on this he had to support a wife and children.

The Supreme Court of Ohio has pronounced the illegality of chattel mortgages and other methods to which insolvent debtors resort for the purpose of giving preferences to creditors on the eve of an assignment. The court decides that such preferences are void, and that the entire property of the assignor must be disposed of for the benefit of all the creditors.

## Washington News.

(From Our Regular Correspondent.)

WASHINGTON, D. C., June 25, 1889.

The Government having fairly started in the building of new ships for the navy, the work may now be expected to go on more rapidly. The construction of steel ships of the intricate designs adapted to modern naval uses, offensive and defensive, was necessarily slow in the beginning, when this branch of the art of shipbuilding was in its infancy, but the ships already constructed have produced a development in this great industry which will lead to more expectations and effective results than have hitherto been obtained. The next few months will, therefore, witness great activity in the completion of plans and awarding contracts for the additional vessels authorized by the late Congress. The new steel ships to be built this year are:

One armed cruiser, 7500 tons; cost \$3,500,000.  
One protected cruiser, 5300 tons; cost \$1,800,000.  
Two protected cruisers, 3000 tons; cost \$1,100,000 each.  
Three protected cruisers, 2000 tons; cost \$700,000 each.  
One naval academy vessel, 800 tons; cost \$260,000.  
Two gun-boats, 1000 tons; cost \$350,000.  
One cruising monitor (Thomas), 3000 tons; cost \$1,500,000.

The contracts are being awarded as rapidly as the drawings and specifications are completed.

The vessels launched or ready to be launched are the 4000 to 4500 ton cruisers Philadelphia, Baltimore and Charlestown, and the gun-boats Yorktown, Concord and Bennington, each 1700 tons, and Petrel 800 tons. The great 6500-ton armored line-of-battle-ship Maine and armored cruiser Texas being constructed at the New York and Norfolk navy-yards are now fairly under way. Here are 20 of the finest vessels afloat of their class, which will be ready within from six months to two years. The cruisers Atlanta, Boston, Chicago and Dolphin are already in commission. The five reconstructed monitors will also add a formidable element of fighting strength.

The progress of the United States to the rank of a first-class naval power has not been confined to paper. The authorization of vessels by the new Congress will even be greater. From all indications, before the close of the present Administration the United States will have at least 50 of the finest types of modern vessels of war displaying the flag of the Republic in the seaports of the globe.

The Navy Department is in receipt of information that the shaft for the Philadelphia, building at the Cramp Yard, has been delivered. It is 65 feet long and 17 inches in diameter, or the largest piece of steel forging ever produced in the United States. It was the first work of the character turned out at the steel plant of the Bethlehem Iron Works, constructed under their contracts with the Government.

### A PIG-IRON DECISION.

An appeal was recently made to the Treasury Department from the decision of the collector at Chicago assessing duty at the rate of  $\frac{3}{8}$  cent per pound on certain imported ferro-silicon. The appellants claim that the article is not the pig-iron of commerce, but is a metal composed of iron and silicon and is used by iron manufacturers to melt with pig-iron, and that it is, therefore, entitled to entry at the rate of 20 per cent. ad valorem under the provision for "metal unwrought, not specially provided for." The appraiser reports that the article is ordinary pig-iron, containing about 10 per cent. of silicon, and is used in mixing with low grades of pig-iron to increase the percentage of silicon, thereby

strengthening the product, and that its value is about one-third more than ordinary pig-iron. The Department has decided that the fact that the article contains a larger proportion of silicon than ordinary pig-iron does not remove it from the category of pig-iron, and has affirmed the decision of the collector. That officer has been informed that the distinction between ferro-silicon and chrome pig-iron lies in the fact that chrome pig-iron is made from a combination of iron and chromic ores, while ferro-silicon is made from a single ore, which, however, contains both iron and silica.

### The Amalgamated Association.

The fourteenth annual convention of the Amalgamated Association of Iron and Steel Workers, which has been in session in Pittsburgh since Tuesday, the 4th inst., was brought to a close on the night of the 21st. The last business before the association was the election of officers, and resulted in the re-election of all the old officers. William Weihe, who has been president of the association for six years, had announced all along that he would not allow his name to go before the convention for re-election, but was chosen president by acclamation, and after considerable persuasion he consented to serve for one more year at least. For the position of secretary there were two candidates, William Martin, the present incumbent, and Stephen Madden, the present assistant secretary. Mr. Martin was elected by a vote of 117 to 71 and Mr. Madden was elected assistant secretary. James Penney was elected treasurer without opposition. The convention then adjourned, to meet in Pittsburgh next June.

It is reported from Pittsburgh that the association granted the application of the bolt-makers for admission to the organization. This will necessitate a bolt-makers' scale. The general strike assessment measure suggested by the American Federation of Trades Unions, whereby all members of the federation are assessed in case of a strike in any of the trades unions, was adopted. An amendment was also passed permitting the admission of a large number of men about the mills who heretofore could not join the organization. Everybody who is employed about the mills can now be freely admitted, with the exception of common laborers. This latter question is left to the discretion of the local lodges to whom the laborers may apply for admission. The association, which has been so conservative, has finally reached out its arms and embraces every class of iron or steel workers. The change will make the Amalgamated Association a stronger competitor of the Knights of Labor for the membership of workmen who could join the Knights of Labor, but owing to the laws of the order could not join the Amalgamated Association.

It is now expected that there will be no strike or trouble of any kind in the Western iron industry this year, but a reduction in the steel mills is probable. The iron scale of wages in force during 1888-89 has been revised, and there are but few changes; in fact, the alterations made in most cases are favored by the manufacturers. It wipes out many objectionable features, and although some new clauses are inserted they are not of a serious character. A complete revision of the scale for nail-cutting was made, averaging a reduction of over 45 per cent.

We have received from Alex. Y. Lee, architect and civil engineer, Pittsburgh, a very fine lithographic sketch entitled "A Bird's-eye View of the Conemaugh Valley," giving the topographical characteristics of the section of country from Conemaugh Lake to Nineveh which was de-

vastated by the flood of May 31. Separate views are given of the South Fork Dam, the watershed of the lake, &c. Copies are for sale by the author.

The Secretary of the Navy has granted the request of the Union Iron Works, of San Francisco, who are building the cruiser Charleston, for an extension of four months in the time allowed by the contract for the completion of the vessel. The application was based upon the statement that the plans, which were purchased by the Navy Department from English ship-builders, were defective. In the case of the machinery it is alleged that the principal defect developed in the last trial trip, and that which prevented its success, was one of design, for which the contractors were not responsible. The other contractors whose requests for extension of time have been denied will appeal to Congress for relief. The extension granted will operate to remit the penalties for delay, which have already accrued in a considerable amount, having averaged about \$150 a day for some time.

The claims of John Roach's assignees are being adjusted by the Government.

# CURRENT HARDWARE PRICES.

JUNE 26, 1889.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers' prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers, at the figures named.

**THE IRIDIUM ANTI-FRICTION METAL**

(Title Registered and Copyrighted 1888)

Is a bearing alloy that will give the *best service* and satisfaction to whatever use it is put. Our continuous orders from our large number of customers is practical and satisfactory evidence; no further needed.

The Iridium Anti-Friction Metal takes the place of Genuine Babbitt or "brasses," with a great saving in money. It is sold at a fair price over cost of manufacture.

Feeling *positive* it will be of *advantage to you* to use it, we solicit a trial order from all who have not adopted it—those who *have* we *hold*, in spite of big advertisements of high-priced metals that cost but *little to make*, though probably much to *sell*.

**MERCHANT & CO., - - Philadelphia, New York, Chicago, London.**

**ZERO****Post's Zero Metal,**

REGISTERED IN U. S. A.,

## IRON AND STEEL WIRE

of every description, plain, galvanized, tinned and lead-coated; spiral ribbon fence wire; steel wire ties for baling hay, straw, rags, excelsior, &c., &c., &c.

### IRON AND STEEL WIRE ROPE

or all purposes, including cables of the best quality and of any desired length for street cable roads. The attention of all users of wire rope is specially called to the Trenton Iron Co.'s

### Patent Locked Wire Ropes

which are far superior to any other in tensile strength and durability; from the fact that the wires in these ropes are interlocked, 'unstranding' or projection of broken wires is impossible, and consequently a smooth surface only is constantly presented to the sheave or drum, causing these latter to last indefinitely. One of these locked wire ropes working under ordinary conditions will outwear two or three ropes of the ordinary style. The Trenton Iron Co. also call attention to their

Patent Wire Rope Tramways (Bleichert system)

also their hoisting and conveying plants for quarries, open cut mines, docks and contractor's work. Haulage and transmission of power by wire ropes a specialty. Surveys made and plans furnished at moderate rates by competent engineers.

Cold Rolled Strip Steel furnished in long coils or cut to lengths and sheared to exact widths when desired in tempers adapted to requirements. Also C. R. Spring Steel. Please mention this paper.

## BEST IRON PAINT.

**IRON BUILDING FOR THE STANLEY RULE AND LEVEL COMPANY, AT NEW BRITAIN, CONN.**

The business of the Stanley Rule and Level Company, of New Britain, Conn., necessitates the storing of large quantities of lumber, in order to have it thoroughly seasoned before being manufactured, as the superior quality of the goods manufactured by this company necessitates thorough, well-seasoned lumber. The building shown above is designed for use in storing lumber and is constructed without a particle of wood-work in any part. In order to allow free ventilation the front of the building is left open, but is provided with an overhanging roof to prevent the rain from beating in and also to afford a protection for teams loading and unloading in stormy weather. The back side of the building is also open a short distance from the bottom to allow free circulation of the air. This plan commends itself particularly for storage purposes where the material must be protected from the action of the elements, at the same time well ventilated and free to the action of the air—the risk from fire is limited to the lowest possible amount.

## JAMES P. WITHEROW, Engineer & Contractor,

Lewis Block, PITTSBURGH, Pa.

GENERAL AGENT FOR

WHITWELL FIRE-BRICK STOVES

AND

CLAPP-GRIFFITHS PATENTS FOR MANUFACTURE  
OF SOFT STEEL

*Especially adapted for A No. 1 Boiler Plates*

*Boiler Rivets, Wire Rods, Stay Bolts*

*Stamping Ware, Nail Plates, &c.*

Will contract to completely erect, equip and place in operation Blast Furnace Whitwell Stoves and Steel Plants as above. As I manufacture at our own works everything appertaining to Blast Furnace and Steel Works construction, can guarantee promptness and satisfaction.

## M. V. SMITH, Metallurgical Engineer.

One-third of a ton of coal will produce the gas to heat and the steam to roll a ton of iron or steel on a 3-high 10-in. train of Rolls and a twenty-ton regenerative gas furnace operated at full capacity on other work in the same proportion.

**HAMILTON BUILDING,**  
PITTSBURGH, PA.

## → A CARD ←

During the time that our chairman, Mr. F. W. Gordon, was agent for the Fire-Brick Hot-Blast Stove Company they had control of his Patent Three Pass (Gordon-Whitwell-Cowper) Stove, and fixed the license charges for the same. This agency expired on January 1st, 1889. The right to construct and negotiate will henceforth rest with our firm, and we will construct these Fire-Brick Stoves free of all license, and will arrange with parties who may desire to erect them for themselves, furnishing drawings, valves and fittings at a reasonable charge. For stoves of the same dimensions, or on a basis of Duty Performed, or Heating Surface within the Plant, it is the cheapest stove on the market. We effect a saving of fully 15 per cent. of the cost of the entire stove plant by doing away with the chimney flue and its retaining walls, the foundation of the draft stack and the draft stack itself, while furnishing a much more efficient stove plant.

**GORDON, STROBEL & LAUREAU,**  
—LIMITED,—  
PHILADELPHIA, PA.

### THE (SPRINGFIELD, MASS.) AERATED FUEL COMPANY'S SYSTEM.

Patented in the United States and in Foreign Countries.

#### THE ONLY RIVAL OF NATURAL GAS. FORGING AND WELDING BY PETROLEUM AIR-BLAST FIRES.

Do not confound this with any Gravity or Steam-Jet Oil Burners. Insurance companies approve of this system. The Oil can reach the fire only when the Air-Compressor is working. Ours is not a gravity system; all oil can be below burners. Wear of Dies lessened. In rolling work the metal works easier than with a coal fire. No Ashes nor Clinkers. Eight gallons Lima crude oil will do more and better work than 200 pounds best hard coal. Thirty to seventy per cent saved. Our system has been in use in large shops nearly two years past. The best fire yet found for lime-kilns, brick-kilns, tile works and potteries. Any desired degree of heat can be kept up continuously or increased as required. Plants near New York and Philadelphia can be shown.

**W. S. COLLINS,** Sole Licensee for Middle Atlantic States,  
171 BROADWAY, NEW YORK.

## BAUER'S Patent Self-Adjusting, Self-Gripping, Self-Acting WRENCH and PIPE TONGS.

The rough adjustment is obtained by shifting  
the short arm from one hole to another, ac-  
cording to the size to be operated on; the fine  
adjustment then being obtained automatically  
as the shorter arm closes on the longer one, and  
the jaws are thus brought together.

It is self-acting, as it grips the work by  
merely grasping the tool in the hand, and need  
not be alternately removed and replaced, as in  
the return motion for a fresh grip the wrench  
releases its hold. It is suitable for any kind of  
work (round, square or hexagon being gripped  
with equal facility), and is the most ef-  
fective Pipe Tongs. Made of solid steel,  
and has no screw to get worn out or stripped.

Liberal discount to the trade.

## Steam Crane for Sale.

We offer for sale a wooden frame Swing Crane of our own manufacture, with chain for a building 31 ft. 8 in. high, wire rope, bolts for timber work, and rails for top sheave frame for jib 25 ft. long. All motions of hoisting, lowering, racking in and out and turning performed by 8 x 10 in. engine attached to base of frame and driving through Robertson Friction Gearing. Cast iron base and top plates; double set of gearing on base plates, not affected by straining or shrinking of timbers; top sheave frame iron, arranged to move the whole length of jib; sheaves bushed with steel and revolving on steel pins; ball and socket hook.

This crane was designed for loads up to 50 tons and has been in use in our own foundry but replaced by our High Speed Power Traveling Crane lately introduced.

Full Particulars and Price furnished on application to

 Blacksmith Shop Outfit, Injectors, Steam and  
 Water Pipe, Valves and Fittings, lot of Floor Plates  
 and other material of value such as is general around  
 a Rolling Mill, too numerous to mention. This prop-  
 erty will be better known as the West Middlesex  
 Rolling Mill. This property must be sold altogether,  
 there being a rolling mill complete. Any part of  
 the machinery will not be sold separately, except  
 the hammer, which is no part of the mill and will  
 be sold separate. For further particulars apply to  
**RALPH J. WICK, Agent, Youngstown, Ohio.**

## HORSE NAIL MACHINERY FOR SALE AT A BARGAIN!

A SMALL INVESTMENT WITH A  
LARGE RETURN!

**\$2,500**

Will purchase all the Machinery and Tools necessary for making 1/4 ton of Horse Nails per day by the cheapest process in use.

These Nails can be sold at a good profit over and above cost of manufacture.

Combining this with some other manufacturing business where Rent, Power, Office, Traveling and other expenses will be at the minimum, it should pay very handsomely on the investment.

Machinery can be inspected at any time and samples of the Nails made with it can be seen.

— ALSO —

## SECOND-HAND MACHINERY!

ALL IN GOOD ORDER.

FOR SALE AT LESS THAN VALUE.

1 Planer—Jones & Lamson's make, 24 x 24 inches, 6 feet bed.

1 Planer—New Haven Mfg. Co. make, 18 x 18 inches, 3 1/2 feet bed.

1 Engine Lathe—14-inch swing, 4 feet between centers, screw cutting, countershaft, &c.

1 Drill Lathe—12-inch swing, 4 feet bed.

2 Post Drills—adjustable tables.

## FACTORY PROPERTY

— OF THE —

## NEW HAVEN NAIL COMPANY,

RIVER STREET, NEW HAVEN, CONN.

Main Building, of wood, is 38 x 180 feet in size. There are two stories in front, facing the street, and running back 60 feet; the lower story is 12 feet high and the upper story 10 feet 6 inches. The rest of the building (70 feet deep) is one-story, with ventilators in the roof, and is 15 feet 10 inches high, making a large airy room, suitable for a variety of purposes.

The Boiler-Room and the Engine-Room are of brick, and are in dimensions as follows:

Boiler-Room 19 1/2 x 34 feet, Engine-Room 13 x 34.

Back of the Boiler Room is a brick coal bin.

Blacksmith Shop and Store-Rooms, at the rear of the factory, 19 x 38. On the west side, connecting Engine-Room with main building, is an addition 12 x 14. On the east side is an addition formerly used as a "tumbling-room" 9 1/2 x 28.

A Horse Shed, with closing doors, and the room next it measures 18 x 31.

Bigelow Engine, in good order, has a 12-inch cylinder and 30-inch stroke.

Two Tubular Boilers, made by the Bigelow Company, of 60 horse-power each, and first-class in every respect.

Four-Ton Fairbanks' Hay Scales is placed at rear of factory.

There is a small but very handy Elevator in front building.

Main Belt, Shafting and Countershaft go with building.

City Water in both front and rear, and Water Closets and Sinks for washing on both floors.

A substantial fence incloses the property and two other lots, and there is an entrance for teams through gates on both Chapel and River streets.

The lot is 100 x 138. Adjoining lots can be purchased if more room is wanted.

CONDITION OF PROPERTY.

These Shops were built in 1881, in a thorough and substantial manner, and they are now in good order and condition, and are suitable for either heavy or light work. The location is first-class in every respect.

This property is worthy the attention of manufacturers seeking a change of location or desiring to own their works. We will take pleasure in showing it to any such, assured that if it will meet the requirements we can induce them to purchase.

For terms and further particulars address

**C. S. MERSICK & CO.,**

NEW HAVEN, CONN.

**FOR SALE.**—One-quarter interest in one of the largest Hardware houses on the Pacific Coast, doing a heavy business and realizing a handsome profit; this business is, and always has been, in a prosperous condition, and seller can give the best of reasons for wishing to dispose of stock; to one taking an active part in the business a good salary can be obtained. For further particulars, address

"PACIFIC COAST,"

Office of The Iron Age, 66 & 68 Duane St., N. Y.

# GIVEN AWAY

FREE GIFT  
OF LAND

For Manufacturing  
Plants or  
Factories.

Located in  
Downingtown, on  
the Brandywine  
River, celebrat-  
ed for its pure water. Fifty minutes from  
Philadelphia. Centre of three railroads. Water  
Works, Gas Works and Electric Lights. Great  
inducements offered to settlers on railroad sid-  
ings. Send for circulars to

Downingtown Improvement Association,

Office 407 Library St., Philadelphia.

## NEW LONDON, CONNECTICUT,

has the best harbor on the coast; coal by water  
direct from mines; exceptional shipping facili-  
ties; four railroads; three lines of steamers;  
water supply; sewers; electric lights; New  
York, 124 miles; Boston, 108 miles; an excellent  
location for manufacturing and residence. Cor-  
respondence invited.

GEORGE WHITTLESY,  
Sec'y of Board of Trade

**FOR SALE.**—A large and well-selected stock  
of Hardware, Agricultural Implements and  
Seeds, with all store fixtures and "good will";  
store is centrally located in a manufacturing  
town of 40,000 inhabitants, in the midst of a rich  
and fertile country; it is now doing a business  
of from \$80,000 to \$100,000 a year; this is a rare  
chance for securing an established and paying  
business; best of reasons given for selling. Ad-  
dress "HARDWARE, IMPLEMENTS, &c.,"  
Office of *The Iron Age*, 66 and 68 Duane Street,  
New York.

One-quarter interest in a manufacturing  
company for sale very low.

Address,

JOHN BROWER,

P. O. Box 1423,

New York.

**HARDWARE STOCK FOR SALE AT A SACRI-  
FICE.**—A good, clean stock of Builders' and  
General Hardware, the best in a city of 25,000 inhabi-  
tants; well established on the main street for 15 years;  
owing to the retirement of the senior member and the  
inability of the junior member to give it proper atten-  
tion because of the Lumber Department to look after,  
we will sell at a discount from the net cost; this is an  
unusually fine opportunity to purchase an established  
business at a sacrifice; stock will invoice about \$5000.  
Address

BENNETT GRIFFIN & SON,  
33 Main Street, Gloucester, Mass.

## FOR SALE.

We wish to sell our line of WAGON and CAR-  
RIAGE MAKERS' HARDWARE and WOOD  
STOCK; the trade has been established for 80  
years, and the location is equal to any in the  
West; average stock about \$30,000; our reason  
for selling is because we wish to confine our-  
selves to the General and Shelf Hardware busi-  
ness exclusively. Address

WESTPHAL-HINDS HARDWARE CO.,  
Dubuque, Iowa.

## FOR SALE.

A thoroughly established Hardware business,  
located in city of 140,000 inhabitants; Western  
New York; on main street; retail trade nearly  
\$70,000; paying good profits; close investiga-  
tion; good reasons for selling; this is a good  
chance for one or two good men; would retain  
one-third interest if desired. Address

"PRINCIPAL,"

office of *The Iron Age*, 66 and 68 Duane st., N. Y.

## TO RENT OR FOR SALE ON EASY TERMS.

A manufacturing interest in first-class run-  
ning condition (experience not necessary, as  
all work is by contract); all goods sold as soon  
as produced at a satisfactory margin of profit;  
has not been shut down for 13 years; supplies  
enough on hand to run several months, which  
can be purchased as needed on easy terms; loss  
of health the sole reason for disposing of it; fac-  
tory 120 feet long, 32 feet wide, two stories high,  
20-horse power engine, 40-horse power boiler, all  
in No. 1 condition; shop fitted with gas and steam  
throughout; correspondence solicited. Address  
"L. E. R.," P. O. Box 2002, N. Y. City.

**WANTED.**—A reliable party to make and sell  
on royalty a staple article in the Hard-  
ware line; the special machinery, dies and tools  
furnished. Address

"BOX 2294,"

Boston, Mass.

# A MANUFACTURING CORPORATION

Having an extensive plant, including foundry,  
boiler, blacksmith and machine shops, wishes  
to secure employment for its facilities. A pat-  
ented specialty preferred. Address

"MANUFACTURER."

Box 235, Boston, Mass.

## TO LET.

The office and warehouse building lately  
occupied by the Reading Iron Works, 220 and  
222 South Fifth St., Philadelphia. This fine  
building was erected expressly for the Reading  
Iron Works in 1887, being 51 x 200 ft., and front-  
ing on three streets, with ample office and  
storage room; is well fitted for carrying on a  
large wholesale and retail business, or would be  
suitable for the purposes of an express com-  
pany. Apply to

JOHN F. KEATOR,  
241 S. 5th St., Philadelphia.

## FOR SALE CHEAP.

100 Tons Steel Strap Rail. Nearly new.  
3 Turn-tables, Hathaway Pattern. Nearly new.  
Address

ERIE ELECTRIC MOTOR CO.,  
Erie, Pa.

# MANUFACTURERS OF HEAVY HARDWARE, METALS OR TOOLS OF ESTABLISHED REPUTATION

desiring to increase their business in the East-  
ern or Western States among the largest buyers  
may secure the services of a gentleman of  
extensive acquaintance visiting above branches  
of trade, who is privileged to add lines of lim-  
ited detail but large volume to his present  
representation of manufacturers where experi-  
enced judgment would be required in making  
large sales or contracts at a minimum cost to  
manufacturer. Address to July 1st

"D.," Box 212,

office of *The Iron Age*, 66 & 68 Duane st., N. Y.

## WANTED.

TRAVELING SALESMEN who are carrying  
special lines and visiting the Hardware and  
Agricultural Implement trade to sell an article  
on commission that is handled by this class of  
dealers; nothing new; no samples required.  
Address, stating territory,

"INDIGO," Box 211,

Portsmouth, Ohio.

## FOR SALE. VALUABLE PATENTS FOR MEAT CHOPPER,

Chopper and Stuffer combined, Steam Auto-  
matic Stuffer, Nos. 274,115, 336,706 and 388,940.  
For price, address

MARKT & CO.,  
146 Worth street, New York.

## YOUR ATTENTION

Is called to the fact that we will license a Hard-  
ware manufacturer having facilities to make  
our new Carpet Stretcher on royalty; it is  
practical, of good design, and cheap to make.  
Also a new Can Opener, which overcomes a  
common difficulty. Address

E. C. ELLWOOD,  
Green's Farms, Conn.

62 John St.—Store, Basement  
and Sub-Cellar

to let or lease; will be put in thorough order;  
new plate-glass windows if desired: low  
rent. Apply to

P. ST. G. BISSELL,  
82 Nassau St., New York.

# MANUFACTURERS

Should locate in the West for  
the Western trade.

Des Moines, Iowa, offers extraordi-  
nary inducements for Industrial  
Enterprises of all kinds.

Seventeen lines of rail-  
ways, low freights, cheap  
coal (50c. per ton), light  
taxes, best location, all  
kinds of clay and many  
other advantages to man-  
ufacturers.

The Des Moines Commercial Ex-  
change invites correspondence and  
visits from all classes of manufact-  
urers. Send for their new pamphlet.  
Address

G. F. SELLECK, Secretary.

## NOTICE

TO HARDWARE MANUFACTURERS.

If you have any desirable specialties for which you  
would like to establish an Agency in Philadelphia,  
please address

J. B. CARTER,  
Hardware Manufacturers' Agent,  
504 Commerce Street, Philadelphia, Pa.

# ROOT'S HANDY CLOTH-BOUND HARDWARE PRICE CARDS.

COPYRIGHTED 1885.

THESE cards cover the lines having a large variety of sizes or numbers, save marking each package or article, in Retail stores, and are convenient for use in Wholesale Sample Rooms. They secure correct and uniform selling prices, for large and small buyers, save time, and are intended for years of constant use. Hence, no hardware dealer can afford to do without them, or spend the time to write and rule out cards by hand. They are printed in distinct type on the best paper, appropriately ruled with blue cross lines and red down rulings, for noting in pencil—List, Cost, Jobbing and Selling prices—as in specimen headings, shown herewith. Card A is mounted one side and B the other side of a

PIECED WARE. [Card No. 26-A.]

Bailed and	8 "				
Copper Bottom.	9 "				

tough, heavy card board, especially adapted for this use, protected on the edges by being cloth-bound, which saves framing. Two-thirds of them are 3 x 13 1/4 inches. This size has been found convenient for hanging on a pilaster finish, or on any narrow surface, without hiding the goods. To hang or chain up each card, there is firmly inserted through the nickel-plated eyelet about 3/8 inch inside diameter. The comparative numbers of the different makers of cabinet and padlocks, rules, levels, etc., have been carefully corrected to the date of issue and many numbers added. Most houses require 6 to 12 cards extra, of each Nos. 32 and 33, to price lines not covered by the other numbers.

## DESCRIPTION AND PRICES.

Card No.	Description	Size and Price per Card.	Card No.	Description	Size and Price per Card.
1	A—Bar Iron, Weight of Round, Square and Flat, per Foot and Tire per set. Western Classification and Prices of Extras on American, Norway and Swedes.	5 1/2 x 18 in. 40 Cts.	23	A—Hooks, Coat and Hat, Wardrobe, School-house, Har-ness, Clothes-line.	3 x 13 1/4 in. 30 Cts.
2	B—Bar Steel, All kinds and Sizes with Prices of Extras. Horse and Mule Shoes, Size, Weight, No. in Keg. Toe Calks. Cut Nails, List of Extras.	3 x 13 1/4 in. 30 Cts.	24	B—Shelf Brackets. Drawer Pulls.	3 x 13 1/4 in. 30 Cts.

## ELECTRIC BELLS

— AND —

## ALL ABOUT THEM.

A Practical Book for Practical Men.

WITH MORE THAN 100 ILLUSTRATIONS.

By S. R. BOTTONE,

Certificated by South Kensington (late of the  
Collegio del Carmine, Turin, and of the  
Istituto Bellino, Novara).

Author of "The Dynamo," "Electric Instruments  
for Amateurs," &c.

One Vol., 12mo, Price \$1.20

### CONTENTS.

CHAPTER I.—Preliminary considerations.  
CHAPTER II.—On the choice of batteries for  
electric-bell work.

CHAPTER III.—On electric bells and other  
signaling appliances.

CHAPTER IV.—On contacts, pushes, switches,  
keys, alarms and relays.

CHAPTER V.—On wiring, connecting up and  
localizing faults.

Sent, postpaid, upon receipt of price, by

**DAVID WILLIAMS,**

BOOKSELLER AND PUBLISHER,

66 and 68 Duane St., New York.

## Why are Shepard's "LIGHTNING" Freezers the Best in the Market?

They are the only Freezers that have the famous **Wheel Dasher**.  
This dasher revolves on its journals, when the can turns, continually forcing the cream  
from the center to circumference of can.  
They therefore freeze the **quickest**. There is less friction than in other freezers.  
They therefore are the **easiest to operate**.  
The Wheel Dasher, as it turns, forms a vacuum in the freezing cream from top to bottom of  
the can, which fills with air and the latter is beaten in the cream, not only making the ice cream  
extra light and palatable, but greatly increasing quantity in the can.  
They therefore make the **best ice cream**, and more of it, from a given  
quantity of cream.  
Cedar Tubs only are used. Most other freezers have pine tubs.  
Finish of castings superior to any make.

**RESULT:**  
Shepard's "Lightning" Freezers freeze the **quickest, easiest**, and make not only  
the best, but the most ice cream from given quantity of cream.

**MORAL:**  
**ASK FOR THE "LIGHTNING," AND TAKE NO OTHER.**

## STAR BUTCHER SAW.

Flat crucible steel backs, polished. Beech handle, polished edges, three brass screws.

Price of the Handles without Blades:

Inches,	14	16	18	20	22	24
Per dozen..	\$8.00.	\$9.00.	\$10.00.	\$11.00.	\$12.00.	\$13.00.

## STAR BUTCHER ★ SAW BLADES.

Length.	Width.	Gauge.	Teeth to inch.	Per doz.
14 and 16 inches.	$\frac{1}{2}$ inch.	24	$9\frac{1}{2}$	\$1.08
18 " 20 "	$\frac{1}{2}$ "	24	$9\frac{1}{2}$	1.20
22 " 24 "	$\frac{1}{2}$ "	24	$9\frac{1}{2}$	1.32

A Common Butcher's Saw Blade costs 50 cents; it is usually filed about 150 times, and at a cost of 10 cents a time, \$15.00. Two dozen Star Butcher Saw Blades will do the same amount of work they cost \$1.32 per dozen and are never to be filed. If the dealer makes 25 per cent.

In selling 24 Star Blades for \$2.64 he gets - - - - - 66c.  
" " 1 Common " " .50 " " - - - - - 12½c.

A clear gain of - - - - - 53½c.

The Butcher pays for 1 common blade and filing, - - - - - \$15.50  
" " " 24 Star " no " - - - - - 2.64

A clear gain of - - - - - \$12.86

As the Star Saw is never to be filed, it is tempered six times as hard as the common saw, and will last six times as long without filing. A great change is taking place in this Butcher Saw business.

## MILLERS FALLS CO.,

93 Reade Street, New York.

## THE PERFECTION SCREW-DRIVER

Mahogany Handles and Steel Blades, highly finished. Nickel-Plated Ferrules.

As will be observed by the cut, a twelve-sided cone is fastened to the end of the blade and this cone fits a corresponding twelve-sided cup which is firmly imbedded in the wood of the handle at its strongest point. A coiled steel spring lies in the cup beneath the cone. In driving a screw with this tool the blade becomes fast by pressure on the handle as the cone is thus forced into its cup, and when the pressure is released the cone is forced out by the action of the spring, thus making it serve the function of a ratchet screw-driver, so that a screw may be driven into the wood or turned out from the wood without shifting the hand. We manufacture also the Acme and Ideal Screw-Drivers, making a splendid line.

**IMPROVED GROUND CROSS-CUT SAWS.**

ALL CROSS-CUT SAWS BEARING THE NAME OF

**HENRY DISSTON & SONS**

ARE MADE OF THE VERY BEST CRUCIBLE CAST  
STEEL, FULLY WARRANTED.

**TOLEDO BLADE.**

Why the Toledo Blade is the Best Working Saw in the Market.

Because it is ground by improved machinery, which insures an even gauge throughout and a true taper from teeth to back, making it four gauges thinner. It is made from the best tough crucible steel, and if properly sharpened will work with little or no set.

**THE CALIFORNIA.**

This saw is of even gauge from end to end, and ground five gauges thinner throughout the entire back than on the teeth, and will retain its gauge as the saw wears narrow, which feature no other saw possesses.

**THE HUMBOLDT.**

This saw is of even gauge on teeth from end to end, and ground five gauges thinner throughout the entire back than on the teeth, and retains its gauge as the saw wears narrow, which feature no other saw possesses.

Our improved machinery and method of grinding insures an evenness that cannot be obtained by any other machine. The very best tough crucible steel that can be made is used in these saws, and each saw is set and sharpened, ready for use. They are papered and stripped so that they can be shipped separately. A trial will convince the most skeptical that they are of a superior quality over all other saws made, as we have spared neither workmanship nor material to accomplish this.

Pruning Shears. Send for Illustrated Catalogue.

# CALIFORNIA LAWN SPRINKLER.

Patented October 2, 1888.

In presenting to you our California Lawn Sprinkler we desire to call your attention to the fact that it is made on scientific principles, and is not made simply TO SELL, but to give satisfaction to the consumer. It is now so much thought of that it is rapidly superseding all other Lawn Sprinklers.

We warrant them to last for years running daily. The bearings are babbitted with the best babbitt metal, and will not leak, wear, or get out of order. From being babbitted with anti-friction metal, it will run with very light pressure, and will water a space of from twenty to sixty feet square evenly, according to the pressure applied. It is a great water economizer. It is the only babbitted Lawn Sprinkler in use. Weight, 3 lbs. Height, 18 inches.

Order sample and convince yourself that at last a good, low-priced Sprinkler has been invented.

Price, \$30 per dozen. Discount to the Trade.

SAMPLE BY EXPRESS, \$3.00.

For Sale by the Trade generally.

## GEM OILER.

Patented February 8, 1880.

The oiler is made of heavy flint glass—strong, clean and durable; filled with the best of oil. It has a metallic top (the bottom is glass), with a flexible chamber with which to squirt the oil. The cap is screwed on to the bottle, making the oiler absolutely leakless.

Being transparent, the quantity of oil in or being poured into the oiler can be seen at a glance, thus enabling you to fill without spilling the oil. Having the bottom and sides all in one piece and of glass, they are perfectly clean, with no spring bottom to leak or come out.

They are sold so cheap that they can be sold again at about the price of a bottle of good oil alone.

To the dealer it is a most convenient article and ready seller.

With the consumer it is a most desirable arrangement, as it enables him to get an oiler with his oil, and a splendid oiler, too.

In using—Place your thumb on the bottom of the oiler, letting the spout pass between the fingers. To squirt the oil, press down on the washer around the spout. This gives a better flow than a spring-bottom oiler, and is easier regulated.

They are sold by Grocers, Stationers, House-Furnishers, Druggists, Hardware Merchants, Novelty Dealers, Type-writer Dealers and Sewing-Machine Dealers.

## PAINE, DIEHL & CO.

Philadelphia, Pa.

## THE SWIFT MILL.

ESTABLISHED 1845.

The annexed cut shows one of the many styles of Coffee Mills of our manufacture, especially adapted to Grocers' use and all retailers of coffee. They are highly ornamental and, workmanship of the very best. We make more than 30 styles.

### Lane's Measuring Faucet.

## LANE'S PATENT STEEL DOOR HANGER.

*The most perfect Anti-Friction Hanger in the Market, because*

It is made of steel throughout, except the wheel, which has a steel axle. It will not break. It is practically free from wear. It is almost noiseless in action. It requires no oil. It has a broad bearing on the door, and keeps in line. It is by far the most durable. It may be used with any track. It is always in order. LANE'S PATENT TRACK is made of steel and is easily put in position. Catches and holds no snow or ice. Door hung thereon cannot jump the track. Is not subject to decay. Requires no fitting, but is ready at once. May be used with hangers of other manufacture. Send for circulars.

Manufactured by **LANE BROS.,** Poughkeepsie, N. Y.

JOHN H. GRAHAM & CO., General Agents, 113 Chambers Street, NEW YORK.

## THE GLOBE COMBINATION CABINET VAPOR STOVE.

Made Exclusively by us. A full line of sizes.

This stove possesses in combination all the recommending features of the low oven, the step and cabinet stoves, so arranged as to make it the most desirable and handsomest Vapor Stove ever constructed. It has the low step rest, and double burner for wash boiler, and an oven located entirely out of the way, which admits of a free, unobstructed use of the whole stove top. The oven is placed on just the right level to afford the user the most comfort and convenience, is large, has the burners always in sight, handsomely polished and nicked base, cast iron bottom, and, as an even roaster and baker, cannot be excelled. The door which opens to form a shelf is attached to oven body with strong cast hinges that will never break or get loose. All six burners on the stove can be used at once, and, if desirable, washing, cooking and baking can be carried on at the same time. The arrangement of this stove is such that under no condition of use does the management of the oven expose the hands to any heat from the burners below, and all risk of fire belonging to the old style back oven is positively removed.

—THE DETACHABLE—  
**EMPIRE SASH CORD FASTENER**  
 (Patent Applied for.)

The simplest and best method of attaching Sash Cords to Window Sashes ever invented, and a great saving in time and patience in putting in or taking out Window Sashes. Every window requires them that is hung with weights.

The sharp rib extending over the top of the fastener through the centre, is by the weight of the sash caused to sink into the frame and thus hold from moving. The most useful invention for Window Sash ever put on the market. Every window requires them.

Reasons why you should use them: It costs less than one and one-half cents per Sash; requires no nails or screws; can be put in or taken out in less than one minute; prevents the knot from fraying out and getting between the sash and frame; does not split the sash like nails or screws; prevents the cord from running back into the weight pocket. Manufactured by the **EMPIRE PORTABLE FORGE CO.** Cohoes, N.Y. U. S. A. Depot for N.Y. City Delivery, C. F. Guyon & Co., 99 Reade St

**Abbe's Patent**  
**SASH CORD FASTENER.**

Patented Feb. 12, 1889.

An entirely new device for fastening braided and all hard laid cords to the sash and weights, without tying knots. Can be applied in less time than is required to unbraid and tie a knot, besides saving 1½ feet of cord. Manufactured in two sizes: No. 1 takes Nos. 7 and 8 cord and No. 2 takes Nos. 9 and 10 cord. Send for prices and circulars to the manufacturer.

## THE Timby Burglar-Proof SASH-LOCK —AND— VENTILATOR.

One Lock only required for a Window. It locks either or both sash securely in any position desired, thereby affording the means of Perfect Ventilation; also absolute security against Burglars and Sneak-Thieves.

Its simplicity, automatic action, strength, ventilating qualities and adaptability to varying thicknesses of sash or inside stops render it more desirable than any other Sash-Lock now offered in the market.

Manufactured from the best Malleable Iron, Steel, Brass and Bronze Metal.

I. G. JENKINS, Manufacturer, Oswego, - N. Y.

New York City Office, 102 Chambers St.

T. F. TIMBY, Manager.

## HUGUNIN 1888 IMPROVED PAT. SCREW SASH BALANCES.

An adjustable Mechanism with positive power for movably balancing Sash. Easily applied or repaired and inexpensive. Costing, applied, less than additional cost of boxed, over plain frame. No attachment to the sash or clock springs to rust out set, and throw away, or sash ribbons to kink and break, allowing ready removal for cleaning, &c. Two widths: Small,  $\frac{1}{4}$ ; Medium,  $\frac{1}{2}$ , for sash, each under 12 and 20 lbs. The 1888 improved are warranted to give permanent satisfaction. Sample Sets by mail, prepaid, 80c. and \$1.00 each, according to size, adapted to buildings, vessels, cars, libraries and for all vertically sliding sash, doors or panels, under 20 lbs. each; little space in frame required for their use. If not kept by your dealer, order direct from ROBT B. HUGUNIN WINDOW FIXTURE MFG. CO., Hartford, Ct.

## Samson Window Cord.

## A MAN OF SAMPLES.

Something About the Men he Met  
"On The Road."

BY WM. H. MAHER.

Should be read by every business man in the country.

It is a book full of keen points about business men and business methods, from the pen of a successful merchant who has not only been "on the road" but has been book-keeper, buyer and head of a house doing a large trade.

The merchant who stays at home can see how men work on the road.

The book-keeper can learn how his letters and drafts are looked upon by the men he writes to.

The stock clerk can get some points about shipping goods and filling orders.

Those who advertise can learn from one of the best advertisers in the United States. Actual names of men and houses are given, but not a line in the book has been paid for in any way.

If men were complimented, it was because the author felt that they deserved it, and others are condemned fearlessly.

Price, 75 Cents.

Sent, postpaid, on receipt of price, by

DAVID WILLIAMS,

Publisher and Bookseller,

66 and 68 Duane Street, New York.

### Bemis & Call Hardware & Tool Co.

#### PATENT COMBINATION WRENCH.

Case-Hardened Throughout. Parts Interchangeable.

This Wrench not only combines the superior qualities of a Gas Pipe Wrench but also all the requisite combinations of a regular Nut Wrench, thus making a combination which has no equal.

#### No. 3 PATENT PIPE WRENCH.

The adjustable jaws of the Wrench are interchangeable; that is, the same serrated plate may be used for either the stationary or sliding jaw, so that if one plate is broken another can be furnished adapted to either jaw without express designation. The slides, nuts and various parts are also interchangeable, thus easily repairing the Wrench at very small expense, and with as perfect practicability for further use as when the Wrench was new.

For Circulars and Price List, address

BEMIS & CALL HARDWARE & TOOL COMPANY, Springfield, Mass.

This Wrench can be furnished with Long Nut or Sleeve.

# "PENNSYLVANIA." THE PENNSYLVANIA HORSE LAWN MOWER.

BEWARE OF IMITATIONS.

The great and unprecedented success of the PENNSYLVANIA LAWN MOWER has induced manufacturers of other Lawn Mowers to imitate our open cylinder. Not being able to use the Patents upon which our knives are formed, they all make a bungling attempt to try and accomplish the same result, in trying to secure the same cutting edge on the knives by a different-shaped edge, which after being in use a short time reduces the edge of the knife to cause great friction, and without securing the desired results.

1889.  
Pennsylvania Lawn Mower.

For Points of Merit see interesting Paper, called

"BLADES of GRASS,"

Furnished free on application.

Lightest and easiest running Horse Mower on the market. Practically noiseless in operation. Made in both open and solid cylinder.

Open Cylinder, with draft irons only. List, \$110

Port Chester, N. Y.,  
MANUFACTURERS OF

**BOLTS, NUTS, RIVETS and WASHERS,**  
CHAMFERED AND TRIMMED  
SQUARE AND HEXAGON NUTS A SPECIALTY.

# LAMBERSON'S HARDWARE PRICE BOOKS.

POCKET EDITION,

4 x 7 inches, 250 pages.

BOUND IN LEATHER.

PRICE, - \$4.00.

LARGE SIZE,

FOR

OFFICE USE.

6 x 9½ inches, 500 pages.

BOUND IN LEATHER,

PRICE, - \$8.00.

THE illustration serves to show the general appearance of the Large Price Book. Dealers who have copies of the first edition will observe that the old classification is abandoned and the alphabetical arrangement adopted in its place. The names of different articles are printed at the upper corner of each page. The index cut on the front edge of the book gives a ready reference to the beginning of each letter, and by turning the corners of the pages any item desired in that division can be very quickly found.

On the first page opened to by the index letter will be found a list of articles beginning with that particular letter, arranged with two spaces after each item for additions of other goods in proper alphabetical order.

Sizes of leading lines are printed, and in case of Rules and Planes comparative numbers are given. Lists are omitted for the obvious reason that they are liable to change, but forms are arranged so that lists may be added with pencil. Useful tables are inserted on Strap Hinges, Nuts, Washers, Wire, Rivets, Stocks and Dies, Rope and Nails. The book is intended primarily for *Salesmen*, but it is no less useful to *Buyers* or *Stock* and *Entry Clerks*, and can be adapted to any purpose for which a price book may be desired. The general plan of the Pocket Edition is the same as in the large book, but the ruling and printing are on a smaller scale. The book is small enough to be carried in the pocket without inconvenience, but the arrangement is so perfect that it will cover a very complete line of hardware.

Sent, Charges Prepaid, on Receipt of the Price by

DAVID WILLIAMS, PUBLISHER AND BOOKSELLER,

66 and 68 Duane Street, New York.

## The Art of Selling.

By F. B. GODDARD.

12mo., Flexible Cloth, 50 Cents.

In this book the author lets the reader into the secrets of the accomplished and successful salesman, illustrates his tact and finesse, and tells how he masters men; but beyond this, the work embraces much information which will be instructive and useful to all classes of business men. Besides suggestions to buyers, it contains chapters on "Changes in Business Conditions and Methods," "Salesmen's Compensation," "Retail Merchants and Salesmen," "Saleswomen," "How to read Character," with a collection of clearly and tersely put important Legal Principles and Decisions Governing Sales. Sent, postpaid, upon receipt of price, by

DAVID WILLIAMS, Publisher and Bookseller,  
66 and 68 Duane St., New York.

**STANLEY'S**  
PATENT  
Roofing  
Bracket.

**STANLEY**

Rule & Level Co.  
New Britain, Conn.

SOLD BY ALL  
HARDWARE DEALERS.

The parts are of Spring Steel, firmly riveted together. Push the beveled ends up under two layers of shingles, already nailed down; the Bracket has two separate bearings on the roof, and is so formed that any increase of pressure from above, increases its stability. One dozen per minute can be placed in position, or removed; and great economy in lumber and nails will be found. There are no loose parts to get lost; and no nail-holes are made in the roof. In constant use these Brackets will last a life-time.

No. 1. Roofing Brackets, 8 inch, ¼ dozen in box. Per Doz., \$3.00

**CORLISS ENGINES**  
MACHINISTS  
IRON FOUNDERS, BOILER MAKERS.  
**ROBT. WETHERILL & CO.**  
CHESTER, PA.

## NEW BOOKS.

**The Art of Selling.** In this book the author lets the reader into the secrets of the accomplished and successful salesman, illustrates his tact and finesse, and tells how he masters men; but beyond this the work embraces much information which will be instructive and useful to all classes of business men. Besides suggestions to buyers, it contains chapters on "Changes in Business Conditions and Methods," "Salesmen's Compensation," "Retail Merchants and Salesmen," "Saleswomen" and "How to Read Character;" with a collection of clearly and tersely put important legal principles and decisions governing sales. By F. R. GODDARD. 12mo, flexible cloth. . . . . \$0.50

**Practical Iron Founding.** A condensed account of the principles and practice of iron founding, both for the student and for the practical man, with principles stated and explained, and including the most recent practice, particularly as it relates to the two branches of machine molding and the melting of iron. Cloth, illustrated with over 100 engravings. . . . . \$1.50

**Manual of American Water Works.** Compiled from the special returns. Containing the History, Details of Construction, Source and Mode of Water Supply, Pumping Machinery, Distribution Consumption, Pressure, Hydrant Rental, Revenue and Expenses, Cost and Debt of Every Water Works in the United States and Canada, and Directory of Water Works, Officials, Engineers and Contractors. Edited by M. N. BAKER. First annual issue, 1888. 8vo, cloth. New York, 1889. . . . . \$1.00

**How to Make a Dynamo.** A Practical Treatise for Amateurs. Containing illustrations and detailed instructions for constructing a small dynamo to produce the electric light. By ALFRED CROFTS. 12mo, cloth. . . . . \$0.80

**Dictionary of Photography for the Amateur and Professional Photographer.** Containing concise and explanatory articles. Illustrated by many specially prepared diagrams. By E. J. WALL. 236 pages, 12mo. . . . . \$1.00

**Aid to Survey Practice:** For reference in Surveying, Leveling and Setting-Out. By L. D. A. JACKSON. Second edition, enlarged, 396 pages, 12mo, cloth. . . . . \$5.00

**A Treatise on Hydraulics.** Contents: Introduction Hydrostatics; Theoretical Hydraulics; Flow through orifices; Flow over weirs; Flow through tubes; Flow in pipes; Flow in conduits and canals; Flow in rivers; Measurement of water power; Dynamic pressure of flowing water; Hydraulic motors; Naval hydromechanics. A number of valuable tables illustrate the text. By MANSFIELD MERRIMAN. Cloth, 8vo. . . . . \$3.50

**Graphics:** or, the art of calculation by drawing lines, applied especially to Mechanical Engineering. By R. H. SMITH. With an atlas of diagrams. 2 vols. . . . . \$5.00
